**Tuscola.**—Seventeen sand and gravel producers reported an output of 1.3 million tons of material. It included molding and fill sand and sand and gravel for building and paving. Moss peat was produced at Caro. Petroleum production totaled 114,000 barrels, of which 95,000 barrels was recovered from the Akron field.

**Van Buren.**—Four fields yielded 21,000 barrels of petroleum. A small quantity of marl was recovered from a pit near Paw Paw. Molding and engine sand was produced from a pit near Grand Haven. Fill and road material was mined at four sites.

**Washtenaw.**—The Washtenaw County part of the Northville field yielded nearly half of a billion cubic feet of natural gas and about 45,000 barrels of petroleum. Nearly 1.9 million tons of sand and gravel was produced at 13 sites. Principal uses were for fill and building and paving. Peat was produced from bogs near Salem and Ypsilanti.

**Wayne.**—The value of mineral production in Wayne County exceeded $45 million, slightly higher than in 1959. Cement, clays, lime, natural gas, petroleum, salt, sand and gravel, and limestone were produced.

Portland and masonry cements were manufactured at two plants of Peerless Cement Co., Division of American Cement Corp. in Detroit. Clay for use at the plants was mined from the Ford clay pit near Allen Park. Portland cement was produced at the Wyandotte plant of the Wyandotte Chemical Corp. Flat Rock Clay Products Co. manufactured draintile from clay mined from a pit in Brownstown township. At Livonia, Lightweight Aggregates Corp. operated a lightweight aggregate plant using clay mined at the site. The output was sold to fabricators of lightweight aggregate products.

Hydrated lime was produced by the Wyandotte Chemical Corp. at Wyandotte. Most of the output was used in manufacturing chemicals. A new lime-producing facility was opened at Detroit by the

Digitized by Google

Solvay Process Division of Allied Chemical Corp. The quicklime produced was used by the company in chemical manufacture.

International Salt Co. mined salt from an underground mine in Detroit. Salt was recovered from artificial brines at Wyandotte by Pennsalt Chemical Corp. and Wyandotte Chemical Corp.

Nearly 2.1 million tons of sand and gravel was produced from pits throughout the county. The output included industrial sands (glass, molding, blast), as well as material for fill and building and paving purposes. Limestone was quarried near Flat Rock and Trenton and used for concrete aggregate and roadstone.

More than 500 million cubic feet of natural gas was recovered from the Wayne County part of the Northville field. About 14,000 barrels of petroleum was produced from the same field. Byproduct sulfur was recovered from crude petroleum by Aurora Gasoline Co., Division of Ohio Oil Co. in Detroit. Crude oil refineries were operated at Flat Rock by Petroleum Specialities, Inc., at Trenton by Socony-Mobil Oil Co., Inc., and at Wyandotte by Wyandotte Chemical Corp.

# The Mineral Industry of Minnesota

By Matthew G. Sikich [1]

MINERAL output in Minnesota in 1960 was valued at over $515 million, a 48-percent increase over 1959. Chief reason for the marked gain was the 52-percent increase in iron-ore shipments. Record high output of sand and gravel, and stone also contributed substantially to the rise in total value of mineral production. Other value gains were recorded for masonry cement, gem stones, manganiferous ore, peat, and tube-mill liners. Decreases were reported for portland cement, clays, lime, and grinding pebbles. Iron-bearing ores (including those containing 5 percent or more manganese, natural) continued to comprise most mineral production in the State, furnishing 92 percent of the total value in 1960. However, demand for iron ore throughout most of 1960 was low; the Nation's steel industry operated at about half capacity during the latter part of the year. As a result, work schedules at many Minnesota mines were curtailed.

**Employment and Injuries.**—Nearly 37.1 million man-hours were worked in Minnesota mineral industries in 1960, excluding office-workers, compared with 29 million man-hours in 1959. Chief reason for the 28-percent gain over the previous year was the longer operating period for most of the State's iron ore mines and beneficiating plants, which were shut down during the 116-day labor strike in 1959.

Four fatalities, all in the iron-mining industry, occurred in 1960 compared with seven in 1959. The number of nonfatal disabling injuries in 1960 was 344, whereas 436 were recorded in 1959.

The Monroe mine of Oliver Iron Mining Division of United States Steel Corp. won the Sentinels of Safety Trophy, the top award, in the open-pit group of the 1960 National Safety Competition. The mine, near Chisholm, worked 518,046 man-hours without a disabling work injury. A number of other Minnesota mines and plants experienced injury-free records in 1960 and received Certificates of Achievement in Safety from the Federal Bureau of Mines.

All employment and injury data were collected from operating companies on a voluntary basis. Data represent virtually complete coverage of the Minnesota mineral industry.

# REVIEW BY MINERAL COMMODITIES

## METALS

**Iron Ore.**—Shipments of iron ore from Minnesota mines (excluding ore containing 5 percent or more manganese, natural) increased 18.6 million long tons, 52 percent over 1959. Principal reason for the substantial gain was the uninterrupted operating season compared with 1959, when a crippling 116-day strike virtually halted ore shipments during the peak operating period. However, because of the general decline in the Nation's economy, expected demand for iron ore by consuming furnaces in 1960 failed to materialize. Operations at many mines were curtailed because of the slack market.

Minnesota continued to lead the Nation in producing iron ore and supplied 66 percent of the total usable iron ore shipped from mines in the United States in 1960.

Iron ore was shipped by 23 companies, operating mines in Crow Wing, Fillmore, Itasca, and St. Louis Counties. Shipments from the Mesabi Range (in Itasca and St. Louis Counties) comprised 95 percent of the State total. Mines in the Cuyuna Range in Crow Wing County, the Vermilion Range in St. Louis County, and the Spring Valley district in Fillmore County furnished the remainder. Open-pit mines furnished 98 percent of the 109.6 million tons of crude ore mined in Minnesota in 1960; underground mines supplied the remainder. Over 80 percent of the crude ore mined during the year was beneficiated. Concentrate constituted 61 percent of the total usable ore shipped; direct-shipping grades furnished the remainder. Crushed, screened, and sized ores not further treated are considered as direct-shipping material. Average iron content of usable ore produced was 54.2 percent, natural, compared with 54.1 percent in 1959.

Approximately 11.4 million tons of taconite concentrate was shipped compared with 8.4 million tons in 1959. Taconite producers were: Erie Mining Co. (agent, Pickands Mather & Co.), at its taconite mine and processing plant near Hoyt Lakes; Reserve mining Co., at its mine in Babbitt and processing plant in Silver Bay; and the Oliver Iron Mining Division of United States Steel Corp., at its mine and concentrator near Mountain Iron and an agglomerating plant at Virginia. After settlement of its royalty dispute with Mesabi Iron Co., Reserve Mining Co. announced plans to increase its Silver Bay plant capacity to about 9 million tons of pellets per year. Plans included construction of a second primary crushing plant in Babbitt, double-tracking the 47-mile railroad, connecting Babbitt and Silver Bay, and constructing new fine-grinding, concentrating, pelletizing, and power facilities at Silver Bay. The expansion program was expected to take 3 years to complete and to cost about $120 million. Reserve also completed contract negotiations for using natural gas in its pelletizing operation—the first use of natural gas in processing Minnesota iron ore.

Encouraged by the passage of the Minnesota semitaconite tax law in 1959, The M. A. Hanna Co. and Oliver Iron Mining Division completed construction of pilot plants near Cooley and Coleraine, respectively, to experiment with treatment of semitaconites. Each plant was to use a Lurgi kiln to convert the nonmagnetic ore to magnetic form for processing by magnetic separation. Capacity of the Hanna plant was expected to be 10 tons of crude ore per hour; that of Oliver, up to 5 tons per hour. The principle of magnetic roasting, known for at least 50 years, was investigated on a pilot-plant scale in the Mesabi Range in the early 1930's and was found technically successful, but economically infeasible. New investigations are warranted by technological and economic changes since that time. In April, The M. A. Hanna Co. made the first shipments of ore from the Pierce mine, which had been under development since the summer of 1957. A new beneficiation plant, having crushing and screening equipment, followed by heavy-medium, cyclone, and spiral separation units, was completed early in the year at the Pierce property. Development work was underway at the Sargent mine, a former underground mine near Keewatin, which Hanna planned to convert to open-pit mining.

one of the largest kilns ever built for producing lime. Molding, engine, and grinding sands were produced from a pit near Ludington. The County Road Commission produced road gravel. Petroleum production declined to 142,000 barrels. In 1959, nearly 250,000 barrels was produced.

**Mecosta.**—Marl for agricultural use was produced near Blanchard and Mecosta. Sand and gravel was produced at three sites. About 49,000 barrels of petroleum and 212 million cubic feet of natural gas were produced from fields in the county.

**Menominee.**—Quicklime and hydrated lime were produced by Limestone Products Division of Northwestern-Hanna Fuel Co. and sold for chemical and industrial purposes. Sand and gravel was produced by three operators.

**Midland.**—Dow Chemical Co. extracted bromine, calcium chloride and calcium magnesium chloride, magnesium compounds, and potash from brines of the Sylvania formation. Salt from artificial brines was also produced.

Kaiser Aluminum and Chemical Corp. completed a periclase plant at Midland to process magnesium hydroxide purchased locally. The output was shipped to a Kaiser refractories plant in Ohio. Oilfields in the county yielded 317,000 barrels of petroleum and 68 million cubic feet of natural gas.

**Missaukee.**—Petroleum and natural gas were the principal mineral commodities. Petroleum production totaled 863,000 barrels compared with 459,000 in 1959, and natural gas production was 322 million cubic feet, up from 209 million in 1959. The largest output came from the McBain and East Norwich fields. A small amount of road gravel was produced.

**Monroe.**—Portland cement was manufactured by the Dundee Cement Co. in its newly completed plant at Dundee. The company also mined clay and quarried limestone at the site for its own use. Limestone was also produced by France Stone Co., Michigan Stone Co., and the Monroe County Highway Commission and sold or used for riprap, flux, concrete aggregate and roadstone, agstone, and railroad ballast. Clay mined near South Rockwood was used in making pottery by F. W. Ritter & Sons Co. Peat was produced for soil conditioning and small quantities of road gravel and petroleum were also reported.

**Montcalm.**—Petroleum production declined to 605,000 barrels from 798,000 in 1959. Natural gas output increased to 385 million cubic feet from 147 million cubic feet in 1959. The largest production of oil and gas came from the Reynolds field. Crude oil was refined at the Crystal Refining Co. plant in Carson City. Large quantities of sand and gravel, used mostly in road construction, was produced at five sites. Peat was dug from a bog near Lakeview.

**Muskegon.**—Salt was produced from artificial brines near Montague by Hooker Electrochemical Co. Sand for industrial purposes, chiefly molding sand, was also produced. About 23,000 barrels of petroleum was produced. The Naph-Sol Refining Co. at Muskegon refined crude oil.

**Newaygo.**—About 72,000 barrels of petroleum was produced from seven fields; the Ensley gasfield yielded 328 million cubic feet of natural gas. Marl and sand and gravel also were produced.

Digitized by Google

**Oakland.**—Sand and gravel valued at more than $5 million was produced at 26 operations, the largest output of any county in the State. Oakland County also was the fourth largest producer of peat. Small quantities of petroleum and natural gas were produced from the Northville field.

**Oceana.**—Seven fields yielded 251,000 barrels of petroleum and 47 million cubic feet of natural gas. Stony Lake, Pentwater, and Crystal Valley fields produced the largest quantities. Sand and gravel for building and paving use also was produced.

**Ogemaw.**—Nearly 500,000 barrels of petroleum and over 800 million cubic feet of natural gas were produced. The Rose City field yielded all the gas and with the West Branch field nearly all the oil. Crude oil was refined at West Branch Refineries, Inc., in West Branch. Sand and gravel was produced at four sites.

**Ontonagon.**—Copper was mined, milled, and smelted by White Pine Copper Co. (a wholly-owned subsidiary of Copper Range Co.). Operations in 1960 did not begin until settlement of a labor strike on February 21. Development of the newly discovered southwest ore body continued. Much diamond drilling and development shaft-sinking was accomplished during the year. Sand and gravel for road use was produced by the county and State highway departments.

**Osceola.**—The Reed City fields yielded the major part of the petroleum (528,000 barrels) and natural gas (445 million cubic feet) produced in the county. The Osceola Refining Co. at Reed City refined crude oil. A substantial quantity of sand and gravel and a small amount of marl also were produced.

**Ottawa.**—Production of about 2.2 million tons of sand and gravel was reported by eight operators. Industrial sands and building and road material were produced. A small amount of marl was dug near Denison. Nearly all of 214,000 barrels of petroleum produced came from the Walker field.

**Presque Isle.**—Limestone for a variety of industrial uses and for concrete aggregate, roadstone, and agriculture was produced at the quarries of both Michigan Limestone Division of U.S. Steel Corp. at Roger City and Chemstone Co. (operators for the Presque Isle Corp.) at Presque Isle. Much of the output from these operations was shipped by water to consumers in the Great Lakes area.

The Onaway Stone Co. produced dimension limestone from its quarry near Onaway. Part of the output was sold as rubble and rough construction stone, and the balance was milled for use as building stone and flagging. The Straits Aggregate Corp. operated a sand and gravel plant at Millersburg, and sold the output for railroad ballast, building and paving material, and fill.

**Roscommon.**—Over 1.2 billion cubic feet of natural gas and 271,000 barrels of petroleum were produced, mostly from the Headquarters and St. Helen's fields. Production of sand and gravel valued at $700,000 was reported by four operators. Most of it was used in road construction.

**Saginaw.**—Clay was mined in the Bay City-Saginaw area for use in cement and for filler and refractories. Road gravel was produced by the State highway department. Nearly 53,000 barrels of petroleum was produced, chiefly from the Birch Run field.

The Straits Aggregate Corp. operated a sand and gravel plant at Millersburg, and sold the output for railroad ballast, building and paving material, and fill.

**Roscommon.**—Over 1.2 billion cubic feet of natural gas and 271,000 barrels of petroleum were produced, mostly from the Headquarters and St. Helen's fields. Production of sand and gravel valued at $700,000 was reported by four operators. Most of it was used in road construction.

**Saginaw.**—Clay was mined in the Bay City-Saginaw area for use in cement and for filler and refractories. Road gravel was produced by the State highway department. Nearly 53,000 barrels of petroleum was produced, chiefly from the Birch Run field.

Digitized by Google

**St. Clair.**—Portland cement was produced at the Port Huron plant of the Peerless Cement Co., Division of American Cement Corp. The company mined clay from a pit at Smith's Creek for its own use.

Diamond Crystal Salt Co. recovered salt from artificial brines produced by dissolving salt from the Salina formation at St. Clair. Peat was produced near Capac. Four operators reported production of sand and gravel.

Five fields yielded 408,000 barrels of petroleum, of which 90 percent came from the Boyd and Peters fields. Over 1 billion cubic feet of natural gas was recovered from two oilfields and three gasfields.

**St. Joseph.**—Marl was recovered from pits near Three Rivers, Sherwood, and Burr Oak. A bog near Three Rivers yielded peat. Sand and gravel produced by three operators was used for fill, building purposes, and road construction.

**Sanilac.**—Peat valued at nearly $1 million was produced from bogs near Miden City and Sandusky, and sold for horticultural use. Road material was recovered from four sand and gravel pits.

**Shiawassee.**—A clay pit near Corunna yielded miscellaneous clay that was used in manufacturing heavy clay products by Michigan Vitrified Tile Co. Sand and gravel mined at five sites was used for fill and building and road construction.

**Tuscola.**—Seventeen sand and gravel producers reported an output of 1.3 million tons of material. It included molding and fill sand and sand and gravel for building and paving. Moss peat was produced at Caro. Petroleum production totaled 114,000 barrels, of which 95,000 barrels was recovered from the Akron field.

**Van Buren.**—Four fields yielded 21,000 barrels of petroleum. A small quantity of marl was recovered from a pit near Paw Paw. Molding and engine sand was produced from a pit near Grand Haven. Fill and road material was mined at four sites.

**Washtenaw.**—The Washtenaw County part of the Northville field yielded nearly half of a billion cubic feet of natural gas and about 45,000 barrels of petroleum. Nearly 1.9 million tons of sand and gravel was produced at 13 sites. Principal uses were for fill and building and paving. Peat was produced from bogs near Salem and Ypsilanti.

**Wayne.**—The value of mineral production in Wayne County exceeded $45 million, slightly higher than in 1959. Cement, clays, lime, natural gas, petroleum, salt, sand and gravel, and limestone were produced.

Portland and masonry cements were manufactured at two plants of Peerless Cement Co., Division of American Cement Corp. in Detroit. Clay for use at the plants was mined from the Ford clay pit near Allen Park. Portland cement was produced at the Wyandotte plant of the Wyandotte Chemical Corp. Flat Rock Clay Products Co. manufactured draintile from clay mined from a pit in Brownstown township. At Livonia, Lightweight Aggregates Corp. operated a lightweight aggregate plant using clay mined at the site. The output was sold to fabricators of lightweight aggregate products.

Hydrated lime was produced by the Wyandotte Chemical Corp. at Wyandotte. Most of the output was used in manufacturing chemicals. A new lime-producing facility was opened at Detroit by the

Digitized by Google

Solvay Process Division of Allied Chemical Corp. The quicklime produced was used by the company in chemical manufacture.

International Salt Co. mined salt from an underground mine in Detroit. Salt was recovered from artificial brines at Wyandotte by Pennsalt Chemical Corp. and Wyandotte Chemical Corp.

Nearly 2.1 million tons of sand and gravel was produced from pits throughout the county. The output included industrial sands (glass, molding, blast), as well as material for fill and building and paving purposes. Limestone was quarried near Flat Rock and Trenton and used for concrete aggregate and roadstone.

More than 500 million cubic feet of natural gas was recovered from the Wayne County part of the Northville field. About 14,000 barrels of petroleum was produced from the same field. Byproduct sulfur was recovered from crude petroleum by Aurora Gasoline Co., Division of Ohio Oil Co. in Detroit. Crude oil refineries were operated at Flat Rock by Petroleum Specialities, Inc., at Trenton by Socony-Mobil Oil Co., Inc., and at Wyandotte by Wyandotte Chemical Corp.

# The Mineral Industry of Minnesota

By Matthew G. Sikich [1]

MINERAL output in Minnesota in 1960 was valued at over $515 million, a 48-percent increase over 1959. Chief reason for the marked gain was the 52-percent increase in iron-ore shipments. Record high output of sand and gravel, and stone also contributed substantially to the rise in total value of mineral production. Other value gains were recorded for masonry cement, gem stones, manganiferous ore, peat, and tube-mill liners. Decreases were reported for portland cement, clays, lime, and grinding pebbles. Iron-bearing ores (including those containing 5 percent or more manganese, natural) continued to comprise most mineral production in the State, furnishing 92 percent of the total value in 1960. However, demand for iron ore throughout most of 1960 was low; the Nation's steel industry operated at about half capacity during the latter part of the year. As a result, work schedules at many Minnesota mines were curtailed.

**Employment and Injuries.**—Nearly 37.1 million man-hours were worked in Minnesota mineral industries in 1960, excluding office-workers, compared with 29 million man-hours in 1959. Chief reason for the 28-percent gain over the previous year was the longer operating period for most of the State's iron ore mines and beneficiating plants, which were shut down during the 116-day labor strike in 1959.

Four fatalities, all in the iron-mining industry, occurred in 1960 compared with seven in 1959. The number of nonfatal disabling injuries in 1960 was 344, whereas 436 were recorded in 1959.

The Monroe mine of Oliver Iron Mining Division of United States Steel Corp. won the Sentinels of Safety Trophy, the top award, in the open-pit group of the 1960 National Safety Competition. The mine, near Chisholm, worked 518,046 man-hours without a disabling work injury. A number of other Minnesota mines and plants experienced injury-free records in 1960 and received Certificates of Achievement in Safety from the Federal Bureau of Mines.

All employment and injury data were collected from operating companies on a voluntary basis. Data represent virtually complete coverage of the Minnesota mineral industry.

# REVIEW BY MINERAL COMMODITIES

## METALS

**Iron Ore.**—Shipments of iron ore from Minnesota mines (excluding ore containing 5 percent or more manganese, natural) increased 18.6 million long tons, 52 percent over 1959. Principal reason for the substantial gain was the uninterrupted operating season compared with 1959, when a crippling 116-day strike virtually halted ore shipments during the peak operating period. However, because of the general decline in the Nation's economy, expected demand for iron ore by consuming furnaces in 1960 failed to materialize. Operations at many mines were curtailed because of the slack market.

Minnesota continued to lead the Nation in producing iron ore and supplied 66 percent of the total usable iron ore shipped from mines in the United States in 1960.

Digitized by Google

Iron ore was shipped by 23 companies, operating mines in Crow Wing, Fillmore, Itasca, and St. Louis Counties. Shipments from the Mesabi Range (in Itasca and St. Louis Counties) comprised 95 percent of the State total. Mines in the Cuyuna Range in Crow Wing County, the Vermilion Range in St. Louis County, and the Spring Valley district in Fillmore County furnished the remainder. Open-pit mines furnished 98 percent of the 109.6 million tons of crude ore mined in Minnesota in 1960; underground mines supplied the remainder. Over 80 percent of the crude ore mined during the year was beneficiated. Concentrate constituted 61 percent of the total usable ore shipped; direct-shipping grades furnished the remainder. Crushed, screened, and sized ores not further treated are considered as direct-shipping material. Average iron content of usable ore produced was 54.2 percent, natural, compared with 54.1 percent in 1959.

Approximately 11.4 million tons of taconite concentrate was shipped compared with 8.4 million tons in 1959. Taconite producers were: Erie Mining Co. (agent, Pickands Mather & Co.), at its taconite mine and processing plant near Hoyt Lakes; Reserve mining Co., at its mine in Babbitt and processing plant in Silver Bay; and the Oliver Iron Mining Division of United States Steel Corp., at its mine and concentrator near Mountain Iron and an agglomerating plant at Virginia. After settlement of its royalty dispute with Mesabi Iron Co., Reserve Mining Co. announced plans to increase its Silver Bay plant capacity to about 9 million tons of pellets per year. Plans included construction of a second primary crushing plant in Babbitt, double-tracking the 47-mile railroad, connecting Babbitt and Silver Bay, and constructing new fine-grinding, concentrating, pelletizing, and power facilities at Silver Bay. The expansion program was expected to take 3 years to complete and to cost about $120 million. Reserve also completed contract negotiations for using natural gas in its pelletizing operation—the first use of natural gas in processing Minnesota iron ore.

Encouraged by the passage of the Minnesota semitaconite tax law in 1959, The M. A. Hanna Co. and Oliver Iron Mining Division completed construction of pilot plants near Cooley and Coleraine, respectively, to experiment with treatment of semitaconites. Each plant was to use a Lurgi kiln to convert the nonmagnetic ore to magnetic form for processing by magnetic separation. Capacity of the Hanna plant was expected to be 10 tons of crude ore per hour; that of Oliver, up to 5 tons per hour. The principle of magnetic roasting, known for at least 50 years, was investigated on a pilot-plant scale in the Mesabi Range in the early 1930's and was found technically successful, but economically infeasible. New investigations are warranted by technological and economic changes since that time. In April, The M. A. Hanna Co. made the first shipments of ore from the Pierce mine, which had been under development since the summer of 1957. A new beneficiation plant, having crushing and screening equipment, followed by heavy-medium, cyclone, and spiral separation units, was completed early in the year at the Pierce property. Development work was underway at the Sargent mine, a former underground mine near Keewatin, which Hanna planned to convert to open-pit mining.

Digitized by Google

The company also was reopening the Mississippi No. 1 mine, to be operated in conjunction with the Sargent.

Jones & Laughlin Steel Corp. began shipments from its Lind-Greenway mine near Grand Rapids. A major stripping program was underway at the company Hill Annex mine near Calumet, extending the south end of the pit. The company also began constructing a new beneficiation plant to process previously unusable iron-bearing material at the Hill Annex. Production was expected to begin in the summer of 1961 at the rate of 500,000 tons of concentrate per year.

Oliver Iron Mining Division began constructing a new concentrator adjacent to its Sherman ore-sizing plant near Chisholm. The plant, with annual capacity of 1.5 million tons of concentrate, will process ores from the Monroe and Sherman groups of mines. The new plant was expected to be completed in 1961.

Pickands Mather & Co. ceased operations at the State-owned Scranton mine near Hibbing in June. However, W. S. Moore Co. obtained a 25-year lease on the property and planned to conduct tests to determine whether the low-grade ore in the mine can be beneficiated into a competitive product. Pickands Mather & Co. reopened the Corsica mine, which had been closed since 1954 and constructed a second screening plant at its Embarrass mine.

Late in 1960 Inland Steel Co. acquired complete ownership of Pacific Isle Mining Co., in which Inland previously held a 50-percent interest.

North Range Mining Co. began shipping from the Nahma mine, a new open-pit mine near Eveleth.

Virtually all the iron ore shipped from the State was for use in manufacturing pig iron and steel. Small quantities were sold for use in paint, as a dense medium for mineral beneficiation, and for manufacturing cement.

Over 97 percent of the ore was transported by rail from the mines and loaded into ore carriers at Lake Superior harbors for shipment to lower Lake ports and thence to consuming districts. Virtually all the remainder was shipped by rail to consumers. Some Minnesota iron ore was consumed at blast and steel furnaces operated at Duluth by the American Steel & Wire Division of United States Steel Corp. and Interlake Iron Corp. Both companies also operated coke ovens at Duluth. Operations were curtailed a large part of the year because of market conditions.

The 1960 navigation season for Minnesota ore shipments opened April 5 at Two Harbors. The final vessel cargo of the season left Silver Bay on November 20, one of the earliest closing dates on record. Chief reason for the early closing was the large stock of ore at lower Lake ports and consuming furnaces.

Lake Erie base prices for iron ore were unchanged from 1959, except for the addition of two new classifications under the Mesabi non-Bessemer grade. The additional classifications were: Fines (under ½ inch), quoted at $10.72 per long ton; and lump and coarse (½ inch and up), at $12.85 per ton. Base price for the standard Mesabi non-Bessemer grade was $11.45 per ton. Average

Digitized by Google

weighted mine value for Minnesota iron ore was $8.60 a long ton, compared with $8.50 in 1959.

The Federal Bureau of Mines expanded research work on iron ores at its new research center at Minneapolis. Pilot-plant development was conducted on an improved flotation process to separate silica from nonmagnetic taconites and semitaconties. Research was initiated on preparation of a super blast-furnace feed in the form of hard, pre-reduced pellets made from iron ore concentrates. Results of a fundamental study of goethite, a hydrated iron oxide mineral, were published.[2]

Statistical data for iron ores containing 5 percent or more manganese, natural, are not included with iron-ore data in this chapter but are treated separately as "manganiferous ore."

**Manganiferous Ore.**—Shipments of manganiferous ore (containing 5 to 35 percent manganese, natural) increased 3 percent over 1959. Manganiferous iron ore (containing 5 to 10 percent manganese, natural) comprised 88 percent of the total shipments. Ferruginous manganese ore (containing 10 to 35 percent manganese, natural) constituted the remainder. Total shipments consisted of 127,403 short tons of direct-shipping grade ore and 313,625 short tons of concentrate. Over 91 percent of the 1,170,859 short tons of crude manganiferous ore mined was beneficiated. Average natural iron and manganese contents of the total shipments in 1960 were 38.41 and 7.83 percent, respectively.

Total value of manganiferous ore shipped from State mines increased nearly 4 percent over 1959. Iron ores containing over 5 percent manganese, natural, have generally been priced as Old Range non-Bessemer on the combined natural iron and manganese content, plus a premium for the natural manganese exceeding 5 percent.

The output of manganiferous ore in 1960 came from eight mines in Crow Wing County in the Cuyuna Range. Producing companies

**TABLE 7.—Shipments of usable[1] manganiferous iron ore and ferruginous manganese ore from mines in the Cuyuna Range**

(Long tons)

| Year | Manganiferous iron ore (5 to 10 percent Mn, natural) | | | Ferruginous manganese ore (10 to 35 percent Mn, natural) | | | Total shipments |

Digitized by Google

were The M. A. Hanna Co., Pickands Mather & Co., and Pittsburgh Pacific Co., Zontelli Brothers Division. The ore was shipped mostly for use in blast and steel furnaces. Some was sold to Manganese Chemicals Corp., which produced various manganese products at its Riverton plant. The Bureau of Mines continued research at its Minneapolis Research Center on developing methods of utilizing the potential manganese resources of the Cuyuna Range. Amenability studies of a wide variety of oxidized carbonate slates by the standard sulfatizing procedure were completed.

**Nickel and Copper.**—Approval by the State Executive Council of rules and regulations governing leases on State-owned land for exploration of copper-nickel deposits was pending at the close of the year.

Exploration of copper and nickel deposits, discovered in the northeastern part of the State in 1948 and investigated by Government agencies and private companies, indicated that the deposits are, at best, marginal.

## NONMETALS

**Abrasives.**—Jasper Stone Co. produced grinding pebbles and tube-mill liners from its quartzite deposit in Rock County. Output of grinding pebbles decreased slightly in quantity and value from 1959. Sales of tube-mill liners decreased in quantity, but increased in value because of higher unit value. The company also sold a quantity of ashlar for architectural use and some broken material for riprap.

**Cement.**—Universal Atlas Cement Division of United States Steel Corp. produced portland and masonry cements at its Duluth plant, the only cement plant in the State. Shipments of portland cement decreased from 1959 principally because sales for highway construction were less. Output of masonry cement decreased in quantity from 1959 but increased slightly in value. Portland-cement output consisted of types I and II (general-use and moderate-heat) and portland-slag cement. Principal raw materials used were limestone, gypsum, blast-furnace slag, and iron dust. The plant has one 200-foot and two 150-foot kilns.

**Clays.**—Total output of clays and shale decreased from 1959, chiefly because output of lightweight aggregate was lower. Clay was produced by six companies from operations in Brown, Carlton, Goodhue, Hennepin, Ramsey, and Redwood Counties for use in manufacturing building brick, lightweight aggregate, vitrified sewer pipe, floor and wall tile, and other products.

Red Wing Potteries, Inc., continued to produce dinnerware and art pottery in Red Wing, chiefly from raw materials produced in other States.

Bloating tests of Minnesota clays and shales were conducted by the Bureau of Mines.

**Gem Stones.**—Amateur gem collectors gathered semiprecious gem stones principally agate and thomsonite, along the north shore of Lake Superior, along the Mississippi River, and in gravel pits in the southeastern part of the State. The material was used mainly for personal gem collections or in handmade jewelry.

Digitized by Google

**Lime.**—Quicklime and hydrated lime were produced in Duluth by Cutler-Magner Co., the sole producer of lime in the State. Total output decreased from 1959. Over 92 percent was sold for chemical and industrial purposes, chiefly paper manufacture, water purification, and metallurgy. The remainder was sold for building and agricultural purposes. A rotary kiln was used for calcining, with bituminous coal as fuel.

**Perlite.**—Crude perlite mined in western States was expanded at plants in Minneapolis by Minnesota Perlite Corp. and Western Mineral Products Co. Total output of the expanded product increased over 1959. The material was sold for use as lightweight aggregate in plaster and concrete, paint additive, and for other purposes.

**Sand and Gravel.**—A record high was established for sand and gravel output. The new mark of 30.3 million short tons surpassed the previous high of 29.6 million tons set in 1958 and represented a 6-percent increase over 1959. Chief reason for the increase was the 1.6 million-ton rise in output for paving use, which more than offset a 4-percent decline in production for building use. Output for railroad ballast increased 13 percent over 1959. Molding-sand production increased 54 percent, whereas sand for glass manufacture decreased 4 percent, compared with 1959. Other quantities of special sands were used for grinding and polishing, sandblasting, oilfield fracturing, engine use, filler, and foundry applications.

Demand for silica sand was expected to rise when new glass-container plants, under construction near Rosemount in Dakota County and near Shakopee in Scott County, begin production in 1961.

Production was reported from every mineral-producing county except Dodge. Major producing areas were in Clay, Dakota, Hennepin, Polk, Ramsey, St. Louis, and Washington Counties, which furnished 39 percent of the State total.

Nearly 72 percent of the 1960 output was for paving and 22 percent for building use. Commercial operations furnished 62 percent of the total production; government-and-contractor operations supplied the remainder. Over 89 percent of the total was shipped by truck; about 6 percent, by river barge; and the remainder, by rail.

**Stone.**—Combined output of basalt, granite, limestone, marl, and quartzite reached a record high of 4.2 million short tons, a 16-percent increase over the previous high in 1959. The marked gain was chiefly attributable to an increase of 647,000 tons of crushed limestone for road construction.

Limestone was quarried from deposits in 16 south-central and southeastern counties. Total output of dimension and crushed limestone increased 21 percent in quantity and 13 percent in value over 1959. The quantity of crushed limestone for concrete aggregate and roadstone increased 29 percent over 1959. However, demand for agricultural limestone was low, resulting in an 11-percent decline in output compared with 1959. Output of dimension limestone remained substantially the same as in 1959, and was used chiefly for structural and architectural use.

Granite was produced in central and northeastern Minnesota, and in the upper Minnesota River Valley. Most of the rough granite was cut, dressed, or polished at finishing plants in Cold Spring, Delano, and St. Cloud. Sales of dressed granite for architectural and monumental purposes increased slightly over 1959. Rough granite sold

Digitized by Google

for monumental use decreased 3 percent in quantity from 1959; production of crushed or broken granite increased 2 percent in quantity. Demand for crushed granite for concrete aggregate and roadstone and railroad ballast was slightly greater than in 1959.

Total production of quartzite, from Nicollet and Rock Counties, was nearly 48,000 short tons valued at about $120,000, about one-third less than in 1959. Sales of crushed and broken quartzite for concrete aggregate, filter blocks, and riprap decreased; sales for refractory purposes increased substantially over 1959. Some dimension quartzite was sold for architectural use.

In St. Louis County, Zenith Dredge Co. crushed basalt for roadstone and railroad ballast. Output decreased from 1959.

Production of calcareous marl increased 21 percent in quantity and 25 percent in value over 1959. Three companies reported production from pits in Cass, Crow Wing, and Wadena Counties. The entire output was sold for agricultural purposes. A report on occurrences and possible uses for marl in Minnesota was published in 1959.[3]

**Sulfur.**—Great Northern Oil Co. recovered byproduct sulfur at its Pine Bend refinery in Dakota County. Shipments increased slightly in quantity but decreased in value, compared with 1959.

**Vermiculite.**—Vermiculite was exfoliated at plants in Minneapolis and St. Paul from crude material mined in Montana. Output in 1960 decreased 18 percent in quantity, chiefly because of declining building activity. The material was sold principally for use as a lightweight aggregate for plaster and concrete, insulation, and litter.

## MINERAL FUELS

**Peat.**—Record output of peat, nearly 1,500 short tons, was established in Minnesota in 1960. The Red Wing Peat Corp. large-scale operation in Carlton County furnished most of the State production. Early in 1960 the company installed a rotary dryer at its processing plant, which was completed in 1959. Several other companies produced peat from bogs in Aitkin, Pine, and St. Louis Counties. Minnesota peat was sold mostly for soil improvement. Other uses included ingredient for potting soils, mushroom beds, seed inoculant, packing for flowers, and earthworm-culture medium. Although some peat was sold in bulk, most of the sales were in containers that ranged in size from 1-quart packages to 6-cubic-foot bags. Demand for peat was fairly high. Most of the shipments were to consumers within the State; however, quantities were shipped as far as Georgia and Florida.

## REVIEW BY COUNTIES

Mineral production was reported from all counties in the State except Waseca. With a predominance of iron-ore mines, St. Louis County continued to lead in value of minerals produced, furnishing nearly 71 percent of the State total. Twelve counties recorded mineral output in excess of $1 million. Mineral output value increased

[3] Schwartz, George M., and Others, Investigation of the Commercial Possibilities of Marl in Minnesota: Minnesota Office of Iron Range Resources and Rehabilitation in cooperation with Minnesota Geol. Survey, 1959.

Digitized by Google

for 56 counties and decreased for 30 counties, compared with 1959. Major gains for Crow Wing, Itasca, and St. Louis Counties were attributable to a substantial rise in iron-ore shipments. However, total value for Fillmore County decreased because shipments of iron ore were less. Mines in Fillmore County had not been involved in the long steel strike, which affected most other mines in the State in 1959. Virtually all the gains or decreases in other counties resulted from demand for road-construction materials. Sand and gravel production was common to all producing counties in 1960, except Dodge.

**Anoka.**—Minnesota Silica Sand Co. produced silica sand for molding and foundry use at its stationary plant near Minneapolis. Sand and gravel for road construction was produced by the Jay W. Craig Co. The county highway department produced gravel for road use and fill.

**TABLE 11.—Value of mineral production in Minnesota, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |

| Watonwan | 84,767 | 102,989 | Sand and gravel. |
| Wilkin | 108,668 | 137,175 | Do. |
| Winona | 685,478 | 749,910 | Stone, sand and gravel. |
| Wright | 232,760 | 242,761 | Sand and gravel. |
| Yellow Medicine | 498,442 | 535,578 | Stone, sand and gravel. |
| Undistributed | 8,572,594 | 5,444,775 | |
| Total | 347,178,000 | 515,255,000 | |

[1] No production reported for Waseca County.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."

**Becker.**—The Becker County Sand & Gravel Co. at a fixed sand and gravel plant near Detroit Lakes produced material for building and road construction, railroad ballast, engine use, and fill. The State and county highway departments produced and contracted for sand and gravel for road use.

**Beltrami.**—Sand and gravel was produced chiefly for building and road construction. Producers included Jay W. Craig Co., Hallett Construction Co., and Ritchie & Tell. Paving gravel was produced by the Minnesota Highway Department.

**Big Stone.**—Granite for architectural and monumental purposes was produced by Cold Spring Granite Co. from its Agate quarry near Ortonville and by Delano Granite Works, Inc., from a quarry near Odessa: Material quarried by both companies was processed at their plants in Cold Spring and Delano, respectively. A custom-sawing plant was operated in Ortonville by Rausch Bros. Granite Co. Rough granite processed at the plant was quarried chiefly in Grant County, S. Dak.

The Hallett Construction Co. portable sand and gravel plant near Odessa produced material for building and road construction. Paving sand was produced by the State highway department.

**Blue Earth.**—Dimension limestone was quarried at Mankato by Mankato Stone Co. and Vetter Stone Co. principally for architectural use; some was sold for curbing, flagging, and rubble. A new processing

Digitized by Google

plant was constructed in 1960 by Vetter Stone Co. Limestone was crushed north of Mankato at quarries operated by Lundin Construction Co. and Mankato Aglime & Rock Co. Output was mainly for use as roadstone, agricultural lime, and riprap.

Sand and gravel for building and road construction and other uses was produced at fixed plants in the Mankato area by Guaranteed Gravel & Sand Co., Hiniker Sand & Gravel Co., and North Star Concrete Co. The State highway department contracted for sand and gravel for road use.

**Brown.**—Ochs Brick & Tile Co. produced shale from a pit near Springfield. It used the output chiefly for manufacturing building brick at its Springfield plant. Shale from the same pit was used by Acolite, Inc., for manufacturing lightweight aggregate at its plant in Springfield.

Sand and gravel for building and road construction was produced by Math N. Schumacher, Wallner Construction Co., and M. M. Youngman in stationary plants at Springfield, New Ulm, and Sleepy Eye, respectively. Portable plants were operated by Roberts Bros. and Carlson Bros., Inc. Paving sand was produced by the State highway department. The county highway department contracted for paving gravel.

**Carlton.**—Several companies produced sand and gravel near Carlton, Cloquet, and Moose Lake for building and road construction, railroad ballast, and fill. The State and county highway departments produced and contracted for paving sand and gravel. The city of Cloquet contracted for paving gravel.

The Nemadji Tile Co. produced fire clay near Moose Lake and used the material chiefly for manufacturing floor tile.

Red Wing Peat Corp. produced sphagnum peat from an 1,800-acre State-owned deposit near Corona, several miles east of Cromwell. Average thickness of the bog is about 15 feet. Harvesting was done on a large scale. A backhoe was used for ditching and blocking out 5- to 8-acre sections, thus accelerating the natural drying process. A unique feature employed by the company in harvesting was the use of "vacuum-cleaner" type rigs, which passed over the tilled peat and sucked up the top layer. Principal plant equipment was an oil-fired, rotary kiln, which the company installed in January for drying the peat. Much of the material was stockpiled after drying. The product was sold mostly in 6 cubic-foot polyethylene-lined bags. The plant was adjacent to tracks of the Northern Pacific Railway Co. However, substantial shipments were made by truck. Less than 50 days were spent in harvesting in 1960 because of poor weather.

**Cook.**—Approximately 5.6 million long tons of taconite-concentrate pellets was shipped from Taconite Harbor, the shipping port of Erie Mining Co. on the north shore of Lake Superior. The pellets were produced at the company plant at Hoyt Lakes in St. Louis County, and transported to the harbor on a 73-mile company-owned railroad. Traveling-belt conveyors were used to load pellets into ore vessels, instead of the conventional chute arrangement. In 1960 the first cargo of pellets was loaded at Taconite Harbor on April 14. The final cargo of the season left the harbor on November 20.

Digitized by Google

Edwin E. Thoreson, at a fixed plant near Grand Marais, produced sand and gravel for building and road construction. Paving gravel was produced by the State highway department and under contract for the county highway department.

**Crow Wing.**—An increase in iron-ore shipments was the chief reason for the 16-percent gain in total value of mineral output from Crow Wing County, compared with 1959. Operating companies and mines, from which iron and/or manganiferous ores were shipped in 1960 were as follows:

| Company: | *Mines* |
|---|---|
| The M. A. Hanna Co. | Alstead group, Feigh, Huntington, Musser, Portsmouth, Robert, and South Hillcrest. |
| Inland Steel Co. | Armour No. 2. |
| Pickands Mather & Co. | Mahnomen and Sagamore. |
| Pittsburgh Pacific Co. Zontelli Brothers Division | Mangan Lot No. 5, Manuel, Merritt Stockpile, North Yawkey, Sagamore, West Airport, and Mangan-Joan. |
| Rhude & Fryberger | Brown Underground. |

All mines operated in the county in 1960 were open pits, except the Armour No. 2 and Brown Underground mines. Approximately 59 percent of the iron ore shipped was direct-shipping grade; the remainder was concentrate. Because of the poor market for ore, work schedules at most operating mines were curtailed. No shipments were made from the following mines, which had shipped in 1959: Maroco (The M. A. Hanna Co.), Mangan-Stai (Pittsburgh Pacific Co.), Rabbit Lake (Pickands Mather & Co.), and Carlson-Nelson (Rhude & Fryberger). The Maroco and Mangan-Stai mines were idle the entire year. Development work only was performed at the Rabbit Lake and maintenance work, at the Carlson-Nelson in 1960. Stockpile shipments of 2,135 tons from the Armour No. 1 mine of Inland Steel Co. were included with Armour No. 2 shipments. The Armour No. 1 shaft was abandoned in 1959. Rhude & Fryberger terminated its lease on the Brown Underground mine, which was operated only during April. Shipments were resumed from the North Yawkey mine, which had last shipped ore in 1956.

The entire State production of manganiferous ore came from eight mines in Crow Wing County. Shipments increased slightly over 1959.

The Manganese Chemicals Corp. plant near Riverton produced manganese carbonate, manganese dioxide, and other manganese products from Cuyuna Range manganiferous ore.

Ripley Sand & Gravel, Inc., at a fixed plant in Brainerd produced sand and gravel chiefly for building purposes.

Calcareous marl for agricultural use was produced near Pequot Lakes by Tweed Bros. A ¼-yard dragline mounted on a half-track chassis was used for excavating the material, which was stockpiled for drying before spreading.

**Dakota.**—Crushed limestone was produced by Edward Kraemer & Sons, Inc., and Northwestern Gravel Co., Inc. Output was used principally for roadstone. Both companies also produced sand and gravel for building and road construction. Other producers of sand and gravel included Bituminous Surface Treating Co., Cords Concrete Products, Jay W. Craig Co., Minnesota Quartz Co., and Standard

Digitized by Google

Building Material Co. Most of the output was for building and road purposes, but some was sold for sandblasting. Sand and gravel for road construction was produced under contract for the State and county highway departments.

Byproduct sulfur was recovered at the Great Northern Oil Co. refinery at Pine Bend. Shipments increased slightly in quantity over 1959 but decreased in value.

Brockway Glass Co. was constructing a new glass-container plant one mile north of Rosemount. The 242,000-square-foot plant was expected to cost $5.75 million and begin operating in 1961.

**Fillmore.**—Iron-ore shipments from Fillmore County mines decreased 20 percent from the record high of 575,000 long tons in 1959. The M. A. Hanna Co. shipped 382,000 long tons of concentrate from its group of open pits near Spring Valley. Schroeder Mining Co. shipped 80,000 tons of concentrate from its Krueger mine near Chatfield. The entire county output of iron ore was shipped by rail to consuming furnaces at Granite City, Ill.

Crushed limestone for agricultural and road purposes was produced by Hadland & Vreeman and Kappers Construction Co. at portable plants near Ostrander and Fountain and by Pederson Bros., at a fixed plant near Harmony. Hector Construction Co., Inc., also produced crushed limestone for roadstone, and paving sand near Lanesboro. Thompson Sand & Gravel produced sand for building use near Peterson. The State highway department produced paving sand.

**Goodhue.**—Fire clay was produced by the Red Wing Sewer Pipe Corp. from pits near Goodhue. Output was used by the company in manufacturing vitrified sewer pipe, draintile, and other products at its plant in Red Wing. Dinnerware and art pottery were manufactured at Red Wing by Red Wing Potteries, Inc., from raw materials produced in other States.

Mann Construction Co. operated a portable crushing plant at various quarries in the county, producing limestone for roadstone, agricultural use, and rubble. It also produced paving sand and gravel. Crushed limestone for road use was produced by Valley Limestone Co. from a quarry near Zumbrota.

Sand and gravel was produced by five commercial operators at fixed and portable plants near Frontenac, Lake City, and Red Wing. Output was used for building and road construction and fill. The State highway department produced and contracted for paving sand and gravel. The county highway department contracted for road gravel.

**Hennepin.**—Over 3 million tons of sand and gravel was produced in Hennepin County, a 13-percent increase over 1959. Operations were chiefly in the suburban areas of Minneapolis. Output was used principally for building and road construction. Commercial operators included the following: Great Northern Railway Co., Anderson Aggregates, Inc., Barton Contracting Co., Consolidated Materials Co., J. W. Craig Co., Chas. M. Freidheim Co., Frisk Sand Co., Glacier Sand & Gravel Co., Hedberg & Sons Co., Oscar Roberts Co., J. V. Gleason, Hopkins Sand & Gravel Co., Industrial Aggregate Co., Keller Bros. Gravel Co., and Mapco Sand & Gravel Co.

Digitized by Google

North Central Lightweight Aggregate Co., Inc., produced clay near Minneapolis and used it for manufacturing lightweight aggregate. Output decreased from 1959.

Minnesota Perlite Corp. and Western Mineral Products Co. expanded perlite at plants in Minneapolis from crude material mined in western States. The product was sold for use as lightweight aggregate in plaster and concrete, paint additive, and other purposes. Vermiculite was exfoliated in Minneapolis at plants operated by B. F. Nelson Mfg. Co. and Western Mineral Products Co. from crude ore mined in Montana and used chiefly as lightweight aggregate in plaster and concrete and for insulation and litter.

Mining and metallurgical research was conducted at the Bureau of Mines research center at Minneapolis.

**Houston.**—Hector Construction Co., Inc., operated a portable plant at various places in the county, producing crushed limestone for roadstone and agricultural purposes and paving sand. Botcher Construction Co. produced limestone for roadstone, agricultural use, riprap, and rubble. The State and county highway departments produced paving sand.

**Itasca.**—Total value of mineral output in Itasca County increased 71 percent because of a substantial rise in iron-ore shipments, compared with strike-bound 1959. Approximately 98 percent of the shipments was beneficiated ore. Direct-shipping grades constituted the remainder. All iron-ore mines operated in 1960 were open pits; no underground mines had been operated since 1953. The following operating companies and mines shipped iron ore in 1960:

| Company: | *Mines* |
|---|---|
| Cleveland-Cliffs Iron Co | Canisteo, Hawkins, Hill-Trumbull, Holman-Cliffs and Sally. |
| The M. A. Hanna Co | Argonne group, Harrison group, Hunner, Mississippi group, and Patrick group. |
| Jessie H. Mining Co | Jessie. |
| Jones & Laughlin Steel Corp | Hill Annex and Lind-Greenway. |
| Oliver Iron Mining Division United States Steel Corp | Arcturus group, King group, and Plummer. |
| Pickands Mather & Co | Bennett, Danube, and Tioga No. 2. |

The M. A. Hanna Co. and Oliver Iron Mining Division of United States Steel Corp. constructed pilot plants near Cooley and Coleraine, respectively, to investigate possible commercial utilization of the vast resources of semitaconite material in the Mesabi Range. Both companies were to use Lurgi kilns for converting the nonmagnetic ore to magnetite, which will respond to magnetic separation. The Hanna pilot plant was to treat 10 tons of feed per hour in a kiln 89 feet long and 9 feet in diameter; the Oliver plant was to treat up to 5 tons per hour in a kiln 50 feet long and 4½ feet in diameter. The Oliver plant, located at the company Trout Lake concentrator, began experimental production late in 1960. For fuel, Oliver began using propane, which was broken down in a special converter into a gas with a chemical composition suitable for the roasting process. Hanna planned to use gas manufactured at the plant from coke. Natural gas, lignite, or other fuels could also be used in the roasting process. Reduction roasting had been tested by Hanna in 1934, but

Digitized by Google

the work was economically unsuccessful. New tests were warranted following passage of a favorable State semitaconite tax law in 1959, and because of technological and economic changes since the early investigations.

Jones & Laughlin Steel Corp. began shipments from the Lind-Greenway mine on the western end of the Mesabi Range. A new washing plant at the mine was operated during the year. Mining was conducted in two separate pits, one on each side of the Prairie River, connected by a truck-haulage road. Conventional power-shovel methods were used. Jones & Laughlin also was developing a sizable addition to the Hill Annex mine near Calumet. A major stripping program was in progress to extend the south end of the pit. The company began building a new concentrator to process iron-bearing material at the Hill Annex. Planned capacity of the plant was about 500,000 tons of concentrate per year. Plant production was expected to begin in 1961.

The M. A. Hanna Co. began stripping at the formerly underground Sargent mine, near Keewatin, and reopened the adjacent Mississippi No. 1 mine under a new State lease, which permitted Hanna to mine in conjunction with operations at the Sargent mine the small tonnage of ore that remained on the Mississippi property.

Jessie H. Mining Co. was removing overburden by dredging at its new property near the Jessie No. 1. The mine was to be pumped dry for normal open-pit operation after the overburden had been removed.

The St. Paul and West Hill mines, operated in 1959 by Pacific Isle Mining Co. and Pickands Mather & Co., respectively, were idle except for maintenance work at the West Hill.

Paving sand and gravel was produced by Jay W. Craig Co. and the State highway department. Neil Baker Co. produced sand for building use at Grand Rapids. The county highway department produced and contracted for road gravel. The contract production was furnished mostly by Hawkinson Construction Co. from various pits in the county.

**Kanabec.**—Paving sand was produced by the State highway department.

The Mora Grey granite quarry of Cold Spring Granite Co. was not operated in 1960.

**Lac qui Parle.**—Cold Spring Granite Co. produced dimension granite for architectural and monumental purposes from the Cold Spring Red quarry near Odessa. The rough material was processed at the company plant in Cold Spring. The North Star Granite Corp. produced granite from its No. 9 quarry near Odessa. The rough granite was finished at the company St. Cloud plant and sold for monumental use. Granite for monumental purposes was also produced by Dakota Granite Co. and Dewar Bellingham Granite Co. near Bellingham. The former company processed the rough stone at its plant in Grant County, S. Dak.

Sand and gravel for building and road construction and fill was produced by W. J. Stolpman, who operated a portable screening plant and a stationary washing plant near Rosen. The State highway department produced paving sand. The county highway department produced and contracted for gravel for road use and fill.

Digitized by Google

**Lake.**—Reserve Mining Co. operated its large taconite-processing plant at Silver Bay. The company processed 15 million long tons of crude taconite, mined near Babbitt in St. Louis County, and shipped 5 million tons of taconite-concentrate pellets from Silver Bay during the year. The first cargo of pellets shipped from the port in 1960 was loaded on April 11. The 1960 navigation season for Minnesota ore shipments closed at Silver Bay on November 20. Reserve announced plans to increase the Silver Bay plant capacity to 9 million tons of pellets per year by constructing a second coarse crushing plant at Babbitt, double tracking the 47-mile railroad between Babbitt and Silver Bay, and increasing the length of the concentrator from 1,350 feet, to 2,150 feet as additional completed production lines are installed. Rod and ball mills were lengthened to increase their capacity. There were 12 units in the concentrator, each having a rod mill and a ball mill. Maintenance and repair buildings at the mine and the plant site were to be doubled in size. The powerplant and vessel-loading facilities also were to be enlarged. In 1960, contracts were completed for the use of natural gas in the company pelletizing operation.

Several companies produced sand and gravel for road construction, railroad ballast, and other uses.

**Le Sueur.**—Dimension limestone was produced and processed near Kasota by the Babcock Co. Principal products included stone cut to architectural specifications and stone veneer. A portion of the output was highly polished and sold for interior trim and facings. Some stone was sold for rough construction and riprap. Crushed limestone and gravel for road use were produced by Ed. Swartout near Kasota.

Silica sand produced from the Jordan Sandstone formation near Le Sueur by Gopher State Silica, Inc., was sold for use in manufacturing glass, molding, oilfield fracturing, filler, and building. E. H. Benjamin produced silica sand near Kasota, which was sold to limestone-processing plants for use in sawing and polishing. At a fixed plant near Gaylord, Glander Washed Sand & Gravel Co. produced sand and gravel for building and road construction. Lundin Construction Co. at a portable plant near Kasota produced gravel for building and road construction and other uses. Paving sand was produced by C. C. Cram near Waterville and by the State highway department.

**Mille Lacs.**—Cold Spring Granite Co. produced dimension granite from its Diamond Grey quarry near Isle and processed it at the company plant in Cold Spring for architectural and monumental purposes.

Sand and gravel for building and road construction was produced by Mille Lacs Sand & Gravel Co. at its fixed plant near Milaca. The State highway department produced and contracted for paving sand and gravel.

**Mower.**—Crushed limestone for roadstone and agricultural use was produced near Austin by Martin Bustad & Son and Osmundson Bros. Hickok Calcium White Rock Co. produced limestone for roadstone, flux, rough construction, and agricultural purposes.

Sand and gravel, which was produced by several companies at fixed and portable plants near Austin and Brownsdale, was used principally for building and road construction. Paving sand and gravel

Digitized by Google

was produced under contract for the State and county highway departments.

**Nicollet.**—Crushed and broken quartzite was produced by New Ulm Quartzite Quarries, Inc., at its quarry near New Ulm. Output decreased from 1959. Sales were principally for concrete aggregate, filter blocks for water and sewage-treatment plants, refractory purposes, poultry grit, and riprap.

Hallett Construction Co. produced sand and gravel near St. Peter for building and road construction. Courtland Sand & Gravel Co. at a fixed plant near Courtland produced sand for building use and fill. A. H. and J. H. Massopust produced paving gravel near New Ulm. Sand and gravel was produced under contract for the State and county highway departments.

**Olmsted.**—Patterson Quarries, Inc., and Quarve & Anderson Co. crushed limestone for roadstone and agricultural purposes.

Sand and gravel was produced near Rochester by Quarve & Anderson Co., Riverside Sand & Gravel Co., and Rochester Sand & Gravel Co. The material was used for building and road construction, fill, and other purposes. Paving sand and gravel was produced under contract for the State and county highway departments.

**Otter Tail.**—Mark Sand & Gravel Co. produced sand and gravel, operating a stationary plant about 15 miles east of Fergus Falls and a portable plant at various other locations. Output was chiefly for road construction. The company also furnished material to a concrete-block plant, a ready-mixed concrete plant, and a concrete-tile factory in Fergus Falls. L. A. Hansen produced paving gravel near Fergus Falls. John Dieseth Co. produced gravel at a portable plant for road construction and other uses. The Minneapolis, St. Paul & Sault Ste. Marie Railroad Co. produced gravel for railroad ballast and fill. T. L. Horstman produced sand and gravel for building use. The State and county highway departments and the city of Fergus Falls produced and contracted for paving sand and gravel.

**Pine.**—Peat was produced by the Pine City Peat Co. from an 80-acre deposit about 3 miles north of Pine City. The product was referred to as tamarack peat. Average depth of the bog is 12 feet, with a reported maximum depth of 60 feet. Excavating and hauling were done under contract. Peat was hauled to Pine City for grinding. Output, sold in bulk and in paper bags, was used primarily for soil conditioning.

Yost Bros. produced sand and gravel at a stationary plant 3.5 miles east of Beroun. The entire output was washed and used for concrete aggregate at the company ready-mixed concrete plant at Beroun. Jay W. Craig Co. at a portable plant in the county produced sand and gravel for road construction. Louis Hultgren & Sons produced sand for molding use near Kerrick. The State highway department produced and contracted for paving sand and gravel.

**Polk.**—Spring Gravel Co. produced sand and gravel at its stationary plant 15 miles southeast of Crookston. Output was sold mainly to road contractors and to a concrete-block factory and ready-mixed concrete plants at or near Grand Forks, N. Dak. Thorson Gravel Co. produced sand and gravel near Fertile for building and road construction, railroad ballast, and fill. Sand and gravel for building use,

Digitized by Google

railroad ballast, and fill was produced by the Great Northern Railway Co. near Benoit and by Northern Sand & Gravel, Inc., near Trail. Ahles & Lush and Jay W. Craig Co. at portable plants in the county produced paving sand and gravel. The State and county highway departments contracted for paving sand and gravel.

**Ramsey.**—Arsenal Sand & Gravel Co. produced sand and gravel near New Brighton for building and road construction and other uses. Paving sand and gravel was produced by Jay W. Craig Co., the State highway department, and under contract for the U.S. Army Corps of Engineers. No silica sand was produced in the county in 1960. The Ford Motor Co., which formerly mined silica sand from the St. Peter Sandstone formation, ceased operations in 1959.

The Twin City Brick Co. produced clay chiefly for use in manufacturing building brick at its St. Paul plant.

Sebesta Stone Co. produced dimension limestone at St. Paul and sold the material principally as rubble.

Vermiculite was exfoliated by the MacArthur Co. at St. Paul from crude material mined in Montana and was sold for use at lightweight aggregate in plaster and concrete, and for insulation.

**Redwood.**—Dimension granite for monumental use was produced near Belview by the View Quarry Co. and Johnson Quarry Co.

Ochs Brick & Tile Co. mined clay near Morton and hauled it by truck to the company brick plant at Springfield for processing.

Sand and gravel was produced for building and road construction and other uses by Buterbaugh Sand Co. and Chapman Gravel Co. at fixed plants near Walnut Grove and Belview, respectively.

**Renville.**—Cold Spring Granite Co. produced dimension granite for architectural and monumental purposes from its Rainbow quarry near Morton and processed the rough stone in Stearns County. The Melrose Tapestry quarry was not operated by the company in 1960.

Several companies produced sand and gravel near Belview, Danube, Olivia, and Sacred Heart. Output was used chiefly for building and road construction. Paving sand was produced by the State highway department.

**Rice.**—Bryan Rock Products, Inc., crushed limestone for roadstone and agricultural use at a portable plant near Northfield. Faribault Quarries produced dimension and crushed limestone near Faribault. Output was used for roadstone, architectural use, rough construction, flagging, and riprap.

Sand and gravel was produced by three companies chiefly in the vicinities of Faribault, Nerstrand, and Northfield. Output was for building and road construction. Paving sand was produced by the State highway department.

**Rock.**—The Jasper Stone Co. produced grinding pebbles and tube-mill liners at its quartzite quarry near Jasper. The company also sold some stone for architectural use and some broken material for riprap.

Hallett Construction Co. produced sand and gravel for building and road construction near Luverne. C. H. Hatting Gravel Co., Inc., produced gravel near Luverne. Output was screened and used mostly on county and township roads. Pronk & Sons produced sand and gravel from a pit about 4 miles west of Leota, mostly for road use. The remainder was used for concrete aggregate at the company

Digitized by Google

ready-mixed concrete plant, located at the gravel pit. Paving sand and gravel was produced under contract for the State and county highway departments. Demand for road material in the county was high.

**St. Louis.**—Mineral output in St. Louis County increased 49 percent in value over 1959, chiefly because of a marked gain in iron-ore shipments over strike-affected 1959. Mines in the county supplied 74 percent of the total usable ore shipments from the State. Approximately 51 percent of the total shipments was direct-shipping grade; the remainder was concentrate. The following operating companies and mines shipped iron ore in 1960:

| Company: | *Mines* |
|---|---|
| Charleson Iron Mining Co | Missabe Mountain and Minnewas LOSP. |
| Haley-Young Mining Co | Elbern. |
| The M. A. Hanna Co | Agnew No. 2–South Agnew, Brunt, Douglas, Duncan, East Alpena, Enterprise, Morton-South Eddy, North Uno, Pierce, South Longyear, and Weggum. |
| Jones & Laughlin Steel Corp | Columbia, Longyear group, and Schley group. |
| W. S. Moore Co | Judson, Judson Extension, Mariska, Mariska Extension, Norman, Scranton, and Yawkey. |
| North Range Mining Co | Nahma. |
| Oglebay Norton Co | St. James. |
| Oliver Iron Mining Division, United States Steel Corp. | Canton (0–39), Emmett Extension, Gilbert, Hull-Rust group, Iron Range Reserve, Kosmerl, McKinley, Monroe group, Pillsbury, Pilotac, Pioneer, Rouchleau group, Sherman group, Soudan, and Stephens. |
| Oreclone Concentrating Corp | Prindle Tailings. |
| Pacific Isle Mining Co | Iroquois, Missabe Mountain LOSP, Shiras, Wacootah, and Wisstar. |
| Pickands Mather & Co | Albany, Bennett Annex, Embarrass, Erie Commercial, Erie Preliminary Taconite Plant, Mahoning, and Wade. |
| Pioneer Mining Co | Mary Ellen. |
| Pittsburgh Pacific Co | Chataco, Commodore, Fayal LOSP, Meadow, Meadow Extension, Missabe Mountain (South Lease), Pearce, Sidney, and Wyoming. |
| Republic Steel Corp | Susquehanna. |
| Reserve Mining Co | Peter Mitchell. |
| Rhude & Fryberger | Alworth, Boeing, and Pearsall. |
| Snyder Mining Co | Godfrey, Webb-Sellers Triangle, and Whiteside. |
| E. A. Young, Inc | Minnewas. |
| Zenith Mining Company | Zenith. |

All mines were in the Mesabi Range except the Pioneer, Soudan, and Zenith underground mines in the Vermilion Range. Other underground mines shipping ore in 1960 were the Albany and the Godfrey.

Shipments of taconite concentrate increased about 3 million long tons over 1959. Taconite producers were as follows: Erie Mining Co. (operating agent, Pickands Mather & Co.), Reserve Mining Co., and the Oliver Iron Mining Division of United States Steel Corp. Erie operated taconite mines and its processing plant near Hoyt Lakes. Finished pellets were hauled over the 73-mile company-owned railroad to Taconite Harbor for shipment to lower Lake ports.

615629—61——36

Digitized by Google

Stockpile shipments were made from the Erie Preliminary Taconite Plant. Two new shaft furnaces were installed at the pelletizing plant in 1960.

Reserve Mining Co. produced taconite at its Peter Mitchell mine near Babbitt. The crude taconite was crushed to about 3-inch size and transported over the company railroad to Silver Bay for further crushing, concentrating, and pelletizing. The company announced plans to increase the annual capacity of its Silver Bay plant to 9 million tons of pellets. The expansion program included constructing a second primary crushing plant at Babbitt and double-tracking the 47-mile railroad connecting Babbitt and Silver Bay. Additional plans are mentioned in the Lake County section.

Oliver operated its Pilotac taconite mine and concentrator near Mountain Iron and hauled the concentrate to the company Extaca plant at Virginia for agglomeration by sintering and nodulizing.

Oliver also began constructing a new beneficiation plant at its Sherman ore-sizing plant near Chisholm. The plant was to process low-grade ores from the Monroe and Sherman groups of mines. Anticipated annual capacity of the plant was 1.5 million tons of concentrate. Plant production was scheduled to begin in 1961.

In April, The M. A. Hanna Co. began shipments from the Pierce mine near Hibbing. A new concentrator, which included crushing, screening, heavy-medium, cyclone, and spiral units, was completed early in the year. About 704,000 long tons of ore was shipped from the property in 1960. Approximately half the total output was concentrate.

Pickands Mather & Co. resumed shipments from the Albany underground and Wade open-pit mines. The company was testing the following new equipment at the Albany mine: A jumbo drill rig mounted on a tractor, a hydraulically-operated timbering machine, and a shuttle car to carry ore from the working face to a conveyor.

The company also reopened the Corsica mine, which was to be operated in conjunction with the Embarrass pit. A second screening plant was constructed at the latter mine. Pickands Mather ceased operations at the State-owned Scranton mine near Hibbing in June. However, W. S. Moore Co. obtained a 25-year lease on the property and operated the mine during the latter part of 1960. Moore planned to investigate whether the low-grade ore remaining in the mine could be treated economically.

Inland Steel Co. acquired complete ownership of Pacific Isle Mining Co. late in the year. Inland previously had held a 50 percent interest in Pacific Isle.

North Range Mining Co. made first shipments from the Nahma open-pit mine near Eveleth. The company, as agent for the Zenith Mining Co., also operated the Zenith underground mine at Ely. A new spiral circuit was added to the concentrating plant at the Zenith.

Rhude & Fryberger terminated its lease on the Alworth pit near Hibbing.

Annual capacity of the Coons-Pacific Co. plant near Eveleth was increased about 50 percent to 1.5 million tons of crude ore.

The American Steel & Wire Division of United States Steel Corp. and Interlake Iron Corp. produced coke and pig iron at plants in

Digitized by Google

Duluth. The former company also produced steel in open-hearth furnaces. Both companies curtailed operations because of poor market conditions.

Portland and masonry cements were produced at Duluth by the Universal Atlas Cement Division of United States Steel Corp.

Cutler-Magner Co. produced quicklime and hydrated lime at Duluth.

Mesaba Granite Co. quarried dimension granite for monumental use near Mountain Iron.

The Zenith Dredge Co. produced crushed basalt near Duluth for roadstone and railroad ballast.

Peat was produced by several companies, including St. Louis County Peat Products Co., Inc., and Arrowhead Peat Co. The former company produced peat from a privately owned, 350-acre bog at Central Lakes. Output was processed by shredding and screening. Arrowhead Peat Co. produced moss peat on company and State-owned land about 5 miles southeast of Wawina. Average depth of the deposit is 10 feet; the maximum depth is 35 feet. Excavating and loading equipment included 1 backhoe, 2 trucks, 2 tractors, and 2 discs. Peat was hauled to the company plant at Floodwood for processing. Plant equipment consisted of a hammermill and a screen. Sales, in packages and bulk, were for greenhouse use and soil improvement. The Wilderness Valley Farms Division of the Chun King Corp. produced reed-sedge peat on its 200-acre bog 3 miles south of Fens. The entire output was used by the company, mostly for mushroom beds and in producing a house-plant soil.

Over 2 million tons of sand and gravel was produced by 11 commercial companies and the State and county highway departments. Output was used for building and road construction, railroad ballast, fill, and other purposes.

**Scott.**—Crushed and broken limestone was produced near Shakopee by Bryan Rock Products, Inc., from its Merriam Junction quarry, and by B & R Rock Products Co. Output was used for agricultural and road purposes and riprap. Landers-Norblom-Christenson Co. crushed limestone near Savage chiefly for roadstone and asphalt filler.

Sand and gravel was produced near Belle Plaine, Chaska, Prior Lake, and Shakopee by four commercial operators and was used principally for building and road construction. Paving sand was produced by the State highway department. The county highway department produced and contracted for road gravel.

American Wheaton Glass Corp. was building a new glass-container plant in Valley Industrial Park near Shakopee.

**Stearns.**—Cold Spring Granite Co. operated six granite quarries near Cold Spring, Rockville, St. Cloud, and St. Joseph and finishing plants at Cold Spring and St. Cloud. The output was used chiefly for architectural and monumental purposes. Some granite was crushed at the Cold Spring plant and sold for poultry grit. North Star Granite Corp. produced dimension granite for monumental use at its Nos. 4 and 5 quarries near St. Cloud. The rough stone was processed at the company plant in St. Cloud. Delano Granite Works, Inc., produced granite for architectural use at a quarry near Rock-

Digitized by Google

ville. Royal Granite Co. operated a finishing plant in St. Cloud. Crushed and dimension granite were produced by Shiely-Petters Crushed Stone Co. near Waite Park. The crushed material was sold mainly for seal-coating bituminous roads and for railroad ballast. The company dimension output was used in constructing the upper lock and dam at St. Anthony Falls in Minneapolis. Granite was produced by the Minnesota State Reformatory at St. Cloud and used for rough construction.

Megarry Bros. and A. C. Petters Co., Inc., produced sand and gravel chiefly for use in building and road construction. The State highway department produced and contracted for paving sand and gravel.

**Steele.**—Limestone was produced near Owatonna by Klemmer Construction Co. for roadstone, agricultural use, and flagging. Much of the output was sold under contract to the city of Owatonna and to Rice and Steele Counties.

Owatonna Aggregates Corp. processed sand and gravel at a heavy-medium plant, which it had operated since 1953 near Owatonna. Crushing was performed with jaw and cone crushers. Ferrosilicon was used as the medium in the heavy-medium section of the plant. Concrete sand was produced by jigging. The company also operated a concrete-block plant, a draintile plant in Owatonna, and a ready-mixed concrete plant in Kenyon. Material was also furnished to another ready-mixed concrete plant in Blooming Prairie. Other producers of sand and gravel included Kohlmier Sand & Gravel Co. and Medford Washed Sand and Gravel Co., at plants near Owatonna and Medford, respectively. Output was used for building and road construction and fill. Paving gravel was produced under contract for the city of Owatonna, the village of Blooming Prairie, and the county highway department.

**Wabasha.**—Patterson Quarries, Inc., produced limestone at a portable crushing plant near Plainview for roadstone and agricultural purposes.

Producers of sand and gravel included the Chicago, Milwaukee, St. Paul & Pacific Railroad Co., Roverud Construction Co., and Wabasha Sand & Gravel Co. The material was used for building and road purposes, railroad ballast, fill, and other uses. Paving sand and gravel was produced under contract for the State and county highway departments.

**Washington.**—J. L. Shiely Co. produced crushed and broken limestone from the Larson quarry at St. Paul chiefly for roadstone and riprap and sand and gravel for building and road construction. Nienaber Contracting Co. crushed limestone for roadstone, agricultural use, and other purposes. Bryan Rock Products, Inc., crushed limestone for road use. Ashbach Construction Co. and Cemstone Products Co. produced sand and gravel. Output was used for building and road construction and other purposes. Paving sand and gravel was produced under contract for the State and county highway departments.

**Winona.**—Dimension limestone was produced near Winona by the Biesanz Stone Co., principally for architectural use. Limestone for

Digitized by Google

roadstone and agricultural use was crushed at St. Charles by Patterson Quarries, Inc., and produced by Fred Fakler at four quarries.

Winona Aggregate Co. produced sand and gravel for building and road construction at its dredging operation near Winona. Paving sand was produced by the State highway department.

**Wright.**—Delano Granite Works, Inc., processed rough stone quarried by the company in Big Stone and Stearns Counties, Minn., and Grant County, S. Dak., at its sawing and finishing plant at Delano.

Several companies produced sand and gravel chiefly for building and road purposes. Paving sand and gravel was produced by the State highway department and also under contract for both the State and county highway departments.

**Yellow Medicine.**—Near Granite Falls, crushed and broken granite for railroad ballast, riprap, and other uses was produced by the Green Co., contractor for the Great Northern Railway Co. Dimension granite for monumental use was produced near Echo by August Evanson.

Deutz & Crow Co., Inc., processed sand and gravel at a fixed plant in Canby; most of the output was used in the company ready-mixed concrete plant. Lesser quantities were sold for road use, mainly seal-coating. Bud Long Construction Co. at a portable plant near Hazel Run produced road gravel, which was sold to local townships and villages, and to home owners for surfacing private driveways. The State and county highway departments produced and contracted for paving sand and gravel.

# The Mineral Industry of Mississippi

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Mississippi Geological Survey.**

By Harry D. Kline [1] and Tracy W. Lusk [2]

VALUE of Mississippi mineral production in 1960 reached a record $199 million, thus continuing an upward trend for the ninth consecutive year. Mineral fuels, petroleum, natural gas liquids, and natural gas, were the most important mineral commodities and represented 91 percent of the value.

New construction pertinent to the mineral industry, included an electrolytic manganese plant and plants for manufacturing brick, clay pipe, potassium nitrate, chlorine, storage batteries, vinyl plastic, and polyurethane foam. The plants either were under construction or were scheduled for completion in 1961.

**TABLE 1.—Mineral production in Mississippi [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays.....thousand short tons.. | 747 | $4,064 | 1,017 | $4,786 |
| Natural gas.....million cubic feet.. | 162,095 | 25.125 | 172,478 | 32,426 |
| Natural gas liquids: | | | | |
| Natural gasoline and cycle products thousand gallons.. | 23,207 | 1,495 | 23,648 | 1,552 |
| LP gases.....do.... | 8,141 | 465 | 10,151 | 564 |
| Petroleum (crude).....thousand 42-gallon barrels.. | 49,620 | 140.921 | [r] 51,819 | [r] 146,648 |
| Sand and gravel.....thousand short tons.. | 7,520 | 7,743 | 6,181 | 5,568 |
| Stone.....do.... | [r] 126 | [r] 114 | 807 | 808 |
| Value of items that cannot be disclosed: Certain metals and nonmetals | ---- | 6,751 | ---- | 7,271 |
| Total Mississippi [4] | ---- | [r] 186,116 | ---- | 198,862 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Preliminary figure.
[3] Excludes certain stone, included with "Value of items that cannot be disclosed."
[4] Total adjusted to eliminate duplicating value of stone.
[r] Revised figure.

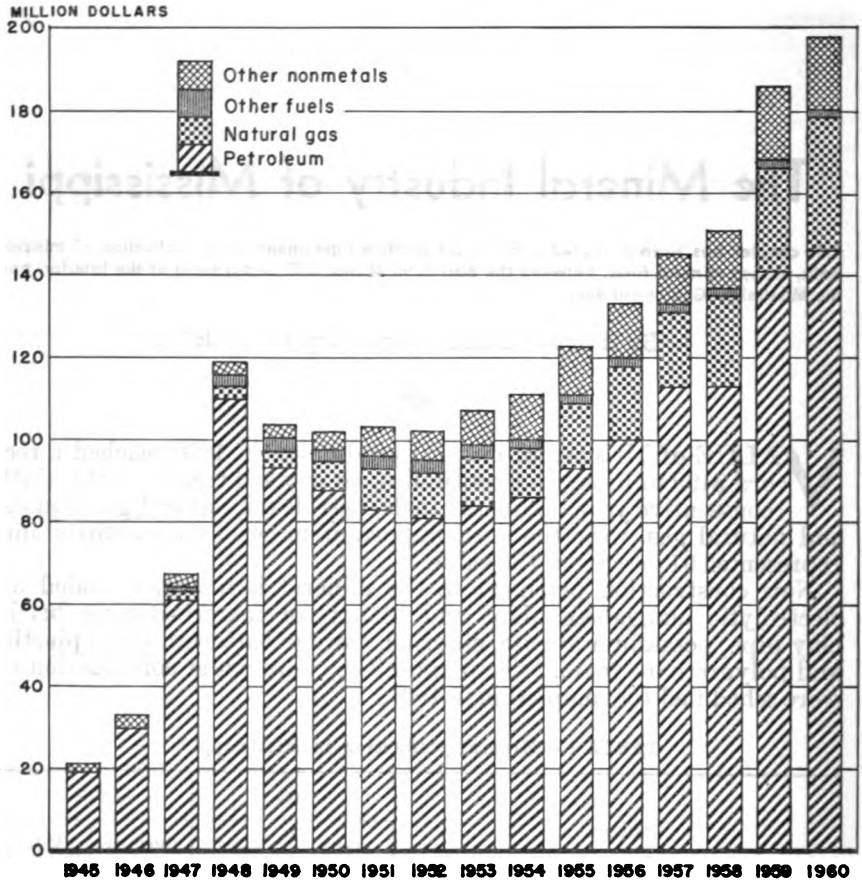

FIGURE 1.—Value of petroleum, natural gas, and total value of mineral production in Mississippi, 1945–60.

Improvement of seaport facilities at Gulfport and Pascagoula and river ports at Vicksburg and Greenville continued. Ownership of the port at Gulfport was transferred from the City of Gulfport to the State of Mississippi. This port will be administered by the State Agricultural and Industrial Board. On July 26, Harrison County voters approved a $5.5 million bond issue to finance deepwater channel improvements and development of a 1,200-acre industrial site in the Gulfport-Biloxi coastal area. The new facilities will aid in marketing Mississippi mineral products.

Mississippi Power Co. started constructing a 112,000-kilowatt unit at its steamplant between Gulfport and Biloxi.

Highway construction was 12 percent less than in 1959. Part of the decrease was attributed to Federal Government delays in providing matching funds.

The Atomic Energy Commission began studies concerning possible use of one of Mississippi's many salt domes for scientific purposes

Digitized by Google

important to the Nation's seismic research program. The proposed project, tentatively planned for Lamar County, will be economically important to the State.

The results of a geologic study along State Highway 16 from the Alabama line to Canton, Miss., were released in November. The report emphasized geologic units containing material suitable for highway construction.[3]

Another publication, prepared by the Federal Geological Survey in cooperation with the Mississippi Board of Water Commissioners and the Mississippi Geological Survey, was released in December. This report concerns mainly water-bearing formations and the quality, quantity, and availability of ground water supplies in 28 northern Mississippi counties.[4]

**Employment and Injuries.**—As a result of increased mineral production, average employment for the year showed a corresponding increase, according to the Mississippi Employment and Security Commission. Employment in the petroleum and natural-gas industries averaged 5,550 workers, and in nonmetal mining and processing industries, averaged 925 workers.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

Production of natural gas, natural gas liquids, and crude petroleum continued on an upward trend. Mississippi ranked ninth among the Nation's oil-producing States. The preliminary 1960 total of 52 million barrels established a new crude-oil production record for the State. Daily average production was about 142,000 barrels of oil and 493 million cubic feet of natural gas from an increased number of wells and fields. Production came from 31 of the 82 counties, mostly in the southern half of the State.

A total of 700 development and exploration wells were completed during 1960, 52 more than in 1959, resulting in expansion of previously located fields and the discovery of new fields. Thirty-four wells were dually completed, and Humble Oil and Refining Co. made four triple completions (the first in the State) in the Bryan field, Jones and Jasper Counties. Geophysical and core-drill crews worked a total of 1,679 weeks, 126 less than 1959.

Twenty-three new field discoveries included Gilliard Lake, Glasscock, and Southwest Cranfield in Adams County; East Fork, McElveen, O'Neil, Smithdale, and Southeast Smithdale in Amite County; Reid in Calhoun County; Carmichael and West Langsdale in Clark County; Little Springs, Northeast Freewoods, and West Bude in Franklin County; Knoxo in Marion and Walthall Counties; South Amory in Monroe County; Johnston Station and Southeast McComb in Pike County; Puckett in Rankin County; Kokomo in Walthall County; Cypress Creek and South Thompson's Creek in Wayne County; and Bentonia in Yazoo County.

Digitized by Google

According to the Mississippi State Oil and Gas Board, 208 oil pools and 47 gas pools were producing in 184 fields at yearend. Producible wells totaled 3,185, an increase of 431 over 1959.

**TABLE 3.—Estimated proved recoverable reserves of crude oil, natural gas liquids and natural gas**

| | Proved reserves, Dec. 31, 1959 | Changes in proved reserves, due to extensions and new discoveries in 1960 | Proved reserves, Dec. 31, 1960 (production was deducted) | Change from 1959, percent |
|---|---|---|---|---|
| Crude oil.....thousand barrels.. | 389,337 | 67,881 | 407,098 | +5 |
| Natural gas liquids [1].....do.... | 40,944 | −2,258 | 36,181 | −12 |
| Natural gas.....million cubic feet.. | 2,486,524 | 242,194 | 2,542,338 | +2 |

[1] Includes condensate, natural gasoline, and LP gases.

SOURCE: American Gas Association, American Petroleum Institute, and Canadian Petroleum Association, Proved Reserves of Crude Oil, Natural Gas Liquids and Natural Gas: Vol. 15, Dec. 31, 1960, pp. 11 12, 21.

**TABLE 4.—Marketed production of natural gas [1]**

| Year | Million cubic feet | Value (thousands) | Year | Million cubic feet | Value (thousands) |
|---|---|---|---|---|---|
| 1951–55 (average)..... | 158,163 | $12,058 | 1958..... | 160,143 | $22,260 |
| 1956..... | 185,137 | 18,143 | 1959..... | 162,095 | 25,125 |
| 1957..... | 169,967 | 17,507 | 1960..... | 172,478 | 32,426 |

[1] Comprises gas either sold or consumed by producers, including losses in transmission, amounts added to storage, and increases in gas pipelines.

**Natural Gas.**—The marketed production of natural gas amounted to 172 billion cubic feet valued at $32.4 million, an increase of 6 percent in quantity and 29 percent in value over 1959. The increase was attributed to utilization in new industries and to expansion of facilities and corresponding consumption rates at existing plants. Proved reserves of natural gas increased 2 percent. Counties leading in natural-gas production in order of value were: Adams, Forrest, Jefferson Davis, Pearl River, and Monroe.

Of the total gas withdrawn, 45,316 million cubic feet was returned to producing reservoirs of the Cranfield and Brookhaven fields.

**Natural Gas Liquids.**—Production of natural gas liquids amounted to 33.8 million gallons valued at $2.1 million, an increase of 8 percent in quantity and 8 percent in value over 1959. About 25 percent of the gross production of natural gas was processed in the State's three natural gasoline and cycle plants—Brookhaven gas-cycling plant in Lincoln County, Cranfield gas-cycling operations in Adams County, and Little Creek processing plant in Pike County.

Sun Oil Co. installed a repressuring plant near McComb, Pike County. The plant was built to produce butane and propane gases.

| December | 4,541 | 4,570 | 2,346 |
| Total: 1960 | [1] 51,819 | 51,833 | ---------- |
| 1959 | 49,620 | 49,643 | ---------- |

[1] Preliminary figure.

Underground storage capacity, as of October 1960, for natural gas liquids at seven caverns in Forrest County salt domes totaled 525,700 barrels of propane, 330,000 barrels of butane, and 1,650,000 barrels of LP gases. The storage facilities were used by Anchor Petroleum Co., General Gas Corp., Skelly Oil Co., and Warren Petroleum Corp.

**Petroleum.**—Production of 52 million barrels of petroleum, valued at $147 million, was 4.4 percent above the 1959 output and established a new record for Mississippi. The five leading petroleum producing counties were Lincoln, Adams, Pike, Jasper, and Lamar.

[1] Based on Oil and Gas Journal data adjusted to Bureau of Mines total.
[2] Preliminary figures.
[3] Bureau of Mines data.

Well completions increased 8 percent over 1959; about 61 percent were development wells. Of 272 exploratory wells drilled, 23 were productive. The average depth of completed wells was 9,830 feet, 410 feet more than the 1959 average.

Approximately 14 percent of the crude petroleum produced was refined at three plants: Southland Oils, Inc., in Rogers Lacy; Paluxy Asphalt Co. in Crupp Station; and Pontiac Eastern Corp. in Purvis. Statewide petroleum-refining capacity was 28,000 barrels of crude oil per calendar day.

**Petrochemicals.**—Southbridge Plastic Products, Inc., announced plans for building a plant to manufacture vinyl plastic at Corinth, Alcorn County. Phillips-Foscue Corp. planned to build a plant at Tupelo, Lee County, to manufacture and fabricate polyurethane foam.

## NONMETALS

**Argon.**—Spencer Chemical Co. produced argon at its facility in Vicksburg for the first full year. Argon, an inert gas, is used chiefly in processes requiring a completely inert atmosphere.

**Cement.**—Production of portland cement increased, and masonry cement output declined during the year. Portland and masonry cements were manufactured at the Marquette Cement Manufacturing Co. plant at Brandon and the Mississippi Valley Portland Cement Co. plant at Redwood.

**Clays.**—Clay production established a new record, exceeding the 1959 tonnage by 36 percent. Increases were reported in the quantities

TABLE 9.—Destination of shipments of portland cement to Mississippi from mills

| Year | Mississippi (thousand barrels) | Change, percent | |
|---|---|---|---|
| | | In Mississippi | In United States |
| 1951–55 (average) | 1,742 | | |
| 1956 | 1,977 | +4.8 | +5.6 |
| 1957 | 2,188 | +10.7 | −6.4 |
| 1958 | 2,778 | +26.9 | +6.4 |
| 1959 | 3,072 | +10.6 | +9.3 |
| 1960 | 3,324 | +8 2 | −7.5 |

of bentonite, miscellaneous clay, fire clay, fuller's earth, and ball clay sold or used.

Miscellaneous clay, used for manufacturing heavy clay products and lightweight aggregates, furnished 59 percent of the clay production. Brick kilns operated in 15 counties.

Bentonite production, at open pits in Itawamba, Monroe, Pearl River, and Smith Counties, increased 19 percent over 1959. Bentonite was used principally as a binder in foundry and steelworks mold-making sands, and as a filtering and decolorizing agent.

Ball clay production, all from Panola County, increased slightly in quantity and value. Production of fuller's earth, mined in Tippah County and used for absorbents, increased 11 percent over 1959.

TABLE 10.—Clays sold or used by producers, by kinds

(Thousand short tons and thousand dollars)

| Year | Bentonite | | Ball clay, fire clay, and fuller's earth | | Miscellaneous clay | | Total | |
|---|---|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 234 | $2,341 | 69 | $772 | 297 | $308 | 600 | $3,421 |
| 1956 | 219 | 2,360 | 94 | 931 | 299 | 299 | 612 | 3,590 |
| 1957 | 220 | 2,372 | 101 | 968 | 295 | 295 | 616 | 3,635 |
| 1958 | 177 | 2,081 | 106 | 964 | 293 | 293 | 576 | 3,338 |
| 1959 | 200 | 2,494 | 117 | 1,138 | 430 | 432 | 747 | 4,064 |
| 1960 | 238 | 2,900 | 181 | 1,287 | 598 | 599 | 1,017 | 4,786 |

Atlas Tile and Brick Co. completed construction of a new plant at Shuqualak, Noxubee County. Locally mined clay was to be used to make buff and other light-colored face brick. The plant had a capacity of 50,000 brick per day.

Delta Macon Brick and Tile Co. began constructing a new clay-products plant at Macon, Noxubee County. The plant, with a planned daily capacity of 60,000 brick, was scheduled to be completed in June 1961. Clay for the plant was to be mined at open pits near Golson, 10 miles west of Shuqualak.

**Limestone.**—Southern Materials of Mississippi, Inc., was constructing a $300,000 plant between Clinton and Raymond, Hinds County, to produce agricultural limestone.

**Magnesium Compounds.**—The H. K. Porter Co. plant at Pascagoula completed its first full year of operation. The company used sea

Digitized by Google

water, dolomite, and chrome ore to produce periclase, other magnesium compounds, and brick.

**Potassium Compounds.**—Southwest Potash Co., Division of American Metal Climax, Inc., began constructing a $7-million plant at Vicksburg. Potassium nitrate and chlorine will be made by a new process.

**Sand and Gravel.**—Production of sand and gravel in Mississippi was down 18 percent in quantity and 28 percent in value from the record set in 1959. Most of the decrease resulted from a decline in road construction.

**TABLE 11.—Sand and gravel sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Commercial | | Government-and-contractor | | Total | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 3,311 | $2,720 | 495 | $315 | 3,806 | $3,035 |
| 1956 | 4,991 | 4,554 | 324 | 147 | 5,315 | 4,701 |
| 1957 | 4,484 | 3,920 | 688 | 424 | 5,172 | 4,344 |
| 1958 | 5,614 | 5,149 | 931 | 1,091 | 6,545 | 6,240 |
| 1959 | 6,921 | 7,199 | 599 | 544 | 7,520 | 7,743 |
| 1960 | 6,068 | 5,522 | 113 | 46 | 6,181 | 5,568 |

Production of sand and gravel was reported from 22 of the 82 counties. Five counties—Copiah, Hinds, De Soto, Washington, and Adams—supplied 58 percent of the total value and 49 percent of the tonnage.

**Sulfur.**—Pontiac Eastern Corp. recovered elemental sulfur from sour natural gas processed at its Lamar County plant. Commercial sulfur production was reported for the first time.

## METALS

**Lead.**—Contract Battery Manufacturing Co. completed a plant near Florence, Rankin County, for manufacturing storage batteries. The plant will use an estimated 12,000 pounds of antimonial lead each day it is operated.

**Manganese.**—American Potash and Chemical Corp. announced plans for building a $5-million electrolytic manganese metal plant adjacent to its sodium chlorate plant near Hamilton, Monroe County. Capacity of the new plant will be 10 million pounds of manganese a year. The plant will use ore from foreign sources, sulfuric acid from Tennessee, coal from Alabama, natural gas from Mississippi, and power from the Tennessee Valley Authority (TVA). The new plant was scheduled for completion late in 1961.

## REVIEW BY COUNTIES

**Adams.**—The county was the leading producer of natural gas and ranked second in petroleum production. Three new oilfields, Glasscock, Southwest Cranfield, and Gilliard Lake, were discovered, and exploratory and development drilling added 24 oil wells to the county total.

Digitized by Google

**Alcorn.**—Corinth Brick & Tile Co. manufactured building brick from miscellaneous clay mined near Corinth.

**Amite.**—Exploratory drilling resulted in the discovery of five new oilfields—East Fork, McElveen, O'Neil, Southeast Smithdale, and

**TABLE 12.—Value of mineral production in Mississippi, by counties [1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Adams | $23,242,525 | $27,180,956 | Petroleum, natural gas, natural gas liquids, sand and gravel. |

Smithdale. The value of petroleum products produced rose 850 percent above the 1959 value as a result of the new discoveries. The county was one of the leaders in crew-weeks of geophysical prospecting.

**Attala.**—Magnet Cove Barium Corp., Kosciusko, processed bentonitic clay and fuller's earth for drilling mud and other purposes. Bell's Brick Yard mined miscellaneous clay for manufacturing building brick and face brick.

**Bolivar.**—Rosedale Gravel Co. produced washed gravel from river bars for road construction.

**Carroll.**—Delta Brick & Tile Co. manufactured building brick from miscellaneous clay mined near Carrollton. Carroll County supervisors mined pit-run gravel for road construction.

**Chickasaw.**—Baldwyn Brick & Tile Co. manufactured brick from miscellaneous clay mined near Okolona. Two gasfields, Trebloc and Coleville, were producing natural gas.

**Clarke.**—Exploratory drilling resulted in the discovery of two new oilfields, Carmichael and West Langsdale. Development drilling added 15 oil wells to producing fields during the year.

**Clay.**—West Point Gravel Co. produced washed sand and gravel for highway and building construction. The State Lime Plant Board produced agricultural limestone from an open pit near Cedar Bluff.

**Copiah.**—The county led in the quantity and value of sand and gravel produced. Production of sand and gravel for highway and other construction purposes was reported by Traxler Gravel Co., Inc., Green Brothers' Gravel Co., Inc., and Lewis Gravel Co.

**De Soto.**—Memphis Stone & Gravel Co. and Weymouth Construction Co. produced washed sand and gravel for highway and other construction work.

**Forrest.**—Forrest County ranked second in natural-gas production. Development drilling added three gas wells to proved fields. American Sand & Gravel Co. produced sand and gravel for highway and other construction purposes. The company also operated the Hattiesburg Brick Works, using locally mined miscellaneous clay for making face brick and structural tile. Pittman Concrete & Gravel Co. produced washed sand and gravel.

**Franklin.**—Exploratory drilling resulted in the discovery of three oilfields, Little Springs, Northeast Freewoods, and West Bude.

**Granada.**—Chocchuma Gravel Co. started producing gravel for highway and other construction in a stationary plant, 4 miles south of Holcomb, with a capacity of 400 cubic yards per day.

**Hancock.**—Production of petroleum and natural gas remained the same as in 1959. Exploratory drilling was unproductive.

**Hinds.**—Southern Materials Co. planned production of agricultural limestone from open pits 15 miles west of Jackson. The county led in tonnage of miscellaneous clay mined, and ranked second in value of sand and gravel production. Development drilling added three oil wells to the county's total during the year.

**Holmes.**—Hammett Gravel Co. reported production of gravel for highway construction.

**Itawamba.**—American Colloid Co. processed locally mined bentonite for moldmaking in foundries and steelworks.

**Jackson.**—The H. K. Porter & Co., Inc., plant at Pascagoula produced magnesium compounds from sea water and dolomite, and completed its first full year's operation.

**Jefferson.**—The value of petroleum and natural gas produced was 18 percent below 1959. Development drilling added one oil and two gas wells. Geophysical prospecting was conducted throughout the year.

**Jefferson Davis.**—Production of petroleum and natural gas was 16 percent less than in 1959. Development and exploratory well drilling resulted in the discovery of five gas wells and one oil well during the year. The county ranked fourth in gas production.

**Jones.**—Laurel Brick & Tile Co., Inc., reported production of miscellaneous clay for use in manufacturing face brick. Development drilling opened 29 oil wells.

**Lamar.**—Pontiac Eastern Corp., Purvis, reported production of sulfur at its natural-gas purification plant. The county ranked fifth in value of petroleum production.

**Lauderdale.**—Meridian Brick Co. used locally mined miscellaneous clay for manufacturing building brick.

**Lee.**—Tupelo Brick & Tile Co. mined miscellaneous clay for manufacturing building brick and other heavy clay products.

**Lincoln.**—For the second consecutive year, the county led in petroleum production. Brookhaven Pressed Brick Co. produced miscellaneous clay for manufacturing brick and other heavy clay products.

**Lowndes.**—C & P Gravel Co., Columbus Gravel Co., Ellis Sand & Gravel Co., and Fleming Gravel Co. produced washed sand and gravel for road and building construction. Columbus Brick Co. mined miscellaneous clay for manufacturing building brick. Hooker Chemical Corp., Columbus, was expanding its capacity for making sodium chlorate.

**Marion.**—The county road department mined pit-run gravel for maintenance and construction of county roads. An 18-percent increase was noted in petroleum and natural gas production. Development and exploratory drilling added six oil and five gas wells.

**Marshall.**—Holly Springs Brick & Tile Co. and Southern Brick & Tile Co. mined miscellaneous clay from nearby pits for manufacturing building brick and other heavy clay products.

**Monroe.**—American Colloid Co. and Eastern Clay Products Department of International Minerals & Chemical Corp. mined bentonite principally for moldmaking in foundries and steelworks. Filtrol Corp. mined and processed bentonite for filtering and decolorizing uses. The county ranked fifth in natural-gas production and retained the lead in bentonite production.

**Noxubee.**—The State Lime Plant Board produced agricultural limestone from an open pit, 2 miles north of Macon. Atlas Tile & Brick Co. completed a new brick plant at Shuqualak. Delta Macon Brick Co. began constructing a face brick plant at Macon.

**Panola.**—Kentucky & Tennessee Clay Co. mined ball clay for glass-refractory use. Hotophia Creek Gravel Co., Inc., produced sand and gravel for paving and structural uses.

**Pearl River.**—Pearl River Clay Co. mined bentonite for use in insecticides and plastic cement. Williams Gravel Co. produced washed

Digitized by Google

sand and gravel for general construction purposes. The production of petroleum and natural gas was down 2 percent from 1959.

**Perry.**—Underwood Sand & Gravel Co. produced washed sand and gravel for building construction.

**Pike.**—Exploratory drilling in Pike County resulted in the discovery of two new oilfields. Development drilling was successful; 154 of the 167 wells drilled were productive. The county ranked third in value of petroleum produced.

**Pontotoc.**—Pontotoc Brick Co. and W. B. Ferguson mined miscellaneous clay for manufacturing building brick.

**Prentiss.**—Locally mined miscellaneous clay was used by Baldwyn Brick & Tile Co. to make building brick.

**Rankin.**—Marquette Cement Manufacturing Co. produced portland and masonry cements at its Brandon plant.

**Simpson.**—Productive development wells furnished a 47-percent increase in petroleum and natural gas production. The county ranked tenth in value of petroleum and gas produced.

**Smith.**—Bentonite was mined from the Burn's pit for use in filtering and decolorizing mineral oils, vegetable oils, and animal fats. Sam Bass and Smith County Lime Co. started mining agricultural limestone from open pits near Silverana. Production of petroleum and natural gas remained at the 1959 level.

**Tippah.**—Wyandotte Chemical Corp. and Howell Southern Products, Inc., mined and processed fuller's earth. The county ranked second in value of clay produced.

**Tishomingo.**—Tri-State Sand Co. mined and processed a sandy clay for moldmaking in foundries and steelworks. Southward Stone Co. quarried sandstone for building purposes.

**Walthall.**—Exploratory drilling resulted in discovery of the Kokomo gasfield. Productive development wells supplied a fourfold increase in the total value of petroleum and natural gas produced in the county.

**Warren.**—Mississippi Valley Portland Cement Co. produced portland and masonry cements at its Redwood plant using limestone and calcareous marl mined locally and shell shipped from Louisiana. Southwest Potash Co., Division of American Metal Climax, Inc., began constructing a plant in Vicksburg to produce potassium nitrate and chlorine.

**Washington.**—Greenville Dredging Co. and Greenville Gravel Co. produced sand and gravel for structural purposes.

**Wayne.**—Exploratory drilling resulted in discovery of two new oilfields, Cypress Creek by Lyle Cashion Co. and South Thompson's Creek by Larco Drilling Co. Development drilling added 15 oil wells to the proved fields.

**Wilkinson.**—Exploration drilling was unproductive.

**Yazoo.**—One new oilfield, Bentonia, was discovered in December by Humble Oil & Refining Co. Sand and gravel was produced for highway and other construction purposes.

# The Mineral Industry of Missouri

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Division of Geological Survey and Water Resources, Department of Business Administration of Missouri.**

By W. G. Diamond [1] and William C. Hayes [2]

VALUE of Missouri's mineral production in 1960 totaled $156 million, approximately $1 million less than in 1959. Missouri was the Nation's largest lead producer for the 53d consecutive year. Seventeen mineral commodities were produced in the State: Seven metals, seven nonmetals, and three mineral fuels. The five principal mineral commodities, in order of value, were cement, stone, lead, lime, and coal. Minerals and mineral fuels came from 105 of the State's 114 counties in 1960, metals from 10, nonmetals from 102, and mineral fuels from 17 counties.

**TABLE 1.—Mineral production in Missouri [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Barite.....short tons | 296,093 | $3,924 | 180,702 | $2,588 |
| Cement.....thousand 376-pound barrels | 13,947 | 46,974 | 12,183 | 42,330 |
| Clays.....thousand short tons | 2,635 | 6,898 | 2,540 | 7,207 |
| Coal.....do | 2,748 | 11,937 | 2,890 | 12,450 |
| Copper (recoverable content of ores, etc.).....short tons | 1,065 | 654 | 1,087 | 698 |
| Iron ore (usable).....thousand long tons, gross weight | 349 | 3,278 | 365 | 3,760 |
| Lead (recoverable content of ores, etc.).....short tons | 105,165 | 24,188 | 111,948 | 26,196 |
| Lime.....thousand short tons | 1,324 | 15,714 | 1,254 | 14,701 |
| Natural gas.....million cubic feet | | | 75 | 19 |
| Petroleum (crude).....thousand 42-gallon barrels | 75 | [3] | [3] 72 | [3] |
| Sand and gravel.....thousand short tons | 10,279 | 11,406 | 10,207 | 11,601 |
| Silver (recoverable content of ores, etc.) thousand troy ounces | 340 | 308 | 16 | 14 |
| Stone.....thousand short tons | 26,939 | 36,435 | 27,180 | 37,878 |
| Zinc (recoverable content of ores, etc.).....short tons | 92 | 21 | 2,821 | 728 |
| Values of items that cannot be disclosed: Native asphalt, cobalt, gem stones, nickel, and values indicated by footnote 2 | | [4] 2,289 | | 2,066 |
| Total Missouri [5] | | [4] 157,189 | | 156,033 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Figure withheld to avoid disclosing individual company confidential data.
[3] Preliminary figure.
[4] Revised figure.
[5] Total adjusted to eliminate duplicating value of clays and stone.

Digitized by Google

The Viburnum lead project of St. Joseph Lead Co. began producing during the year. Ore was hoisted through a shaft in Crawford County and milled in Iron County at a rate of 3,000 tons per day. Expenditures at Viburnum in 1960 totaled more than $6.5 million. Development of the Pea Ridge iron ore project continued. At yearend, the service shaft had reached a depth of 2,274 feet and the main ore-hoisting shaft, a depth of 1,882 feet. The first ore was mined from a drift 1,675 feet below the collar of the service shaft.

**Exploration.**—Unprecedented minerals exploration was experienced in Missouri in 1960 as a result of recent lead and iron ore discoveries. Expenditures and area tested by the exploration activities exceeded the totals for any previous year. Companies performing exploration in some capacity included: St. Joseph Lead Co.; National Lead Co.; American Zinc, Lead & Smelting Co.; American Smelting & Refining Co.; Bear Creek Mining Co. (subsidiary of Kennecott Copper Corp.); New Jersey Zinc Co.; American Metal Climax, Inc.; The Eagle Picher Co.; and Missouri-Cliffs, Inc. (subsidiary of Cleveland-Cliffs Iron Co.).

Exploration activity increased near Bunker. Mining Companies purchased nearly 77 acres in the Bee Fork area and 240 acres in the West Fork vicinity. Extensive drilling was done in the Midridge area.[3]

Missouri-Cliffs, Inc., explored for iron ore in Washington County. The company began its exploration in 1959 with studies of aerial magnetic maps.[4] Earl Vaught started drilling on a property about 10 miles south of Granby. The Granby area was the site of a rich ore deposit mined in the late 1800's.[5]

**Employment.**—Average employment declined 2 percent in the metal-mining industry and 11 percent in the nonmetal-mining industry. An increase of about 1 percent was noted in the coal-mining industry.

**Government Programs.**—No contracts for Government participation in exploration projects for strategic minerals, through the program of the Office of Minerals Exploration (OME), were in effect in Missouri at the end of 1960. Final settlement was made on the contract with American Zinc, Lead & Smelting Co. for the investigation of copper and lead resources in Dent and Iron Counties during the year.

**TABLE 2.—Average annual employment of mining industries**

| Industry | 1956 | 1957 | 1958 | 1959[1] | 1960 |
|---|---|---|---|---|---|
| Metal mining | 3,524 | 3,767 | 3,540 | 3,263 | 3,195 |
| Nonmetal mining | 3,991 | 4,030 | 3,941 | 4,286 | 3,820 |
| Coal mining | 921 | 970 | 800 | 856 | 864 |
| Total | 8,436 | 8,767 | 8,281 | 8,405 | 7,879 |

[1] Revised figures.

# REVIEW BY MINERAL COMMODITIES

## NONMETALS

Nonmetals supplied 71 percent of the total value of mineral production.

**Barite.**—Missouri was the second largest barite producing State and led the Nation in value of shipments, with $2.6 million. Barite was mined in Washington and Jefferson Counties and processed at grinding plants in Washington and St. Louis Counties. The output was used in oil-well drilling muds and chemicals.

**TABLE 3.—Barite sold or used by producers**

| Year | Short tons | Value | Year | Short tons | Value |
|---|---|---|---|---|---|
| 1951-55 (average) | 318,644 | $3,201,334 | 1958 | 199,268 | $2,666,496 |
| 1956 | 381,642 | 4,461,955 | 1959 | 296,093 | 3,923,651 |
| 1957 | 317,350 | 3,938,486 | 1960 | 180,702 | 2,587,820 |

**Cement.**—Cement plants in St. Louis, Cape Girardeau, Jackson, and Ralls Counties produced 12.6 million barrels of portland cement, utilizing an average 80 percent of total plant capacity. About 59 percent of the cement was produced by wet-process and 41 percent by dry-process methods. Nearly 85 percent of shipments totaling 11.9 million barrels were in bulk and 15 percent in bags; approximately 92 percent was transported by railroad, and the remainder by truck and boat. Truck shipments were reported for the first time in Missouri with the installation of two truck bulk-loading silos by Missouri Portland Cement Co. at its Kansas City plant. All plants also produced masonry cement.

**TABLE 4.—Portland cement production and shipments**

(Thousand barrels and thousand dollars)

| Year | Production | Shipments | | Year | Production | Shipments | |
|---|---|---|---|---|---|---|---|
| | | Quantity | Value | | | Quantity | Value |
| 1951-55 (average) | 10,744 | 10,760 | $28,772 | 1958 | 12,143 | 11,813 | $39,376 |
| 1956 | 12,441 | 12,014 | 36,888 | 1959 | 13,610 | 13,583 | 45,430 |
| 1957 | 10,866 | 10,794 | 34,307 | 1960 | 12,606 | 11,856 | 40,915 |

| 1958 | 1,176 | 4,806 | 9 | 143 | 27 | 190 | 848 | 847 | 2,060 | 5,986 |
| 1959 | 1,623 | 5,630 | 6 | 93 | 28 | 197 | 978 | 978 | 2,635 | 6,898 |
| 1960 | 1,508 | 5,867 | 4 | 73 | 29 | 268 | 999 | 999 | 2,540 | 7,207 |

**Clays.**—Missouri ranked high in manufacture of refractories because of its many deposits of fire clay especially suitable for superduty refractories. Refractories were produced by Kaiser Refractories and Chemicals Division, Kaiser Aluminum and Chemicals Corp.; A. P. Green Fire Brick Co.; Harbison-Walker Refractories Co.; Walsh Refractories Corp.; Refractories Division, H. K. Porter Co., Inc.; Wellsville Fire Brick Co.; General Refractories Co.; North American Refractories Co.; and Corhart Refractories Co., Inc. Contractors mined most of the clay. Gilliam Mining Co., Bethlehem Co., and Fluetsch Bros. mined fire clay for use in horizontal zinc retorts in Oklahoma and Texas. Lightweight aggregate was produced from shale in Platte County by Carter-Waters Corp. Heavy clay products and cement also were made from miscellaneous clay. W. S. Dickey Clay Manufacturing Co. installed a new tunnel kiln at its Evens and Howard plant in St. Louis.[6] Hydraulic Press Brick Co. added facilities to produce shale and fire clay brick at its plant in St. Louis County at a cost of $350,000. Clays were produced in 20 counties; the five leaders were Gasconade, Audrain, Callaway, Montgomery, and St. Louis.

**Gem Stones.**—Gem varieties of agate and various other minerals were recovered in Missouri in 1960.

**Lime.**—Lime was produced at six lime plants—two in Greene County and one each in Marion, Newton, St. Francois, and Ste. Genevieve Counties. Production of lime decreased 5 percent from 1959, and value decreased 6 percent. Approximately 86 percent of the lime was used for chemical and industrial purposes, and 14 percent for building and refractory uses.

**Perlite.**—J. J. Brouk & Co. processed crude perlite mined in Western States, at its plant in St. Louis. The expanded perlite was used mainly as lightweight aggregate.

**Sand and Gravel.**—Sand and gravel was produced, chiefly from stream deposits, in 64 counties. Over 86 percent of total production was used for building and highway construction. Industrial sand was produced in Franklin, Jasper, Jefferson, St. Charles, and St. Louis Counties. These counties also led the State in total value of sand and gravel produced. Commercial operations furnished 94 percent of the total tonnage and 96 percent of the total value; the remainder

**TABLE 7.—Lime sold or used by producers**
(Thousand short tons and thousand dollars)

| Year | Quicklime | Hydrated lime | Total lime | |
|---|---|---|---|---|
| | | | Quantity | Value |
| 1951-55 (average) | 1,009 | 202 | 1,211 | $12,054 |
| 1956 | 1,254 | 227 | 1,482 | 15,814 |
| 1957 | 1,172 | 221 | 1,393 | 16,475 |
| 1958 | 953 | 220 | 1,173 | 14,136 |
| 1959 | 1,089 | 235 | 1,324 | 15,714 |
| 1960 | 1,030 | 224 | 1,254 | 14,701 |

was Government-and-contractor output. Over 98 percent of the commercial sand and gravel was washed. Shipments of commercial production were 71 percent by truck, 26 percent by rail, and 3 percent by water or other methods.

**TABLE 8.—Sand and gravel sold or used by producers**
(Thousand short tons and thousand dollars)

| Year | Commercial | | Government-and-contractor | | Total | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951-55 (average) | 6,766 | $6,790 | 1,087 | $712 | 7,853 | $7,502 |
| 1956 | 8,161 | 8,873 | 1,424 | 1,244 | 9,585 | 10,117 |
| 1957 | 7,198 | 8,000 | 1,282 | 942 | 8,480 | 8,942 |
| 1958 | 8,281 | 9,285 | 691 | 443 | 8,972 | 9,728 |
| 1959 | 9,573 | 10,959 | 706 | 447 | 10,279 | 11,406 |
| 1960 | 9,631 | 11,194 | 576 | 407 | 10,207 | 11,601 |

**Stone.**—Output from Missouri quarries included limestone, granite, marble, sandstone, and miscellaneous stone. Limestone production was reported from 82 counties and supplied 97 percent of the total tonnage and 94 percent of the total value. Crushed and dimension granite were produced in Iron County. Dimension marble was quarried in Jasper, Ste. Genevieve, and Greene Counties; crushed marble in Jasper, Jefferson, and Madison Counties. Sandstone was quarried in Shannon and Vernon Counties. Miscellaneous stone (chats) was produced in St. Francois and Jasper Counties. Principal uses for crushed stone were concrete aggregate, roadstone, riprap, and agricultural stone; dimension stone was used as monumental and building stone. Commercial producers supplied 98 percent of total tonnage.

Asphaltic sandstone for road surfacing was produced in Barton County by Bar-Co Roc, Inc.

**Tripoli.**—Tripoli was processed from Oklahoma ore by American Tripoli Division of The Carborundum Co. at its Seneca plant in Newton County. Production was lightly less than in 1959.

**Vermiculite.**—Crude vermiculite from Western States was exfoliated at plants in St. Louis and Jackson Counties.

[3] Chats; also includes small quantity of other stone.

## METALS

**Mine Mills and Smelters.**—At the beginning of 1960 five mine mills were operating in Southeastern Missouri—National Lead Co. Madison mill (Madison County), St. Joseph Lead Co. Indian Creek mill (Washington County), and Federal, Bonne Terre, and Leadwood mills (St. Francois County). The new Viburnum mill of St. Joseph Lead Co. began processing ore from the newly developed mine on July 15. The company reported that a construction program started at the Federal mill would eliminate tables used to produce gravity concentrate and convert the mill to an all-flotation operation. Also, flotation circuits were added to produce copper concentrate. Zinc flotation circuits were added at the Leadwood mill. At Herculaneum, St. Joseph Lead Co. smelted and refined lead. The refinery building was enlarged and two 250-ton kettles were installed. The silver refinery was rebuilt and a third blast furnace was constructed. National Lead Co. refined cobalt and nickel at Fredericktown.

**Cadmium, Gallium, Germanium, and Indium.**—These metals occur as trace elements in Missouri lead-zinc ores and were recovered from zinc smelter flue dusts. Since no source was designated for any of the concentrate smelted in Missouri, no State of origin was assigned for these by-product metals.

**Cobalt and Nickel.**—Cobalt and nickel were recovered from the complex lead-copper-cobalt-nickel ores in Madison County by National Lead Co. at Fredericktown. The refinery was leased from the U.S. Government.

**Columbium-Tantalum and Uranium.**—Mallinckrodt Nuclear Corp., a subsidiary of Mallinckrodt Chemical Works, processed domestic euxenite concentrate, mostly from Idaho. The company supplied approximately 1,000 kilograms of 93-percent uranium oxide to the Consolidated Edison Co. Indian Point nuclear power plant. The

Digitized by Google

uranium oxide was shipped to Lynchburg, Va., mixed with thorium oxide, and fabricated into fuel element pellets. The company also received a contract from Argonne National Laboratory for 1,200 kilograms of highly enriched uranium metal (99.95-percent). Total cost of the two contracts was more than $34 million.

**Copper.**—Copper was recovered from lead-copper ore in Madison County and lead ore in St. Francois County. Output was greater than in 1959.

**Iron Ore.**—Meramec Mining Co., owned jointly by Bethlehem Steel Corp. and St. Joseph Lead Co., continued development of the Pea Ridge iron ore project. At yearend the mine service shaft and main hoisting shaft had reached depths of 2,274 feet and 1,882 feet, respectively. The 26-mile railroad spur running from Cadet to the mine and plant site was completed by Missouri Pacific Railroad Co. The warehouse, machine shops, and office building were completed. The first ore was mined from a drift 1,675 feet below the collar of the service shaft. The ore body was further explored by diamond core drilling equipment installed on the 1,675-foot level.

The long-range drilling program undertaken jointly by American Zinc, Lead and Smelting Co. and Granite City Steel Co. continued. In the Bourbon area, where 18 holes had been drilled since 1956, the possible existence of a 100-million-ton iron ore deposit was indicated. Engineering studies were started to bring the mine into production and build a 10,000-ton-per-day concentrating plant and a pelletizing plant.[1]

Brown-ore (limonite) and hematite-ore output increased 4 percent in tonnage and 15 percent in value over 1959. Production was reported from 20 mines in 7 counties.

**Iron and Steel.**—In May, the Sheffield Division of Armco Steel Corp. shut down three open-hearth furnaces at its Kansas City plant. According to the company, it was the first time in 25 years that all the open-hearth furnaces had been shut down because of business conditions. The electric furnace department continued to operate. The company Kansas City No. 1 rodmill also closed during 1960.

Iron and steel scrap and pig iron were used in making castings, by iron and steel foundries, principally in the St. Louis and Kansas City areas.

**Lead.**—Mine production of recoverable lead totaled 111,948 tons—45 percent of the U.S. production. For the third consecutive year, no lead was produced in Southwestern Missouri. The price of lead was 12 cents per pound (New York) from January 1 until December 13, then dropped to 11 cents through December 31. The new lead-mining property of St. Joseph Lead Co. at Viburnum started production on July 15. Ore was hoisted through Shaft No. 27 in Crawford County. Work continued on Shaft No. 28 at the mill site in Iron County. The milling rate was 3,000 tons per day. Only preliminary work was done on Shaft No. 29 in Washington County. When the three shafts are operational, the milling rate will be increased to 6,000 tons per day. The company provided complete community facilities at the Viburnum townsite near the mill. Company expenditures in 1960 exceeded $6.5 million.

**TABLE 13.—Mine production of lead and zinc in southeastern and central Missouri, in terms of concentrate and recoverable metals [1]**

| Year | Lead concentrate (galena) | | Zinc concentrate (sphalerite) | | Recoverable metal content [2] | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | Lead | | Zinc | |
| | Short tons | Value (thousands) [3] | Short tons | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) |
| 1951-55 (average) | 179,996 | $30,968 | 5,825 | $535 | 124,213 | $37,277 | 3,286 | $900 |
| 1956 | 174,131 | 33,266 | 6,484 | 542 | 123,395 | 38,746 | 3,345 | 917 |
| 1957 | 179,312 | 31,597 | 5,903 | 448 | 126,323 | 36,128 | 2,866 | 665 |
| 1958 | 159,068 | 23,015 | 770 | 41 | 113,123 | 26,471 | 362 | 74 |
| 1959 | 146,765 | 21,698 | 206 | 12 | 105,165 | 24,188 | 92 | 21 |
| 1960 | 155,781 | 23,105 | 5,602 | 446 | 111,948 | 26,196 | 2,821 | 728 |

[1] Based on southeastern and central Missouri ore "dirt" and old tailing treated at mills.
[2] In calculating metal content of ores from assays, allowance has been made for smelting losses. In comparing values of concentrate "ore" and metal, value for concentrate is that received by producer, whereas value of lead and zinc is calculated from average price for all grades.
[3] Values are arbitrary because part of lead concentrate is smelted by producer.

**TABLE 14.—Mine production of lead and zinc in southwestern Missouri, in terms of concentrate and recoverable metals [1]**

| Year | Lead concentrate (galena) | | Zinc concentrate (sphalerite) | | Recoverable metal content [2] | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | Lead | | Zinc | |
| | Short tons | Value | Short tons | Value | Short tons | Value | Short tons | Value |
| 1951-55 (average) | 2,170 | $458,031 | 10,612 | $1,103,085 | 1,688 | $541,776 | 5,739 | $1,768,940 |
| 1956 | 496 | 102,096 | 1,862 | 161,502 | 388 | 121,832 | 1,035 | 283,590 |
| 1957 | 29 | 5,576 | 161 | 12,742 | 22 | 6,292 | 85 | 19,720 |
| 1958-60 | | | | | | | | |

[1] Based on southwestern Missouri ore "dirt" and old tailing treated at mills.
[2] In calculating metal content of ores from assays, allowance has been made for smelting losses. In comparing values of concentrate "ore" and metal, value for concentrate is that received by producer, whereas value of lead and zinc is calculated from average price for all grades.

**TABLE 15.—Tenor of lead and zinc ore, old tailing, and slimes milled and concentrate produced, by district**

| | Southeastern Missouri | |
|---|---|---|
| | 1959 | 1960 |
| Concentrate production: | | |
| Lead, short tons | 146,765 | 155,781 |
| Zinc, do | 206 | 5,602 |
| Concentrate obtained from: | | |
| Lead, percent | 2.63 | 2.64 |
| Zinc, do | 0.004 | 0.094 |
| Metal content of ore: [1] | | |
| Lead, do | 1.89 | 1.90 |
| Zinc, do | 0.002 | 0.05 |
| Average lead content of galena concentrate, do | 73.12 | 73.33 |
| Average zinc content of sphalerite concentrate, do | 49.51 | 55.94 |
| Average value per ton: | | |
| Galena concentrate | $147.84 | $148.31 |
| Sphalerite concentrate | $56.68 | $79.61 |
| Total material milled, short tons | 5,573,517 | 5,897,813 |

[1] Figures represent metal content of crude ore only as recovered in the concentrate; data on tailing losses not available.

**TABLE 17.—Quoted prices of 60-percent zinc concentrate and 80-percent lead concentrate at Joplin, Mo., in 1960**

| Zinc concentrate | | Lead concentrate | |
|---|---|---|---|
| Period | Price per short ton | Period | Price per short ton |
| Jan. 1-Jan. 7 | $76.00 | Jan. 1-Nov. 7 | $141.72 |
| Jan. 8-Dec. 12 | 80.00 | Nov. 8-Dec. 18 | 139.56 |
| Dec. 13-Dec. 18 | 76.00 | Dec. 19-Dec. 31 | 125.16 |
| Dec. 19-Dec. 31 | 72.00 | | |

Source: E&MJ Metal and Mineral Markets.

**Silver.**—Silver recovery decreased substantially because of less demand for desilverized lead. As a result, only pig lead was produced at the Herculaneum smelter of St. Joseph Lead Co. Lead and lead-copper ores in Madison and St. Francois Counties contain silver.

**Silicon.**—Monsanto Chemical Co. began producing ultrapure silicon metal for electronics use at its plant near St. Charles in St. Charles County.

**Zinc.**—Production of recoverable zinc increased after declining for 7 consecutive years. Output was reported from St. Francois and Washington Counties. The price of Prime Western slab zinc was 12½ cents per pound (East St. Louis) on January 1, rose to 13 cents January 8, dropped to 12½ cents December 13, and was 12 cents from December 19 to yearend.

No zinc was produced in the Southwestern Missouri part of the Tri-State district for the third consecutive year. (Details of Tri-State activity are given in the Oklahoma chapter.)

## MINERAL FUELS

**Coal.**—Bituminous coal was mined in 15 counties; more than 1,000 tons each was reported from 33 mines. Ten underground mines in five counties supplied 3 percent of the State total coal tonnage and 5 percent of total value. All underground production was cut by ma-

Digitized by Google

chines; 81 percent was power drilled. Strip-mine production, reported from 23 mines in 12 counties, supplied 97 percent of total tonnage and 96 percent of total value. Overburden excavated in 1960, totaling nearly 46 million cubic yards, averaged 17 cubic yards for each ton of coal strip mined. At 8 mines, 66 percent of total coal tonnage was mechanically cleaned, and at 10 mines over 37 percent of total tonnage was crushed. Seven percent of the coal at six mines was oil treated.

**TABLE 18.—Coal production**

(Thousand short tons and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 2,873 | $11,620 | 1958 | 2,592 | $11,111 |
| 1956 | 3,283 | 13,223 | 1959 | 2,748 | 11,937 |
| 1957 | 2,976 | 12,691 | 1960 | 2,890 | 12,450 |

**Petroleum.**—Crude petroleum was recovered near St. Louis and near Tarkio in Atchison County. Quantity and value approximated that for 1959. Continental Oil Co. began work on a petroleum terminal at Bethany in July. The terminal, which will have a capacity of 70,000 barrels of gasoline and fuel oil, will be owned jointly by Continental, D–X Sunray Oil Co., and Skelly Oil Co. The plant will have four storage tanks for two grades of gasoline and two grades of fuel oil, and truck loading facilities. Petroleum products will come from Oklahoma. The strike at the Sugar Creek refinery of Standard Oil Co. (Ind.) at Kansas City involving more than 700 workers, that began in July 1959, ended in March.

## REVIEW BY COUNTIES

Mineral production was reported in 105 of the 114 counties; 21 counties reported production valued at $1 million or more. Five counties—St. Louis, St. Francois, Ste. Genevieve, Cape Girardeau, and Jackson—contributed 58 percent of the total mineral-production value. No output was reported in Carroll, Chariton, Holt, Mississippi, New Madrid, Schuyler, Scotland, Scott, and Webster Counties.

**Adair.**—Coal was mined underground by Billy Creek Coal Co., Inc., and Blacksmith Coal Co., Inc. Bailey Limestone Co., Inc., crushed limestone for concrete aggregate, roadstone, and agricultural stone.

**Andrew.**—George W. Kerford Quarry Co. and the U.S. Army Corps of Engineers quarried and crushed limestone for riprap for the banks of the Missouri River.

**Atchison.**—Petroleum was recovered near Tarkio.

**Audrain.**—Audrain County, second in clay production for the sixth consecutive year, reported output of fire clay for refractories. Fire clay was mined by Kaiser Refractories & Chemicals Division, Kaiser Aluminum & Chemical Corp.; A. P. Green Fire Brick Co.; Walsh Refractories Corp.; Harbison-Walker Refractories Co.; North American Refractories Co.; and Wellsville Fire Brick Co. Limestone was quarried and crushed for concrete aggregate, roadstone, and agricultural stone by Molino Lime Co.

**TABLE 19.—Value of mineral production in Missouri, by counties [1]—Continued**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Putnam | $433,319 | (2) | Coal. |
| Ralls | 6,949,143 | $5,764,215 | Cement, stone, coal, sand and gravel. |
| Randolph | 2,880,130 | 3,005,100 | Coal, stone. |
| Ray | 328,609 | (2) | Stone. |
| Reynolds | (2) | (2) | Sand and gravel. |
| Ripley | 54,377 | 45,261 | Sand and gravel, iron ore. |
| St. Charles | 1,124,759 | 1,170,713 | Stone, sand and gravel. |
| St. Clair | 1,311,591 | (2) | Coal, stone, sand and gravel. |
| St. Francois | 25,461,065 | 25,823,104 | Lead, iron ore, lime, stone, zinc, copper. |
| Ste. Genevieve | 13,411,804 | 12,900,372 | Lime, stone, sand and gravel. |
| St. Louis | 30,712,897 | 29,052,925 | Cement, sand and gravel, stone, clays, petroleum. |
| Saline | 487,987 | 484,450 | Stone. |
| Schuyler | 50,000 | | |
| Scott | (2) | | |
| Shannon | 533,500 | 393,428 | Iron ore, stone, sand and gravel. |
| Shelby | (2) | (2) | Stone. |
| Stoddard | 202,474 | 226,700 | Sand and gravel. |
| Stone | (2) | (2) | Stone, sand and gravel. |
| Sullivan | (2) | (2) | Stone. |
| Taney | (2) | (2) | Do. |
| Texas | 150,879 | 39,507 | Stone, sand and gravel. |
| Vernon | 450,966 | 277,691 | Coal, stone, sand and gravel. |
| Warren | 353,172 | 298,934 | Clays, stone, sand and gravel. |
| Washington | 7,299,826 | 6,171,183 | Lead, barite, zinc, sand and gravel. |
| Wayne | 370,199 | 82,238 | Stone, sand and gravel, iron ore. |
| Worth | (2) | (2) | Stone. |
| Wright | 116,575 | 63,633 | Do. |
| Undistributed | 7,345,596 | 9,549,972 | |
| Total | [3] 157,189,000 | 156,033,000 | |

[1] Counties not listed because no production was reported in 1959 or 1960: Carroll, Charlton, Holt, Mississippi, New Madrid, Scotland, and Webster.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Revised figure.

**Barton.**—Clemens Coal Co. and Jones Coal Co. strip mined coal. Bar-Co Roc, Inc., produced asphaltic sandstone for use on roads. Limestone was quarried and crushed for concrete aggregate, roadstone, agstone, and riprap by John J. Stark.

**Bates.**—Limestone was quarried and crushed for concrete aggregate, roadstone, agricultural stone, and riprap by Alvis Limestone & Concrete Products, Inc., and Frank Underwood. Coal was strip mined by Mullies Coal Co. Building gravel was produced by Clyde S. Miller.

**Benton.**—Trager Quarries, Inc., produced crushed limestone for concrete aggregate and roadstone. J. C. Orender obtained gravel for paving from deposits in the county. Missouri State Highway Department contracted for paving gravel.

**Boone.**—Limestone was quarried and crushed for concrete aggregate, roadstone, agstone, and riprap by Adrian Materials Co., N. R. Garrett, Boone Quarries, Inc., Central Stone Co., and U.S. Army Corps of Engineers. Sand and gravel was produced by Columbia Sand & Towing Co. and Columbia Special Road District. Columbia Brick & Tile Co. mined shale and fire clay for heavy clay products.

**Buchanan.**—Pioneer Sand Co. produced building, paving, and railroad ballast sand. Limestone was quarried and crushed for concrete aggregate, roadstone, agricultural stone, and riprap by Everett Quarries, Inc., L. S. Stafford, and U.S. Army Corps of Engineers.

**Butler.**—Kittredge Sand & Gravel Co., Grobe & Sons, and the Missouri State Highway Department obtained sand and gravel for build-

Digitized by Google

ing, paving, and other uses. Clay for pottery was mined by Ozark Development Co.

**Caldwell.**—Limestone was quarried and crushed for concrete aggregate, roadstone, and agstone by Farmers Rock & Lime Co., Everett Quarries, Inc., and Kingston Stone Co.

**Callaway.**—The county ranked third in clay output and fourth in coal production. Producers of fire clay for use in refractories included Harbison-Walker Refractories Co., Walsh Refractories Corp., Clayton & Crawson, Kaiser Refractories & Chemicals Division, Kaiser Aluminum & Chemical Corp., A. P. Green Fire Brick Co., and Refractories Division, H. K. Porter Co., Inc. Mariott-Reed Coal Co. strip mined coal. Limestone was quarried and crushed by Auxvasse Stone & Gravel Co., Callaway Rock Quarry, and Sulgrove Mining & Quarry Co. for concrete aggregate, roadstone, agstone, riprap, and railroad ballast. Missouri State Highway Department contracted for paving gravel.

**Cape Girardeau.**—Cape Girardeau County ranked fourth in value of mineral production and sixth in stone production. Marquette Cement Manufacturing Co. quarried limestone and clay for portland and masonry cements. During the year improved river-barge cement-loading facilities were completed. The Federal Materials Co., Inc., Farmers Limestone Co., and Jackson Limestone Quarry produced crushed limestone for concrete aggregate, roadstone, agstone, and riprap. Cape Girardeau Sand Co. produced building sand and Eddie Erlbacher Materials Co. produced paving gravel. Kasten Clay Products, Inc., and Ceramo Co., Inc., mined common red clay for brick, pottery, and stoneware.

**Carter.**—Brown iron ore was shipped from Carter County to steel mills in Alabama. Missouri State Highway Department obtained paving gravel from local deposits.

**Cass.**—Hackler & Limpus Quarry, Emmet Brosnahan Rock Co., Marino & Hoover Crushed Rock Co., Deitz Hill Development Co., and S & W Quarries quarried and crushed limestone for concrete aggregate, roadstone, and agstone. Miscellaneous clay for brick and tile was mined by United Brick & Tile Co.

**Cedar.**—Limestone was quarried and crushed for concrete aggregate, roadstone, and agstone by Alvis Limestone & Concrete Products, Inc., and Freeto Construction Co.

**Christian.**—Joe Howard quarried and crushed limestone for concrete aggregate, roadstone, and agstone. Missouri State Highway Department contracted for paving gravel.

**Clark.**—Limestone was quarried and crushed for concrete aggregate, roadstone, agstone, and riprap by Baker Quarry Co. and Brooks Quarry, Inc. Coal was strip mined by Hamlin Bros. Coal Co.

**Clay.**—The county ranked fourth in value of stone production. Limestone was crushed mainly for concrete aggregate, roadstone, and riprap. Producers included Kansas City Quarries Co., Midwest Precote Co., J. H. Oldham Stone Co., Everett Quarries, Inc., and the Clay County Highway Department.

**Clinton.**—Limestone was quarried and crushed for concrete aggregate, roadstone, agstone, and riprap by Everett Quarries, Inc.

Digitized by Google

**Cole.**—Sand and gravel, mined near the Osage and Missouri Rivers, was used mainly for building and paving. Producers included Leonard Barnhart, Jefferson City Sand Co., Elam Construction Co., Inc., and the Cole County Highway Department. Crushed limestone for use as riprap was produced by the U.S. Army Corps of Engineers.

**Cooper.**—Hall & Riley Quarries & Construction Co., W. J. Menefee Construction Co., Castle Bros. Quarry Co., and the U.S. Army Corps of Engineers quarried and crushed limestone for concrete aggregate, roadstone, agstone, and riprap. Sand and gravel for building and paving was obtained by Missouri River Sand & Gravel Co.

**Crawford.**—The first lead ore was mined from Shaft No. 27 of the Viburnum operation of St. Joseph Lead Co. and milled in Iron County. A. P. Green Fire Brick Co., Dillon Bros., Walsh Refractories Corp., and Refractories Division, H. K. Porter Co., Inc., mined fire clay for refractories. Missouri State Highway Department contracted for paving gravel.

**Dade.**—Lockwood Rock Poducts quarried and crushed limestone for concrete aggregate and roadstone. Tyler & Claypool Coal Co. strip mined coal in the county.

**Daviess.**—Limestone was quarried and crushed for concrete aggregate, roadstone, and agstone by Snyder Quarries. Sand for building use was obtained by Bethany Falls Transit Mixed Concrete Co.

**De Kalb.**—Limestone for concrete aggregate, roadstone, agstone, and riprap was produced by Everett Quarries, Inc.

**Douglas.**—Paving gravel was obtained from local deposits by Welton & Gray Gravel Co. Missouri State Highway Department obtained gravel for paving.

**Franklin.**—Franklin County ranked fourth in value of sand and gravel produced. Sand and gravel, used mainly for building and paving, was produced by Pacific Pebbles, Inc., St. Louis Material & Supply Co., Meramec Aggregates, Inc., Washington Sand Co., Clifford Dewert, and the Missouri State Highway Department. A small quantity was used for grinding and polishing. Crushed limestone and dolomite were produced for concrete aggregate, roadstone, agstone, and riprap by George P. Dawson, Inc., Oliver L. Taetz Co., Inc., J. E. McKeever, Edwin Bebermeyer, Tourville Limestone Quarry, and Porter Dewitt. Fire clay for refractories was mined by Kaiser Refractories & Chemicals Division, Kaiser Aluminum & Chemical Corp., Thacher & Hoer Mining Co., and Refractories Division, H. K. Porter Co., Inc.

**Gasconade.**—Gasconade County continued to lead in clay output. Eight refractories manufacturers used burley, flint, and diaspore fire clays. General Chemical Division of Allied Chemical Corp. mined fire clay for chemical uses. Limestone was quarried and crushed by Oliver L. Taetz Co., Inc., for concrete aggregate and roadstone.

**Gentry.**—Albany Gravel Co., Inc., crushed limestone for concrete aggregate, roadstone, and agstone and produced gravel for paving.

**Greene.**—Greene County ranked third in value of lime production and seventh in value of stone production. Ash Grove Lime & Portland Cement Co. quarried limestone at its Galloway and Springfield quarries for use in making lime and for concrete aggregate, roadstone, and soil conditioner. Other limestone producers included

Digitized by Google

Griesemer Stone Co., Graystone Quarry Co., and Concrete Co. of Springfield. Carthage Marble Co. prepared dimension marble at its quarry. Sand and gravel was obtained for paving by G. B. Mason and Fair Grove Sand Co.

**Grundy.**—Jay Wilcox Limestone Quarry Co., E. E. Trenary, and Trager Quarries, Inc., quarried and crushed limestone for concrete aggregate, roadstone, agstone, and riprap.

**Harrison.**—L. W. Hayes, Inc., and Davis-Snyder Quarries, Inc., crushed limestone for concrete aggregate, roadstone, and agstone. Coal was mined underground in Harrison County by New Black Diamond Coal Co. Construction was started on a petroleum terminal at Bethany, to be owned jointly by Continental Oil Co., D–X Sunray Oil Co., and Skelly Oil Co. The terminal will have a capacity of 70,000 barrels of gasoline and fuel oil with four storage tanks, two for gasoline and two for fuel oil.

**Henry.**—Henry County continued to lead in coal production; six strip mines produced over 1,000 tons each. Producers included Peabody Coal Co., Redding Coal Co., Bud Jones Coal Co., Madole Bros. Coal Co., and W. & W. Coal Co. Williams Rock Co., Inc., Davis Rock Co., and O. A. Knisely quarried and crushed limestone for concrete aggregate, roadstone, and agstone.

**Howard.**—Glasgow Quarries and the U.S. Army Corps of Engineers produced crushed limestone for concrete aggregate, riprap, and agstone. Sand for paving uses was produced by Glasgow Sand Co.

**Howell.**—Howell County ranked third in iron-ore production. Shook & Fletcher Supply Co., Howard Construction Co., Four Mining Co., Lane & Essex, and Riggs & Morrison mined brown iron ore.

**Iron.**—Crushed granite for riprap and dimension granite for building and monumental purposes were produced by Heyward Granite Co. Dolomite was quarried for agstone by Duncan Bros., Inc. The Viburnum lead mill of St. Joseph Lead Co. began operating during the year at 3,000-tons-per-day capacity. Development of Shaft No. 28 at the millsite continued.

**Jackson.**—Jackson County ranked second in value of stone production, third in cement and sand and gravel, and fifth in total minerals. Limestone was crushed at 10 quarries for concrete aggregate, roadstone, riprap, and agstone. Leading producers were Beyer Crushed Rock Co., Union Quarries, Union Construction Co., Stewart Sand & Material Co., and Kansas City Quarries Co. Dimension limestone was produced by Gerald Hodgins Quarry, Charles Rove Rock Quarry, and George & Clark Stone Contractors. Limestone and shale for manufacturing portland and masonry cements were quarried near Independence by Missouri Portland Cement Co. Kansas City Quarries Co. and Stewart Sand & Material Co. produced sand and gravel mainly for building and paving purposes. United Brick & Tile Co. mined miscellaneous clay for heavy clay products. The Zonolite Co. plant in Jackson County exfoliated vermiculite from Montana. Standard Oil Co. (Ind.) produced heptene concentrate and sodium cresylate at its petrochemical plant at Sugar Creek, using petroleum fractions as raw material.

Digitized by Google

**Jasper.**—The county ranked fifth in value of stone and seventh in value of sand and gravel production. Carthage Marble Corp. quarried marble for use as rough building stone, dressed building stone, and dressed monumental stone; the company also produced crushed stone. Crushed limestone was produced by Independent Gravel Co., Carthage Crushed Limestone Co., and Freeto Construction Co. for concrete aggregate, roadstone, agstone, and other purposes. Miscellaneous stone (chats) was produced by American Zinc, Lead and Smelting Co. and Independent Gravel Co. Blast sand, grinding and polishing sand, building and paving gravel, and railroad ballast gravel were produced by Independent Gravel Co. Solar Nitrogen Chemicals, Inc., began constructing a $15 million plant to manufacture anhydrous ammonia, urea, and related products, adjacent to the explosives plant of Atlas Powder Co. near Joplin. Solar was a joint subsidiary of Atlas Powder Co. and Standard Oil Co. (Ohio).

**Jefferson.**—Jefferson County continued to rank second in value of sand and gravel produced. High-purity silica sand, used in plate glass and for molding, grinding, and polishing, was produced by Pittsburgh Plate Glass Co., Aubuchon Silica Mining Division of Portage-Manley Sand Co., and Masters Bros. Silica Sand Co. Building sand and gravel was produced by Monarch Building Materials Corp. and Ficken Material Co. Jefferson County Highway Department contracted for paving gravel. Marble Products Co. of Georgia crushed stone for use as an aggregate in terrazzo. Paul H. Guidicy produced crushed and dimension limestone. Leading producers of crushed limestone were Bussen Quarries, Inc., Vigus Quarries, Inc., Kitson Bros. Quarry, and Henry Trautman. Crude barite was mined by Postlewait Mining Co. Ammonia, ammonium nitrate, nitric acid, and ammonia solutions were manufactured by Armour Agricultural Chemical Co., Nitrogen Division, at its Crystal City plant. Dow Chemical Co. produced polystyrene and styrofoam at its Pevely plant, using styrene as raw material. Mallinckrodt Nuclear Corp. operated its nuclear fuel production center at Hematite.

**Knox.**—Knox County Stone Co., Inc., and McSorley Lime & Rock Co., Inc., quarried and crushed limestone for concrete aggregate, roadstone, riprap, agstone, and other uses.

**Lafayette.**—Sand for building and paving was obtained by Glasgow Sand Co. and Raymond Drivers Sand Co. Red Stone Co. and Deitz Hill Development Co. quarried and crushed limestone for concrete aggregate, roadstone, and riprap. Coal was mined underground by F. W. Goodloe Coal Co., Earl Ashford Coal Co., and Jones Coal Co.

**Lewis.**—Lewis County ranked sixth in value of sand and gravel production. Missouri Gravel Co. produced paving sand and gravel near LaGrange. Missouri Gravel Co. and Hamill Lime Co. produced crushed limestone for concrete aggregate, roadstone, agstone, and railroad ballast.

**Lincoln.**—Limestone was quarried and crushed for concrete aggregate, roadstone, and agstone by Watson Quarry and Gessman Quarry. Missouri State Highway Department contracted for paving gravel. Lee Roberts produced fill sand and gravel and paving gravel. Fire clay for refractories was mined by Harbison-Walker Refractories Co.

Digitized by Google

**Linn.**—Limestone was quarried and crushed for concrete aggregate, roadstone, and agstone by Bailey Limestone Co. Sayre Coal Co. strip mined coal.

**Livingston.**—Cooper Contracting Co., Farmers Rock & Lime, Inc., Trager Quarries, Inc., and Fred McVey Quarry quarried and crushed limestone for concrete aggregate, roadstone, agstone, and riprap. Cooley Gravel Co. produced building, paving, railroad ballast, and fill sand. Sampsel Gravel Co. produced paving gravel. Midland Brick & Tile Co. mined miscellaneous clay for use in brick and tile.

**Madison.**—Ores containing lead, copper, silver, cobalt, nickel, and iron were mined at the Madison mine of National Lead Co. near Fredericktown. At the refinery near Fredericktown, cobalt and nickel were recovered from iron rejects of the lead-copper circuit of the Madison mill. Marble Products Co. of Georgia crushed stone for use as an aggregate in terrazzo.

**Maries.**—Maries County ranked eighth in value of clay production. Refractories Division, H. K. Porter Co., Inc., A. P. Green Fire Brick Co., and Harbison-Walker Refractories Co., mined diaspore, burley, and fire clays for refractories. Crushed limestone for concrete aggregate, roadstone, and agstone was produced by Smith Quarries.

**Marion.**—Marblehead Lime Co. quarried limestone near Hannibal for quicklime and hydrated lime; limestone also was produced for use as asphalt filler and mineral food. S. D. Fessenden & Sons crushed limestone for agricultural purposes.

**Mercer.**—Twin State Quarries, Inc., and Wilcox Quarries quarried and crushed limestone for concrete aggregate, roadstone, agstone, and riprap.

**Miller.**—Eldon Quarry Co. crushed limestone for concrete aggregate, roadstone, and agstone. Gravel was obtained from local deposits by C. W. Roweth Co. and the Missouri State Highway Department.

**Moniteau.**—Limestone was quarried and crushed by Moniteau County Agricultural Association, Inc., for concrete aggregate, roadstone, and agstone. U.S. Army Corps of Engineers obtained crushed limestone for riprap. Missouri State Highway Department contracted for paving gravel.

**Monroe.**—Gilliam Mining Co., Bethlehem Co., and Fluetsch Bros. mined fire clay for use in horizontal zinc retorts and condensers. Fire clay for refractories was mined by Walsh Refractories Corp. Hamilton Lime Co., Central Stone Co., and Wilkerson Bros. quarried and crushed limestone for concrete aggregate, roadstone, agstone, and riprap. Gravel was obtained locally by Wilkerson Bros. and the Missouri State Highway Department.

**Montgomery.**—Montgomery County ranked fourth in value of clay production. Fire clay for refractories was mined by six companies. McClain Lime Quarry crushed limestone for concrete aggregate, roadstone, and agstone. Two Rivers Sand & Gravel Co. produced sand and gravel mainly for paving.

**Newton.**—Quicklime and hydrated lime were manufactured by The Southwest Lime Co. using limestone quarried locally; limestone was sold for concrete aggregate, roadstone, agstone, and riprap. American Tripoli Division of The Carborundum Co. processed tripoli for

Digitized by Google

polishing and buffing compounds at its Seneca plant from crude material mined in Ottawa County, Okla.

**Nodaway.**—Dillon Stone Co. quarried and crushed limestone for concrete aggregate, roadstone, and agstone. Earl Wilson Sand Co. dredged sand and gravel mainly for building and paving purposes.

**Oregon.**—Oregon County ranked fourth in value of iron-ore output. Miller & Reynolds, Plateau Iron Ore Corp., and Midwest Mining Co. mined brown iron ore from open pits. Limestone was quarried and crushed for use as soil conditioner by O. O. Mainprize. Missouri State Highway Department obtained paving gravel locally.

**Osage.**—The county ranked sixth in value of clays produced. Fire, diaspore, and burley clays were mined for use in manufacturing refractories. Producers included A. P. Green Fire Brick Co., North American Refractories Co., Kaiser Refractories & Chemicals Division, Kaiser Aluminum & Chemical Corp., and Walsh Refractories Corp. Paving gravel was obtained by Osage County Highway Department and Missouri State Highway Department.

**Perry.**—Gibbar Bros. crushed limestone for concrete aggregate, roadstone, and agstone, and produced gravel for building purposes.

**Pettis.**—Howard Construction Co. and W. J. Menefee Construction Co. quarried and crushed limestone for concrete aggregate and roadstone. Missouri State Highway Department contracted for paving gravel.

**Phelps.**—A. P. Green Fire Brick Co., Dillon Bros., and Refractories Division, H. K. Porter Co., Inc., mined fire clay for refractories. Bray Construction Co. and Jessie Nivens quarried and crushed limestone for concrete aggregate, roadstone and agstone. Sand and gravel for building and paving was produced by Grisham Sand & Gravel Co.

**Pike.**—Limestone was quarried and crushed for concrete aggregate, roadstone, and agstone by Hamill Lime Co., Magnesium Mining Co., and Galloway Limestone Co. Sand and gravel for building and paving was obtained by Goodman Sand and Gravel Co. and Missouri State Highway Department. Hercules Powder Co. manufactured ammonia, methanol, formaldehyde, and pentaerythritol from natural gas at its petrochemical plant near Louisiana.

**Platte.**—Everett Quarries, Inc., Midwest PreCote Co., Bowen Construction Co., and U.S. Army Corps of Engineers quarried and crushed limestone for concrete aggregate, roadstone, agstone, and riprap. Carter-Waters Corp. mined shale for manufacturing lightweight aggregate.

**Polk.**—Limestone was quarried and crushed for concrete aggregate and roadstone by W. J. Menefee Construction Co. Butcher Gravel Co. produced building and paving gravel near Humansville. Missouri State Highway Department contracted for paving gravel.

**Pulaski.**—J. H. Walser Construction Co. and Big Piney Sand Co. produced building and paving sand and gravel. Missouri State Highway Department contracted for paving gravel.

**Putnam.**—Coal was mined underground by Clark Coal Co. and strip mined by Kirkville Coal Co. and Husted Bros. Coal Co.

**Ralls.**—Ralls County ranked fourth in value of cement production. Universal Atlas Cement Co. produced portland and masonry cements at its plant near Ilasco. Limestone and shale for cement were ob-

Digitized by Google

tained near the plant. Central Stone Co. quarried and crushed limestone for concrete aggregate, roadstone, and agstone. Coal was strip mined by Couch Coal Co. and Clarence D. Day. Paving gravel was obtained locally by Edward B. Cooper.

**Randolph.**—Randolph County ranked second in value of coal output. Coal was mined underground by D. L. Bradley Coal Co., Fately Coal Co., and Nejedly Coal Co. Peabody Coal Co. and Amidei Quarry & Mining Co. strip mined coal. Limestone was quarried and crushed for concrete aggregate, roadstone, and agstone by N. J. Cooksey Co. and Potter Stone Co.

**Ray.**—Limestone was quarried and crushed for concrete aggregate, roadstone, and agstone by Steva Stone Co. and Orrick Stone Co.

**Ripley.**—Building and paving sand and gravel were produced by Wright Gravel Co. Ripley County Mining Co. mined brown iron ore.

**St. Charles.**—St. Charles County ranked fifth in value of sand and gravel production. Tavern Rock Sand Co. produced glass, molding, engine, and other industrial sands. Missouri State Highway Department contracted for paving gravel. St. Charles Quarry Co., O'Fallon Quarry & Supply Co., Joerling Bros. Quarry, and Schiermeier Limestone Co. quarried and crushed limestone for concrete aggregate, roadstone, agstone, and riprap. Monsanto Chemical Co. began producing ultrapure silicon metal for electronic uses at its plant near St. Charles.

**St. Clair.**—St. Clair County ranked third in value of coal production. Coal was strip mined by Pittsburg & Midway Coal Mining Co. and Osage Coal Co. Limestone was quarried and crushed for concrete aggregate, roadstone, and agstone by Hunt Limestone Co. Missouri State Highway Department contracted for paving gravel.

**St. Francois.**—St. Francois County led in value of lead, iron ore, and zinc and ranked second in value of copper, lime, and total mineral production. At Iron Mountain, Midwest Ore Co. (formerly Ozark Ore Co.) mined hematite iron ore. St. Joseph Lead Co. mined and milled lead ore that yielded copper and zinc as byproducts. Valley Dolomite Corp. produced dead-burned dolomite for refractory uses; crushed dolomite was used as refractory material, fertilizer filler, concrete aggregate, roadstone, and agstone. St. Joseph Lead Co. produced crushed dolomite for agricultural and fluxing purposes. Chats from lead and iron ore milling was used mainly for concrete aggregate and roadstone; producers included St. Joseph Lead Co. and Trap Rock Material & Engineering Co.

**Ste. Genevieve.**—The county led in lime production and ranked third in stone output and total mineral production. Limestone, quarried and crushed by Mississippi Lime Co., was used to produce quicklime and hydrated lime at a plant near Ste. Genevieve. Lime was used for chemical, industrial, and building purposes. The company also sold limestone for glass, whiting, asphalt filler, poultry grit, coal mine rock dust, and various other purposes. Crushed limestone also was produced by Cliffdale Quarry & Manufacturing Co. and Ste. Genevieve Building Stone Co. Dimension limestone was produced by Ste. Genevieve Building Stone Co. Dimension marble was produced by Weiler Marble Co., Inc., and Tennessee Marble Co. Bauman Bros. obtained sand and gravel for building and paving.

Digitized by Google

**St. Louis.**—St. Louis County led in cement, sand and gravel, and stone production and total mineral production value. Portland and masonry cements were manufactured at Prospect Hill by Missouri Portland Cement Co. and at Lemay by Alpha Portland Cement Co. West Lake Quarry & Material Co. produced crushed and dimension limestone. Producers of crushed limestone included Vigus Quarries, Inc., Rock Hill Quarries Co., Riverview Stone & Material Co., Bussen Quarries, Inc., George A. Janssen, Inc., and Frank Ruprecht & Sons Quarry & Material Co. Stone was crushed for concrete aggregate, roadstone, riprap, and agricultural purposes. Sand and gravel for construction purposes, unground industrial sands, and ground sands were produced. Leading producers, by value, were Winter Bros. Material Co., Inc., Pioneer Silica Products Co., Missouri Aggregates, Inc., Missouri Illinois Material Co., and Simpson Sand & Gravel Co. Shale and plastic fire clay were mined for heavy clay products and refractories. Hydraulic Press Brick Co. built additional facilities to produce a new line of shale and fire clay face brick. Titanium pigments were produced by the Titanium Division of National Lead Co. Monsanto Chemical Co. increased its capacity to produce maleic anhydride 50 percent, to 60 million pounds per year; calcium phosphate, bisphenol, and fumaric acid also were produced. Crude vermiculite from Western States was exfoliated by Zonolite Co. Perlite, expanded at a plant in St. Louis from crude perlite mined in Western States, was used mainly as a lightweight aggregate in building plaster. A small quantity of petroleum was recovered. Crude barite was ground by the DeLore Division of National Lead Co.

**Saline.**—Hall & Riley Quarries, Howard Construction Co., Gilliam Rock, Inc., and Scott Quarries quarried and crushed limestone for concrete aggregate, roadstone, and agstone.

**Shannon.**—Shannon County ranked second in iron ore production. Brown iron ore was mined by Shook & Fletcher Supply Co. and Ozark Mining Corp. Ozark Stone Products Co. and Salem Stone Co. produced dimension sandstone. Limestone was quarried and crushed by Crider Bros. Lime Co. for use as soil conditioner. Missouri State Highway Department obtained paving gravel from local deposits.

**Shelby.**—Central Stone Co. and Turner Lime & Rock Quarry quarried and crushed limestone for concrete aggregate, roadstone, and agstone.

**Stoddard.**—Sand and gravel for building and paving was produced by Hill & Stuart, Inc., Brown Sand & Gravel Co., Inc., and Warren Gravel Co.

**Stone.**—Gillioz Co., Inc., quarried and crushed limestone for concrete aggregate and roadstone. Missouri State Highway Department contracted for paving gravel.

**Sullivan.**—Limestone was quarried and crushed by Partin Lime & Rock Co. and Twin State Quarries, Inc., for concrete aggregate, roadstone, and agstone.

**Taney.**—Poulin & Son Rock & Lime Co. quarried and crushed limestone for concrete aggregate, roadstone, and agstone.

Digitized by Google

**Texas.**—Limestone was quarried and crushed for soil conditioner by Long Bros. and Earl Duke. Missouri State Highway Department obtained paving gravel.

**Vernon.**—Coal was strip mined by M. L. Schooley Coal & Construction Co. and Ellis Coal Co. Trager Quarries Inc., Jones Coal & Rock Co., and Alvis Limestone & Concrete Products Co. quarried and crushed limestone for concrete aggregate and roadstone. Missouri Native Stone Co. produced dimension sandstone. Paving gravel for road maintenance was produced by Blue Mound Township and Osage Township.

**Warren.**—Walsh Refractories Corp. and Harbison-Walker Refractories Co. mined fire clay for refractories. Limestone was quarried and crushed for concrete aggregate, roadstone, and agstone by Sprick Quarry. Gravel for paving was obtained by Missouri State Highway Department and Warren County Department of Roads.

**Washington.**—The county ranked first in barite production and second in zinc and lead production. Barite production was reported from 13 operations by 10 companies. Leading producers were Milwhite Mud Sales Co., Magnet Cove Barium Corp., DeSoto Mining Co., Midwest Mining Co., and Hornsey Bros. Lead ore containing small quantities of zinc was mined and milled at the St. Joseph Lead Co. Indian Creek Plant. Lead also was recovered in mining and washing barite. Development of the Pea Ridge iron-ore deposit was continued by Meramec Mining Co. Building and paving sand and gravel and railroad ballast gravel were produced by Mount Sand & Gravel Co., Midwest Mining Co., and Missouri State Highway Department.

**Wayne.**—Brown iron ore was mined by various producers and shipped to steel mills. Harris Lime Co. quarried and crushed limestone for use as a soil conditioner. Building and paving sand and gravel was produced by Williamsville Stone Co. and Missouri State Highway Department.

# The Mineral Industry of Montana

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Montana Bureau of Mines and Geology.**

By Frank B. Fulkerson,[1] Gary A. Kingston,[1] and A. J. Kauffman, Jr.[2]

MINERAL production in Montana in 1960 increased $11.5 million (7 percent) over 1959 and reversed a 3-year decline in the annual value of output from mines, mills, quarries, and wells in the State. The 1960 value of $178.9 million was the third highest on record (exceeded only in 1956 and 1957). Production of copper gained over the preceding year after settlement in February of a 6-month strike at Butte mines. This was the main factor behind the increased State value for 1960. Quantity and value of marketable phosphate rock continued to advance to new highs. Output of several other commodities increased, including gold, silver, chromium, manganese, fluorspar, and natural gas. Declines were recorded for lead, zinc, cement, coal, and vermiculite.

Recovery of crude petroleum increased slightly; however, the total value of this product was $3.6 million less because the average value per barrel dropped from $2.56 to $2.41. More sand and gravel was produced than in 1959, but the value was less.

Crude petroleum, copper, and sand and gravel provided 80 percent of the State total value of mineral production.

**Trends and Developments.**—Two new phosphate rock mines were being developed. A mechanical planer devised by the Federal Bureau of Mines for underground phosphate mining was to be used at one of the mines with production scheduled to begin in 1961. Another development in the mineral industries was construction on a 190-mile petroleum pipeline from Glendive, Mont., to Minot, N. Dak. In 1961 a crude oil pipeline was to cross the State from the Cut Bank oilfield to the Wyoming State line south of Billings.

The Anaconda Company began an $11 million, 5-year program to bring high-grade copper ore reserves into production from deep levels. The company also planned a $6 million program for improving and enlarging the Anaconda Reduction Works.

**Consumption, Trade, and Markets.**—Immediate construction of the Libby Dam on the Kootenai River in northwestern Montana would be feasible under a basic agreement reached by the United States and

**TABLE 1.—Mineral production in Montana [1]**

| Mineral | | 1959 | | 1960 | |
|---|---|---|---|---|---|
| | | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Chromium ore and concentrate [2] | short tons, gross weight | 105,381 | $3,765 | 106,716 | $3,813 |
| Clays [3] | thousand short tons | 46 | 48 | 63 | 77 |
| Coal (bituminous and lignite) | do | 345 | 1,478 | 313 | 1,188 |
| Copper (recoverable content of ores, etc.) | short tons | 65,911 | 40,469 | 91,972 | 59,046 |
| Fluorspar | do | 18,542 | (4) | 31,273 | (4) |
| Gold (recoverable content of ores, etc.) | troy ounces | 28,551 | 999 | 45,922 | 1,607 |
| Iron ore (usable) | thousand long tons, gross weight | 50 | 254 | 55 | 293 |
| Lead (recoverable content of ores, etc.) | short tons | 7,672 | 1,765 | 4,879 | 1,142 |
| Manganese ore and concentrate (35 percent or more Mn) | short tons, gross weight | 21,604 | 1,520 | 29,036 | 1,996 |
| Manganiferous ore and concentrate (5 to 35 percent Mn) | do | 2,415 | 34 | 676 | 11 |
| Natural gas | million cubic feet | 30,743 | 2,306 | 33,418 | 2,373 |
| Petroleum (crude) | thousand 42 gallon barrels | 29,857 | 76,434 | [5] 30,240 | [5] 72,878 |
| Sand and gravel | thousand short tons | 10,930 | 12,587 | 12,589 | 11,657 |
| Silver (recoverable content of ores, etc.) | thousand troy ounces | 3,420 | 3,096 | 3,607 | 3,265 |
| Stone | thousand short tons | 1,186 | 1,691 | 1,183 | 1,576 |
| Uranium ore | short tons | 2,890 | (4) | 1,726 | 29 |
| Zinc (recoverable content of ores, etc.) | do | 27,848 | 6,405 | 12,551 | 3,238 |
| Value of items that cannot be disclosed: Barite, cement, gem stones, gypsum, lime, mica, natural gas liquids, phosphate rock, pyrites (1959), talc, thorite concentrate (1959), tungsten (1960), vermiculite, and values indicated by footnote 4 | | | 15,248 | | 15,217 |
| Total Montana [6] | | | 167,328 | | 178,854 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Excludes tonnage used for ferrochromium production; included with "Value of items that cannot be disclosed."
[3] Excludes fire clay and bentonite (1959); included with "Value of items that cannot be disclosed."
[4] Figure withheld to avoid disclosing individual company confidential data.
[5] Preliminary figure.
[6] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime; 1959 total revised.

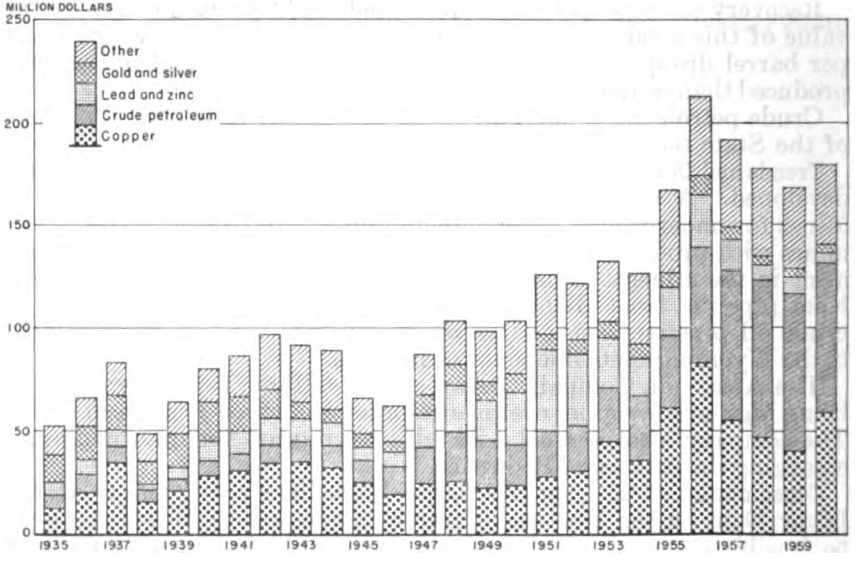

FIGURE 1.—Value of copper, crude petroleum, lead and zinc, gold and silver, and total value of mineral production in Montana, 1935–60.

Sources: Survey of Current Business, Construction Review, Pacific Builder & Engineer, Montana Highway Commission, The Farm Income Situation, Montana Labor Market, and Bureau of Mines.

Total and per-capita personal income received by Montana residents increased in 1960; however, the gain was smaller than the national percentage increase because of declining income from many basic sectors of the State economy, including agriculture, mining, lumber and timber products, and transportation and utilities. Cash receipts from agriculture declined, where as in the Nation this income rose. Operating economies in the petroleum industry and closing of zinc mining owing to uncertain market conditions reduced wage and salary income from mining. Activity in the lumber industry dropped

Digitized by Google

as the result of decreased homebuilding in the Nation. Employment by interstate railroads, an important industry in the State, continued to drop owing to mechanization and curtailed passenger service among other factors.

Construction declined only slightly, judging from the 2-percent decline in employment in this industry; however, the market for cement decreased sharply, probably because some large military and public works projects were completed. Building permit valuation, covering construction in the larger towns and cities, decreased 7 percent compared with a 10-percent decline in the Nation in this category of construction.

The Montana Highway Commission awarded a total of $30.8 million in contracts, 50 percent more than in 1959. The 1960 contracts included work on 38.4 miles of interstate highway, 218 miles of primary road, 232 miles of secondary road, and 10,776 feet of structure.

**Employment and Injuries.**—Average employment in the mining industry declined from 7,800 to 7,300 owing to less employment in petroleum production, metal mine closures, and the effects of the 1959–60 strike. Butte, center of the metal-mining industry in the State, has had a substantial labor surplus since 1957.

**TABLE 3.—Employment for selected mineral industries**

| Year | Total mining | Metal mining | Nonmetals, including coal | Petroleum and natural gas | Processing | |
|---|---|---|---|---|---|---|
| | | | | | Primary metals | Petroleum refining |
| 1951-55 (average) | 11,500 | 8,400 | 1,100 | 2,000 | 3,700 | (1) |
| 1956 | 12,400 | 8,700 | 900 | 2,800 | 4,600 | 1,200 |
| 1957 | 11,300 | 7,500 | 900 | 2,900 | 4,900 | 1,200 |
| 1958 | 8,700 | 5,300 | 700 | 2,700 | 4,200 | 1,000 |
| 1959 | 7,800 | 4,600 | 700 | 2,500 | 3,100 | 900 |
| 1960 | 7,300 | 4,500 | 700 | 2,100 | 3,700 | 1,000 |

| Coal mines | 161 | 155 | 200,036 | | 8 | 40 |
| Total | 4,701 | 249 | 9,376,277 | 3 | 123 | 13 |

[1] Includes cement- and lime-processing plants.
[2] Preliminary figures.

Employment in smelting and refining increased but did not regain all the losses that occurred in 1959 when a strike reduced the annual average.

Injury statistics in table 6 were compiled from reports by mining companies to the Bureau of Mines.

**Government Programs.**—The Office of Minerals Exploration (OME) approved a project at the Northern Milling Co. Marietta lead-zinc mine, Broadwater County. Other active contracts under a program to encourage exploration for strategic mineral occurrences covered work at mines in Jefferson (lead, zinc, copper), Judith Basin (lead, zinc), and Powell Counties (lead, zinc).

| Powell: | | | | | |
| Howard Banks | Hidden Hand group. | do | June 23, 1959 | 13,900 | 50 |

## REVIEW BY MINERAL COMMODITIES

### METALS

**Aluminum.**—Anaconda Aluminum Company, Columbia Falls, produced 12 percent more primary aluminum than in 1959; output was 56,625 short tons according to the annual company report to shareholders. This was the highest production since 1956.

Production facilities were operated at 87.5 percent of capacity the entire year, which left 30 of 240 reduction cells inactive. A new wage contract was negotiated between Anaconda and the Aluminum Workers Trades Council, AFL–CIO, providing an average wage increase of $0.075 an hour; approximately 530 persons were employed at the Columbia Falls plant.

**Chromium.**—The American Chrome Co., a subsidiary of The Goldfield Consolidated Mines Co., continued mining and milling chromite at the Mouat operation (near Columbus) for delivery to the Government under a Federal stockpiling contract. Deliveries during the year totaled 106,716 tons of concentrate, leaving a balance of 82,259 tons to be delivered on a 900,000-ton contract. American Chrome Co. successfully produced ferrochromium from the Mouat ore at the pilot smelter near the company mill at Nye. Over 500 tons of refined ferrochromium was made, and carload lots were marketed to major steel producers.

After demonstrating that commercial-grade ferrochromium could be produced from the low-grade ore, American Chrome Co. proposed to the Government that the company be granted a Federal contract to smelt the 900,000 tons of stockpiled concentrate to ferrochromium.

**Copper.**—The return to production on February 15 of The Anaconda Company copper concentrator, after the prolonged 1959 strike, raised

Digitized by Google

copper output 40 percent to 91,972 tons, compared with 65,911 tons in 1959. The Anaconda Company Butte-area mines supplied over 99 percent of the State total.

A major development for the Butte area was an announcement by Anaconda of an $11 million, 5-year program to tap high-grade copper ore reserves at deep levels. Also, the company announced a $6 million replacement and modernization program at the Anaconda Reduction Works.

Full production at Anaconda underground and pit mines was attained in March following the February reopening. Average output per operating day at the Berkeley pit exceeded the 1959 average by 14 percent. The Kelley block-caving operation yielded a daily average of 11,505 tons of copper ore, and nine new ore blocks were brought into production. High-grade copper veins were mined in the Mountain Con mine, and the Steward mine was rehabilitated after development work disclosed high-grade copper veins at lower levels. The Kelley No. 1 shaft was being deepened to serve as a centralized hoisting shaft for working the deeper levels of the Butte mines.

Work was completed on an enlarged, tailings-disposal system at the Anaconda Reduction Works at Anaconda; also, a 370-foot diameter tailings thickener was constructed that was capable of recovering 12,000 gallons of water a minute for reuse.

**Gold.**—Production reached 45,922 ounces, a 61-percent increase over the 28,551 ounces in 1959. The Anaconda Berkeley pit and Kelley mine (Silver Bow County) and the Mayflower and West Mayflower properties (Madison County) of the Peter Antonioli estate yielded sizable quantities; all showed increased output over 1959 and contributed in large part to the State rise.

**Iron Ore.**—Two companies shipped 55,481 long tons of iron ore, 11 percent more than the 50,081-ton 1959 output. Magnetite from the Iron Cross property (Ralls & Harris Bros.) near Radersburg, Broadwater County, was used in manufacturing cement. The Willow Creek mine (Young-Montana Corp.) near Stanford, Judith Basin County, yielded magnetite for shipment to Cleveland Cliffs Iron Co., Superior, Wis., and to numerous companies in the Pacific Northwest and Canada. Lump ore mined from the Willow Creek property contained an average of 63 percent iron and slightly over 1 percent moisture.

**Lead.**—Output was 4,879 tons, a decline of 36 percent from 1959. This decrease was due to curtailed production of lead-bearing zinc ore by Anaconda. Operations at the Anaconda Reduction Works zinc concentrator were not resumed until April, following the late 1959 smelter strike settlement; the plant was closed again in September following suspension of company lead and zinc mining, further curtailing load output (see zinc). Also contributing to the drop in production was a 7-month strike at the American Smelting and Refining Co. Jack Waite mine.

**Manganese.**—Output from three companies—The Anaconda Company Trout Mining Co., and Taylor-Knapp Co.—exceeded the 21,604-ton (35 percent or more manganese) 1959 shipments by 34 percent, reaching 29,036 tons. Manganiferous (5 to 35 percent manganese) ore production was 676 tons, a 72-percent decrease compared with 1959. The drop was due to the extended closure of a base-metal smelter in Idaho that used the material as an electrolytic-cell cleaner.

**Silver.**—Silver production, 3,606,991 ounces, was up 5 percent from 1959 principally because of increased tonnages of copper ore mined from Anaconda properties. Silver obtained from copper ore more than offset a decline in the quantity of silver recovered from zinc ores, caused by curtailed zinc-ore mining by Anaconda.

**Steel.**—Webb & Knapp, Inc., continued studies to determine the feasibility of constructing an integrated steel plant at Anaconda. The proposed 350,000-ton-annual-capacity plant was to use iron-bearing slag derived from the Anaconda Reduction Works. A contract was signed during the year with the Bonneville Power Administration (BPA) for a total of 150,000 kilowatts of firm and interruptible low-cost Federal power. Shipment of 750 tons of slag was made to Strategic-Udy Metallurgical Chemical Process, Ltd., at Niagara Falls, Ontario, Canada, for large-scale testing in a prototype of the plant to be erected at Anaconda.

**Tungsten.**—Minerals Engineering Co. mined scheelite from the Calvert mine (Red Button group) near Wise River, Beaverhead County; the ore was trucked to a company mill at Glen for concentrating before shipment to an eastern consumer and to a processing plant at Salt Lake City, Utah. Mining and milling continued throughout the year except for a 1-month closure during the fall when facilities for a new upgrading process were installed at the mill. A company research program led to the new process that began successful operation in December and resulted in cost reductions. Through improved mining and stripping the Calvert mine yielded ore running 1.13 percent tungsten trioxide.

**Uranium.**—Ore shipments totaled 1,726 tons from six mines in Carbon County. Four operations delivered uranium ore to a reduction plant at Riverton, Wyo. Although total tonnage and value declined, average ore grade (percent of contained uranium oxide) increased over 1959.

**Zinc.**—Curtailed production of zinc ore by The Anaconda Company caused a 55-percent decline from the strike-reduced output of 27,848 tons in 1959. Anaconda's Alice pit (Silver Bow County) and East Helena slag fuming operation (Lewis and Clark County) produced most of the 12,551 tons. Mining at the company Anselmo zinc mine was not resumed following settlement in February of a 6-month labor strike and accessible ore recoverable by pit operations at the Alice mine was depleted and operations terminated in July. Also, the Elm Orlu-Black Rock low-grade zinc project was suspended because of market considerations. The termination of zinc mining by Anaconda brought about closure of the company electrolytic zinc operation at Anaconda; the Great Falls electrolytic zinc plant was to treat all zinc concentrate (purchased and toll) received by the company.

Digitized by Google

## NONMETALS

**Barite.**—The quantity of barite sold or used by producers declined to about half of the 1959 total. Baroid Sales Division, National Lead Co., the only producer, mined and ground barite near Greenough, Missoula County. Output was used primarily as a weighting agent in oil-well-drilling mud.

The Montana Bureau of Mines and Geology announced discovery of barite mineralization on the west flank of Tobacco River Valley, 5 miles southwest of Eureka, Lincoln County. This discovery was incidental to a survey of mineral resources in northwestern Montana sponsored jointly by the State, the Great Northern Railway, and Pacific Power & Light Co.

**Cement.**—The quantity and value of cement shipments declined 24 and 22 percent, respectively, compared with 1959. The Trident plant (Gallatin County) of Ideal Cement Co., Montana Division, continued to be the only cement producer. Limestone and sandstone for use in the process were mined locally by the company. Destinations within the State accounted for 87 percent of the cement sold; shipments also were made to Wyoming, North Dakota, and Idaho.

**Clays.**—There was a substantial increase in production of miscellaneous clay and fire clay, but no bentonite was mined. Miscellaneous clay for making heavy clay products was dug in Fergus and Yellowstone Counties. Two companies—Treasurelite Division, Treasure State Industrial Products, Inc. (Cascade County), and Montana Lite-weight Aggregate Co. (Yellowstone County)—produced and expanded shale for use as lightweight aggregate. Fire clay was mined near Armington, Cascade County.

The Montana Bureau of Mines and Geology published a report of clay and shale resources in the State.[3]

**Fluorspar.**—Shipments of fluorspar by Cummings-Roberts, Darby, Ravalli County, increased to 31,300 tons from 18,500 tons in 1959. Crude fluorspar mined at the Crystal Mountain open pit was trucked to the Darby plant for processing. The steel industry continued to be the major consumer.

**Gypsum.**—The quantity and value of crude gypsum mined decreased 7 and 13 percent, respectively, compared with 1959. Two mines in Fergus County furnished the output. Most of the production was calcined and sold as ground gypsum, wallboard, and lath. Uncalcined gypsum was used as a retarder in portland cement.

**Lime.**—Quantity and value of lime output increased 37 and 41 percent, respectively, compared with 1959, approaching the tonnage and exceeding the value established as a high in 1958. Quicklime produced in Deer Lodge County was used locally at an ore concentrator and metallurgical works. Limestone also was calcined in Powell County.

**Mica.**—Three operations contributed to a fourfold increase in the quantity of mica shipped to the Government purchase depot at Custer, S. Dak. The bulk of the output came from the Thumper No. 1 mine

[3] Sahinen, U. M., Smith, R. I., and Lawson, D. C., Progress Report on Clays of Montana: Montana Bureau of Mines and Geol. Bull. 13, 1960, 83 pp.

Digitized by Google

(Planet Exploration Co.) near Gallatin Gateway, Gallatin County. Small quantities were recovered in Beaverhead and Madison Counties.

**Phosphate Rock.**—Output of marketable phosphate rock increased 7 percent above 1959 and reached a new high for both quantity and value. Mines in Beaverhead, Powell, and Silver Bow Counties furnished the output, part of which was exported to British Columbia. Phosphate rock was processed to elemental phosphorus, phosphoric acid, and phosphate fertilizers.

According to The Anaconda Company report to shareholders, its phosphate fertilizer plant at Anaconda was sold to J. R. Simplot Co., Pocatello, Idaho, and the Conda (Idaho) phosphate rock deposits were leased to the purchasing company. Sulfuric acid from the Anaconda plants was to be sold to the Simplot company. Until completion of dismantling and moving of the plant, Anaconda was to produce ammonium phosphate fertilizers for Simplot.

Phosphate rock from Conda, Idaho, was processed by Rocky Mountain Phosphates, Inc., using facilities at the old Domestic Manganese & Development Co. plant at Butte. A defluorinated phosphate product for use as an animal food supplement was made.

The Bunker Hill Co. continued work at the Jack Pine phosphate-rock prospect near Elliston. Development consisted of driving two tunnels and roadbuilding.

Encouraged by adaptation of the Bureau of Mines mechanical planer[4] to phosphate mining, Montana Phosphate Products Co. started work at a mine near Maxville designed specifically for use of the planer. Mining was scheduled to begin in 1961 on beds 5–7 feet thick that dip 30–60 degrees.

**Sand and Gravel.**—Output of sand and gravel increased to 12.6 million tons from 10.9 million tons in 1959, but the value decreased to $11.7 million from $12.6 million. A large increase in the quantity of sand and gravel used by the State highway department more than offset a sizable drop in requirements at U.S. Army Corps of Engineers projects. Distribution by use was as follows: Road material, 90 percent; building, 7 percent; railroad ballast and miscellaneous, 3 percent. These figures are identical to those for 1958 but differ from the 1959 percentages of 79, 15, and 6, respectively.

**Stone.**—Quantity and value of stone produced were 1.2 million tons and $1.6 million, respectively, a slight decrease from 1959. A drop in commercial output was almost offset by a gain in production for use by Federal, State, county, and municipal agencies. Greater quantities of limestone, granite, and sandstone were quarried, whereas basalt production dropped 23 percent. Building and decorative stone was produced at a quarry in Park County.

**Sulfur.**—Production and shipments of high-purity elemental sulfur by Montana Sulphur & Chemical Co., Yellowstone County, were less than in 1959. Two oil refineries in the area furnished hydrogen sulfide for processing.

[1] Included with "Other" to avoid disclosing individual company confidential data.
[2] Sand and gravel used for miscellaneous and unspecified purposes, including items indicated by footnote 1.
[3] Owing to rounding, individual items may not add to totals shown.

**Talc.**—Tonnage and value of talc mined were 5 and 10 percent lower, respectively, than in the record year 1959. Three companies produced from eight mines—two in Beaverhead County and six in Madison County. Part of the talc produced was ground at Barratts, Beaverhead County, and East Helena, Lewis and Clark County. Talc was shipped to grinders in Grand Island, Nebr., Los Angeles, Calif., and Ogden, Utah. Most of the ground product was used for making paint. There was a significant change in the use pattern of ground talc (1959 percentages are in parentheses): Paint, 68 percent (57 percent); ceramics, 22 percent (20 percent); and miscellaneous including paper, cosmetics, insecticides, rice polishing, and textiles, 10 percent (23 percent).

**Vermiculite.**—Output of crude vermiculite was 8 percent lower than in 1959. The Libby, Lincoln County, open-pit mine of Zonolite Co. continued to be the main source of vermiculite in the United States. Most of the production was shipped out of State for exfoliating; a small quantity was expanded by a company in Great Falls, Cascade County. Vermiculite traditionally used in the building industry for insulating and fireproofing, was, according to the company, beginning to be used in many lawn, garden, and agricultural products, and as a distribution agent in animal feeds.

## MINERAL FUELS

**Coal.**—A 32,000-ton decline in output of bituminous coal and lignite brought the 1960 production down to 313,000 tons. Nineteen mines in nine counties contributed to the total tonnage. Musselshell County

Digitized by Google

mines furnished most of the bituminous coal, and Richland County was the major source of lignite. The steam-electric generating plant of Montana-Dakota Utilities Co. at Sidney was the leading lignite consumer.

**Petroleum and Natural Gas.**[5]—Recovery of petroleum set another record; output was 30.2 million barrels ($72.9 million) compared with 29.9 million barrels ($76.4 million) in 1959. The lower valuation was due to a $0.15-a-barrel decrease in the average price. Petroleum again was the leading commodity in value of output and represented 41 percent of the State value of mineral production. Forty-two percent of the State total came from the Pine, Cabin Creek, and Poplar-East fields; each field had output exceeding 3 million barrels. Other fields producing more than 1 million barrels included Elk Basin, Sumatra, Cut Bank, and Stensvad. Five oilfields, in Musselshell, Roosevelt, Rosebud, Sheridan, and Stillwater Counties and three gasfields, in Custer, Stillwater, and Toole Counties, were discovered compared with two and three fields, respectively, in 1959.

During the year, 343 wells (176 development and 167 exploratory) were drilled; total footage drilled was 1.7 million feet, and the average depth was 6,811 feet. Of the wells drilled, 128 yielded oil, 7 issued gas, and 208 were dry. The average daily output of the 3,707 producing wells in the State was 22.3 barrels.

Crude oil production from fields in central Montana had more than doubled in 2 years, mainly because of increasing recovery from the Stensvad field (brought into production in 1958) and continued expansion of the Sumatra and Ivanhoe fields. Montana ranked 12th in the Nation as a liquid petroleum source and 14th in proved reserves.

Ten refineries processed 24.9 million barrels of crude oil; Montana wells furnished 42 percent of the total and Wyoming wells supplied almost 58 percent. Canadian wells contributed less than 0.1 percent

Gross withdrawals of natural gas (marketed production plus quantities used in repressuring, as well as that vented and wasted) totaled 34.7 billion cubic feet, compared with 31.7 billion cubic feet in 1959. Cut Bank-Reagan in Glacier and Toole Counties continued to be the leading natural-gas-producing field (11.2 billion cubic feet). Other fields producing more than 1 billion cubic feet were Bowdoin, Cedar Creek, Bowes, Cabin Creek, Dry Creek, Keith Block, Kevin Sunburst, Pine, and Whitlash.

One of the most significant wildcat wells drilled in Montana in recent years was brought in by T. E. Murphy Corp. (Murphy, Sletvold No. 1), 13 miles northeast of Wolf Point, Roosevelt County. The test flow was 476 barrels a day through a 7/32-inch choke. The well was the westernmost in the Williston Basin yielding crude oil from a Devonian horizon. Another wildcat well (Sinclair, Kesterson No. 1) drilled by Sinclair Oil & Gas Co., 10 miles southeast of the main part of the Sumatra field in Rosebud County, showed promise of a new producing area. This was the first drilling activity in this vicinity.

Construction of a 190-mile pipeline from Glendive, Mont., to Minot, N. Dak., was begun by Farmers Union Central Exchange of South St. Paul, Minn. This was to be an extension of the line the company had from Laurel to Glendive. Announcement was made of a proposed crude-oil pipeline to be completed by mid-1961 from fields near Cut Bank to the Wyoming border south of Billings. The pipeline would connect at the southern end with other lines to transport crude oil to Midwestern markets.

A report concerned with oil and gas in Montana was published during the year.[6]

## REVIEW BY COUNTIES

**Beaverhead.**—The Argenta mining district had nine operating base- and precious-metal mines, of which the Maulden was the principal producer, yielding 2,474 tons of lead ore. High-grade gold ore was mined from the Yellowband property.

Lively Mining Co. produced 1,890 tons of silver ore from the Hecla mine near Melrose in the *Bryant* district. Lead-zinc slag from the old Glendale Smelter dump was shipped to the East Helena smelter; 3,673 tons of old slag yielded nearly $80,000 in recoverable metals.

A total of 15 gold, silver, copper, lead, and zinc mines operated in the county compared with 13 in 1959; the Maulden, Hecla, Glendale Smelter dump, and the Jack mine were the only producing properties that had operated in 1959. The 11 new producers were the Amaranth, Coolidge, Cross, Eightball, Magnolia, Park, Yellowband, Comet, Sweeney, White Cap, and Clara properties.

Spokane National Mines, Inc., was developing the New Departure silver mine 16 miles west of Dillon; and old cyanide mill was rehabilitated to treat ores by flotation as well as cyanidation.

There were no developments at the Carter Creek iron deposit after its purchase by North American Utilities Corp. in 1959.

Sawyer Petroleum Co. assigned its Horse Prairie thorium property west of Armstead to Techmanix Corp., Salt Lake City, Utah. No activity was reported at the property. Techmanix processed 200 pounds of concentrate in a Salt Lake City pilot plant to produce a test lot of thorium hydrate, assaying higher than 90 percent.

Minerals Engineering Co. mined tungsten ore from the Calvert mine near Wise River. Ore was trucked to a mill near Glen; concentrate was shipped from the mill directly to purchasers or to a Salt Lake City, Utah, processing plant for upgrading. The company annual shareholders report stated the following concerning the mill:

> With respect to our research programs, important results were obtained during the past year. The new ore upgrading process developed for use in our Montana operations has been in successful operation since December and has been achieving a substantial reduction in cost that will be reflected in future earnings.

The company also reported that the mine was developed further by improved mining and stripping and was yielding ore running 1.13 percent tungsten trioxide.

| Ravalli | (2) | (2) | Fluorspar, sand and gravel, lead, silver, zinc, gold. |
| Richland | (2) | (2) | Coal, petroleum. |
| Rosebud | 7,059 | 9,092 | Petroleum, coal. |
| Sanders | (2) | (2) | Lead, zinc, stone, silver, sand and gravel, copper, gold. |
| Sheridan | 1,512 | 1,622 | Petroleum, coal. |
| Silver Bow | 51,719 | 66,353 | Copper, silver, manganese, zinc, phosphate rock, gold, lead, sand and gravel. |
| Stillwater | (2) | (2) | Chromium, stone, petroleum, gold, silver. |
| Sweet Grass | | (2) | Sand and gravel. |
| Treasure | (2) | 46 | Do. |
| Valley | 1,726 | 495 | Do. |
| Yellowstone | 1,877 | 1,685 | Petroleum, sand and gravel, clays. |
| Undistributed[4] | 32,059 | 30,223 | |
| Total[5] | [6] 167,328 | 178,854 | |

[1] Chouteau, Powder River, and Wheatland Counties did not report production.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Daniels and Roosevelt; Dawson and McCone; Fallon, Prairie, and Wibaux; Garfield and Petroleum; and Glacier, Pondera, Teton, and Toole Counties have been combined because of joint oilfield production.
[4] Includes value of gem stones, natural gas, natural gas liquids, petroleum, and some sand and gravel that cannot be assigned to specific counties and values indicated by footnote 2.
[5] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.
[6] Revised figure.

Phosphate rock produced at the Canyon Creek and Quartz Hill mines of Victor Chemical Works was shipped to the company elemental phosphorus plant at Silver Bow. Talc from the Tri-State Minerals Co. Smith-Dillon and Crown mines was ground at the Barratts mill. A small quantity of mica was produced at the Sparkle mine, 11 miles southeast of Dillon.

Digitized by Google

**Big Horn.**—Crude oil recovered from three fields was about 7,000 barrels less than in 1959. Natural gas withdrawals increased slightly.

**Blaine.**—Production of crude oil from the Bowes field was 250,000 barrels, compared with 323,000 barrels in 1959. Natural gas output from the same field increased to 1.4 billion cubic feet, 535 million cubic feet more than in 1959. One bituminous coal mine was active.

**Broadwater.**—Ralls & Harris Bros. shipped 19,313 long tons of iron ore (magnetite) from the Iron Cross mine near Radersburg; the ore went entirely into cement production.

The Marietta mine of Northern Milling Co. in the *Park (Indian Creek)* district yielded a sizable quantity of gold ore. Other gold properties operated were the Big Buck, *Beaver* district, and the Keating and Ohio Keating, both in *Cedar Plains* district. Small tonnages of lead and zinc ores were produced at the January and East Pacific, *Beaver* district, Silver Queen, Skyline, and Valley View mines, all in *Park* district.

A small quantity of stream gravel was worked at the Diamond Hill placer in the *Park* mining district.

**Carbon.**—Uranium ore was mined at the Bob No. 6, Dandy, Marie No. 2, and Perc No. 14 by The Hidden Splendor Mining Co., the principal producer. The Dandy and Perc No. 14 also were worked by Joe Highsmith. Pryor Mining Co. operated the Old Glory, and J. J. Stoick mined the Swamp Frog.

Decreases in the output of petroleum, natural gas, and coal compared with 1959 mainly were responsible for a drop of $3.7 million in the value of fuels and nonmetals. The Elk Basin field (ranking fourth in the State) yielded 2.7 million barrels of crude oil, 1.3 million barrels less than in 1959. A new field, Mackay Dome, on the Carbon-Stillwater County boundary had initial production of 2,600 barrels. Natural gas recoveries from the four fields in the county were 41 million cubic feet below 1959. There was an increase in the tonnage of limestone quarried at Warren by The Bighorn Limestone Co. Two bituminous coal mines were active.

**Carter.**—Output of crude oil from the Repeat field rose from 30,000 barrels in 1959 to 39,000 barrels.

**Cascade.**—Modernization of The Anaconda Co. Great Falls electrolytic copper refinery continued, and all Anaconda electrolytic zinc refining was diverted to the Great Falls plants.

Cascade county regained first position as a source of sand and gravel even though production was slightly less than in 1959. There was a fourfold increase in the quantity of fire clay mined at the Armington pit for use at the Anaconda Reduction Works in Deer Lodge County. Robinson Insulation Co. expanded vermiculite for use as loose fill insulation, lightweight aggregate, and for soil conditioning. One mine produced bituminous coal.

**Daniels and Roosevelt.**—These counties were considered as a unit because the Bredette-North oilfield extends over the Roosevelt County line into Daniels County. Combined crude oil output was 3.3 million barrels, compared with 3.9 million barrels in 1959. Most of the production came from the Poplar-East field in Roosevelt County (ranking third in the State). Recovery from the Bredette-North field dropped from 87,000 barrels in 1959 to 29,000 barrels. In Daniels County the

Digitized by Google

Line Coulee field yielded 438 barrels, compared with 12,000 barrels in 1959. Initial production from Tule Creek, a new field, totaled 31,000 barrels.

**Dawson and McCone.**—Crude oil production from the two-county area (combined because the Richey field underlies parts of both counties) was slightly higher than in 1959. The Glendive field in Dawson County was the leading producer in the combined area. Recovery from the Richey-Southwest field in McCone County was 79,000 barrels (49,000 in 1959).

**Deer Lodge.**—Fluosolids reactor installation continued at the Anaconda Reduction Works and was to be completed late in 1961; the reactors were to be used in roasting copper concentrate. Also, a new conveyor system to move copper calcines from the roasters to the reverberatory furnaces was being installed. A remote-control unit for the conveyor belt and a distribution system between the ore crushing plant and the concentrator bins were installed. A new tailing thickener was put in operation, and an enlarged tailing disposal system neared completion.

Electrolytic zinc operations at the Anaconda Reduction Works were terminated at yearend. Future zinc concentrate intake was to be handled at the Great Falls electrolytic zinc plant.

The Anaconda Company annual shareholders report showed manganese nodule production of 7,369 tons and ferromanganese output of 11,017 tons. Cadmium recovered from zinc ores was 620 tons.

Gold and silver ores were mined at the Cameron, Gold Coin, Silver Chain, and Champion properties.

Quicklime made from limestone mined by Anaconda at Brown's quarry was used at company ore-processing and metallurgical operations. The company did not roast pyrite to make sulfuric acid as it had done for many years; gases from fluosolid reactors (roasting copper ores) were used instead. Anaconda operated its phosphate fertilizer plant for J. R. Simplot Co., Pocatello, Idaho, to whom it had been sold. Plans called for dismantling and shipping the plant to Pocatello, Idaho. Refractories were made from clay mined in Cascade County.

**Fallon, Prairie, and Wibaux.**—This area, considered as a unit for reporting petroleum production, continued as the major source in the State. Output of 11.5 million barrels ($27.9 million) was over 1 million barrels higher than that of 1959. The Pine field (5.1 million barrels), underlying the three counties, and the Cabin Creek field (4.5 million barrels), Fallon County, were the first and second ranking oilfields in the State.

Natural gas withdrawals totaled 6.9 billion cubic feet. Cedar Creek field in Fallon County dropped to third place from second as a source of natural gas. Output from the field was 4.6 billion cubic feet, compared with 5.1 billion cubic feet in 1959. Production from Pine field was 1 billion cubic feet (933 million in 1959); and withdrawals from Cabin Creek field in Fallon County totaled 1.1 billion cubic feet (971 million in 1959).

**Fergus.**—Gypsum was mined near Heath by United States Gypsum Co. and near Hanover by Ideal Cement Co. Lewistown Brick & Tile

Digitized by Google

Co. manufactured building brick and tile and other heavy clay products from clay mined at nearby pits.

Flathead.—Kaiser Aluminum & Chemical Corp. delivered the first alumina to Anaconda Aluminum Co., Columbia Falls, under a previously negotiated contract.

The Flathead mine in the *Hog Heaven* district, operated by Waino Lindbom, yielded silver ore.

Gallatin.—Gallatin County was the leading source of nonmetals in the State, and the Trident plant of Ideal Cement Co., Montana Division, was the principal mineral industry in the county. Limestone output from the Trident quarry (Ideal Cement Co.) led the State in stone production. Most of the mica mined in Montana came from a deposit near Gallatin Gateway.

Garfield and Petroleum.—Output of petroleum from the Cat Creek field (underlying parts of both counties) increased to 181,000 barrels—30,000 barrels more than in 1959.

Glacier, Pondera, Teton, and Toole.—This four-county area, considered as a unit for reporting petroleum production, was the second most important source of crude oil in the State. Total output was 4 million barrels compared with 3.9 million in 1959. Cut Bank, the principal gas-producing field (including Reagan) and an important crude oil source, underlies parts of Glacier, Pondera, and Toole Counties. The Pondera field (underlying Pondera and Teton Counties) had production totaling 505,000 barrels (521,000 in 1959). In order of crude oil output, the principal fields were Cut Bank (2.1 million barrels), Kevin-Sunburst (744,000 barrels), and Pondera.

Natural gas withdrawals totaled 12.5 billion cubic feet (11.3 billion cubic feet in 1959); Cut Bank-Reagan yielded 11.2 billion cubic feet and Kevin-Sunburst furnished most of the remainder.

Granite.—Battery-grade manganese ore was mined by Taylor-Knapp Co. and The Trout Mining Co. in the Philipsburg area. Trout Company produced and shipped a lesser quantity of under 35-percent metallurgical-grade ore to The Bunker Hill Co. for use as a cell cleaner at the Kellogg, Idaho electrolytic zinc plant.

Over 34,000 tons of zinc ore was mined from the Trout Mining Co. Algonquin property, *Flint Creek* district. Silver came from the Comanche Extension, Cudgie-Taylor, Harper, and Little Emma mines in the same district. Gold ore was mined at the Copper Queen, *Boulder* district, Bluebell, *Dunkelburg* district, and Mickey, *Red Lion* district properties. The Black Pine, *Henderson* district, and Sally Ellen, *South Boulder* district, both yielded silver ore.

Two small-scale hand placer mines were active—one each in the *Alps (Bonita)*, and *Garnet* districts.

Jefferson.—Eighteen gold, silver, and base-metal mines were active, yielding nearly 13,000 tons of ore having a recoverable metals value of $184,759. Principal producer was the Alta-Custer, *Colorado* district, operated by Lahey-Leasing Co. The Crystal (M & H Mining Co.) and the Silver Crescent (Montana Gold & Silver Co.) both in the *Cataract* district, yielded moderate tonnages of gold-silver ore. Other producing properties were the Big Jim (lead-zinc) and Hie Ore (gold-silver). *Amazon* district; Bonanza Jack (gold-silver), Hiawatha (silver), Mount Thompson (silver), Obelisk (silver), and Silver Hill

Digitized by Google

(gold-silver), *Cataract* district; Loeber (gold), Nellie Grant (lead-zinc), and The Finder (gold), *Clancy* district; Uranium (lead), *Colorado* district; Klondyke (gold), *Elkhorn* district; Montana (silver), *Homestake* district; Yama (silver), *McClellan* district; and Silver Queen (silver), *Whitehall* district.

Stream gravel was worked at three small-scale hand placer operations—one in the *Cataract* district and two in the *Clancy* district.

Mines and mineral deposits of the county were the subject of a report.[7]

**Judith Basin.**—In the *Barker* district, the Block P group (lead-zinc) was worked by the Hughesville Lumber & Mining Co., Inc., and lead ore was mined at the Tiger property.

The Willow Creek iron deposit was mined by Young-Montana Corp. Ore was shipped to Cleveland Cliffs Iron Co., Superior, Wis.; The Anaconda Company, Anaconda, Mont.; Kaiser Engineering Co., Hanford, Wash.; Prairie Pipe Manufacturing Co., Ltd., Regina, Saskatchewan; Premier Steel Co., Edmonton, Alberta; Bethlehem Steel Co., Seattle, Wash.; and Oregon Steel Mills, Portland, Oreg.

**Lewis and Clark.**—Old tailings and slag represented the bulk of the material treated at 16 metal operations. Zinc slag from current and past production of the American Smelting and Refining Co. East Helena smelter was fumed at an adjacent plant of The Anaconda Company. Silver-bearing tailing from the Peck mill, *Helena* district was shipped by Louis Peura. Other producing metal mines were the Pearl (lead-zinc), *Blue Cloud* district; Nick & Dick (lead), *Canyon Ferry* district; Stemple Gold (gold), *Gould-Stemple* district; Mike Horse (lead), *Heddleston* district; assay office cleanup (lead), Franklin dump (gold), and Hopeful (gold), *Helena* district; Humdinger (gold), *Madison Gulch* district; Copper Hill (silver), *Marysville* district; Howard (gold-silver), Monte Christo (silver), Transit (lead-zinc), and Woodrow Wilson (gold), *Rimini* district; and the Rosetta (copper), *Wolf Creek* district.

**Liberty.**—Output of crude oil declined to 39,000 barrels, 16,000 less than in 1959. Natural gas withdrawals also were less—3.7 billion cubic feet compared with 3.9 billion cubic feet in 1959. Keith Block and Whitlash fields, each yielding over 1 billion cubic feet, were the principal natural gas sources.

**Lincoln.**—St. Paul Lead Co. mined lead-zinc ore from the St. Paul and Snowshoe properties in the *Libby* district. Several tons of gold ore was produced from the Gloria mine in the *Troy* district

Vermiculite mining near Libby by Zonolite Co. was the major nonmetal mining activity. A small quantity of sand and gravel also was produced.

**Madison.**—Gold ore was mined at the Mayflower and West Mayflower properties, *Renova* district and gold-silver ore was mined at the Dictator and Bell Union mines, *Sheridan* district. The Easton Pacific, *Virginia City* district also yielded considerable gold-silver ore. Fifteen other operating metal mines were the Strawberry (gold), Mammoth (gold), Colorado (gold), Concentrator (gold),

[7] Roby, R. N., Ackerman, W. C., Fulkerson, F. B., and Crowley, F. A., Mines and Mineral Deposits (Except Fuels), Jefferson County, Montana: Montana Bureau of Mines and Geol. Bull. 16, 1960, 122 pp.

Digitized by Google

Golconda (gold), Shoemaker gold, Barry Bench (lead), Hunt gold, Cherry copper, Bluebird gold, Little Goldie (gold), Mollie copper, Lost Lode gold-silver, Mountain Chief (gold), and Paige gold.

Talc mining continued to be the principal nonmetal mineral industry activity in the county. Three companies operated six mines—Sierra Talc Co. (Yellowstone, Tri-State Minerals Co. (Regal and Treasure State, and American Clayes Corp. (Ruby, Sweetwater, and Madison). American Clayes had a screening plant at Alder. Mica from the Merlin mine, 12 miles south of Ennis, was sold to the Government purchase depot at Custer, S. Dak.

**Meagher.**—Hoon, Inc., operated the Black Hawk (silver) and Cumberland (lead) mines, and Hamilton Mines, Inc., mined lead-zinc ore from the Yellowstone property—all three properties were in the *Castle Mountain* district. The Copper Duke mine, *Musselshell* district, yielded copper ore.

Some placer mining was done at the *Beaver* district Little Buck placer.

**Mineral.**—The Nancy Lee mine in the *Keystone* district yielded a large tonnage of lead ore. Small tonnages of ore were produced at The Silverstreak (gold, Prosperity (silver), and Mineral King (silver) properties.

**Missoula.**—Gold ore was mined from the Pioneer, *Clinton* district, and Nine Mile, *Nine Mile* district mines.

As in past years, barite mining by Baroid Sales Division, National Lead Co. was the principal mineral industry in the county. Some sand and gravel and stone also were produced.

**Musselshell.**—Petroleum and bituminous coal were the principal commodities. Eight oilfields yielded 1.1 million barrels of crude oil, 375,000 barrels more than in 1959. There was one new field (Keg Coulee), and one field (Devils Basin) that did not produce compared with the preceding year.

The county continued to supply most of the bituminous coal mined in the State. Production from eight mines was 93,000 tons; 1959 output was 128,000 tons. The Roundup Mining Co. Roundup No. 3 mine was the principal producer.

**Park.**—The Nebraska No. 1 and No. 2 placer claims in the *Sheepeater* district yielded a small quantity of gold.

**Phillips.**—Little Rockies Mining & Development Co. produced a small tonnage of gold-silver ore from the Little Ben mine in the *Little Rockies* district. The Blue Rock and Lucky Maud placers in the same district, also were active.

**Powell.**—Five metal mines were active—the Royal (gold), Bonanza (gold), Black Cloud (copper), Golden Anchor (lead-zinc), and Arnold (copper) properties. The Golden Anchor, operated by Golden Anchor Mining & Milling Co., Inc., was the leading operation.

Bench gravel was mined by hydraulic methods to yield gold at the Ophir property in the *Ophir* district.

Powell County continued to be the chief source of phosphate rock in the State because of increased output by both Montana Phosphate Products Co. and George Relyea. Most of the production was exported to Trail, British Columbia, Canada, for use in manufacturing phosphate fertilizers by The Consolidated Mining & Smelting Com-

Digitized by Google

pany of Canada, Ltd. Limestone was calcined by Elliston Lime Co.; both quicklime and hydrated lime were marketed.

**Ravalli.**—The Curlew Mining & Exploration Co. Curlew mine, *Curlew* district, yielded a small tonnage of lead-zinc ore.

Fluorspar mining by Cummings-Roberts at the Crystal Mountain open pit continued to be the principal mineral industry in the county. Output was trucked to a mill at Darby.

**Richland.**—Output of lignite by Knife River Coal Mining Co. at Sidney increased. Crude oil recovery from the Brorson field reached 44,000 barrels, 8,000 barrels higher than in 1959.

**Rosebud.**—An increase of $2 million in the value of petroleum produced made the county second in the State as a crude oil source. The leading fields—Sumatra and Stensvad—produced 2.1 and 1.9 million barrels, respectively; both increased over 1959. Hibbard, a new field, produced 47,000 barrels. Bituminous coal output reached a new low.

**Sanders.**—The principal metal producing mine was the Jack Waite in the *Eagle* district, worked under a long-term lease by American Smelting and Refining Co.; however, production was curtailed by a 7-month strike. Two other metal mines—Montana Standard, *Prospect Creek* district (lead-zinc) and Raven *Thompson River* district (copper)—were small producers.

**Sheridan.**—Crude oil recovery reached 707,000 barrels, compared with 687,000 barrels in 1959. The first production from Dwyer, a new field, was 92,000 barrels. A small quantity of lignite was mined.

**Silver Bow.**—As in previous years, mines of The Anaconda Company led in quantity and value of gold, silver, copper, lead, and zinc produced in the State. Ore treated or sold rose from 8.7 million tons in 1959 to 12.2 million tons; however, the number of operating properties declined from 15 to 11. Value increased from $50.2 million to $64 million. Copper ore supplied 11.9 million tons of the total compared with 8.1 million tons for the preceding year. Zinc ore production dropped from nearly 600,000 tons in 1959 to less than 200,000 tons. Copper ores yielded 175 million pounds of recoverable copper, and zinc ores yielded 9.5 million pounds of recoverable zinc.

There was no mine production of manganese ore; The Anaconda Company shipped manganese nodules (56 percent manganese), produced from previously mined ore, to the company ferromanganese plant and to other consumers.

*Summit Valley* (*Butte*) *District.*—All metal produced in Silver Bow County came from this district. Leading producers were two Anaconda company copper mines—the Berkeley open pit and Kelley block-caving operation. The Anaconda Butte Hill vein mines (Mountain Con and Steward) ranked third in copper output. Over 8 million pounds of copper was recovered from mine water through precipitating operations of The Anaconda Company.

Silver ore was mined by Anaconda at the Alice mine, and old tailings from the Champion mine yielded silver ore for treatment at the company smelter.

Zinc mining was terminated by The Anaconda Company during the year; the only zinc property mined by the company was the Alice pit, from which approximately 170,000 tons of ore was taken.

**TABLE 15.—Mine production of gold, silver, copper, lead, and zinc in Silver Bow County, in terms of recoverable metals**

| Year | Mines producing | Material sold or treated (thousand short tons) | Gold, lode and placer (troy ounces) | Silver, lode and placer (thousand troy ounces) |
|---|---|---|---|---|
| 1951-55 (average) | 20 | 5,271 | 18,426 | 5,600 |
| 1956 | 21 | 9,395 | 31,132 | 6,772 |
| 1957 | 19 | 10,673 | 27,312 | 5,069 |
| 1958 | 22 | 10,745 | 17,374 | 3,308 |
| 1959 | 16 | 8,679 | 18,615 | 3,204 |
| 1960 | 11 | 12,169 | 21,819 | 2,918 |
| 1882-1960 | | (1) | 2,312,000 | 618,168 |

| Year | Copper (short tons) | Lead (short tons) | Zinc (short tons) | Total value (thousands) |
|---|---|---|---|---|
| 1951-55 (average) | 67,315 | 15,081 | 69,551 | $69,521 |
| 1956 | 96,292 | 14,989 | 63,375 | 111,138 |
| 1957 | 91,393 | 9,617 | 43,169 | 73,328 |
| 1958 | 90,557 | 5,492 | 26,580 | 57,942 |
| 1959 | 65,810 | 4,456 | 22,459 | 50,149 |
| 1960 | 91,754 | 1,889 | 4,755 | 63,980 |
| 1882-1960 | 7,541,000 | 398,000 | 2,284,000 | 3,490,175 |

[1] Data not available.

## The Anaconda Company annual report to shareholders stated that:

Underground and pit mining operations in Butte, Montana, were resumed on February 15, following settlement of the prolonged strike which started in these and other Western Operations on August 19, 1959. Full production from the mines was attained in March 1960.

Production of copper at the Berkeley pit in Butte averaged 32,610 tons per operating day, compared with an average of 28,500 tons per operating day in 1959. The average stripping ratio during this period was 2.40 tons of waste for each ton of ore mined.

A new and revolutionary type of electric truck is undergoing tests at the Berkeley pit, and results to date are encouraging. This vehicle, designed to haul approximately 70 tons per load, travels out of the pit on a 15 percent grade at a speed of from twelve to fifteen miles per hour. The development of a truck of this type will be a major improvement in cost and efficiency of hauling ore and waste from this and other open pits to the company as they increase in depth and length of haul.

The Kelley block-caving operation produced a daily average of 11,505 tons of copper ore. Nine new ore blocks were brought into production during the year, and the 1600 level was being prepared for production by the installation of track and other facilities.

High grade copper ore was produced from veins in the Mountain Con mine. The Steward vein mine was rehabilitated, and preparations are in progress to put it on an operating basis. Recent development work on lower levels of this mine has disclosed new high grade copper ore.

To improve production efficiency and to prepare for working the deeper levels of the Butte mines, several new projects were started during the past year. The principal project is the deepening of the Kelley No. 1 shaft for centralized hoisting. The sinking of the Mountain Con shaft was resumed to develop the high-grade ores which occur below present working levels. An internal subshaft is being sunk from the 4000 level of the Steward mine. This subshaft, the deepened Mountain Con shaft, and other subshafts will later become tributaries to a common 4400-foot level for transfer of ore to the Kelley No. 1 shaft.

The Tuolomne shaft is being rehabilitated and deepened and will be equipped for use as a new central pumping facility for the Butte mines. When completed, it will replace the central pumping plant now located at the High Ore shaft.

Two new fully automatic, rotary air compressors are being installed at the Cora compressor plant to replace the obsolete Leonard plant facilities.

Digitized by Google

The Anselmo zinc mine and the Emma manganese mine were not reopened after the strike.

Mining of zinc ore accessible through pit operations was completed at the Alice pit, and the operation terminated on July 29.

Work on the Elm Orlu-Black Rock low-grade zinc project was suspended, pending improvement in metal prices.

The company reported that the Butte, Anaconda & Pacific Railway Co. handled a record total of 12,709,515 tons of ore during the year.

Mines operating in the district not owned by Anaconda were the Mat lease (zinc), Mono Receiver No. 2 (silver), Northern Pacific (silver), Poser (silver), and Tuxedo (silver).

Victor Chemical Works mined phosphate rock at its Maiden Rock property near Melrose. Output, which was higher than in 1959, was processed to elemental phosphorus at the company Silver Bow plant.

**Stillwater.**—A small tonnage of gold ore was extracted from the Senate property in the *Yellowstone River* mining district.

American Chrome Co. continued mining and milling chromite for delivery to the Federal Government under a purchase contract. A small tonnage of concentrate was used in a company pilot plant for producing ferrochromium. The company annual report made the following statement, concerning the ferrochromium operation:

The addition of a refining furnace to the ferrochrome smelter pilot plant was completed in September and a production run of 520 tons of refined chrome was made. . . . Carload-lot sales of it have been made to leading steel companies. . . . . Unfortunately the location of the mine imposes a marketing handicap because of high rail freight to the distant stainless steel production areas, and as the deposit contains only one grade of ore the range of ferrochrome grades which can be smelted from it is limited; also this ore must compete with cheap foreign ore imported without duty. . . .

The comprehensive marketing studies which American Chrome Company has made, as well as Government statistics on use, show a growing demand for ferrochrome and for use of the grades which can be produced at Nye. The steel companies have stated they would like to see a domestic source chromium facility operating in the United States. . . . A vigorous effect is being made to accomplish this objective and a Proposal to the Government is being made by American Chrome for smelting into ferrochrome the 900,000 ton chromite ore concentrate stockpile being completeed in 1961. Conversion of this stockpile would result in 388 million pounds of chromium. . . .

**Toole.**—Whitlash Mining Co. mined 31 tons of copper ore from the Whitlash mine in the *Gold Butte* district.

**Valley.**—Value of sand and gravel output dropped to $495,000 from $1.6 million in 1959 because of lessened demand by the U.S. Army Corps of Engineers at its Glasgow Air Force Base project and by the Bureau of Reclamation at the Milk River project. Valley County dropped from first to third place in output of sand and gravel.

**Yellowstone.**—Recovery of crude oil from two fields declined to 376,000 barrels—155,000 barrels less than in 1959. Waste gases from the Continental Oil Co. and Humble Oil & Refining Co. refineries near Billings were transported to Montana Sulphur & Chemical Co. for conversion to high-purity elemental sulfur.

The county ranked second in sand and gravel production. Output was moderately larger than in 1959. Shale was expanded to lightweight aggregate by a company near Billings. Lovell Clay Products Co. made heavy clay products from clay mined locally.

# The Mineral Industry of Nebraska

By D. H. Mullen [1]

THE VALUE of mineral production in Nebraska in 1960 continued to rise and reached $103.7 million, a gain of 7 percent. Of all minerals produced, only clays and pumice failed to increase in value. The mineral fuels (natural gas, natural gas liquids, and petroleum) furnished 73 percent of the total value of all mineral output and 75 percent of the increase over the 1959 value. Output of petroleum increased 1.5 million barrels and was credited with 68 percent of the value of all minerals. Petroleum exploratory and development drilling was less than that of the preceding year; however, the success ratio remained high. An important achievement was the successful exploratory program in the Cambridge Arch area, east of the Denver-Julesburg basin, where the first production from Cambrian formations was made.

Modest but continued gains in value noted for most of the nonmetals contributed to the gradual increase in total value of mineral production.

**TABLE 1.—Mineral production in Nebraska [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays.....thousand short tons.. | 131 | $133 | 108 | $109 |
| Gem stones..... | (2) | 3 | (2) | 4 |
| Natural gas.....million cubic feet.. | 13,128 | 2,087 | 15,258 | 2,670 |
| Petroleum (crude).....thousand 42-gallon barrels.. | 22,881 | 65,897 | [3] 24,428 | [3] 70,108 |
| Sand and gravel.....thousand short tons.. | 11,202 | 8,301 | 10,876 | 8,746 |
| Stone.....do.... | 3,236 | 5,235 | 3,336 | 5,651 |
| Value of items that cannot be disclosed: Cement, natural gas liquids, and pumice..... | ---------- | 17,679 | ---------- | 18,384 |
| Total Nebraska [4]..... | ---------- | [5] 97,130 | ---------- | 103,687 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Weight not recorded.
[3] Preliminary figure.
[4] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime (1959).
[5] Revised figure.

Construction of the 75,000-kilowatt sodium-cooled, graphite-moderated nuclear powerplant being built by the Atomic Energy Commission (AEC) at Hallam, and begun in April 1959, was 55 percent complete

[1] Commodity-industry analyst, Bureau of Mines, Denver, Colo.

Digitized by Google

at the end of the year; completion was scheduled for early 1962. Careful review of the design of the reactor, conducted to evaluate the possibility of an incident such as fuel-element failure, resulted in some design changes. The reactor will supply power to the distribution system of the Consumers Public Power District of Nebraska, which will operate the AEC reactor. Construction progress was delayed because the reactor vessel—successfully shipped by barge from Philadelphia by way of the Atlantic Ocean, Gulf of Mexico, Mississippi, and Missouri Rivers to a landing in Nebraska—slipped from a truck trailer 40 miles from the plant site on June 22. Reloading the 65-ton vessel, 22 feet in diameter and 35 feet in height was difficult; but it was delivered to Hallam on July 11. A complete examination showed that the vessel had sustained on serious damage; it was then moved into place.

**Employment and Injuries.**—Table 2 shows 1960 Bureau of Mines employment and injuries data in the minerals industries, exclusive of petroleum.

**TABLE 2.—Employment and injuries in the mineral industries[1] in 1960[2]**

| Industry | Number of operations | Average number of men employed | Total man-hours worked | Injuries | | Frequency rate (injuries per million man-hours) |
|---|---|---|---|---|---|---|
| | | | | Fatal | Nonfatal | |
| Sand and gravel | 180 | 761 | 1,420,464 | ---------- | 12 | 8.4 |
| Stone | 31 | 603 | 1,457,856 | ---------- | 16 | 11.0 |
| Other[3] | 7 | 236 | 735,550 | ---------- | 4 | 5.4 |

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

**Natural Gas.**—Natural gas from gas wells and oil-well gas after processing, marketed through pipelines, was 16 percent greater than in 1959. Dry natural gas came from fields in Deuel and Cheyenne Counties, and oil-well gas came from fields in Kimball, Banner, and Cheyenne Counties.

**Natural Gas Liquids.**—Natural gasoline, butane, and propane recovery at natural-gasoline plants was 9 percent above that of 1959. Natural gas liquids were recovered at five plants, two in Cheyenne, two in Kimball, and one in Deuel Counties. Natural-gasoline plants at the Big Springs field in Deuel County and at the West Sidney field in Cheyenne County were refrigeration-absorption plants; the Kimball and Banner plants near Kimball and the Huntsman plant in Cheyenne County were absorption plants. Daily capacity of the plants was 77.5 million cubic feet, and the average daily throughput was 68.9 million cubic feet.

Digitized by Google

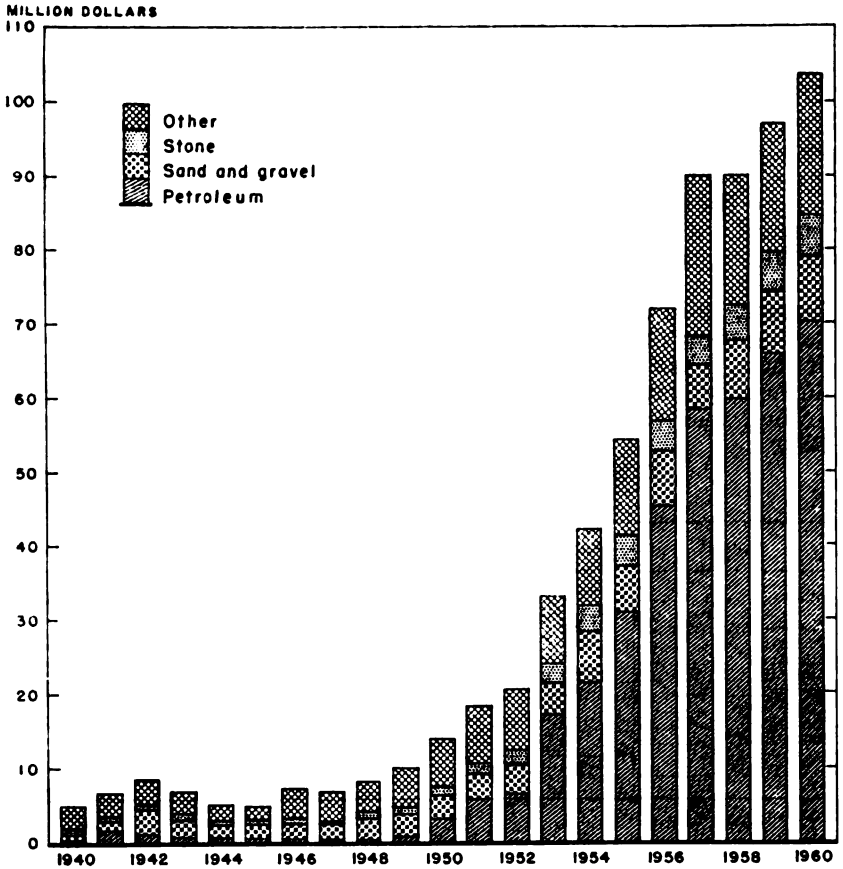

FIGURE 1.—Value of petroleum, sand and gravel, and stone, and total value of mineral production in Nebraska, 1940–60.

**Petroleum.**—Petroleum production from 1,571 wells in 255 fields in 9 counties was 7 percent above that of 1959. The increase in value (5 percent) represented 64 percent of the gain in total value of mineral production in 1960. Exploratory drilling, although lower than in 1959, was rewarding. Of 391 wells drilled, 36 were successful, giving a success ratio of 9 percent. The exploratory drilling east of the Denver-Julesburg basin in Red Willow, Dundy, and Hitchcock Counties along the Cambridge Arch, evoked considerable interest. Drilling in this area resulted in producing wells in Pennsylvanian formations. At the Sleepy Hollow field, production was obtained from Pennsylvanian and Cambrian formations, the latter the first in the State. Most of the exploratory drilling was done in the Nebraska part of the Denver-Julesburg basin where 307 wells were completed; 30 were successful for a success ratio of 9 percent, 1 percent less than in 1959. This drilling was centered in Banner, Cheyenne, and Kimball Counties, and, to a lesser extent, in Morrill

Digitized by Google

County. Of 14 additional exploratory wells drilled in the area in Box Butte, Dawes, Sioux, Scott's Bluff, and Sioux Counties, 1, in Sioux County, was successful. Another development well was completed in Box Butte County. In the Denver-Julesburg basin, 2 new producers were completed in Yuma County, Colo., and 1 in Phillips County, Kans. In the Hugoton area, 1 new producer was completed in Kearney County. Of 11 wells drilled in Hitchcock County, 2 were producing at year's end. Of the 10 wells in Kimball County, 4 were dry holes, 2 were completed as producers, and 4 were drilling at year's end. In the Denver-Julesburg basin, 23 new producers were completed in Kimball County, 46 in Banner, 24 in Cheyenne, and 10 in Morrill. Of the wells in the area currently under development drilling, 37 had 3 or more new producers: 6 were dry holes, and 3 were shut in. Total drilling was 4.2 million feet (2.1 million exploratory, 2.1 million development) compared with 5.4 million feet (2.4 million exploratory, 3.0 million development) in 1959.

TABLE 2.—Crude petroleum production, by counties

Thousand barrels

| County | 1960 | 1961 | Principal fields in 1961 in order of production |
|---|---|---|---|
| Banner | 7,854 | 7,771 | Stranahan, Wilson Ranch, Barrett, Brinkerhoff, Kenmac [illegible] |
| Cheyenne | 4,155 | 3,422 | Orchard, Horse Power, Dorman, Jones, Sparrow. |
| Chase | 7 | 4 | McCook, Culbertson. |
| Hitchcock | 21 | 24 | Beaver, Culbertson. |
| Kimball | 10,229 | 9,671 | Rose, Bryan, Southwest Potter, Enders, Jarmio. |
| Morrill | 262 | 177 | Orchard, Lake, Omar. |
| Red Willow | 13 | 13 | Arapaho, Cherry Hollow. |
| Richardson | 142 | 123 | Dawson, Falls City. |
| Scotts Bluff | 15 | 17 | Cedar Canyon, Kooltadeau. |
| Total | 22,901 | 21,425 | |

1 Preliminary figures.

The Nebraska Oil and Gas Conservation Commission, created by the State Legislature in 1959, completed its staff with headquarters at Sidney in Cheyenne County. For each of nine fields, the Commission ordered special rules specifying semi-annual bottom-hole pressure surveys of key wells and quarterly gas-oil ratio tests at all wells. An intensive bottom-hole pressure and production tests at the Roesell field in Kimball County were completed to determine the producing mechanism in the reservoir. Production was limited at three fields to conserve reservoir energy and use that energy properly. A maximum gas-flow limitation was ordered at the Rohlfing field in Cheyenne County until operators installed compression facilities and marketed the casing-head gas produced. An 80-acre well-spacing pattern was established temporarily at the Culbertson field, discovered in 1960, to determine the most economical method of development. The Commission staff completed a prescriptive field nomenclature for the entire State.

## NONMETALS

**Cement.**—Shipments of portland and masonry cements from plants in Cass and Nuckolls Counties declined slightly although the value was higher. Prices in 1960 averaged $3.45 per barrel for portland cement and $4.42 for masonry cement, compared with $3.31 and $4.23, respectively, in 1959. Shipments were made to consumers in Nebraska (79 percent) and Iowa (15 percent), and in lesser amounts, to consumers in South Dakota, Kansas, Minnesota, and Colorado. The eight kilns at the two plants, operating an average of 322 days each, had an output rate of 94 percent of capacity. Approximately 71.6 million kw. hours of electricity, all purchased, was used at the plants. One plant used finished portland cement as a base for manufacture of masonry cement; the other used cement clinker.

Digitized by Google

**Clays.**—Fire clay and miscellaneous clay were produced in four counties for manufacturing art pottery, building brick, draintile, sewer pipe, other clay products, and portland cement. Total clay production was 18 percent below that of 1959.

**Gem Stones.**—Gem stones and gem materials such as agate, agatized wood, jasper, petrified wood, and chalcedony were collected by gem societies and individuals in various parts of the State. The value, reported by collectors, was 33 percent above that of 1959.

**Perlite.**—Crude perlite from deposits in New Mexico was processed by Western Mineral Products Co. at its Omaha plant. The expanded product was used in building plaster and as a concrete aggregate.

**Pumice.**—The value of pumice produced in Custer County was 5 percent below that of 1959. The crude pumice was ground and sized for use in cleansing and scouring compounds and as an abrasive.

**Sand and Gravel.**—Production of sand and gravel came from 59 of the State's 93 counties. Output declined 3 percent in quantity but increased 5 percent in value compared with 1959, as more of the product was prepared. Commercial production at 134 operations in 54 counties was 93 percent of the State total. Major uses included paving and road construction (57 percent) and building (37 percent). Of the remaining 6 percent, produced by Government crews and contractors in 16 counties, 78 percent was used for roadbuilding and 11 percent each for building and fill. Fifty-nine percent of the total production was used for road construction and 35 percent for building. The quantity of sand and gravel washed, screened, or otherwise prepared continued to increase and was 88 percent of the total compared with 76 percent in 1959. The value of sand and gravel ranged from $0.44 per ton for unwashed material to $0.84 for washed. Counties that produced more than 500,000 tons each were Cass (1,165,200 tons), Dodge (1,115,100 tons), Douglas (869,400 tons), Hall (764,600), and Sarpy (834,300 tons).

Construction of the National System of Interstate and Defense Highways continued. Because the Bureau of Public Roads changed its method of reporting progress in 1960, no comparable data were available for 1959; however, a report[2] showed that from July 1, 1956, to December 31, 1960, 27.9 miles of the Interstate System had been completed to full standards; 12.9 miles, of which 0.3 mile was toll, had been improved to standards adequate for current traffic; 31.1 miles were under construction; and engineering and right-of-way acquisition had started on 195.1 miles. Total designated mileage of the system in Nebraska was 489.5 miles, leaving 222.2 miles to be planned and built. Under the Federal-Aid program for primary, secondary, and urban highways, 693.7 miles were completed, and 896.8 miles were under construction.

**Stone.**—Crushed and broken limestone was produced in 12 counties, and dimension limestone (rubble) was produced in 2 counties. Total stone output gained 3 percent in quantity and 8 percent in value over that of 1959. Crushed limestone was used as riprap, concrete aggregate, and road material and was also used in manufacturing cement,

[2] Less than $1,000.

as agricultural lime, for whiting, and as a filler in rubber, putty, and asphalt. In two counties, contractors produced crushed limestone for riprap and road construction for the State department of roads and county highway departments. Major production came from Cass, Nemaha, and Washington Counties.

**Talc.**—Sierra Talc Co. ground crude talc from mines in California and Montana at its plant at Grand Island in Hall County for use in ceramics, paint, plastics, paper, rubber, textiles, and toilet preparations.

**Vermiculite.**—Western Mineral Products Co. exfoliated crude vermiculite from mines in Montana at its plant in Omaha. The product was used for loose-fill insulation, as an aggregate in plaster, and for litter in stock pens.

## METALS

Although no metals were produced in Nebraska, substantial quantities of ferrous and nonferrous metals were used at numerous manufacturing plants. Lead bullion from smelters in other States was refined by the American Smelting and Refining Co. (Asarco) at its plant in Omaha. Antimonial lead also was recovered as a byproduct.

## REVIEW BY COUNTIES

**Banner.**—Banner County retained second place in production of petroleum. Output from 399 wells in 57 fields was 7.8 million barrels, a gain of 468,000 barrels or 6 percent over that of 1959. Major production came from the Singleton, Willson Ranch, Barrett, and Brinkerhoff fields. Of 66 exploratory wells completed, 7 were successful. All were within four townships in the center of the county, and each was less than 2 miles from producing areas.

The Falstaff field, discovered in October, began by producing 200 barrels of oil a day on pump from the J sandstone at a depth of 6,583 to 6,586 feet. An offset well to the east also pumped 200 barrels of oil a day, but offsets to the northeast and west were failures. The discovery well at the Bull Canyon field, west of any previously producing well in the county, was completed in February and pumped 187 barrels of oil a day from the J standstone at a depth of 6,755 to 6,759 feet. An offset well to the northeast was abandoned. Farther east in the same township, discovery wells were completed at the Gabe Rock field in January and at the Showlow field in August. Beginning production at each was 100 barrels of oil a day on pump from the J sandstone. Offsets at each field were failures. The North Lovercheck field, separated from the Lovercheck field by dry holes, was discovered in July. Starting production was 110 barrels of oil a day on pump from the J sandstone at a depth of 6,040 to 6,044 feet. An offset well to the north confirmed the discovery, but offset wells to the northeast and northwest were failures. The only D-sandstone discovery in the county during the year was completed in July at the Red Dog field; the discovery well pumped 125 barrels of oil a day at a depth of 6,239 to 6,253 feet. An offset well to the east was abandoned.

Development drilling resulted in 46 new producing wells, chiefly in the Willson Ranch field and 7 other fields. Oil-well gas from some Banner County fields was processed at natural-gasoline plants in Kimball County.

The county highway department produced paving gravel for road construction.

**Cass.**—The county led in the value of cement, clay, and stone; was second in sand and gravel; and ranked third in total value of mineral production. The value of mineral production represented 59 percent of the value of all nonmetal production and 16 percent of all mineral production in the State.

Digitized by Google

The Louisville plant of the Ash Grove Lime & Portland Cement Co. produced portland and masonry cements. Cement rock and shale used at the plant were mined from nearby deposits. Finished portland cement was used as a base for manufacturing masonry cement.

**TABLE 6.—Value of mineral production in Nebraska, by counties [1]**

| County | 1959 | 1960 [2] | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Adams | $10,700 | $38,100 | Sand and gravel. |

**TABLE 6.—Value of mineral production in Nebraska, by counties[1]—Continued**

| County | 1959 | 1960[2] | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Thomas | $300 | | |
| Valley | (3) | $41,700 | Sand and gravel. |
| Washington | | (3) | Stone. |
| Webster | (3) | (3) | Sand and gravel. |
| York | (3) | (3) | Do. |
| Undistributed[6] | [5] 10,322,943 | 12,514,902 | |
| Total[7] | [5] 97,130,000 | 103,687,000 | |

[1] The following counties are not listed because no production was reported: Arthur, Blaine, Box Butte, Burt, Cherry, Dakota, Dundy, Garfield, Gosper, Grant, Greeley, Hooker, Howard, Johnson, Keya Paha, Logan, McPherson, Rock, Thurston, Wayne, and Wheeler.
[2] Value of petroleum is preliminary.
[3] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[4] Excludes natural gas and natural gas liquids.
[5] Revised figure.
[6] Includes natural gas liquids, natural gas, some gem stones and sand and gravel (1959) that cannot be assigned to specific counties, and values indicated by footnote 3.
[7] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime (1959).

Kahler Pottery Co., Inc., mined fire or stoneware clay for manufacturing art pottery and flowerpots. Sand and gravel for building and paving was produced by Lyman-Richey Sand & Gravel Corp. at its Nos. 5 and 6 plants and by Western Sand & Gravel Co. at its Cedar Creek and South Bend plants.

**Cheyenne.**—Petroleum production from 327 wells in 63 fields was 3.8 million barrels, a decline of 8 percent from 1959; however, the county continued to rank third in petroleum output. Of 73 exploratory wells drilled, 7 in the northern half of the county were successful. The Faro field, 1.5 miles north of the Reimers field, was completed in April. Beginning production was 336 barrels of oil a day from the J sandstone at a depth of 4,773 to 4,775 feet. Offset wells to the east, south, and west and a stepout well to the northwest were failures. At the Keno field (discovered in June), east of the Sell field, early production was 200 barrels of oil a day from the D sandstone at a depth of 4,419 feet. Three offset wells were failures. The discovery well at the Black Jack field was completed in March and pumped 110 barrels of oil a day from the J sandstone at a depth of 5,399 feet. Two offset wells were abandoned. The discovery well at the Bezique field, completed in July, pumped 145 barrels of oil a day from the J sandstone at a depth of 5,343 to 5,353 feet. No extensions were attempted; however, the field was important because of its proximity to three other fields in the same township. Other discoveries and their beginning production rates were the West Sell field, 72 barrels of oil a day from the D sandstone, and the Ace High field, 148 barrels of oil a day from the J sandstone. New producers resulting from development drilling were in the Frei field (a 1959 discovery), and the Slama, Engelland, Graff, and Pebble fields. Oil-well gas from Cheyenne and Banner County fields was processed by Ohio Oil Co. at its Huntsman and West Sidney fields. Combined daily capacity of the plants was 25 million cubic feet of gas, and daily throughput averaged 18.5 million cubic feet. Natural gasoline, butane, and propane were recovered; and the residual gas was marketed through pipelines.

Digitized by Google

**Deuel.**—Natural gas from the Big Springs field was processed by Kansas-Nebraska Natural Gas Co., Inc., at its Big Springs compressor and refrigeration-absorption plant. The plant operated at capacity with a daily throughput of 35 million cubic feet of gas. Natural gasoline, butane, and propane were recovered; the residual gas was marketed through company-owned pipelines.

**Dodge.**—The county ranked second in producing sand and gravel. The output was used for building, paving, and fill material. Major producers were the Lyman-Richey Sand & Gravel Corp. Nos. 12 and 13 plants, Christensen Sand & Gravel Co., Lincoln Sand & Gravel Co., and Lux Sand & Gravel Co. Uehling Fertilizer Service produced limestone for agricultural use.

**Douglas.**—The county ranked third in producing sand and gravel, which was used as building, road-construction, and fill materials. Major producers were the Lyman-Richey Sand & Gravel Corp. Nos. 9 and 11 plants, Acme Sand & Gravel Co., Hartford Sand & Gravel Co., and McCann Sand & Gravel Co. Paving gravel was produced for the county highway department. Asarco operated its lead refinery at Omaha. Western Mineral Products Co. processed perlite and vermiculite from deposits in Western States in Omaha. Omaha Brick Works produced miscellaneous clay for manufacturing building brick and other heavy clay products.

**Dundy.**—One of the new oilfields discovered in 1960 was in Dundy County. Seven exploratory wells were completed. The discovery well at the Pierce Lake field, completed in November, pumped 203 barrels of oil a day from the Lansing-Kansas City (Pennsylvanian) formation at a depth of 4,138 feet. Two offset wells were successful, but no production was recorded for 1960.

**Garden.**—Petroleum production from the McCord and Richards fields was 14 percent below that of 1959. No drilling was done in the county during the year. Oshkosh Sand & Gravel produced building, paving, and fill sand. Sand and gravel for building and paving was produced for State, county, and city highway departments.

**Hall.**—Nine operators produced sand and gravel for building, paving, and fill. A small quantity of engine sand also was produced. Major operators were Luther & Maddox, H & M Equipment Co., Inc., Third City Sand Co., and Armour Construction Co. The Sierra Talc Co. plant in Grand Island ground crude talc from deposits in California and Montana.

**Hitchcock.**—Petroleum production from 38 wells in 3 fields increased nearly fourfold over that of 1959. In July and August the North Fork and the Culbertson fields, respectively, were discovered from the 12 exploratory wells completed. North Fork initial production was 48 barrels a day on pump from the Lansing-Kansas City formation at a depth of 4,060 to 4,064 feet. The Culbertson discovery well pumped 288 barrels of oil a day from the Lansing-Kansas City formation at a depth of 3,765 to 3,902 feet. At the Culbertson field, which may develop into a major producer, the State Oil and Gas Conservation Commission temporarily established an 80-acre well-spacing pattern as a means of observing the effects of wide well spacing on the yield of newly discovered fields. The Burr Oak and

Digitized by Google

Frakes fields, discovered in 1958 and 1959, respectively, were combined with the Reiher field, a 1959 discovery. The only other production came from the one-well Hudson field, a 1958 discovery. Development drilling, all in the Reiher area, added 22 new producers. One unsuccessful well was drilled just north of the field.

**Jefferson.**—Endicott Clay Products Co. mined miscellaneous clay for manufacturing building brick and other heavy clay products. Sand and gravel for building, paving, fill material, and other uses was produced by Consolidated Sand & Gravel Co., R. M. Weblemoe Co., and Steele Bros. Total sand and gravel production was 278,000 tons.

**Kimball.**—The county led in petroleum production and in value (30 percent) of all mineral production. Petroleum output, from 766 wells in 111 fields, was 7 percent above that of 1959. Exploratory and development drilling was extensive, but at a lower rate than in 1959. Of 92 exploratory wells completed, 9 were successful. Completed in April, the discovery well of the Haussner field near the western border of the county pumped 276 barrels of oil a day from the J sandstone at a depth of 7,176 to 7,180 feet. A step-out well 1 mile to the southeast, also completed in April, pumped 245 barrels of oil a day from the J sandstone in an open hole at a depth of 7,213 to 7,221 feet. Offset wells to the north and southeast were abandoned. The Euchre field, discovered in February, 2 miles northeast of the Haussner, had an initial production of 600 barrels of oil a day on pump from the J sandstone at a depth of 7,007 feet. Offset wells to the east, south, and west were abandoned, but an offset to the north pumped 205 barrels of oil a day from a 2-foot interval in the J sandstone. The Hilltop field north of Kimball was discovered in June. The discovery well pumped 260 barrels of oil from the J sandstone at a depth of 6,411 to 6,419 feet. An offset well to the west pumped 123 barrels of oil a day. The Malcolm field, discovered in September, directly west of the Hilltop, initially produced 240 barrels of oil a day on pump from the J sandstone at a depth of 6,420 feet. Three confirmation wells were failures. The Alpha field, southeast of the Cornils field, was discovered in October; its beginning production was 237 barrels of oil a day from the J sandstone at a depth of 7,004 to 7,018 feet. An offset well to the west and a step-out well to the northwest were failures. The Bravo field, discovered 2 miles east of the Alpha in August, initially produced 14 barrels of oil a day from the J sandstone at a depth of 6,872 to 6,875 feet. The Yukon field, discovered in October, southwest of the Russell field, pumped 181 barrels of oil a day from the J sandstone at a depth of 7,126 to 7,128 feet. Other discoveries and beginning production rates were the Apatite field, discovered in October, 62 barrels of oil a day on pump from the J sandstone; the Wewoka field, discovered in February, 141 barrels of oil a day on pump from the J sandstone; and an unnamed field, discovered in December, 40 barrels of oil a day on pump from the J sandstone.

Development drilling resulted in 55 new producing wells. Three fields, discovered in 1959, had considerable success. At the Russell field, eight wells were completed along the southern end; five wells

Digitized by Google

that failed were completed to the east, south, and west. Development added 4 producers and 4 failures to the Painter field in the central part of the county, and at the Brook field 12 new producers were completed. At the Southwest Potter field, discovered in 1951 in Kimball and Cheyenne Counties, five new oil wells were completed. Two to three new producers, each, were completed at the Cabella, Cornils, Fernquist, Fifer, Hill, Houtby, and Simpson fields.

Oil-well gas from fields in Kimball and Banner Counties was processed at the Kimball and Banner gasoline plants near Kimball by Antelope Gas Products Co. Natural gas liquids (natural gasoline, butane, and propane) were recovered, and residual gas was marketed through pipelines. Combined daily capacity of the plants was 17.5 million cubic feet of gas, and average daily throughput was 15.4 million cubic feet. Wilson Brothers, Inc., produced building and fill gravel.

**Lancaster.**—Yankee Hill Brick Manufacturing Co. produced miscellaneous clay for manufacturing building brick and other heavy clay products. Schwarck Quarries, Inc., produced dimension limestone (rubble) for building and crushed limestone for concrete aggregate, road building, and agricultural use.

**Morrill.**—Petroleum production from 60 wells in 11 fields was 19 percent below that of 1959. Exploratory drilling resulted in the discovery of four new fields. The Cutthroat field (discovered in July), about a mile north of the Cheyenne County line, initially produced 262 barrels of oil a day from the J sandstone at a depth of 5,230 to 5,234 feet. The Matador field, discovered in July, pumped 512 barrels of oil a day from the J sandstone at a depth of 5,110 to 5,112 feet. An offset well to the east was a failure. Beginning production from an unnamed field, discovered in December, 1 mile southeast of the Lindberg, was 263 barrels of oil a day on pump from the J sandstone at a depth of 5,254 to 5,270 feet. The most significant discovery was the Dunlap field, 5 miles northeast of the Craig field. The discovery well, completed in February, pumped 209 barrels of oil a day from the D sandstone at a depth of 4,120 to 4,123 feet. An offset well to the south pumped 309 barrels of oil a day; a third well pumped 465 barrels of oil a day. Offset wells to the east, north, and west were failures.

Development drilling, resulting in 23 new producers, was almost entirely in the Waitman field (18 new wells), discovered in 1957, and at the Lane field. Lyman-Richey Sand & Gravel Corp. produced building and paving sand and gravel at its No. 23 plant.

**Nemaha.**—Crushed and broken limestone for riprap, concrete aggregate, road construction, and agriculture was produced by Colaska Production Co. and Nelson Quarries, Inc.

**Nuckolls.**—Portland and masonry cements were produced at the Superior plant by Ideal Cement Co. Cement rock used at the plant was mined by the company at a quarry in Jewell County, Kans. The plant operated near capacity for 323 days. Portland cement clinker was used as a base in manufacturing masonry cement. C. F. Bondegard and the Estate of George K. Werner produced paving gravel.

County. Of 34 additional exploratory wells drilled to the north and east in Box Butte, Dawes, Scotts Bluff, and Sioux Counties, 1, in Scotts Bluff, was successful. Although development drilling declined, it was particularly successful along the Cambridge Arch. In the Ackman field, discovered late in 1959 in Red Willow County, 46 additional wells, all producing from the Oread and Lansing-Kansas City (Pennsylvanian) formations, were completed; and at the Sleepy Hollow field, discovered in 1960, 19 wells were producing at yearend. At the Reiher field in Hitchcock County, a 1959 discovery, an additional 21 producers were completed. In the Denver-Julesburg basin, 53 new producers were completed in Kimball County, 46 in Banner, 29 in Cheyenne, and 22 in Morrill. Of 150 fields in the area having some development drilling, 26 had 2 or more new producers; of these, 8 had more than 3. Total drilling was 4.9 million feet (2.1 million exploratory, 2.8 million development) compared with 5.4 million feet (2.4 million exploratory, 3.0 million development) in 1959.

**TABLE 3.—Crude petroleum production, by counties**

(Thousand barrels)

| County | 1959 | 1960 [1] | Principal fields in 1960 in order of production |
|---|---|---|---|
| Banner | 7,303 | 7,771 | Singleton, Willson Ranch, Barrett, Brinkerhoff, Kenmac Ludden. |
| Cheyenne | 4,155 | 3,822 | Cook, Itner, Doran, Dorman, Juelfs, Spearow. |
| Garden | 7 | 6 | McCord, Richards. |
| Hitchcock | 75 | 294 | Reiher, Culbertson. |
| Kimball | 10,238 | 10,975 | Sloss, Brook, Southwest Potter, Enders, Jaunto. |
| Morrill | 933 | 757 | Olsen, Lane, Craig. |
| Red Willow | 13 | 553 | Ackman, Sleepy Hollow. |
| Richardson | 142 | 153 | Dawson, Falls City. |
| Scotts Bluff | 15 | 97 | Cedar Canyon, Roubadeau. |
| Total | 22,881 | 24,428 | |

[1] Preliminary figures.

The Nebraska Oil and Gas Conservation Commission, created by the State Legislature in 1959, completed its staff with headquarters at Sidney in Cheyenne County. For each of nine fields, the Commission ordered special rules specifying semi-annual bottom-hole pressure surveys of key wells and quarterly gas-oil ratio tests at all wells. An intensive bottom-hole pressure and production tests at the Russell field in Kimball County were completed to determine the producing mechanism in the reservoir. Production was limited at three fields to conserve reservoir energy and use that energy properly. A maximum gas-flow limitation was ordered at the Rohlfing field in Cheyenne County until operators installed compression facilities and marketed the casing-head gas produced. An 80-acre well-spacing pattern was established temporarily at the Culbertson field, discovered in 1960, to determine the most economical method of development. The Commission staff completed a prescriptive field nomenclature for the entire State.

## NONMETALS

**Cement.**—Shipments of portland and masonry cements from plants in Cass and Nuckolls Counties declined slightly although the value was higher. Prices in 1960 averaged $3.45 per barrel for portland cement and $4.42 for masonry cement, compared with $3.31 and $4.23, respectively, in 1959. Shipments were made to consumers in Nebraska (79 percent) and Iowa (15 percent), and in lesser amounts, to consumers in South Dakota, Kansas, Minnesota, and Colorado. The eight kilns at the two plants, operating an average of 322 days each, had an output rate of 94 percent of capacity. Approximately 71.6 million kw. hours of electricity, all purchased, was used at the plants. One plant used finished portland cement as a base for manufacture of masonry cement; the other used cement clinker.

## NONMETALS

**Cement.**—Shipments of portland and masonry cements from plants in Cass and Nuckolls Counties declined slightly although the value was higher. Prices in 1960 averaged $3.45 per barrel for portland cement and $4.42 for masonry cement, compared with $3.31 and $4.23, respectively, in 1959. Shipments were made to consumers in Nebraska (79 percent) and Iowa (15 percent), and in lesser amounts, to consumers in South Dakota, Kansas, Minnesota, and Colorado. The eight kilns at the two plants, operating an average of 322 days each, had an output rate of 94 percent of capacity. Approximately 71.6 million kw. hours of electricity, all purchased, was used at the plants. One plant used finished portland cement as a base for manufacture of masonry cement; the other used cement clinker.

Digitized by Google

**Clays.**—Fire clay and miscellaneous clay were produced in four counties for manufacturing art pottery, building brick, draintile, sewer pipe, other clay products, and portland cement. Total clay production was 18 percent below that of 1959.

**Gem Stones.**—Gem stones and gem materials such as agate, agatized wood, jasper, petrified wood, and chalcedony were collected by gem societies and individuals in various parts of the State. The value, reported by collectors, was 33 percent above that of 1959.

**Perlite.**—Crude perlite from deposits in New Mexico was processed by Western Mineral Products Co. at its Omaha plant. The expanded product was used in building plaster and as a concrete aggregate.

**Pumice.**—The value of pumice produced in Custer County was 5 percent below that of 1959. The crude pumice was ground and sized for use in cleansing and scouring compounds and as an abrasive.

**Sand and Gravel.**—Production of sand and gravel came from 59 of the State's 93 counties. Output declined 3 percent in quantity but increased 5 percent in value compared with 1959, as more of the product was prepared. Commercial production at 134 operations in 54 counties was 93 percent of the State total. Major uses included paving and road construction (57 percent) and building (37 percent). Of the remaining 6 percent, produced by Government crews and contractors in 16 counties, 78 percent was used for roadbuilding and 11 percent each for building and fill. Fifty-nine percent of the total production was used for road construction and 35 percent for building. The quantity of sand and gravel washed, screened, or otherwise prepared continued to increase and was 88 percent of the total compared with 76 percent in 1959. The value of sand and gravel ranged from $0.44 per ton for unwashed material to $0.84 for washed. Counties that produced more than 500,000 tons each were Cass (1,165,200 tons), Dodge (1,115,100 tons), Douglas (869,400 tons), Hall (764,600), and Sarpy (834,300 tons).

Construction of the National System of Interstate and Defense Highways continued. Because the Bureau of Public Roads changed its method of reporting progress in 1960, no comparable data were available for 1959; however, a report[2] showed that from July 1, 1956, to December 31, 1960, 27.9 miles of the Interstate System had been completed to full standards; 12.9 miles, of which 0.3 mile was toll, had been improved to standards adequate for current traffic; 31.1 miles were under construction; and engineering and right-of-way acquisition had started on 195.1 miles. Total designated mileage of the system in Nebraska was 489.5 miles, leaving 222.2 miles to be planned and built. Under the Federal-Aid program for primary, secondary, and urban highways, 693.7 miles were completed, and 896.8 miles were under construction.

**Stone.**—Crushed and broken limestone was produced in 12 counties, and dimension limestone (rubble) was produced in 2 counties. Total stone output gained 3 percent in quantity and 8 percent in value over that of 1959. Crushed limestone was used as riprap, concrete aggregate, and road material and was also used in manufacturing cement,

[2] Less than $1,000.

as agricultural lime, for whiting, and as a filler in rubber, putty, and asphalt. In two counties, contractors produced crushed limestone for riprap and road construction for the State department of roads and county highway departments. Major production came from Cass, Nemaha, and Washington Counties.

**Talc.**—Sierra Talc Co. ground crude talc from mines in California and Montana at its plant at Grand Island in Hall County for use in ceramics, paint, plastics, paper, rubber, textiles, and toilet preparations.

**Vermiculite.**—Western Mineral Products Co. exfoliated crude vermiculite from mines in Montana at its plant in Omaha. The product was used for loose-fill insulation, as an aggregate in plaster, and for litter in stock pens.

## METALS

Although no metals were produced in Nebraska, substantial quantities of ferrous and nonferrous metals were used at numerous manufacturing plants. Lead bullion from smelters in other States was refined by the American Smelting and Refining Co. (Asarco) at its plant in Omaha. Antimonial lead also was recovered as a byproduct.

## REVIEW BY COUNTIES

**Banner.**—Banner County retained second place in production of petroleum. Output from 399 wells in 57 fields was 7.8 million barrels, a gain of 468,000 barrels or 6 percent over that of 1959. Major production came from the Singleton, Willson Ranch, Barrett, and Brinkerhoff fields. Of 66 exploratory wells completed, 7 were successful. All were within four townships in the center of the county, and each was less than 2 miles from producing areas.

The Falstaff field, discovered in October, began by producing 200 barrels of oil a day on pump from the J sandstone at a depth of 6,583 to 6,586 feet. An offset well to the east also pumped 200 barrels of oil a day, but offsets to the northeast and west were failures. The discovery well at the Bull Canyon field, west of any previously producing well in the county, was completed in February and pumped 187 barrels of oil a day from the J standstone at a depth of 6,755 to 6,759 feet. An offset well to the northeast was abandoned. Farther east in the same township, discovery wells were completed at the Gabe Rock field in January and at the Showlow field in August. Beginning production at each was 100 barrels of oil a day on pump from the J sandstone. Offsets at each field were failures. The North Lovercheck field, separated from the Lovercheck field by dry holes, was discovered in July. Starting production was 110 barrels of oil a day on pump from the J sandstone at a depth of 6,040 to 6,044 feet. An offset well to the north confirmed the discovery, but offset wells to the northeast and northwest were failures. The only D-sandstone discovery in the county during the year was completed in July at the Red Dog field; the discovery well pumped 125 barrels of oil a day at a depth of 6,239 to 6,253 feet. An offset well to the east was abandoned.

Development drilling resulted in 46 new producing wells, chiefly in the Willson Ranch field and 7 other fields. Oil-well gas from some Banner County fields was processed at natural-gasoline plants in Kimball County.

The county highway department produced paving gravel for road construction.

**Cass.**—The county led in the value of cement, clay, and stone; was second in sand and gravel; and ranked third in total value of mineral production. The value of mineral production represented 59 percent of the value of all nonmetal production and 16 percent of all mineral production in the State.

Digitized by Google

The Louisville plant of the Ash Grove Lime & Portland Cement Co. produced portland and masonry cements. Cement rock and shale used at the plant were mined from nearby deposits. Finished portland cement was used as a base for manufacturing masonry cement.

**TABLE 6.—Value of mineral production in Nebraska, by counties[1]**

| County | 1959 | 1960 [2] | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Adams | $10,700 | $38,100 | Sand and gravel. |
| Antelope | (3) | 17,700 | Do. |
| Banner | 21,050,740 | [4] 22,342,500 | Petroleum, sand and gravel. |
| Boone | (3) | (3) | Sand and gravel. |

**TABLE 6.—Value of mineral production in Nebraska, by counties[1]—Continued**

| County | 1959 | 1960[2] | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Thomas | $300 | | |
| Valley | (3) | $41,700 | Sand and gravel. |
| Washington | | (3) | Stone. |
| Webster | (3) | (3) | Sand and gravel. |
| York | (3) | (3) | Do. |
| Undistributed[4] | [5] 10,322,943 | 12,514,902 | |
| Total[7] | [5] 97,130,000 | 103,687,000 | |

[1] The following counties are not listed because no production was reported: Arthur, Blaine, Box Butte, Burt, Cherry, Dakota, Dundy, Garfield, Gosper, Grant, Greeley, Hooker, Howard, Johnson, Keya Paha, Logan, McPherson, Rock, Thurston, Wayne, and Wheeler.
[2] Value of petroleum is preliminary.
[3] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[4] Excludes natural gas and natural gas liquids.
[5] Revised figure.
[6] Includes natural gas liquids, natural gas, some gem stones and sand and gravel (1959) that cannot be assigned to specific counties, and values indicated by footnote 3.
[7] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime (1959).

Kahler Pottery Co., Inc., mined fire or stoneware clay for manufacturing art pottery and flowerpots. Sand and gravel for building and paving was produced by Lyman-Richey Sand & Gravel Corp. at its Nos. 5 and 6 plants and by Western Sand & Gravel Co. at its Cedar Creek and South Bend plants.

**Cheyenne.**—Petroleum production from 327 wells in 63 fields was 3.8 million barrels, a decline of 8 percent from 1959; however, the county continued to rank third in petroleum output. Of 73 exploratory wells drilled, 7 in the northern half of the county were successful. The Faro field, 1.5 miles north of the Reimers field, was completed in April. Beginning production was 336 barrels of oil a day from the J sandstone at a depth of 4,773 to 4,775 feet. Offset wells to the east, south, and west and a stepout well to the northwest were failures. At the Keno field (discovered in June), east of the Sell field, early production was 200 barrels of oil a day from the D sandstone at a depth of 4,419 feet. Three offset wells were failures. The discovery well at the Black Jack field was completed in March and pumped 110 barrels of oil a day from the J sandstone at a depth of 5,399 feet. Two offset wells were abandoned. The discovery well at the Bezique field, completed in July, pumped 145 barrels of oil a day from the J sandstone at a depth of 5,343 to 5,353 feet. No extensions were attempted; however, the field was important because of its proximity to three other fields in the same township. Other discoveries and their beginning production rates were the West Sell field, 72 barrels of oil a day from the D sandstone, and the Ace High field, 148 barrels of oil a day from the J sandstone. New producers resulting from development drilling were in the Frei field (a 1959 discovery), and the Slama, Engelland, Graff, and Pebble fields. Oil-well gas from Cheyenne and Banner County fields was processed by Ohio Oil Co. at its Huntsman and West Sidney fields. Combined daily capacity of the plants was 25 million cubic feet of gas, and daily throughput averaged 18.5 million cubic feet. Natural gasoline, butane, and propane were recovered; and the residual gas was marketed through pipelines.

Digitized by Google

**Deuel.**—Natural gas from the Big Springs field was processed by Kansas-Nebraska Natural Gas Co., Inc., at its Big Springs compressor and refrigeration-absorption plant. The plant operated at capacity with a daily throughput of 35 million cubic feet of gas. Natural gasoline, butane, and propane were recovered; the residual gas was marketed through company-owned pipelines.

**Dodge.**—The county ranked second in producing sand and gravel. The output was used for building, paving, and fill material. Major producers were the Lyman-Richey Sand & Gravel Corp. Nos. 12 and 13 plants, Christensen Sand & Gravel Co., Lincoln Sand & Gravel Co., and Lux Sand & Gravel Co. Uehling Fertilizer Service produced limestone for agricultural use.

**Douglas.**—The county ranked third in producing sand and gravel, which was used as building, road-construction, and fill materials. Major producers were the Lyman-Richey Sand & Gravel Corp. Nos. 9 and 11 plants, Acme Sand & Gravel Co., Hartford Sand & Gravel Co., and McCann Sand & Gravel Co. Paving gravel was produced for the county highway department. Asarco operated its lead refinery at Omaha. Western Mineral Products Co. processed perlite and vermiculite from deposits in Western States in Omaha. Omaha Brick Works produced miscellaneous clay for manufacturing building brick and other heavy clay products.

**Dundy.**—One of the new oilfields discovered in 1960 was in Dundy County. Seven exploratory wells were completed. The discovery well at the Pierce Lake field, completed in November, pumped 203 barrels of oil a day from the Lansing-Kansas City (Pennsylvanian) formation at a depth of 4,138 feet. Two offset wells were successful, but no production was recorded for 1960.

**Garden.**—Petroleum production from the McCord and Richards fields was 14 percent below that of 1959. No drilling was done in the county during the year. Oshkosh Sand & Gravel produced building, paving, and fill sand. Sand and gravel for building and paving was produced for State, county, and city highway departments.

**Hall.**—Nine operators produced sand and gravel for building, paving, and fill. A small quantity of engine sand also was produced. Major operators were Luther & Maddox, H & M Equipment Co., Inc., Third City Sand Co., and Armour Construction Co. The Sierra Talc Co. plant in Grand Island ground crude talc from deposits in California and Montana.

**Hitchcock.**—Petroleum production from 38 wells in 3 fields increased nearly fourfold over that of 1959. In July and August the North Fork and the Culbertson fields, respectively, were discovered from the 12 exploratory wells completed. North Fork initial production was 48 barrels a day on pump from the Lansing-Kansas City formation at a depth of 4,060 to 4,064 feet. The Culbertson discovery well pumped 288 barrels of oil a day from the Lansing-Kansas City formation at a depth of 3,765 to 3,902 feet. At the Culbertson field, which may develop into a major producer, the State Oil and Gas Conservation Commission temporarily established an 80-acre well-spacing pattern as a means of observing the effects of wide well spacing on the yield of newly discovered fields. The Burr Oak and

Digitized by Google

Frakes fields, discovered in 1958 and 1959, respectively, were combined with the Reiher field, a 1959 discovery. The only other production came from the one-well Hudson field, a 1958 discovery. Development drilling, all in the Reiher area, added 22 new producers. One unsuccessful well was drilled just north of the field.

**Jefferson.**—Endicott Clay Products Co. mined miscellaneous clay for manufacturing building brick and other heavy clay products. Sand and gravel for building, paving, fill material, and other uses was produced by Consolidated Sand & Gravel Co., R. M. Weblemoe Co., and Steele Bros. Total sand and gravel production was 278,000 tons.

**Kimball.**—The county led in petroleum production and in value (30 percent) of all mineral production. Petroleum output, from 766 wells in 111 fields, was 7 percent above that of 1959. Exploratory and development drilling was extensive, but at a lower rate than in 1959. Of 92 exploratory wells completed, 9 were successful. Completed in April, the discovery well of the Haussner field near the western border of the county pumped 276 barrels of oil a day from the J sandstone at a depth of 7,176 to 7,180 feet. A step-out well 1 mile to the southeast, also completed in April, pumped 245 barrels of oil a day from the J sandstone in an open hole at a depth of 7,213 to 7,221 feet. Offset wells to the north and southeast were abandoned. The Euchre field, discovered in February, 2 miles northeast of the Haussner, had an initial production of 600 barrels of oil a day on pump from the J sandstone at a depth of 7,007 feet. Offset wells to the east, south, and west were abandoned, but an offset to the north pumped 205 barrels of oil a day from a 2-foot interval in the J sandstone. The Hilltop field north of Kimball was discovered in June. The discovery well pumped 260 barrels of oil from the J sandstone at a depth of 6,411 to 6,419 feet. An offset well to the west pumped 123 barrels of oil a day. The Malcolm field, discovered in September, directly west of the Hilltop, initially produced 240 barrels of oil a day on pump from the J sandstone at a depth of 6,420 feet. Three confirmation wells were failures. The Alpha field, southeast of the Cornils field, was discovered in October; its beginning production was 237 barrels of oil a day from the J sandstone at a depth of 7,004 to 7,018 feet. An offset well to the west and a step-out well to the northwest were failures. The Bravo field, discovered 2 miles east of the Alpha in August, initially produced 14 barrels of oil a day from the J sandstone at a depth of 6,872 to 6,875 feet. The Yukon field, discovered in October, southwest of the Russell field, pumped 181 barrels of oil a day from the J sandstone at a depth of 7,126 to 7,128 feet. Other discoveries and beginning production rates were the Apatite field, discovered in October, 62 barrels of oil a day on pump from the J sandstone; the Wewoka field, discovered in February, 141 barrels of oil a day on pump from the J sandstone; and an unnamed field, discovered in December, 40 barrels of oil a day on pump from the J sandstone.

Development drilling resulted in 55 new producing wells. Three fields, discovered in 1959, had considerable success. At the Russell field, eight wells were completed along the southern end; five wells

Digitized by Google

that failed were completed to the east, south, and west. Development added 4 producers and 4 failures to the Painter field in the central part of the county, and at the Brook field 12 new producers were completed. At the Southwest Potter field, discovered in 1951 in Kimball and Cheyenne Counties, five new oil wells were completed. Two to three new producers, each, were completed at the Cabella, Cornils, Fernquist, Fifer, Hill, Houtby, and Simpson fields.

Oil-well gas from fields in Kimball and Banner Counties was processed at the Kimball and Banner gasoline plants near Kimball by Antelope Gas Products Co. Natural gas liquids (natural gasoline, butane, and propane) were recovered, and residual gas was marketed through pipelines. Combined daily capacity of the plants was 17.5 million cubic feet of gas, and average daily throughput was 15.4 million cubic feet. Wilson Brothers, Inc., produced building and fill gravel.

**Lancaster.**—Yankee Hill Brick Manufacturing Co. produced miscellaneous clay for manufacturing building brick and other heavy clay products. Schwarck Quarries, Inc., produced dimension limestone (rubble) for building and crushed limestone for concrete aggregate, road building, and agricultural use.

**Morrill.**—Petroleum production from 60 wells in 11 fields was 19 percent below that of 1959. Exploratory drilling resulted in the discovery of four new fields. The Cutthroat field (discovered in July), about a mile north of the Cheyenne County line, initially produced 262 barrels of oil a day from the J sandstone at a depth of 5,230 to 5,234 feet. The Matador field, discovered in July, pumped 512 barrels of oil a day from the J sandstone at a depth of 5,110 to 5,112 feet. An offset well to the east was a failure. Beginning production from an unnamed field, discovered in December, 1 mile southeast of the Lindberg, was 263 barrels of oil a day on pump from the J sandstone at a depth of 5,254 to 5,270 feet. The most significant discovery was the Dunlap field, 5 miles northeast of the Craig field. The discovery well, completed in February, pumped 209 barrels of oil a day from the D sandstone at a depth of 4,120 to 4,123 feet. An offset well to the south pumped 309 barrels of oil a day; a third well pumped 465 barrels of oil a day. Offset wells to the east, north, and west were failures.

Development drilling, resulting in 23 new producers, was almost entirely in the Waitman field (18 new wells), discovered in 1957, and at the Lane field. Lyman-Richey Sand & Gravel Corp. produced building and paving sand and gravel at its No. 23 plant.

**Nemaha.**—Crushed and broken limestone for riprap, concrete aggregate, road construction, and agriculture was produced by Colaska Production Co. and Nelson Quarries, Inc.

**Nuckolls.**—Portland and masonry cements were produced at the Superior plant by Ideal Cement Co. Cement rock used at the plant was mined by the company at a quarry in Jewell County, Kans. The plant operated near capacity for 323 days. Portland cement clinker was used as a base in manufacturing masonry cement. C. F. Bondegard and the Estate of George K. Werner produced paving gravel.

615629—61——41

Digitized by Google

**Red Willow.**—Petroleum production from 63 wells in 5 fields increased from 13,000 to 553,000 barrels of oil, nearly a 43-fold gain over that of 1959. Probably the most important discovery in the State was the production of oil from the Reagan (Cambrian) formation in the Sleepy Hollow field. The discovery well, completed in July, pumped 144 barrels of oil a day from a depth of 3,418 to 3,422 feet. The field is 7 miles northeast of the Ackman field, discovered in 1959. Additional wells were drilled, and by the end of the year there were 19 producing wells; the average daily production from the field was 454 barrels. At the Ackman field, 46 successful wells were drilled, and production at yearend exceeded 2,000 barrels a day. Producing formations in the Ackman field were the Lansing-Kansas City and Oread of Pennsylvanian age; the latter was a new producing horizon. The Silver Creek field, 2 miles south of the Sleepy Hollow field, was discovered in July, and initial production was 47 barrels of oil a day from the Lansing-Kansas City formation. Sand and gravel for building, paving, and fill was produced by Davidson-Merritt Sand & Gravel Co., Midwest Sand & Gravel Co., and McCook Sand and Gravel Co. Contractors produced building and paving sand for the Federal Bureau of Reclamation.

**Richardson.**—Petroleum production from the Barada, Dawson, Falls City, and Snethen fields increased slightly over that of 1959; and one successful development well was completed. Harmon Gravel Co. and the county highway department produced paving gravel. George W. Kerford Quarry Co. produced crushed and broken limestone for riprap and road construction.

**Sarpy.**—The county ranked fourth in the production of sand and gravel and fifth in crushed stone. Building and paving sand and gravel, railroad ballast, and fill sand were produced by the Lyman-Richey Sand & Gravel Corp. Nos. 2 and 7 plants, Richfield Sand and Gravel Co., and Thomas Construction, Inc. Contractors produced paving sand and gravel for the State and county highway departments. Total production was 834,300 tons. Crushed and broken limestone for riprap and road construction was produced by Stone Products, Inc., and by contractors for the State highway department.

**Scotts Bluff.**—Petroleum production from two fields increased more than sixfold over that of 1959. Production came from the Vessels field (discovered in 1957 and renamed the Cedar Canyon) and the Roubadeau field (discovered in January). The discovery well pumped 170 barrels of oil a day from the J sandstone at a depth of 5,667 to 5,670 feet. This discovery was the most northerly producer in western Nebraska. An offset well to the north and a step-out well to the southwest were abandoned. The Consumers Cooperative Refinery Association operated its refinery at Scottsbluff. Throughput was 901,520 barrels of crude oil, a slight decrease from 1959. Crude oil came from fields in Banner County and southeastern Wyoming. Eisele Concrete Products Co. produced building sand and gravel, and contractors produced paving gravel for the county highway department.

# The Mineral Industry of Nevada

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Nevada Bureau of Mines.**

By L. E. Davis,[1] R. Y. Ashizawa,[2] and L. Giorgetti[2]

THE TOTAL VALUE of 1960 mineral production in Nevada was $80.3 million, a gain of more than $10 million. This value had been exceeded in only 4 other years, 1954 through 1957. The gain was attributed to a strike-free metal-mining industry that produced 20,000 tons more copper than in 1959. The value of this increase in copper output more than offset declines in value of 5 other

**TABLE 1.—Mineral production in Nevada [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Antimony ore and concentrate short tons, antimony content | 10 | $2 | | |
| Barite short tons | 91,298 | 623 | 85,711 | $580 |
| Copper (recoverable content of ores, etc.) do. | 57,375 | 35,228 | 77,485 | 49,745 |
| Fluorspar do. | 16,745 | 407 | 18,505 | 388 |
| Gem stones | (2) | 100 | (2) | 100 |
| Gold (recoverable content of ores, etc.) troy ounces | 113,443 | 3,971 | 58,187 | 2,037 |
| Gypsum thousand short tons | 818 | 2,738 | 802 | 2,721 |
| Iron ore (usable) thousand long tons, gross weight | 698 | 3,712 | 734 | 3,648 |
| Lead (recoverable content of ores, etc.) short tons | 1,357 | 312 | 987 | 241 |
| Manganese ore (35 percent or more Mn)[3 4] short tons, gross weight | [5] 56,611 | [5] 3,918 | 49,076 | 3,301 |
| Manganiferous ores (5 to 35 percent Mn) do. | 200 | (6) | (6) | (6) |
| Mercury 76-pound flasks | 7,156 | 1,628 | 7,891 | 1,648 |
| Petroleum (crude) thousand 42-gallon barrels | 32 | (6) | [7] 25 | (6) |
| Sand and gravel thousand short tons | 6,436 | 7,522 | 4,685 | 5,224 |
| Silver (recoverable content of ores, etc.) thousand troy ounces | 611 | 553 | 707 | 640 |
| Stone thousand short tons | 840 | 1,587 | 579 | 1,370 |
| Talc and soapstone short tons | 5,824 | 50 | 4,882 | 30 |
| Zinc (recoverable content of ores, etc.) do. | 217 | 50 | 420 | 108 |
| Value of items that cannot be disclosed: Brucite (1959), clays, diatomite, lime, magnesite, molybdenum concentrates (content), perlite, pumice (volcanic cinder), salt, sulfur ore, tungsten concentrate (60-percent $WO_3$ basis), uranium ore, and values indicated by footnote 6 | | 8,458 | | 9,091 |
| Total Nevada [8] | | [5] 70,164 | | 80,285 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Weight not recorded.
[3] Includes concentrates and nodules.
[4] Quantity and value of low-grade shipments to custom mills not included.
[5] Revised figure.
[6] Figure withheld to avoid disclosing individual company confidential data.
[7] Preliminary figure.
[8] Total adjusted to eliminate duplicating value of limestone used in manufacturing lime.

Digitized by Google

metals, 10 nonmetals, and crude petroleum. The metal commodities as a group rose in quantity and value about 25 percent, compared with 1959. In addition to an important increase in copper production, outputs of molybdenum concentrate and uranium ore reached record highs in both quantity and value. The number of flasks of mercury recovered and shipped in 1960 was the largest on record, but the value was exceeded in both 1955 and 1958, years in which a relatively high production was accompanied by a correspondingly high unit price. Only three of the nonmetals produced in 1960 displayed advances in both quantity and value. Two of the three, lime and diatomite, set new records and the third, salt, had greater production and value in only one previous year, 1957. In that year major strikes occurred in the salt industry in California; resulting in an abnormally high output in Nevada.

There were several significant developments during 1960. Extensive exploration for iron and copper ores occurred in Churchill and Pershing Counties by Southern Pacific Co. (iron) and Columbia Iron Mining Co. (iron); in Lyon County by Bear Creek Mining Co. (copper), Columbia Iron Mining Co. (iron) and Utah Construction and Mining Co. (iron); in Mineral County by Pacific States Steel Corp. (iron); and in White Pine County by Bear Creek Mining Co. (copper). A new iron property, the Barth mine in Eureka County, went into production late in the year. The Anaconda Company started construction on a 5,000-ton-a-day (2 section) sulfide flotation plant and took a 2-year option on 103 claims of the Mt. Wheeler mine and adjoining Jeppson claims, White Pine County. These claims will be explored for beryllium minerals supplementary to the exploration previously completed by Beryllium Resources, Inc. Construction was begun on a fertilizer plant at Caselton, Lincoln County, utilizing old tailings from the idle Combined Metals Reduction Co. lead-zinc mill. The Ruby Hill Mining Co. was formed in a joint venture to further test the Richmond-Eureka mine, Eureka County. One of the participants, Newmont Mining Corp., was to manage the deep drilling program. Open-pit mining was begun at the Merrimac antimony claims in Taylor Canyon, White Pine County, by Nokai Dome Oil Co. A multimillion dollar project was programed that would include a 4,500- to 5,000-ton-a-day mill, a lime plant, and a major water supply for the mill at a site near the Mineral County operations of Argentum Mining Co.

**Employment and Injuries.**—Employment statistics collected and compiled by the Federal Bureau of Mines in cooperation with the Nevada State Inspector of Mines disclosed virtually no change in overall employment in the mineral industries, compared with 1959. However, the number of man-hours worked generally followed production values in the commodity groups, up 23 percent in the metals group (production-value increase of 25 percent) and off 13 percent in the nonmetals group (production-value drop of 10 percent).

Fatal injuries were down 50 percent from the preceding year, nonfatal lost-time injuries dropped 14 percent, and total injuries per thousand workers dropped 16 percent. By commodity groups, injuries did not follow the man-hour trend as total injuries for metal mining declined 31 percent and those for nonmetal mining rose 15

Digitized by Google

percent. One fatality occurred that was charged to a metal mine when employees leaving work in a company truck collided head-on with another vehicle. An employee died as a result of injuries sustained in the accident. Three fatalities occurred at nonmetal operations. An employee working in a stone quarry was killed when struck on the head by a rock. A truck driven by an employee of a rock-products company was struck by a train, killing the driver. An electrician was killed when he fell through a manway in a flotation plant where mechanics were installing a pump.

**TABLE 2.—Employment and injuries in the mineral industries[1]**

| Industry | 1959 | | | | 1960 | | | |
|---|---|---|---|---|---|---|---|---|
| | Employees | Injuries | | | Employees | Injuries | | |
| | | Fatal | Nonfatal | Total | | Fatal | Nonfatal | Total |
| Metal mining | 2,977 | 6 | 94 | 100 | 3,201 | 1 | 68 | 69 |
| Nonmetallic mining and quarrying | 1,622 | 2 | 45 | 47 | 1,397 | 3 | 51 | 54 |
| Total | 4,599 | 8 | 139 | 147 | 4,598 | 4 | 119 | 123 |

[1] Excludes mineral fuels. Data collected and compiled by the Federal Bureau of Mines in cooperation with the Nevada State Inspector of Mines.

Average weekly earnings per employee that were reported by the Nevada Employment Security Department rose from $111.97 in December 1959 to $114.54 in December 1960. The average work-week dropped from 42 hours 54 minutes to 41 hours 36 minutes for the same period.

**Consumption, Trade, and Markets.**—Except for Ormsby County where mineral production was confined to volcanic cinder and sand and gravel, both metal and nonmetal commodities were reported from each Nevada county. The output of clays, volcanic cinder, salt, sand and gravel, stone (except limestone), and tungsten concentrate was totally consumed within the State. Most of the gypsum and limestone, and some of the perlite, was consumed by Nevada industries; the remainder was further processed for out-of-State consumers. Nevada had only one smelter (copper) and no refineries. Therefore, most metal ores were concentrated or beneficiated before shipment. The concentrates and residues produced, together with many ores, were consigned to mills and smelters outside the State or sold directly to consumers. Producers of iron ore and concentrate, magnesite and magnesia products, crude perlite, and diatomite were favored with a relatively good export trade in 1960. At Henderson, Clark County, Titanium Metals Corp. of America imported titanium minerals, from which the metal and its alloys were produced. American Potash & Chemical Corp. imported manganese ores that were treated to obtain electrolytic manganese dioxide, and Stauffer Chemical Co. utilized salt from sources in California to produce chlorine and caustic soda.

**Legislative and Government Programs.**—Several sections of the Nevada State Mining Laws were revised by the Nevada State Legislature and became effective in 1960. Section 517.040, which was amended effec-

| County and contractor | Property | Commodity | Contract | | |
|---|---|---|---|---|---|
| | | | Date | Total amount | Government participation (percent) |
| **Elko:** John H. Uhalde | Aladdin | Copper-lead | Apr. 29, 1957 | $62,610 | 50 |
| **Esmeralda:** Gold Eagle Mines, Inc. | Gold Eagle | Lead-zinc | May 18, 1960 | 20,660 | 50 |
| **Lincoln:** Southpaw Joint Venture | Southpaw | Manganese | Dec. 27, 1957 | 12,852 | 75 |
| **White Pine:** Hamilton Corp | Hamilton | Lead-zinc-copper. | June 18, 1958 | 37,520 | 50 |

Center emphasized research in the rare and precious metals groups, but of primary interest in Nevada was the continuing program in the electrowinning of tungsten and molybdenum. Studies on the electrorefining of these two metals were in progress at the Boulder City Research Laboratory.

The Bureau's mining research activity in Nevada stressed rock slope stability and subsidence research, and in situ measurements and instrumentation and photoelastic investigations at open pit copper mines in White Pine County. Late in the year a tie-in survey was made of the borehole and underground workings at the Atomic Energy Commission (AEC) Nevada test site, Mercury, Nev.

Bureau of Mines resources work conducted in 1960 encompassed the collection and dissemination of statistics on minerals and accidents in Nevada in cooperation with State agencies. Resource investigations included: The mercury potential of Nevada (as a part of the total domestic potential); beryllium and other rare metals studies; and the beginning of a survey of chemical (mineral) raw materials and the clay resources of Nevada. The last study was being conducted in cooperation with the Nevada Bureau of Mines.

## REVIEW BY MINERAL COMMODITIES

### METALS

**Antimony.**—The only production of antimony during 1960 was from the Nokai Dome Oil Co. property in the *Taylor* mining district, White Pine County. A small tonnage of ore was treated in its 30-ton capacity furnace and baghouse plant; the resultant antimony oxides were shipped to a Los Angeles, Calif., manufacturer for use as a paint pigment.

Property in the *Big Creek* mining district, Lander County, were inactive during the year. Mine development was in progress at the White Caps mine near Manhattan, Nye County, but no antimony ore was shipped.

**Beryllium.**—In March 1960, Beryllium Resources, Inc., Salt Lake City, Utah, completed exploration and relinquished its lease on the Mt. Wheeler mine in the Snake Range, about 40 miles southeast of Ely, White Pine County. Work included about 11,000 feet of under-

Digitized by Google

ground diamond drilling and 700 feet of drifts, crosscuts, and raises. About 2,000 tons of development ore which averaged 0.5 percent BeO, was stockpiled at the mine. The beryllium minerals, phenacite, bertrandite, and beryl, occur in a favorable limestone bed along and at the intersection of fissures that strike northeast, and quartz veins that trend from east to west.

During December, The Anaconda Company acquired a 2-year option on 103 claims of Mt. Wheeler Mines, Inc., and 16 claims of the adjoining Jeppson group. The company planned extensive underground exploration and development of the known beryllium bearing zones and an investigation of the entire area to determine the extent of the beryllium mineralization. The Bureau of Mines Salt Lake City Metallurgy Research Center continued concentration tests on the complex Mt. Wheeler ores.

Beryllium Associates, Salt Lake City, Utah, acquired a lease on the Leavitt group of 36 claims in the Virgin Mountains, about 14 miles south of Mesquite, Clark County, and began an investigation of the beryl and chrysoberyl-bearing pegmatite dikes during October through December.

**Copper.**—A 35-percent increase in 1960 in the recoverable copper output, compared with 1959, resulted from uninterrupted strike-free production. The copper properties of Kennecott Copper Corp. (White Pine County), The Anaconda Company (Lyon County),

[4] Includes Douglas, Esmeralda, Eureka, Nye, Storey Counties, and counties indicated by footnote 2.

Bristol Silver Mines Co. (Lincoln County), and the Copper Canyon group of claims (Lander County) were the source of virtually all the copper recovered from ores mined within the State. Although 26 active mines contributed to the total copper output, only 10 were classified as copper mines. Kennecott Copper Corp. mined only at its Liberty pit, but stockpile withdrawals were made from ore previously mined at the Tripp and Veteran pits. The company removed nearly 18 million tons of waste from the Liberty pit in mining 7.5 million tons of ore. Over 8,000 feet of churn drilling was done during routine exploration and development work in the Liberty pit area. Anaconda leached newly mined crude ore and ore stockpiled in 1959. The company shipped copper precipitates that had been produced in 1959 when labor strikes closed its smelting facilities to its Montana smelter. Approximately 5.5 million tons of waste was stripped from the pit area and more than 4 million tons of copper ore was mined. Exploration and development included over 2,000 feet of diamond drilling and about 50,000 feet of rotary drilling. Bristol Silver Mines Co. completed over 1,200 feet of long hole drilling

Digitized by Google

and more than 1,600 feet of drifts and raises in exploration, which resulted in nearly 7,600 tons of development rock. In 1960 Kennecott Copper regained the position of major Nevada copper producer, followed by Anaconda and Bristol Silver Mines Co.

**Gold.**—Total gold output in Nevada was nearly 50 percent less than in 1959. Placer gold recovery declined 98 percent, attributed to the closing of the Round Mountain dredging operation, Nye County, in December 1959. Nine placer properties and one sand and gravel

**TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in 1960, by classes of ore or other source materials, in terms of recoverable metals**

| Source | Number of mines [1] | Material sold or treated (short tons) | Gold (troy ounces) | Silver (troy ounces) | Copper (pounds) | Lead (pounds) | Zinc (pounds) |

Digitized by Google

operation reported gold recovery in 1960. The more than 10,000-ounce increase in lode gold output was not enough to offset the decline in placer recovery. About 70 percent of the lode gold was recovered in treating copper ores and concentrates, which were credited with the entire increase. Only one-fourth of the total 1960 recoverable lode gold was derived from gold ores. The Goldacres open-pit gold mine, Lander County, continued to lead in production of lode gold. Of all other lode mines in Nevada, only the Diamond-Excelsior lead mine, Eureka County, contributed appreciably to the remaining 5 percent of recoverable lode gold.

**Iron Ore.**—Production and shipments of iron ores and concentrates rose 8 and 5 percent, respectively, above 1959 tonnages. This increase was stimulated by the rising demands of Japanese steel mills. Nearly 68 percent of the direct shipping ores mined and 94 percent of all concentrates produced were consigned for export. Although direct shipping ore production and shipments increased 23 percent, the tonnage of iron ore received at concentrators was 2 percent lower. Shipments of concentrates dropped 6 percent, primarily as the result of negotiations between Mineral Materials Co. and Columbia Iron Mining Co., beginning in May and culminating in December with the sale of the Buena Vista mine and plant, Churchill County. The mine and plant were operated at reduced tonnage May through September and then closed. Only one other concentrator was operated—at the Minnesota mine in Douglas County by Standard Slag Co.

Of 13 active iron properties, the Iron King in Humboldt County was the only underground operation. In production for the first time in 1960, the Barth mine in Eureka County was the sole producer of hematite ore. All others were open pit mines that produced magnetite ores.

Some of the considerable exploration for iron ore conducted during the year began in 1959 or before. Utah Construction and Mining Co. explored the Dayton area, Lyon County; Columbia Iron Mining Co. explored the area near the juncture of Douglas, Lyon, and Ormsby Counties; Seaforth Nevada Corp. carried out geophysical surveys in the Brunswick Canyon area, Ormsby County; Pacific States Steel Co. pursued a drilling program near Hawthorne, Mineral County; the W. G. Austin interests tested two iron prospects near Luning, Mineral County; and the Southern Pacific Co. continued an extensive exploration program in the Buena Vista area of Churchill and Pershing Counties.

**Iron and Steel Scrap.**—Ferrous scrap consumption, including shredded detinned cans of The Anaconda Company copper leaching plant, Lyons County, decreased 7 percent from 1959. Home scrap produced was down 11 percent to 8,500 tons, 21 percent of consumption. Purchased scrap received remained constant at 35,000 tons, 87 percent of consumption.

**Lead.**—Recoverable lead production was 370 tons less than in 1959, declining more than 27 percent. Of the total lead produced, 85 percent was recovered from lead ores, 8 percent from copper ores, 5 percent as a residue resulting from treating manganese ores, and 2 percent from all other primary sources. Three lead mines in Elko County, one each in Eureka and White Pine Counties, and a copper mine in

Digitized by Google

Lincoln County were sources of more than three-fourths the lead produced. Thirty-six mines contributed to the total output. The major producers, with more than 100 tons each, were the Delno and Rosebud mines, Elko County; the Diamond-Excelsior, Eureka County; and the Hamilton, White Pine County.

During extensive exploration and development, ore was stockpiled at the Gold Note mine in Elko County, the LSZ property in Lincoln County, and the New Potosi mine in Mineral County. The exploratory work consisted principally of drifts and raises but included several hundred feet of longhole drilling.

**Manganese.**—The Clark County properties of Manganese, Inc., were the only source of manganese ore and concentrate in Nevada in 1960. The company mined ore from underground and open-pit deposits and concentrated and nodulized it in a nearby plant before shipment. Shipments, all to General Services Administration (GSA), were about 12 percent below the tonnages reported in 1959. During the year the company completed a substantial amount of development that included shaft sinking, drifting and crosscutting, and about 5,000 feet of rotary drilling. More than 8,000 tons of development rock was produced from underground exploration, and over 400,000 tons resulted from surface work. At Henderson, American Potash & Chemical Corp. produced electrolytic manganeses dioxide (battery grade) from ores mined in Mexico.

**Mercury.**—Nearly 2 percent less mercury ore was mined than in 1959, but 4 percent more tonnage was treated to recover the metal. Furnaced and retorted ores averaged 0.5 and 1 pound higher, respectively, than in 1959. Production rose 9 percent, shipments increased 16 percent, and yearend stocks were up nearly 73 percent. Twenty properties in 7 counties were the source of the total output, but 3 mines in Humboldt County yielded 90 percent of production and shipments. One of the three, the Cordero mine, was the major mercury producer in the State and the second largest in the nation. Five mines, 2 in Humboldt County and 1 each in Esmeralda, Nye, and Pershing Counties, yielded more than 100 flasks during 1960.

**TABLE 8.—Mercury production by methods of recovery**

| Year | Direct-furnaced | | Retorted | | Unclassified,[1] flasks | Total | | Operating mines |
|---|---|---|---|---|---|---|---|---|
| | Ore (short tons) | Flasks | Ore (short tons) | Flasks | | Flasks | Value[2] | |
| 1951–55 (average) | 25,481 | 3,662 | 754 | 116 | 2 | 3,780 | $921,664 | 17 |
| 1956 | | | | | | 5,859 | 1,522,871 | 51 |
| 1957 | 111,088 | 16,609 | 30,083 | 2,846 | 53 | 6,313 | 1,559,185 | 45 |
| 1958 | | | | | | 7,336 | 1,680,384 | 35 |
| 1959 | 92,669 | 13,268 | 11,329 | 1,709 | ---------- | 7,156 | 1,627,847 | 20 |
| 1960 | | | | | | 7,821 | 1,648,354 | 20 |

[1] Includes mercury recovered from miscellaneous dump material.
[2] Value calculated at average New York price.

**Molybdenum.**—Production of molybdenite concentrate in 1960 was limited to the byproduct output from copper ores mined by the Kennecott Copper Corp. in the Robinson district, White Pine County, and recovered in its nearby concentrator. Production was con-

Digitized by Google

siderably higher in 1959 when work was interrupted by strikes. The entire output was shipped to an out-of-State consumer.

**Silver.**—Production of recoverable silver rose 16 percent above 1959. The 99-percent decline in placer silver output, due to the closing of the Round Mountain mine, was more than offset by increased lode silver production. Recovery from silver ores was over 45 percent of the total lode silver output; byproduct recovery from the treatment of copper ores, 38 percent; from lead ores, 15 percent; and from all other lode mine sources, less than 2 percent. Four mines: The Liberty pit (copper ore) in White Pine County, the Mohawk (silver ore) in Esmeralda County, the Mt. Diablo (silver ore) in Mineral County, and the Bristol (copper ore) in Lincoln County, supplied more than 78 percent of the total lode silver recovered.

**Tungsten.**—Tungsten ore production was limited to 4 mines, only 1 of which yielded as much as 50 tons of crude ore. However, six producers shipped to the tungsten carbide plant of Nevada Scheelite Division, Kennametal, Inc., near Rawhide, Mineral County. Nevada Scheelite also purchased concentrates produced out-of-State and consumed its own stocks produced in previous years. Most of the tungsten concentrates produced and shipped in 1960 were recovered from ore mined at the Quick group of tungsten claims in the Fondaway Canyon area, Churchill County. A few tons of ore was mined and treated at a nearby tungsten prospect, but the property was abandoned after a test run. Stockpiled ore was treated at the Hilltop group, Churchill County, and the concentrate shipped. Relatively small tonnages of tungsten ores were mined and treated at two properties in the Paradise Peak area, Nye County, but shipments were made by only one producer. Shipments of tungsten concentrates to Nevada Scheelite depleted stocks at the Slim Pickens group, Mineral County, and materially reduced those held at the Minerva mine, White Pine County.

**Uranium.**—Commercial uranium ore was consigned to Oregon and Utah processing plants by four producers, two each in Elko and Lander Counties. The tonnage shipped was more than 3 times that in 1959, and although the average $U_3O_8$ content was 46 percent less, the total value rose over 54 percent.

**Zinc.**—The reported increase of nearly 94 percent in output of recoverable zinc, compared with 1959, was furnished principally through reactivation of the Willard zinc mine, White Pine County, and the Mountain View group of zinc claims, Eureka County. The Willard had been inactive since 1953 and the Mountain View group since 1956. More than 90 percent of the zinc production was recovered from ores of 6 mines: Zinc ores from the above mentioned mines; copper ore from the Bristol mine, Lincoln County; and lead ores from the Diamond-Excelsior in Eureka County, the Hamilton in White Pine County, and the Delno in Elko County.

**Other Metals.**—At the Overlook group of claims, a cobalt-nickel prospect near Battle Mountain, Lander County, only assessment work was done in 1960, consisting primarily of rehabilitating a tunnel and advancing the face a few feet. Two other nickel prospects, the Niganz in Eureka County and the Ludwig in Lyon County, were abandoned.

Some activity, consisting of shaft sinking and annual assessment

Digitized by Google

work, was reported at the Glasco columbium-tantalum claims in the Denio area of Humboldt County, Exploration and development work at the Rainbow group of claims (titanium minerals) in the *Northumberland* district, Nye County, included shaft sinking, rotary drilling, and trenching. At the Myrtle mine, a rutile prospect in Hungry Valley, Washoe County, shaft sinking and drifting was done in completing assessment work. This property was also prospected for mica.

No activity was reported from the tin prospect in the Rabbit Hole district of Pershing County. Considerable exploration work was done by rotary drilling (5,900) feet and trenching (300 feet) at a vanadium prospect (Siskon vanadium mine) in the west edge of the *Fish Creek* district, Nye County. A nearby property, the scene of considerable drilling in 1959, was abandoned in 1960. The proposed beneficiation plant for treating zircon ore, which was to be built near Caliente, Lincoln County, did not materialize.

## NONMETALS

**Barite.**—The tonnage of crude barite mined was nearly double the 1959 figure, but shipments were down 6 percent and yearend stocks were 5 times the quantity reported at the close of 1959. The total output was supplied by 8 deposits in 4 counties with major production from the Rossi mine, Elko County, and the Mountain Springs property, Lander County. The State's only grinding plant, at Battle Mountain, crushed and ground crude barite mined from Nevada deposits. The plant product was shipped to the producer's out-of-State compounding plants and prepared for use in well-drilling muds. California grinders received all crude shipments.

**Brucite and Magnesite.**—Standard Slag Co. and Basic, Inc., mined magnesite from deposits in the Gabbs area, Nye County, and fired the mineral in nearby plants, producing caustic-calcined and refractory magnesias and various refractory products. Basic, Inc., upgraded magnesite by flotation, and brucite by heavy-medium separation. No brucite was mined in 1960, all shipments being made from beneficiated stockpile ore. Production of magnesite and shipments of brucite and magnesite were about 7 percent below 1959 figures.

**Clays.**—The quantity of clays sold or used was moderately below the 1959 figure. Clay pits were worked and stockpile withdrawals were made during the year for fuller's earth in Lyon County, bentonitic clay in Nye County, and fire and miscellaneous clays in Washoe and White Pine Counties. All of the fuller's earth and bentonitic clay was shipped to processors in California. Fire clay and miscellaneous clay were utilized within the State for furnace mortar and for refractory and building brick. Reno Press Brick Co., Reno, continued to lead in clay production.

**Diatomite.**—The quantity and value of Nevada diatomite production increased appreciably compared with 1959. Much of the increase was attributable to the development of a new pit of filter-grade diatomite by the Eagle-Picher Co., supplementing the output from its mine in Pershing County which began production in 1958. Five open-pit operations, one each in Churchill, Esmeralda, Lincoln, Pershing, and

Digitized by Google

Storey Counties, were the source of all diatomite mined. Preparation plants were operated in conjunction with open-pit mines in Esmeralda, Pershing, and Storey Counties. Crude material from a Churchill County deposit was processed in the producer's Lyon County plant. Prepared material was sold for filtration, insulation, abrasives, fillers, and other uses to paint and insecticide manufacturers, nitrate fertilizer producers, poultry supply dealers, and other chemical companies in the United States, Canada, Europe, South Africa, and South America. A small quantity of the crude mineral was sold to a California consumer for use as a soil conditioner and stock feed supplement.

**Fluorspar.**—The tonnage of crude fluorspar ore shipped to consumers in Nevada increased slightly over 1959 with principal production from the Crowell and Goldspar properties near Beatty, Nye County. Metallurgical-grade fluorspar from the Crowell mine was shipped to California steel plants. Crude fluorspar from the Goldspar mine was utilized in the producer's California cement plant. The Carp mine, Lincoln County, shipped a moderate tonnage of metallurgical-grade fluorspar from its stockpile to a California steel plant. Annual assessment work was completed on properties in Churchill, Clark, Lander, Pershing, and Nye Counties.

**Gem Stones.**—Significant quantities of gem material were gathered in Nevada by individual collectors, mineralogical clubs, and commercial producers. The yield of gem material was mostly wonderstone, which was collected in the Fallon area, Churchill County. The Lone Mountain Turquoise mine in the Lone Mountain area, Esmeralda County, a property in the Cortez District, Lander County, and the Turquoise Bonanza mine on the east slope of Pilot Mountain, Mineral County, were the sources of most of the State's turquoise output. Collectors reported appreciable quantities of petrified wood gathered in Churchill, Humboldt, and Nye Counties. Reports of noteworthy quantities of other gem materials collected included agate in Churchill, Elko, and Lyon Counties; opal in Humboldt, Lyon, and Pershing Counties; quartz crystals in Lyon and Washoe Counties, and jasper and black jade in Lyon County.

**Gypsum.**—Production of crude gypsum, which declined 2 percent in quantity from 818,000 tons in 1959 to 802,000 tons in 1960, was affected only slightly by the relatively lower demand for building materials in California, the principal market for Nevada's gypsum and gypsum products. A moderate tonnage of uncalcined gypsum continued to be sold for portland cement retarder and for agricultural use. The remainder of the crude output was processed at calcining plants in Nevada and California. The Blue Diamond Co. (division of the Flintkote Co.) quarry and plant in Clark County, was Nevada's principal producer of crude and calcined gypsum. The United States Gypsum Co. quarried in Pershing County and produced calcined products at its nearby plant at Empire in Washoe County. Fibreboard Paper Products Corp. shipped crude gypsum from its Clark County quarry to company plants at Los Angeles and Newark, Calif.

**Lime.**—Quicklime and hydrated lime output at plants in Clark and White Pine Counties gained 20 percent in quantity, compared with 1959. Output of metallurgical-grade lime, the principal product of

Digitized by Google

these plants, furnished virtually the entire increase. Other grades of lime were produced for the building trade as well as for water purification and softening, glass, agriculture, and insecticides. Some of the hydrated lime was consumed within the State, but most of the lime was shipped to other Western States including Hawaii. A new lime plant was under construction near Coaldale, Esmeralda County, to supply high calcium metallurgical lime required for mineral processing at the Argentum Mining Co. silver ore leaching operation.

**Perlite.**—Production of crude perlite decreased again in 1960, as demand by the building industry lessened. Three mines, two in Lincoln County and one in Pershing County, furnished the total yield. Expanded perlite was supplied by plants in Washoe and Clark Counties. A large percentage of the Nevada crude perlite was shipped to consumers in other States and Canada.

**Pumice (Volcanic Cinder).**—A decline in construction activities contributed to a moderate decrease in the output of volcanic cinder, compared with 1959. Production was limited to deposits in three

**TABLE 9.—Sand and gravel sold or used by producers, by classes of operations and uses**

| Class of operation and use | 1959 | | 1960 | |

[2] Includes figures for State, counties, municipalities, and other Government agencies.

Digitized by Google

Nevada counties. Crude and prepared volcanic cinder from Mineral and Ormsby Counties was used in manufacturing concrete aggregate. Volcanic cinder output from Nye County was crushed, ground, and screened for use in building blocks.

**Salt.**—E. J. Huckaby Trucking Co., under contract to Leslie Salt Co., surface-mined solar salt at a dry lake bed 27 miles east of Fallon for local consumption.

**Sand and Gravel.**—Sand and gravel output dropped 36 percent in quantity from 6.4 million tons in 1959 to 4.1 million tons in 1960. Consumption of paving gravel, which comprised more than half of the total sand and gravel produced in the State, dropped from 4.9 million tons in 1959 to 2.6 million tons in 1960. An expected increase in road construction activity in 1960 did not materialize. As a result, several producers, who were solely dependent on government contracts, closed by midyear.

Requirements for paving material in Clark County declined by more than 1 million tons; demand for structural sand and gravel increased. Silica sand output from the Overton area for glass and molding uses was less in 1960. Producers in Washoe County reported a moderate decline in the output of sand and gravel for both building and road construction. All 17 counties yielded sand and gravel for construction. Notable output, other than that of Clark and Washoe Counties, came from Lincoln, Elko, and Humboldt Counties.

**Stone.**—The total output of stone quarried declined 31 percent in quantity from 840,000 tons in 1959 to 579,000 tons, chiefly because of decreased requirements for riprap and coarse aggregates normally used on government projects for retaining walls and bank protection, and as road base. Limestone quarried in Clark and White Pine Counties for lime, flux, and other uses, comprised a substantial part of the total stone yield. Production of dimension quartz and sandstone used for building construction increased for the first time since 1955, and large quantities of decorative rock were quarried in Clark and White Pine Counties. Marble was quarried in Mineral County for terrazzo,

**TABLE 10.—Stone sold or used by producers, by uses [1]**

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |

Digitized by Google

and calcareous marl was produced at one of several deposits in Washoe County for use in poultry and livestock feed.

**Sulfur.**—Production of sulfur ore from Nevada's only active sulfur deposit, in Humboldt County, decreased appreciably below the 1959 output. A relatively small tonnage was sold for use as a soil aid.

**Talc and Soapstone.**—Production and sales of talc and soapstone dropped to the lowest level reported in more than 20 years. The value of shipments to grinders was 52 percent below the 1959 figure as the quality of the minerals mined dropped appreciably. As in previous years the entire production came from Esmeralda County deposits.

**Water.**—Interest continued in the development of sources of geothermal power. At Brady's Hot Springs, Churchill County, on U.S. Highway 40 northeast of Fernley, the Magma Power Co. continued tests on the two wells drilled in the area, and in the Geyser Terrace area, south of Beowawe, Eureka County, the company completed a second test well and continued testing to determine if enough geothermal energy could be developed to operate an electric generating plant.

### MINERAL FUELS

**Petroleum.**—Two wells of the Eagle Springs oilfield in Railroad Valley, Nye County, yielded 22 percent less crude oil than in 1959. Development drilling in the area was limited to one well started in early September by Shell Oil Co., but it did not produce in 1960. The Eagle Springs field had no gas or condensate production. Elsewhere in the State, a total of 10,336 feet was drilled in search of oil or gas. This footage included 4 test wells to an average depth of 2,584 feet. The centers of wildcat drilling were in Clark County in the general area east of Las Vegas and in Churchill County near Fallon.

## REVIEW BY COUNTIES

**Churchill.**—Iron ore was mined from the Iron Hat property and the Buena Vista group of claims in the *Buena Vista* district. Ore from the former was direct shipping ore while that from the latter was upgraded in the producer's magnetic separation plant. Late in the year the Buena Vista mine and plant was sold to Columbia Iron Mining Co., a subsidiary of United States Steel Corp. Between May and December about 60,000 feet of diamond drilling was completed on the property for the new owner. The iron ore production was mostly consigned to iron and steel plants, but a small tonnage was sold for use as concrete aggregate for shielding purposes. Two operators in Fondaway Canyon, *Shady Run* district, mined and concentrated tungsten ore. The concentrates were sold to a Mineral County tungsten-carbide plant.

A Fallon producer supplied local requirements of sand for concrete and masonry and crushed gravel for concrete and base material for an airfield runway. Maintenance crews and contractors for the Nevada Highway Department used pit-run and prepared sand and gravel for several road projects in the county.

County crews also quarried and crushed basalt and limestone used by the Truckee-Carson Irrigation District. Miscellaneous stone was

Digitized by Google

**TABLE 11.—Value of mineral production in Nevada, by counties**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Churchill | $692,482 | $389,063 | Sand and gravel, iron ore, tungsten, stone, salt, gold, lead, gem stones, silver, zinc. |
| Clark | 12,567,850 | 11,718,209 | Lime, manganese nodules, sand and gravel, gypsum, stone, lead, gold zinc, copper, silver. |
| Douglas | 1,650,830 | 1,549,103 | Iron ore, sand and gravel, zinc, lead, gold, silver. |
| Elko | 1,251,522 | 647,241 | Sand and gravel, barite, lead, silver, uranium, gold, zinc, copper, mercury, stone, gem stones. |
| Esmeralda | 1,140,441 | 969,741 | Diatomite, silver, gold, mercury, talc and soapstone, sand and gravel, gem stones, copper, stone, lead. |
| Eureka | 591,023 | 238,123 | Gold, sand and gravel, lead, zinc, silver, copper, iron ore. |
| Humboldt | 2,526,087 | 2,698,072 | Mercury, iron ore, sand and gravel, stone, gem stones, gold, sulfur ore, silver. |
| Lander | 928,983 | 970,361 | Barite, gold, uranium, copper, sand and gravel, gem stones, silver, mercury, zinc, lead. |
| Lincoln | [1] 1,486,741 | 1,386,807 | Sand and gravel, perlite, copper, fluorspar, silver, lead, zinc, gold, stone, diatomite. |
| Lyon | 19,041,083 | 20,232,382 | Copper, diatomite, sand and gravel, stone, clays, gold, silver, gem stones. |
| Mineral | 198,457 | 198,434 | Silver, barite, sand and gravel, gold, lead, stone, tungsten, gem stones, copper, mercury, zinc, pumice (volcanic cinder). |
| Nye | 4,851,382 | 1,695,473 | Magnesite, fluorspar, sand and gravel, petroleum, mercury, gold, barite, pumice (volcanic cinder), silver, stone, tungsten, clays, iron ore, gem stones. |
| Ormsby | 79,558 | (2) | Pumice (volcanic cinder), sand and gravel. |
| Pershing | 2,450,598 | 2,917,884 | Iron ore, diatomite, gypsum, sand and gravel, mercury, perlite, gold, silver, lead, zinc. |
| Storey | 1,217,450 | 1,135,790 | Diatomite, gold, sand and gravel, silver. |
| Washoe | 1,701,303 | 1,168,853 | Sand and gravel, stone, clays, gold, silver, gem stones. |
| White Pine | [1] 17,710,079 | 32,231,151 | Copper, gold, lime, molybdenum, silver, stone, sand and gravel, zinc, lead, tungsten, clays. |
| Undistributed [3] | [1] 78,131 | 138,310 | |
| Total | [1] 70,164,000 | 80,285,000 | |

[1] Revised figure.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Includes gem stones, gold, mercury, manganiferous ore, tungsten, and silver that cannot be assigned to specific counties, and value indicated by footnote 2.

used by a highway contractor for riprap. A dry lakebed east of Fallon yielded the State's only salt production, which was consumed locally. Diatomite mined from a deposit near the county road between Nightingale and U.S. Highway 40 was processed in the producer's Lyon County plant.

A few tons of lead ore mined in the *Chalk Mountain* district yielded recoverable lead, zinc, silver, and gold. Gold ore from the Dixie Comstock property in the *Dixie Marsh* district was shipped to a California smelter for gold and silver recovery.

**Clark.**—The U.S. Lime Products Division, The Flintkote Co., operated three lime plants in the county and produced a wide variety of construction, agricultural, chemical, and industrial lime. Plants were operated at Apex (two rotary kilns), Henderson (four rotary kilns and a pressure hydrator), and Sloan (a batch hydrator). The company quarried high calcium limestone at the Apex quarry for making lime and for chemical and metallurgical use, concrete aggregate, railroad ballast, and poultry grit. The Sloan quarry was the source of dolomitic limestone used for metallurgical flux, in refractories and chemical processing, and for making lime.

Blue Diamond Co., Division of The Flintkote Co., produced crude gypsum for agricultural and cement retarder use and manufactured

Digitized by Google

gypsum plaster and wallboard at Blue Diamond near Las Vegas. Fibreboard Paper Products Corp. shipped crude gypsum from its quarry near Apex to its California wallboard plants.

Sand and gravel operators in the Las Vegas area produced larger tonnages of these materials than in 1959, principally for local use and Government construction projects. Some of the sand and gravel was trucked for use in the Lake Mead recreational area, at Nellis Air Force Base, and for State highway projects that included approaches to the City of Las Vegas and paving the Henderson-Boulder City and Valley of Fire roads. Silica sand produced in the Overton area was prepared for glass, molding, blast, and refractory uses. The Valley of Fire northeast of Las Vegas was the source of varicolored quartz quarried and shipped for use as decorative building stone. Building stone was also produced at a quarry a few miles southwest of Jean. Basalt (rubble) was used by crews of the Federal Bureau of Land Management in its Range Improvement program. Nearly 6,500 tons of granitic rock was used for riprap in the Davis Dam project of the Federal Bureau of Reclamation. Contractors for the City of Las Vegas quarried and prepared limestone for use in street construction. One plant at Las Vegas expanded perlite, which was obtained from a Lincoln County producer, for plaster and concrete aggregate. Another nearby plant utilized volcanic cinder from a Nye County deposit in making precast building block and tile.

The State's entire manganese ore and concentrate production was supplied by the mines, concentrator, and nodulizing facilities of Manganese, Inc. More than 250,000 tons of ore from open pit, underground, and stripping operations were fed to the mill, yielding over 60,000 tons of concentrate, from which nearly 44,000 tons of manganese oxide nodules were produced. At Henderson the American Potash & Chemical Corp. produced electrolytic battery-grade manganese dioxide from manganese ore mined in Arizona and Mexico. Approximately 93 percent of the recoverable lead credited to the county, together with some zinc and copper, was derived from lead residue produced by Manganese, Inc., as a byproduct in treating manganese ores. Some lead was recovered from dump material shipped from the Duplex property in the *Searchlight* district. Zinc ore mined at the Argentena prospect contained the remaining zinc and lead, and the Iron Gold copper mine furnished the remainder of the county's copper output. Ore from the Orion mine in the Eldorado Canyon area yielded gold and silver. The operators of this property completed considerable exploration work during the year and stockpiled about 250 tons of development rock.

**Douglas.**—Standard Slag Co. worked the Minnesota iron mine and upgraded the ore with magnetic separators. The entire output from the plant was shipped for export. During the year the company completed about 2,000 feet of diamond drilling and stripped 500,000 cubic yards of waste from the deposit. Sand and gravel from stream deposits of the Carson River in the Minden and Gardnerville areas were used for local construction and county road projects, and trucked to Carson City for concrete aggregate. Crews of the State and County highway departments produced sand and gravel for maintenance and repair of roads.

Digitized by Google

Lead-zinc ore from the Carbonate Hills mine in the *Mountain House* district contained virtually all the recoverable lead, zinc, and silver produced in the county during 1960. In the same district, an inclined shaft was rehabilitated at the Arrowhead gold mine, a 1959 producer. Gold was recovered by amalgamation from a few tons of ore that was mined from the Victoria prospect southeast of Gardnerville.

**Elko.**—A commercial plant at Elko prepared sand and gravel principally for use in building construction. Maintenance crews of State, county, and municipal road agencies produced their own requirements for sand and gravel used for seal coating, road base, and fill. A Las Vegas contractor utilized pit-run gravel and prepared sand and gravel for grading and surfacing State Route 11 between Jack Creek and Deep Creek. Utah Construction and Mining Co. made a sample shipment of limestone from the Pilot quarry near Elko to an out-of-State lime plant. Baroid Division, National Lead Co., mined crude barite at its Rossi property in the *Boulder Creek* district, where more than 1,000 feet of exploratory drilling was completed in 1960. The ore was shipped to the producer's plant at Merced, Calif. Crude barite previously mined by Estabrook Barite Co. was shipped from the company's Carlin stockpile to California grinders.

Three lead mines, the Delno and Gold Note in the *Delano* district and the Rosebud in the *Island Mountain* district, were the sources for a large portion of the recoverable lead, zinc, copper, and silver in the county. The Bootstrap mine in the *Boulder Creek* district furnished most of the gold output. Dump material from the Rio Tinto mine in the *Mountain City* district yielded recoverable copper. Cleanup at old operations in the *Lynn* district produced considerable gold and some silver. In 1960 there were two new producers of commercial uranium ore. Bogdanich Development Co. operated the Rimrock mine in the *Ivanhoe* district, and Valley Engineering and Development Co. mined uranium ore at the East and South Fork properties in the *Mountain City* district. Both operators shipped to processing plants in Oregon and Utah. During the year, about 4,000 feet of rotary drilling was completed at the South Fork property as part of an exploration program. Three mines in the *Ivanhoe* district, the Clementine, Governor, and Old Timer, were sources of relatively small tonnages of cinnabar ore furnaced or retorted to recover mercury. Assessment and maintenance work only were reported at the Liquid Metals and Silverado mercury mines in the *Tuscarora* district. In the *Battle Mountain* district some tunnelling, drifting, and crosscutting was done at the Horse Mountain claims and Silver Cloud mine, but no metal production was reported.

**Esmeralda.**—Great Lakes Carbon Corp., Dicalite Division, mined and processed diatomite at its mine and plant near Basalt. The plant products were shipped for use in paper, paint, and insecticides. The State's entire output of talc and soapstone came from deposits in the county. The quantity and value of this output were the lowest since before World War II. State and county road crews dug more than 20,000 tons of sand and gravel for use in the maintenance and repair of roads. Nearly 52,000 tons of pit run and prepared sand and gravel was used by Nacon Co., Inc., in constructing part of State Highway 3 east of Lida. About 350 tons of miscellaneous stone was quarried and

Digitized by Google

used as riprap by crews and contractors of the Nevada State Highway Department. Nevada Clay Products Co. conducted routine maintenance and some development work during 1960 at the President clay deposit near Dyer. No production, sales or shipments were reported by the company.

U.S. Milling and Minerals Corp. operated its Silver Peak mill on silver and gold ores mined at the Mohawk and Ohio mines, and several hundred tons of silver ore from a company-operated mine in Nye County. The Mohawk mine had been reactivated following its closure after a major cave-in late in 1959. Gold and silver were recovered from the Mary (Marybel) property in the *Silver Peak* district. The county's only lead output was contained in a shipment of lead ore made to a Utah smelter from the Poor Boy prospect in the *Lida* district. Over 2 tons of copper was recovered from material salvaged during equipment cleanup at an old mill site near Columbus Marsh. Considerable development, including shaft sinking and longhole drilling, was completed at the Gold Eagle (Sally Louise) lead-zinc mine in the *Weepah* district, but no ore was shipped. Mercury ores from three mines in the *Fish Lake Valley* district yielded all the mercury produced in the county during 1960. The B&B mine was the major producer and was credited with over 400 flasks produced and shipped.

**Eureka.**—Crews of the County of Eureka and the Nevada Highway Department produced about 57,000 tons of sand and gravel used in the county for road maintenance and repair.

Lead ore mined by Consolidated Eureka Mining Co. in the *Eureka* district contained nearly all the gold, silver, copper, lead, and zinc produced. However, a relatively small tonnage of zinc ore from the Mountain View group in the *Lone Mountain* district yielded some lead, zinc, and silver. The Ruby Hill Mining Co. was formed during the year as a compromise venture to end the operational conflict between Eureka Corp. and Richmond-Eureka Mining Co. The participating companies—Newmont Mining Corp., Cyprus Mines Corp., and Hecla Mining Co.—provided funds for full exploration and development of the Richmond-Eureka mine. No production was reported, but 42,293 feet of rotary drilling was recorded. The *Lynn* district was the source of placer gold and silver recovered at the Lynn placer property where bench gravels were worked. Cleanup at the Bulldog placer mine yielded a small quantity of gold.

A new iron mine began production and shipments in November. Ore from this mine was high in phosphorus, and to meet export specifications the producer blended the output with ore from an Humboldt County iron mine. The Modarelli iron mine was idle in 1960.

**Humboldt.**—Ores mined in the *Opalite* and *Poverty Peak* districts supplied 90 percent of Nevada's mercury production and shipments. The Cordero mine near McDermitt, the State's principal source of the metal, yielded more than 6,000 flasks. Extensive exploration and development work completed at the Cordero property during the year included shaft sinking, 3,500 feet of drifts and raises, and about 5,500 feet of churn and longhole drilling. In the *Poverty Peak* district, ore from the Cahill mine and dump material from the Hapgood property were retorted to recover mercury. At the McAdoo mercury mine in

Digitized by Google

the *Battle Creek* district exploration and development work was carried out, but no production was reported. Two iron mines were active—the Iron King underground mine and the Red Bird (Humboldt Iron) open pit operation, both in the *Jackson Creek* district. Some ore from the Iron King was blended with high phosphorus ore of the Barth mine, Eureka County, to bring the latter to export specifications. About 5,000 feet of rotary drilling was completed on the Homestead iron prospect in the Jackson Mountains northwest of Winnemucca. Near Winnemucca, the Homer Verne prospect yielded gold and silver by amalgamation from 30 tons of ore. Cleanup at the Buckskin gold property resulted in a few ounces of gold and silver. At the Getchell group of gold claims in the *Potosi* district considerable exploration and development work was done during 1960, including shaft sinking, raises, drifts, and crosscuts, and diamond, core, and longhole drilling.

Maintenance crews of the City of Winnemucca and Nevada Highway Department produced their own sand and gravel requirements for road repair. Contractors for the highway department dug more than 240,000 tons of pit-run sand and gravel and prepared the materials for highway projects in the northeastern part of the county. Sandstone was quarried and sawed at the Wadsworth claim near Virgin Valley for building use. Sulfur ore for agricultural use was mined from an open-pit deposit in the Kamma Mountains near Sulphur.

**Lander.**—Magnet Cove Barium Corp. operated its Battle Mountain grinding plant on crude barite that was withdrawn from a stockpile and newly mined from its Greystone claims. Two other barite properties, the Shelton mine in the *Argenta* district and the Mountain Springs deposit south of Battle Mountain, were also active during the year. Crude mineral from the Shelton mine was shipped to a grinder in the San Francisco Bay area. The operator of the Mountain Springs deposit, Mineral Products Division, Food Machinery Corp., shipped to a company-owned chemical plant at Modesto, Calif.

The Goldacres open-pit mine in the *Bullion* district was the county's largest active lode gold mine and the second largest lode gold producer in Nevada. Gold in ore from the New Pass (Thomas W.) mine at New Pass was ground in a stamp mill and recovered by amalgamation. Gold and silver were also recovered from ores of the Big Creek and McCoy mines of the *Big Creek* and *McCoy* districts, respectively. Bench gravels were worked by drift methods at the Dahl placers in the *Battle Mountain* district to recover gold and silver. Copper ore mined on the Copper Canyon property was shipped to the smelter at McGill, White Pine County, and copper precipitates recovered from dump material at the same location were shipped to the Tacoma, Wash. smelter.

Apex Uranium Inc. mined commercial uranium ore from the Early Day and Rundberg claims. The former property, in the *Reese River* district, was the State's most consistent uranium producer, yielding commercial ore each year since 1955. Ore from the Early Day was shipped to a Salt Lake City processing plant; the Rundberg production was consigned to a processor at Lakeview, Oreg. Uranium ores mined at the Low Boy claims in the same district by the Valley View

Digitized by Google

Uranium Mining Co., Inc., were shipped to the Oregon plant. Exploration and development at these mines included shaft sinking, tunneling, and drilling. A comparatively small tonnage of mercury ore from the Antler group of claims in the *Wildhorse* district was retorted to recover the metal.

Sand and gravel produced in the county by crews of State and county road agencies was used for highway maintenance.

**Lincoln.**—The Wilkin Pit near Pioche was worked to supply local construction needs for sand and gravel. A small quantity was used by the City of Caliente for paving. Sand and gravel was also produced at various locations in the county and used in paving projects by the Nevada Highway Department and the Atomic Energy Commission. More than 150,000 tons of pit-run and prepared aggregate was consumed in constructing a rerouted section of Highway 93 north of Pioche. Union Pacific Railroad Co. used several thousand tons of stone that was quarried and crushed near Caliente for railroad ballast. A small tonnage of miscellaneous stone was quarried by maintenance crews of the Bureau of Land Management and used for road repair. Lincoln County deposits supplied most of the crude perlite produced in the State during 1960. The crude mineral was quarried by Combined Metals Reduction Co. at the Hollinger property near Pioche, and by Delamar Perlite Co. at its open pit and underground mines southwest of Caliente. Most of the production was shipped to out-of-State expanding plants. Metallurgical-grade fluorspar mined near Carp by Wells Cargo, Inc., was consigned to a California steel producer. A comparatively small tonnage of diatomite was mined near Panaca and shipped to a California consumer for use in preparing soil conditioners and fillers in stock feed supplements.

Only four metal mines were active, and all shipments were to a Utah smelter. The Bristol copper mine, *Jack Rabbit* district, was the county's major producer followed by the LSZ and Hamburg lead mines, *Pioche* district, and the Tempiute silver mine, *Tempiute* district. Combined Metals Reduction Co. shipped a smaller tonnage of lead-zinc ore mined in 1959 or earlier. All ores shipped contained recoverable gold, silver, copper, lead, and zinc. One ton of ore from the Cherry (Old Silver Peak) mine near Carp, also shipped to the Utah smelter, contained a few ounces of recoverable silver. Construction was started on a plant at Caselton to produce a soil supplement from tailings at the idle Combined Metals Reduction Co. lead-zinc mill.

**Lyon.**—The Yerington mine of The Anaconda Company was the major active mining operation in the county during 1960, and the State's second largest copper producer. Shipments of copper precipitates to company smelting facilities in Montana exceeded production. Precipitates had been stockpiled during the labor strikes in 1959, which did not close the Yerington operations. Early in the year Anaconda began construction on a 5,000-ton concentrator at Weed Heights that was expected to begin treating sulfide ore by the fall of 1961. Bear Creek Mining Co., subsidiary of Kennecott Copper Corp., reportedly filed on 110 mining claims in Mason Valley as a result of extensive prior exploration in the area. The Yerington City Council granted a Kennecott request to release land for mining

Digitized by Google

that had been reserved for municipal expansion. Boyles Bros. Drilling Co. of Salt Lake City also drilled for Kennecott Copper Co. in the Yerington area, and for Columbia Iron Mining Co., a subsidiary of United States Steel Corp. Utah Construction & Mining Co. completed several thousand feet each of diamond and rotary drilling at the Dayton iron prospect. A small tonnage of gold ore from the Summit group of claims in the *Yerington* district was amalgamated to recover gold and silver. The producer completed considerable exploratory work on the claims and stockpiled about 300 tons of development rock.

Diatomite mined by Aquafil Co. Division, Kohl Enterprises, Inc., in Churchill County was processed in the producer's Fernley plant, and the prepared products were sold to out-of-State chemical companies. More than 10,000 tons of sand and gravel was prepared and used by State highway crews for road maintenance. Sand and gravel for building and road construction was produced by several operators along the Carson River, some of whom utilized old placer tailings near Dayton. Stone prepared for use as rubble and roofing granules was produced by Seaforth-Nevada Corp. near Stewart. Fuller's earth from stockpiles at the Jupiter pit near Weeks was shipped by Industrial Minerals & Chemical Co. to one of its California plants and prepared for feed pellets and various other uses.

**Mineral.**—Except for a token shipment of ore from the Nevada Rand gold prospect a few miles north of Hawthorne, all gold, silver, copper, lead, and zinc production was recovered from silver and antimonial lead ores of the *Candelaria* district. Argentum Mining Co. leached silver ores from its Lucky Hill, Mt. Diablo, and Northern Belle mines and produced bullion. Bullion and antimonial lead ore from the New Potosi mine were shipped to a California smelter. At the New Potosi an appreciable amount of exploration and development work was done and about 650 tons of development rock was stockpiled. At the Copper Chief copper prospect a few miles east of Mina, churn drilling was done as a part of an exploration program.

The Columbus (Noquez) barite mine near Candelaria was worked in 1960, and the crude mineral was shipped to the producer's plant at Terminal Island, Calif. The mine was worked by both open-pit and underground methods and development during the year included shaft sinking and drifting. Except for the sand and gravel produced by State highway crews for road maintenance in the county, all pit-run and prepared sand and gravel produced was consumed in the highway project on the west side of Walker Lake between Babbitt and Schurz. This project required approximately 20,000 tons of these materials in 1960. Sonora Marble Aggregate Co. quarried marble at a deposit near Luning and used the material for terrazzo. Argentum Mining Co. began constructing a lime plant near its ore leaching operation to supply lime for that operation. The company planned to sell any surplus lime on the open market. Volcanic cinder was produced from a deposit near Mina by Pumco Aggregate and was used for lightweight concrete aggregate.

Nevada Scheelite Division, Kennametal, Inc., operated a tungsten carbide plant near Rawhide, utilizing purchased tungsten concen-

Digitized by Google

trates in addition to those previously produced by the company. Mercury production was limited to one flask recovered from ore retorted at the Reward mine in the *Pilot Mountains* district.

**Nye.**—Magnesite mined in the Gabbs area by Basic, Inc., and Standard Slag Co. was converted to caustic-calcined and refractory magnesias and other products used by the refractories industries and by consumers of refractory products. Basic, Inc., upgraded previously mined brucite in a heavy-medium plant, and used most of the product in its Ohio refractories plant. Basic also placed a 500 ton-a-day flotation plant in operation about midyear to upgrade magnesite. Standard Slag Co. mined a relatively small tonnage of iron ore from its nearby Iron Mountain property and used the ore as an additive in producing deadburned magnesias. The Crowell (Daisy) and Gold Spar fluorspar mines produced during 1960. Metallurgical-grade fluorspar from the former was consigned to out-of-State consumers. The latter was operated by Monolith Cement Co. and the mineral was consumed in the producer's California cement plant. Crude barite from the Jumbo mine east of Tonopah was sold to a southern Nevada contractor for concrete aggregate used in special shielding. Barite mined at the Summit Creek deposit north of Tonopah was custom ground at Laws, Calif.

Sand and gravel was produced by crews of Nye County and the Nevada Highway Department and by a contractor for the Atomic Energy Commission. Over 74,000 tons of gravel was prepared for use in the highway project east of Warm Springs before winter weather shut down construction work. Western Silica Co. produced several hundred tons of opalite for silica flour at its Snowwhite operation southeast of Goldfield near the Esmeralda County line. Shipments of bentonitic clay were made from the New Discovery mine near Beatty to California for use in pharmaceuticals and underground workings were being developed during the year. Volcanic cinder was dug near Lathrop Wells by Cind R Lite Co. and trucked to the producer's cinder block plant in Las Vegas.

The oil wells of Shell Oil Co. at Eagle Springs yielded the entire crude petroleum output in the State. At yearend the company had not completed another well that had been begun in September in the area.

Five mercury properties were active in the county during 1960, but only the Horse Canyon mine near Manhattan yielded more than 100 flasks. Considerable exploration and development work was done at this mine, including shaft sinking and diamond drilling. At the Redbird mercury property in the *Belmont* district, development consisted of tunnels and raises. About 10,000 cubic yards of waste was stripped from the Ione mercury ore body in the *Union* district. Some shaft sinking and trenching were reported at the Jack Pot mine in the same district, but no ore was treated. At the A&B mine in the *Tybo* district, 50 feet of shaft was sunk, and 150 feet of drilling was completed. A part of the relatively small mercury yield was recovered in processing development rock.

Cleanup operations at the Round Mountain placer mine and silver ore trucked from the Tonopah King mine yielded virtually all the gold and silver produced in the county. Small quantities of gold and

Digitized by Google

silver were recovered by amalgamation from bench gravels worked by drift methods near Manhattan, and from gold ore of the Crown Point gold property. Late in the year the Tybo lead-zinc mine (*Tybo* district) was sold to the Carson Land and Development Co., Modesto, Calif. Two operators in the Paradise Peak area worked tungsten properties and produced concentrates. One producer shipped to the Mineral County tungsten carbide plant; the other stockpiled all concentrate produced.

**Ormsby.**—Reno Ready-Mix Concrete Co. produced volcanic cinder from the leased Carson City Cinder Lite deposit near the Carson City airport and prepared the material for use as lightweight aggregate. Sand and gravel obtained from deposits along the Carson River and Clear Creek was prepared for use as concrete aggregate by local producers. A contractor for the Nevada Highway Department produced more than 95,000 tons of pit-run and prepared sand and gravel for resurfacing Highway 50 south of Carson City. Highway department crews produced sand and gravel to meet State road maintenance requirements in the county.

**Pershing.**—The *Mineral Basin* district was the center of iron ore production and output was 5 percent greater than in 1959. Five operators at 7 open-pit mines and prospects mined nearly 195,000 tons of direct shipping grade ore, much of which was consigned to foreign iron and steel plants. Dodge Construction Co. was the major producer; its operations were at the Section 29 (Thomas) mine and Iron Horse (Ford Prospect) group. All ore that was shipped by this operator was exported. Nevada Iron Ore Co., Inc., worked the S.P. (Thomas) lease; the Segerstrom-Heizer property was mined by a contractor; Consolidated Minerals Corp. produced iron ore at the Section 16 mine; and W. M. Fisk mined from the Phoenix group and the Iron Mass prospect. Total shipments were 9 percent above 1959 figures.

A new deposit of filter-grade diatomite was developed by Eagle-Picher Co. in the Trinity Mountain area to supplement production from the Tunnel Hill mine west of Lovelock. The material was processed in the company plant at Colado and was sold for a wide variety of industrial uses. United States Gypsum Co. mined crude gypsum at its Empire quarry near Gerlach at the Washoe County line. The crude mineral was moved by overhead tram to the Empire mill and board plant across the county line. Sand and gravel was produced and prepared by crews of Pershing County and the Nevada Highway Department for road maintenance and repair. Crude perlite was produced at the Pearl Hill quarry northwest of Lovelock, crushed and sized at the Kodak plant, and shipped to the producer's expansion plant at Empire, Washoe County.

Only two mercury properties were active. Most of the recovered metal was produced in processing development ore mined at the Freckles (Roman) mine in the Table Mountain area. The remainder was retorted from cinnabar ore of the Hard Luck mine in the *Antelope* district. Two operators used a nonfloating washing plant and a third used small-scale hand methods to recover gold and silver from stream gravels in the Willow Creek area. Ancient river bed and bench gravels were washed by individuals in the *Rabbit Hole* and *Placerites* dis-

Digitized by Google

tricts to recover relatively small quantities of gold and silver. Lead ore from the Keystone mine in Mill Canyon, silver ore and dump materials from two mines in the Rochester area, and silver ore from the Silver Reef mine in the *Seven Troughs* district contained recoverable gold, silver, lead, and zinc. Gold ore from the Portland Extension mine in the latter district and the Green Gold prospect in the *Table Mountain* district were sources of relatively small quantities of gold and silver.

**Storey.**—A substantial percentage of Nevada's total diatomite production was mined at the Eagle-Picher Co. Celatom open-pit mine a few miles east of Clark Station. The crude material was crushed, dried, calcined, and classified in the company plant at Clark Station. The plant products were shipped to consumers in the United States and Canada for use in insulation, as an abrasive and filler, and in a variety of other applications. A comparatively small tonnage of sand was produced in the county for road maintenance by crews of the Nevada Highway Department.

Production of gold and silver was limited to the quantities recovered by amalgamation from ore mined at the site of the old Fisher mine and mill at Virginia City.

**Washoe.**—More than 1 million tons of sand and gravel was produced in the county for building and highway construction. A substantial percentage of the total output was produced and prepared at commercial plants along the Truckee River near Reno. The Steamboat Spring area yielded a modest quantity of sand and gravel and crews of the State and county road agencies produced sand and gravel at various places for their own use. Calcareous marl was quarried at the Double Check Products deposit 5 miles east of Flanigan and was used in preparing poultry and livestock feed. Pacific Fertilizer Co. did some exploration and maintenance work at its marl deposit near Pyramid, but no shipments were made. A small tonnage of miscellaneous stone was produced by a contractor for State highway use as riprap. Reno Press Brick Co. mined clays at its Faith and Geiger pits near Steamboat Springs and at the Revelation pit near Sparks; it used the materials for making brick and other clay products in its Reno plant. The United States Gypsum Co. processed crude gypsum from its nearby quarry in a mill and board plant at Empire and operated an adjacent expanding plant on crude perlite from its quarry near Lovelock, Pershing County.

Two gold mines operated intermittently in the *Olinghouse* district, the Sunbeam and the Renegade. Gold and Silver were recovered from ores of both mines by amalgamation. Exploration work at the Big Ledge and North View groups of claims in the *Peavine* district yielded about 300 tons of development rock that was stockpiled.

**White Pine.**—Virtually all the recoverable copper produced in White Pine County came from ores mined in the *Robinson* district by Kennecott Copper Corp. Copper ore mined from the Liberty pit was processed in the company's McGill concentrator and smelter together with previously mined ore from the Veteran and Tripp pits. These ores were the source of byproduct molybdenum concentrate that was recovered by flotation in the McGill concentrator and represented the entire molybdenum production in the State. Copper ores that were

Digitized by Google

produced at the Kansas mine, *Aurum* district, and the Sunnyside mine, *Robinson* district, together with material collected in cleanup at various small copper properties were shipped to a Utah smelter. Copper precipitates produced in cleanup at the Vanderbilt leaching plant were sold to the McGill smelter. Some diamond drilling was done at the Kansas mine as part of an exploration program, and an extensive drilling program for copper ore was conducted by the Bear Creek Mining Co., subsidiary of Kennecott Copper Corp., in the Lane City area. A very high percentage of the gold and silver credited to the county was recovered as a byproduct in treating copper ores of the *Robinson* district. However, lead ores of the Belmont, Hamilton, and Rocco Homestake mines, and zinc ore from the Willard mine, *Robinson* district, contained modest quantities of recoverable gold and silver together with some copper, lead, and zinc. The Mammoth mine in the *Robinson* district also yielded gold and silver, and the operator completed some tunneling, drifting, and shaft sinking during the year. Ore produced during exploration at the Belmont mine was stockpiled; some was shipped in 1960. The dust problem at the tailings area of the McGill concentrator was noticeably reduced through planned planting of rye grass, alfalfa, clover, and wheat. The Anaconda Company took an option on 103 lode claims in the Mount Washington area and on the Jeppson claims to the north. The former are the property of Mt. Wheeler Mines Co. and were explored previously for beryllium minerals by Beryllium Resources, Inc. Anaconda planned to continue the exploration. Some of the previously produced and stockpiled tungsten concentrate at the Minerva mine near Shoshone was shipped to the Nevada Scheelite tungsten carbide plant in Mineral County.

Kennecott Copper Corp. quarried high calcium limestone near McGill and produced hydrated lime for use in its nearby concentrator and smelter. The equipment used included 13 coke-fired shaft type kilns and a batch hydrator. Some of the limestone was consumed as metallurgical flux, concrete aggregate, and railroad ballast. Quartzite from the Star Dust quarry north of Baker was shipped to Utah and California for use as flagging and building stone. Crews and contractors for White Pine County and the Lehman Caves National Monument produced sand and gravel used by these agencies in structures, and road construction and repair. Maintenance crews of the Nevada Highway Department produced sand and gravel for their own needs at various places in the county. Fire clay dug from the McDonough clay beds near East Ely, was sold to Kennecott Copper Co., for use in its McGill copper smelter.

The Merrimac antimony claims were worked by open-pit methods, and a few tons of ore was shipped to a Utah smelter. The operator was paid for the contained gold, silver, copper, lead, and zinc, but no antimony was recovered. Late in the year the producer furnaced some stockpiled ore and recovered a comparatively high grade antimony oxide, which was shipped to a California buyer for use as a paint pigment.

# The Mineral Industry of New Hampshire

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the New Hampshire State Planning and Development Commission.**

By Stanley A. Feitler [1] and Mary E. Otte [2]

THE VALUE of New Hampshire mineral production reached a new high of $5.3 million in 1960, an increase of 12 percent over 1959. Increased tonnage and value of construction materials, principally for highways, offset the drop in quantity and value of sheet mica sold. Mineral production was reported from every county.

**Legislation and Government Programs.**—State and cooperative State-and-Federal highway construction continued during 1960. These highway programs and the continued purchase of strategic minerals for the Federal stockpile were the main reasons for the high mineral production. Strategic-quality mica (hand-cobbed and full-trimmed) produced in New Hampshire was purchased by General Services Administration (GSA) at its Franklin, N.H., Spruce Pine, N.C., and Custer, S. Dak. depots. All the State's beryl was sold to GSA at the Franklin, N.H. depot.

**TABLE 1.—Mineral production in New Hampshire [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Beryllium concentrate.....short tons, gross weight.. | 20 | $12 | 14 | $8 |
| Clays.....do.... | 26,150 | 26 | 27,260 | 27 |
| Gem stones | (2) | 10 | (2) | 15 |
| Mica: | | | | |
| Sheet.....pounds.. | 119,163 | 1,133 | 80,065 | 904 |
| Scrap.....short tons.. | (2) | (2) | 415 | 14 |
| Peat.....do.... | 25 | (2) | 23 | (2) |
| Sand and gravel.....thousand short tons.. | 5,124 | 2,887 | 6,621 | 3,687 |
| Stone.....short tons.. | 82,141 | 488 | 104,105 | 594 |
| Value of items that cannot be disclosed: Feldspar and values indicated by footnote 3 | ---------- | 166 | ---------- | 68 |
| Total New Hampshire | ---------- | 4,722 | ---------- | 5,317 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Weight not recorded.

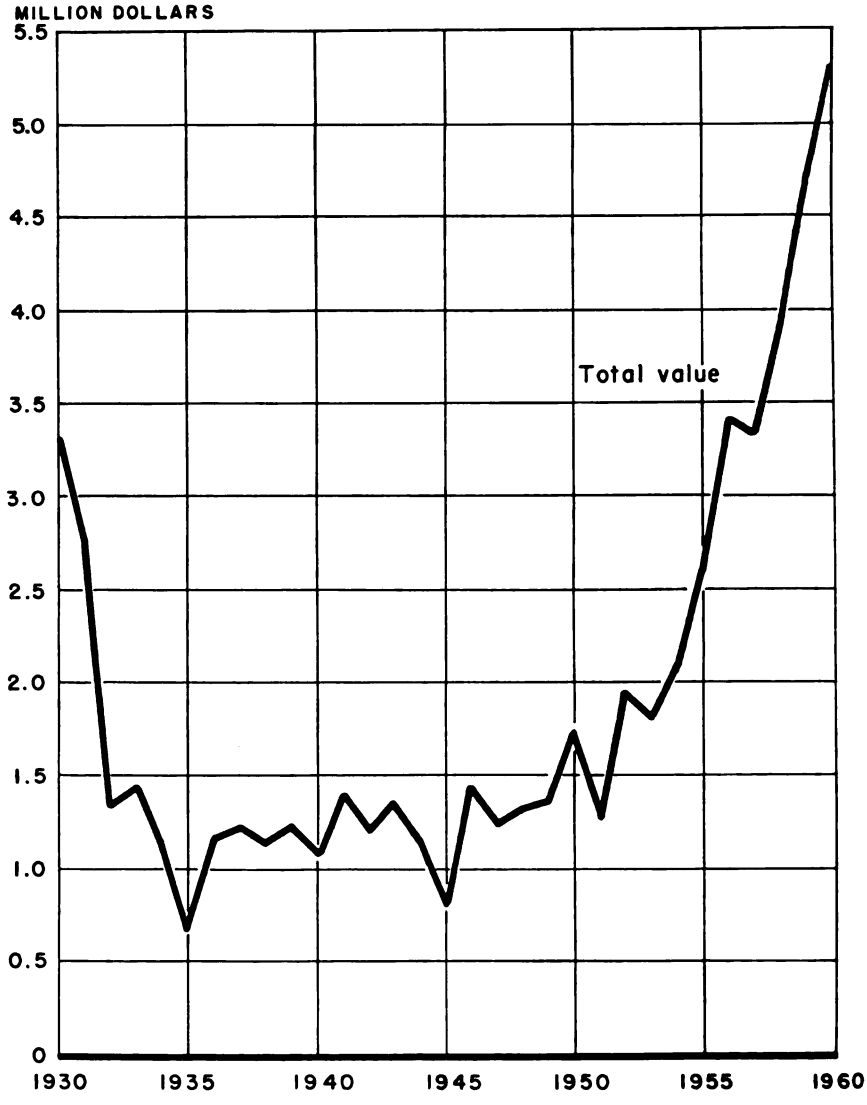

FIGURE 1.—Total value of mineral production in New Hampshire, 1930–60.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

Clays.—Production of miscellaneous clay for use in the manufacture of building brick was 4 percent greater than in 1959. Three brickyards operating in Rockingham and Grafton Counties produced about 11 million building brick.

Digitized by Google

**Feldspar.**—Tonnage and value of potash feldspar production continued to decrease because competition of imported ceramic products caused reduced consumption by the U.S. ceramic industry.

Although nepheline syenite imports from Canada had not made serious inroads into the potash feldspar market, they had increased competition among domestic producers for that part of the feldspar market that had not been taken over by nepheline syenite. The value of finely ground potash feldspar in 1960 was more than $0.50 lower per ton than in 1959. Total sales were lower than in 1959, as the decrease in sales for pottery and tile exceeded the increase in sales for sanitary ware and insulators. The principal markets for ground feldspar from New Hampshire were New York, Massachusetts, New Jersey, and Connecticut.

**Gem Stones.**—The value of recovered gem stones and mineral specimens increased during 1960. Gem and mineral dealers acquired material produced as a byproduct of mica and feldspar mining, but most of the value was in specimens obtained by amateur collectors, principally in Grafton, Carroll, Cheshire and Sullivan Counties. Fine, euhedral, smoky quartz crystals were recovered from vugs in granite at the Red Stone quarry near Conway (Carroll County).

**Mica.**—The value of sheet mica production, although 20 percent below 1959, was the second highest on record. Most of the value was in strategic-quality sheet mica which was sold to the Government at the GSA depots at Franklin, N.H., Spruce Pine, N.C., and Custer, S. Dak. Both quantity and value of full-trimmed mica were down more than 60 percent compared with 1959; the average price per pound dropped from $16.22 in 1959 to $14.18. The quantity of hand-cobbed mica dropped 22 percent, but the value increased 32 percent. This change was caused by wide use in 1960 of a 1958 regulation affecting the purchase of hand-cobbed mica by GSA. Previously, mica sold as hand-cobbed was purchased by GSA on a basis of quality and quantity at a maximum price of $600 per ton. The seller might receive less than $600 if the mica, after trimming, was not up to required quality and quantity.

The new regulation gave the buyer the option, after the mica was trimmed by GSA, to pay a fixed charge per pound for trimming labor and sell the mica as full trimmed. Under the new regulation it was to the seller's advantage to deliver the highest possible quality of hand-cobbed mica to the GSA depot. Careful sorting of hand-cobbed mica before delivery to GSA was largely responsible for the decrease in quantity of hand-cobbed mica. More producers found it profitable to sell high-quality mica as hand-cobbed under the new regulation. Hand-cobbed mica sold in 1960 had an average value of $0.50 per pound as compared with $0.30 in 1959. Slightly less scrap and more punch and washer mica were sold to industry than in 1959. Most of the mica was produced in Grafton and Cheshire Counties, although small quantities were reported from Merrimack and Sullivan Counties. The Keyes, Palermo, Ruggles, and Hoyt Hill mines were the principal mica producers in Grafton County, but 19 other mines also contributed to the total. The Big mine was the leading producer in Cheshire County, where mica was recovered from 12 mines during 1960. Three mica mines were worked in Mer-

615629—61——43

Digitized by Google

rimack County and one in Sullivan County. Production of wet-ground mica was lower than in 1959, but the average price per ton was higher. Mica ground to 325-mesh was used in paint and wallpaper, whereas coarser material (160-mesh) was used as a mold lubricant in the manufacture of rubber goods. Three quarters of the crude scrap mica used for grinding was imported from India; the rest was of domestic origin.

**Peat.**—A small quantity of humus peat for use as a soil conditioner was produced in Belknap County.

**Sand and Gravel.**—Production of sand and gravel increased for the sixth consecutive year, and sand and gravel continued to be the State's leading mineral commodity. Output of sand and gravel for building and paving by commercial producers in 1960 was virtually the same as in 1959. A large increase was reported for commercially produced sand and gravel sold for fill and miscellaneous uses. A small quantity of sand was sold for use as engine sand and as a filter medium, and more than 4,000 tons of gravel was sold for railroad ballast. Noncommercial output of sand and gravel for highway construction was higher by 20 percent in tonnage and more than 40 percent in value.

Merrimack, Grafton, and Cheshire Counties led the State in total tonnage; commercial and Government-and-contractor production was reported for all counties. As in 1959, 71 percent of commercial and 3 percent of non-commercial tonnage was washed, screened, or otherwise prepared. The only sand and gravel shipped by rail was used for railroad ballast. The Manchester Highway Department in Hillsboro County and the Concord Commissioner of Public Works in Merrimack County reported production of sand and gravel for highway construction and maintenance by their crews.

Commercial sand and gravel operations employed 106 production workers for 200,000 man-hours during the year, with a productivity rate of 10 tons per man-hour.

**TABLE 2.—Sand and gravel, and stone production by Government-and-contractor operations, by counties**

(Short tons)

| County | Sand and gravel | | Stone | |
|---|---|---|---|---|
| | 1959 | 1960 | 1959 | 1960 |
| Belknap | 139,573 | 102,539 | ---------- | 1,920 |
| Carroll | 355,693 | 105,547 | ---------- | ---------- |
| Cheshire | 429,931 | 302,023 | ---------- | 4,444 |
| Coos | 414,804 | 243,483 | 279 | 996 |
| Grafton | 289,758 | 518,844 | 206 | 12,880 |
| Hillsboro | 307,867 | 367,181 | 375 | 1,027 |
| Merrimack | 812,583 | 1,007,533 | 1,914 | 11,353 |
| Rockingham | 267,679 | 250,588 | ---------- | 206 |
| Strafford | 205,912 | 131,453 | ---------- | ---------- |
| Sullivan | 160,349 | 448,432 | 8,250 | 223 |
| Total | 3,384,149 | 3,477,623 | 11,024 | 33,051 |

**Stone.**—Stone production increased 27 percent in tonnage and 22 percent in value over 1959. Dimension granite accounted for most of the value of output by the stone industry in the State, although

Digitized by Google

the tonnage was small. The John Swenson Granite Co., Inc., produced dressed architectural stone, curbing, and a small quantity of riprap from granite quarried at its Swenson Gray quarry near Concord. Rough blocks were freed on three sides by flame cutting and broken loose from the floor by light blasting. Crude granite from the nearby Gray quarry, as well as pink and green granite from Swenson Co. quarries in southern Maine, was dressed at the company's stone plant in Concord.

The New Hampshire Department of Public Works and Highways reported production of noncommercial granite from all counties except Carroll and Strafford. The quantity produced in 1960 was about the same as that reported in 1958 but represented a large increase over 1959.

Miscellaneous stone mined by the Iafolla Crushed Stone Co., Portsmouth, was prepared and sold for use in concrete, highway construction, and riprap.

### METALS

**Beryllium.**—The quantity of hand-cobbed beryl recovered from mines in New Hampshire was lower in 1960 than in 1959. Beryl sold at the GSA Purchase Depot at Franklin had an average value of 27.7 cents per pound and an average grade of 11.2 percent beryllium oxide. Grafton was the leading county with six mines producing 91 percent of the State total. Production was reported from three mines in Cheshire County and one mine each in Merrimack and Rockingham Counties.

## REVIEW BY COUNTIES

**Belknap.**—Tilton Sand & Gravel, Inc., Tilton, produced building and paving sand and gravel, sand for fill, and miscellaneous gravel.

Perkins Peat Bog recovered humus peat near Barnstead and sold the material in bulk form.

**Carroll.**—Paving sand and gravel was produced near Conway by Alvan J. Coleman.

Topaz, quartz crystals, and other gem and mineral specimens were recovered near North Conway and on Hurricane and Baldface Mountains.

**Cheshire.**—Paving sand and gravel, and gravel for fill was produced by Cold River Sand & Gravel Corp. near North Walpole. Keene Sand & Gravel, Inc., Swanzey, produced sand and gravel, mainly for building and paving, and a quantity of gravel for use as fill.

Cheshire County continued to rank second in sheet mica production, although quantity and value decreased 30 and 37 percent, respectively. Twelve producers recovered full-trim, hand-cobbed, and some scrap mica from mines near Alstead, Gilsum, Alexandria, Grafton, Orange, and Danbury. Most of the mica was sold to the Government through the GSA purchase depot at Franklin, but some was shipped to the Spruce Pine, N.C., and Custer, S. Dak., purchase depots.

Despite a continued decline in the quantity and value of feldspar production in 1960, Cheshire County remained the leading source for

**TABLE 3.—Value of mineral production in New Hampshire, by counties**

| County | 1959 | 1960 | Minerals produced in 1960, in order of value |
|---|---|---|---|
| Belknap | (1) | (1) | Sand and gravel, stone, peat. |
| Carroll | $128,579 | $83,020 | Sand and gravel, gem stones. |
| Cheshire | 848,032 | 709,442 | Sand and gravel, mica, feldspar, gem stones, stone, beryl. |
| Coos | 153,928 | 177,713 | Sand and gravel, stone. |
| Grafton | 1,148,080 | 1,226,395 | Mica, sand and gravel, clays, stone, feldspar, beryllium, gem stones. |
| Hillsboro | (1) | (1) | Sand and gravel, stone. |
| Merrimack | (1) | 1,374,698 | Sand and gravel, stone, mica, beryllium. |
| Rockingham | (1) | 323,641 | Sand and gravel, stone, clays, beryllium. |
| Strafford | (1) | (1) | Sand and gravel. |
| Sullivan | 163,331 | 222,389 | Sand and gravel, gem stones, stone, mica. |
| Undistributed [2] | [3] 2,279,855 | 1,199,609 | |
| Total | 4,722,000 | 5,317,000 | |

[1] Figure withheld to avoid disclosing individual company confidential data.
[2] Includes value of beryllium, gem stones, mica, and sand and gravel not assigned to specific counties and value indicated by footnote 1.
[3] Revised figure.

this material in the State. Golding Keene Co. recovered crude potash feldspar from the Colony mine near Alstead. The material was ground at the local company-owned grinding mill for use chiefly in pottery, floor tile, sanitary ware, and insulators. The Golding Keene Co. Kidder mine near Alstead was idle during the year. Foote Mineral Co. discontinued production of ground feldspar in its mill at Cold River early in 1960. During most of the year the mill was used to grind imported petalite (lithium aluminum silicate) for use in ceramics.

Green tourmaline, aquamarine, beryl, quartz crystals, and fluorite gem and mineral specimens were recovered, mainly near Alstead and Gilsum.

The quantity and value of beryl output decreased, with two mines operating during the year compared with three in 1959. Both producers sold their output to GSA.

**Coos.**—Building, paving, and fill sand and gravel, and gravel for use as railroad ballast were produced in the county. Pits were operated during 1960 by Lessard Sand & Gravel Co. (Gorham), Fred Corrigan (Randolph), and Clyde B. Gray and Maine Central Railroad Co., both near Colebrook.

**Grafton.**—Grafton County ranked second in value of mineral production in the State. The county continued to lead in sheet mica production despite declines of 32 percent and 14 percent in quantity and value, respectively. Twenty-five mica producers operated 23 mines during the year, mainly near Groton, Grafton, and Orange. All hand-cobbed and full-trim sheet mica was sold to the Government in 1960. The average price was $13.01 per pound of full trim, including hand cobbed converted to full trim, compared with $10.37 per pound in 1959. Some scrap mica was also produced. The Ruggles mine near Grafton Center was sold by Whitehall Co., Inc., to A. S. Wahlstrom and mined for mica by Ruggles Mining Co.

Commercial sand and gravel production was reported near Campton, Littleton, and West Lebanon. The material was used mainly for building and paving.

Digitized by Google

Densmore Brick Co., Lebanon, mined and processed miscellaneous clay for manufacturing building brick.

A stockpile of crude potash-soda feldspar was sold by Ruggles Mining Co., Grafton, to the Golding Keene Co. and shipped to the latter company's grinding plant at Alstead (Cheshire County) for processing.

Grafton remained the leading beryl producing county, despite a decline in production and value, with six active producers in 1960, compared with five in 1959. Hand-cobbed beryl containing an average of 11.2 percent beryllium oxide was recovered from mines near Wentworth, Grafton, and North Groton. The entire output was sold to GSA at Franklin.

Gem and mineral enthusiasts were active during the year searching waste dumps and outcrops of the many pegmatites. Among the large variety of mineral specimens collected were clevelandite, aquamarine, perthite, torbernite, autunite, and gummite.

**Hillsboro.**—Commercial sand and gravel, used chiefly for building and paving, was produced by four operators near Manchester and Peterborough.

**Merrimack.**—Manchester Sand, Gravel & Cement Co., Inc., Hooksett, reported output of building and paving sand and gravel and engine sand. Frank Palazzi & Sons, Inc., produced sand and gravel for use as fill material.

The John Swenson Granite Co., Inc., Concord, quarried granite and produced dressed architectural stone and curbing. The company also sold granite for riprap.

The quantity and value of sheet mica produced in the county was higher as the number of producers increased from three in 1959 to five in 1960. The Brownell Prospect and Danbury mines (both near Danbury) and the North Star mine near Wilmot were active during the year. Wilbur L. Brownell recovered limited quantities of hand-cobbed and full-trim sheet mica and beryl at the Brownell Prospect mine near Danbury. All mica and beryl were purchased by the Government.

**Rockingham.**—Structural sand and gravel and fill gravel were produced near Exeter by L. Chester and Clayton W. Simpson.

Iafolla Crushed Stone Co., Portsmouth, quarried and prepared miscellaneous stone for riprap, concrete aggregate, and roadstone.

Miscellaneous clay, used for manufacturing building brick, was recovered from open pits by Eno Bros. Brick Co., Exeter, and W. S. Goodrich, Inc., Epping.

Beryl was recovered from the Chandler mine near Raymond by Albert F. Cebula and sold to GSA.

**Strafford.**—Structural sand and gravel and fill gravel were recovered commercially near Dover and Durham.

**Sullivan.**—Unprocessed sand and gravel for paving material was recovered near Grantham.

Hand-cobbed mica was recovered at the Sargeant mine near Claremont and sold to GSA.

Amateurs and dealers recovered gem and mineral specimens, principally from pegmatites.

# The Mineral Industry of New Jersey

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the New Jersey Division of Planning and Development, Bureau of Geology and Topography.**

By Joseph Krickich [1] and Stanley A. Feitler [1]

MINERAL production in New Jersey in 1960 was valued at $56.4 million—5 percent below 1959. The decline was attributed mainly to decreased shipments of iron ore, the State's third-ranking mineral commodity, although demand was less for most other minerals. The values of stone and sand and gravel, however, were greater than in 1959.

**TABLE 1.—Mineral production in New Jersey [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays.....thousand short tons.. | 700 | $1,895 | 664 | $1,597 |
| Gem stones..... | (2) | 6 | (2) | 7 |
| Peat.....short tons.. | 28,300 | 278 | 25,100 | 192 |
| Sand and gravel.....thousand short tons.. | 11,033 | 18,620 | 11,594 | 19,511 |
| Stone.....do.... | 10,079 | 22,133 | 10,202 | 22,814 |
| Value of items that cannot be disclosed: Iron ore, lime, manganiferous residuum, magnesium compounds, marl (greensand) and uranium (1960). Excludes limestone and oystershell used in manufacturing lime. | ---------- | 16,547 | ---------- | 12,288 |
| Total, New Jersey..... | ---------- | 59,479 | ---------- | 56,409 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Weight not recorded.

**Trends and Development.**—Exploration and testing of ilmenite-bearing sands in Ocean County continued during the year. Glidden Co. began planning a concentrating plant; production of ilmenite concentrate was expected to begin in 1962. Minnesota Mining & Manufacturing Co., broke ground for a large integrated roofing granule plant near Belle Mead in Somerset County. The first shipment of uranium ore from New Jersey was made from a mine in Sussex County. Iron ore production was at low ebb with only two mines active. Output of beryllium oxide ceramic materials in Passaic County increased and research was expanded.

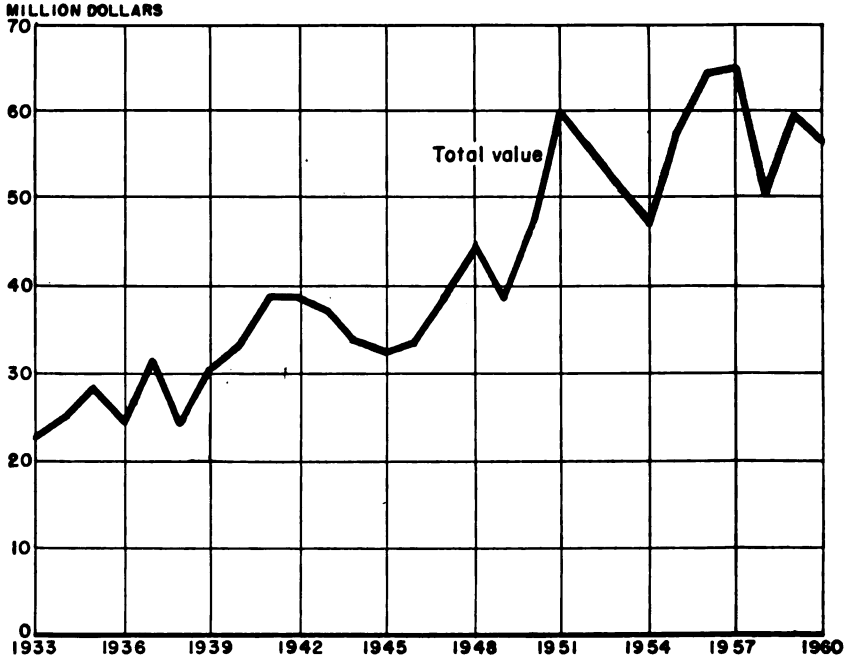

FIGURE 1.—Total value of mineral production in New Jersey, 1933–60.

New Jersey continued as an important center for processing concentrates of rare-earth minerals into a wide variety of alloys and pure elements. Production of tungsten and molybdenum began at the recently completed metallurgical plant of Wah Chang Corp., in Bergen County. Air Reduction Co., Inc., completed a new laboratory for research and pilot-scale testing of fuels and oxidizers in Gloucester County.

**Employment and Injuries.**—Preliminary data for the mineral industry in the State indicated that total man-hours worked increased 3 percent compared with 1959 and was attributed to increased employment at smelters. Employment (excluding office workers) declined in all other categories and are shown in table 2. Injury experience improved substantially over 1959. Although the number of fatalities (2) remained the same, total nonfatal injuries dropped sharply. The biggest improvement was in the stone industry, where nonfatal injuries dropped from 106 in 1959 to 59 in 1960.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Clays.**—Production of fire clay was the same as in 1959, but the output of miscellaneous clay was less, resulting in a 5-percent decrease in total clay output. Miscellaneous clay supplied most of the tonnage, but fire clay had a greater total value. Building brick, lightweight aggregate, and heavy clay products were manufactured from the miscellaneous clay. The largest volume of fire clay, produced in Mid-

| Metal mines and mills | 6 | 577 | 1,142,561 | 1 | 18 | 17 |
| Coke ovens and smelters | 4 | 3,614 | 9,300,330 | 1 | 74 | 8 |
| Total | 152 | 6,201 | 14,313,029 | 2 | 176 | 12 |

[1] Includes clay and greensand marl.
[2] Preliminary figures.

dlesex, Cumberland, and Camden Counties, was used for firebrick and block and in foundries and steel works. Moderate quantities of fire clay were used in fire clay mortar, linoleum and oil cloth, kiln furniture, heavy clay products and architectural terra cotta. Clay companies employed 56 miners at 23 pits for a total of 67,000 hours and reported 4 lost-time injuries during 1960. Productivity, in terms of clay recovered by pit employees, was 9.9 tons per man-hour.

**Gem Stones.**—Gem and mineral societies as well as many individual collectors obtained mineral specimens from various localities. Mine dumps at Franklin (Sussex County) continued to be the most productive area and yielded a large quantity and variety of mineral specimens.

**Gypsum.**—Crude gypsum from out-of-State mines was calcined at plants in Bergen, Burlington, and Essex Counties for use in manufacturing plaster, lath, sheathing, and wallboard. Barrett Division, Allied Chemical Corp. began production at its new automated plant in Bergen County. The new installation had facilities for unloading crude gypsum from ocean-going vessels and for calcining and manufacturing finished plaster building products.

**Lime.**—Both tonnage and value of lime production were 7 percent less than in 1959. One company in Sussex County burned lime for use in construction, agriculture, and chemical applications.

**Magnesium Compounds.**—Total output of magnesium compounds was less than in 1959. Magnesia for refractory uses was produced in Cape May County from sea water and out-of-State dolomite. Refined magnesium compounds, manufactured principally from purchased magnesium carbonate, were produced in Warren County.

**Marl, Greensand.**—Output of greensand marl in Burlington and Gloucester Counties was less than in 1959. The greensand was sold for use as fertilizer (for its content of available potash) and for use in water-softening equipment (for its glauconite content).

Digitized by Google

**Perlite.**—Crude perlite mined in southwestern States was shipped to plants in Middlesex, Passaic, Somerset, and Union Counties, where it was expanded for use in acoustical plaster, ultralightweight concrete, and as a soil conditioner.

**Pigments.**—A wide variety of metal-base pigments were manufactured at nine plants in five counties. Iron oxide pigments were manufactured in Essex, Mercer, and Middlesex Counties; lead pigment, in Middlesex County; and zinc pigment, in Middlesex and Bergen Counties. One plant each in Camden and Middlesex Counties produced titanium dioxide.

**Sand and Gravel.**—Both tonnage and value of sand and gravel produced were 5 percent greater than in 1959. Demand for commercially produced sand and gravel by the construction industry was higher during the year, but the total value was lower, because of a lower average price in 1960. The most important industrial applications were sand for molding, glass, and blast sand. The average price in these three categories was $3.37 per ton, $0.06 per ton higher than in 1959. Washed and screened sand also was used for filtration, engine, and fire or furnace applications.

Ground sand, used principally by foundries, as a filler and as an ingredient in glass, was produced in greater quantities than in 1959. Other uses for ground sand included abrasive, chemical, pottery, porcelain, tile, and metallurgical applications.

Cumberland County was the principal sand and gravel (2.4 million tons valued at $8.2 million) producing county in the State. Next in order of output were Morris, Burlington, and Ocean Counties, from which 1 million or more tons each was reported. Commercial producers washed and screened 89 percent of the tonnage sold, the same percentage as in 1959. Of the material delivered to consumers, 84 percent was delivered by truck; 14 percent by railroad; and 2 percent by waterway. Commercial sand and gravel producers employed 1,032 men who worked 2,022 hours and produced 5.7 tons of finished sand and gravel per man-hour. Construction and maintenance crews of the Atlantic County Road Department and the Camden County Highway Department produced less sand and gravel than in 1959.

**Stone.**—Stone production had a higher total value (40 percent of the State total) than any other mineral commodity produced in New Jersey in 1960. Tonnage and value increased 1 percent and 3 percent, respectively, compared with 1959. Stone used as concrete aggregate and roadstone furnished 86 percent of the tonnage and 81 percent of the value of all stone produced.

Basalt (traprock) made up 88 percent of the total stone tonnage and 82 percent of the value. Principal applications for basalt were as concrete aggregate and roadstone but some was also used as riprap, railroad ballast, and for miscellaneous purposes. More than three-quarters of the basalt was produced in Somerset and Passaic Counties, but output also was reported for Bergen, Essex, Hunterdon, Mercer, and Union Counties. Limestone, mined only in Sussex County, was the second most important stone in terms of value. It was used principally as filler, agstone, concrete aggregate, roadstone, and additive in livestock food. Granite, mined at quarries in Morris and Hunterdon Counties, was used as concrete aggregate, roadstone, and riprap. Oystershell was recovered in Gloucester County, and marble was

[1] Included with "Other sand" to avoid disclosing individual company confidential data.
[2] Includes ground, other sand, and uses indicated by footnote 1.
[3] Included with "Other gravel" to avoid disclosing individual company confidential data.
[4] Includes railroad ballast gravel.
[5] Less than $1,000.
[6] Less than 1,000 tons.

produced in Warren County. Stone producers employed 918 men who worked 1,780,000 man-hours and produced 5.3 tons of finished stone per man-hour.

*Roofing Granules.*—The quantity and value of roofing granules from Bergen, Passaic, and Somerset Counties were greater than in 1959. The average price for natural (uncolored) granules was $0.49 per ton higher than in 1959, but artificially colored granules were $0.80 per ton lower in average value. Basalt (traprock) was the principal raw material for roofing granules, but some of the artificially colored product was made with aplite shipped into the State from Virginia. Minnesota Mining & Manufacturing Co. began constructing an integrated roofing granule plant near Belle Mead (Somerset County). Diabase from Sourland Mountain was to be used as raw material.

**Sulfur.**—Production, as measured by shipments of sulfur recovered as a byproduct in the liquid purification of gas, was reported from plants in Gloucester, Middlesex, and Union Counties. Output of 43,000 long tons and value of $1,077,000 represented increases of 26 and 27 percent, respectively, over 1959. Part of the sulfur was self-consumed in chemical processes, and the remainder was sold to sulfuric acid manufacturers.

Digitized by Google

**Vermiculite.**—Plants in Essex and Mercer Counties exfoliated crude vermiculite. Part of the crude material was of foreign origin, and part was mined in other States.

## METALS

**Base Metals.**—Foreign and domestic base metal ores, intermediate products, and scrap were smelted and refined at a number of plants in the State. Copper and precious metals were produced at the smelting and refining plant of American Metal Climax, Inc., at Carteret. International Smelting & Refining Co., a subsidiary of The Anaconda Company, produced copper cathodes and furnace shapes at its Perth Amboy plant. Federated Metals Division of American Smelting & Refining Co. operated three metallurgical plants. At Perth Amboy, primary and scrap metals were refined and processed to produce aluminum and magnesium alloys, copper base alloys, and lead products; at Trenton and Newark, white-metal alloys, zinc die cast, zinc, and zinc dust were produced. Casswell, Strauss & Co., Inc. (Sewaren), and Revere Smelting & Refining Co. (Newark) produced lead, lead alloys, and briquetted copper from secondary metals. The State's only base metal mine (zinc), in Sussex County, was idle.

**Ferroalloys.**—Production of ferroalloys was about the same as in 1959. Shipments during 1960 were principally ferroalloys of columbium, titanium, vanadium, tantalum-columbium, and boron.

**Indium.**—High Purity Metals, Inc., Hackensack, and Federated Metals Division of American Smelting & Refining Co., Perth Amboy, produced high-purity indium and other rare and precious metals.

**Iron Ore.**—Production of crude ore decreased in 1960 because one of the iron ore mines active in 1959 was idle. Two mines (Morris County and Warren County) continued to produce magnetite ore by shrinkage and sublevel stoping. Crude ore was beneficiated magnetically and shipped principally for conversion to pig iron and steel, but quantities were sold for use in manufacturing iron powder and paint and as aggregate in dense concrete for radioactive shielding.

**Iron and Steel.**—John A. Roebling's Sons, Division of Colorado Fuel & Iron Corp., produced open-hearth steel in Burlington County. Crucible Steel Co. of America produced steel in electric furnaces at its mill in Essex County.

**Iron and Steel Scrap.**—The principal activity in iron and steel scrap centered about Camden, Jersey City, Port Newark, and Trenton. Inventories at the end of the year were slightly below those at the beginning of 1960. Shipments for exports were the principal factor in maintaining a good level of operation during the year. Exports supplied more than 60 percent of total shipments from yards. Foreign consumption was principally of No. 1 heavy melting steel; other grades for the export market in decreasing order of tonnage were

Digitized by Google

No. 2 heavy melting steel, No. 2 and all other bundles, and No. 1 electric furnace bundles. Grades in demand for domestic consumption in decreasing order of tonnage were No. 2 and all other bundles, No. 1 heavy melting steel, No. 2 heavy melting steel, and cast-iron scrap other than borings.

**Rare-Earth Metals.**—Separated rare-earth metals, misch metal, ferrocerium, and other compounds of rare-earth elements were produced in Bergen, Essex, and Passaic Counties. Continued research on processing methods made more of the rare-earth elements available in high-purity form.

**Titanium.**—Glidden Co. completed pilot-plant work to test recovery of ilmenite and other heavy minerals during the year. Most of the exploratory drilling at the company-owned deposit also was completed. Engineering and design of the concentration plant to be erected in Jackson Township, Ocean County, was well underway. In addition to producing ilmenite concentrate, the company planned to recover byproduct sand and gravel and associated heavy minerals, including zircon. American Smelting & Refining Co. and American Cyanamid Co. continued to hold other tracts of land containing titanium-bearing sand deposits.

**Uranium.**—A quantity of uranium ore mined in Sussex County was delivered at Salt Lake City, Utah, for processing. This was the first recorded production of uranium ore in the State although specimens containing uranium minerals had been collected over a period of years.

## MINERAL FUELS

**Coke and Coal Chemicals.**—Koppers Co., Inc. (Hudson County), operated a merchant plant having an annual capacity of 1.1 million tons of coke. Quantities of monoammonium phosphate, crude coal tar, crude light oil, intermediate light oil, and naphthalene (under 74° C.) were recovered as byproducts.

**Peat.**—Both quantity and value of peat recovered were less than in 1959. The output, from bogs in Somerset, Sussex, and Warren Counties was sold principally in bulk for use as a soil conditioner.

**Petroleum.**—Seven refineries operated in two general areas, both accessible to tidewater; five plants were in the New York area (Middlesex, Union, and Hudson Counties); and two, near Philadelphia (Gloucester County). Total daily operating capacity of the active plants was 513,000 barrels of crude oil and 147,100 barrels of cracked and reformed gasoline. Four laboratories conducted petroleum research chiefly on production development, new processes, and product utilization. Over 4,000 persons were employed at the laboratories operated by Cities Service Research and Development Co., Cranberry; Esso Research and Engineering Center, Florham Park; Esso Research Center, Linden; and Socony-Mobil Oil Co., Paulsboro.

## REVIEW BY COUNTIES

**Atlantic.**—Commercial output of sand and gravel decreased 15 percent from 1959 and totaled 100,000 tons. Seven operations were active, chiefly near Buena Vista, Folsom, Hammonton, Oceanville, and Port Republic. Production, mostly processed sand, was used for paving, building, and molding. Eighty-eight percent of the commercial output was shipped by truck and the remainder, by rail. Crews of the Atlantic County Road Department produced sand and gravel for paving and fill.

**Bergen.**—Crushed stone was produced in Bergen County for the first time in more than 5 years. Traprock excavated under contract with the Port of New York Authority was used for concrete aggregate, roadstone, and fill. The excavation provided access on the New Jersey side to the new lower deck of the George Washington Bridge. Production of sand and gravel, chiefly for building and paving purposes, decreased from 869,000 tons in 1959 to 790,000 tons in 1960. All of the material was processed and shipped by truck. Output was reported from four operations at Mahwah, Paramus, Ramsey, and Wyckoff. Alluvial clays, used in manufacturing building brick, were recovered from a pit near Carlstadt by Tri-County Brick Corp.

Construction was completed, and production was begun at the gypsum-calcining mill of Barrett Division, Allied Chemical Corp. in Edgewater. The calcined gypsum was used in manufacturing gypsum plaster building products at the company adjacent Shadyside plant. Royce Chemical Co. (Carlton Hill) manufactured zinc oxide and leaded zinc oxide pigment. Artificially colored roofing granules were produced by The Flintkote Co. at its East Rutherford plant.

**TABLE 5.—Value of mineral production in New Jersey by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Atlantic | $183,629 | $202,926 | Sand and gravel. |
| Bergen | 1,307,403 | 2,431,090 | Stone, sand and gravel, clays. |
| Burlington | 1,140,883 | 1,222,531 | Sand and gravel, greensand marl, clays. |
| Camden | 1,091,670 | 1,208,620 | Sand and gravel, clays. |
| Cape May | (2) | (2) | Magnesium compounds, sand and gravel, gem stones. |
| Cumberland | 7,243,863 | 8,321,757 | Sand and gravel, clays. |
| Essex | (2) | (2) | Stone. |
| Gloucester | 578,500 | 540,020 | Sand and gravel, greensand marl, stone. |
| Hunterdon | (2) | (2) | Stone. |
| Mercer | (2) | (2) | Stone, gem stones. |
| Middlesex | 2,391,801 | 2,215,484 | Clays, sand and gravel. |
| Monmouth | 770,306 | 856,934 | Sand and gravel. |
| Morris | 13,495,987 | 10,706,757 | Iron ore, sand and gravel, stone, clays. |
| Ocean | 1,713,131 | 1,420,172 | Sand and gravel. |
| Passaic | 6,671,071 | 5,685,988 | Stone, sand and gravel, clays. |
| Salem | 11,650 | (2) | Sand and gravel. |
| Somerset | 9,760,060 | 9,593,389 | Stone, clays, peat, gem stones. |
| Sussex | 3,544,025 | 3,487,656 | Stone, manganiferous residuum, sand and gravel, lime, peat, uranium, gem stones. |
| Union | (2) | (2) | Stone. |
| Warren | (2) | (2) | Iron ore, sand and gravel, stone, clays, peat. |
| Undistributed[3] | 9,574,701 | 8,515,387 | |
| Total | 59,479,000 | 56,409,000 | |

[1] No production reported in Hudson County.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Includes value of gem stones not assigned to specific counties and values indicated by footnote 2.

Maywood Chemical Works, Maywood, produced a variety of rare-earth metals and compounds. High Purity Metals, Inc., Hackensack, a subsidiary of Accurate Specialities Co., Inc., began to produce high purity rare-earth metals. It continued to process and market ultra-pure indium, germanium, gold, and other materials, principally for electronic applications.

**Burlington.**—Sand and gravel, chiefly for building and paving, was produced at six operations—two each near Riverside and Mount Holly and one each near Burlington and East Riverton. Total county output decreased 3 percent from 1959. Truck, railroad, and waterway were used by producers to transport their material to market. Seventy-six percent of the output was processed material Limited quantities of molding and other sand were produced. National Soil Conservation, Inc., Medford, continued to produce greensand marl for sale as a natural fertilizer. Church Brick Co. manufactured building brick from miscellaneous clay produced near Fieldsboro. Crude gypsum was calcined for manufacturing finished building material at the Burlington plant of National Gypsum Co. A wide variety of open-hearth steels for wire and specialties was made at the Trenton plant of John A. Roebling's Sons, Division of Colorado Fuel & Iron Corp.

**Camden.**—Commercial production of sand and gravel increased from 583,000 tons in 1959 to 774,000 tons in 1960. Nine producers were active near Atco, Berlin, Gloucester Township, Grenloch, Pennsauken Township, Winslow, and Woodcrest. Output consisted chiefly of molding and other industrial sand and structural and paving material. Construction and maintenance crews of the Camden County Highway Department produced paving gravel. Eighty-nine percent of the commercial output was processed material. Pro-

Digitized by Google

ducers shipped their material by truck (79 percent) and railroad (21 percent).

Miscellaneous clay, used exclusively for manufacturing building brick, was produced near Winslow Junction by the New Jersey Division of Alliance Clay Product Co. Ward Sand and Materials Co., Delair, produced plastic fire clay and miscellaneous clay for use in refractories. The Camden coke plant of Public Service Electric & Gas Co. had been abandoned on May 14, 1959, and production of coke and byproduct coal chemicals discontinued. New Jersey Zinc Co. produced titanium dioxide (titanium white) at its Gloucester City pigment plant, where expanded facilities were completed in 1960.

**Cape May.**—Northwest Magnesite Co. produced refractory magnesia from sea water and dolomite at its Cape May plant. Tuckahoe Sand and Gravel Co. and Courtland Sand and Gravel Co. processed building sand and gravel near Tuckahoe and Cape May Court House, respectively. John F. Gandy, using portable equipment, mined sand and gravel near Marmora for highway construction. All of the material was shipped to consumers by truck.

**Cumberland.**—Cumberland County continued to be the leading sand and gravel producing county and supplied 42 percent of the State's total valuation of sand and gravel. Output of sand and gravel totaled 2,438,796 short tons, a 12-percent increase over 1959. Production was reported from 14 operations in the county and consisted mainly of molding and glass sand. Blast, fire, filter, and engine sand as well as building, paving, and other sand and gravel also were produced. National Glass Sand Corp. and Pennsylvania Glass Sand Corp., both of Millville, and Port Silica Sand Co., Inc., Port Elizabeth, produced ground sand that was used as foundry, abrasive, and filler sand, and for enamel, glass, pottery, porcelain, and other purposes. Daniel Goff Co., Inc. (Millville), mined plastic fire clay for use as a binder for foundry sand. William Edge discontinued the grinding of oystershell near Dorchester.

**Essex.**—Basalt for construction material and riprap was mined at West Orange by Orange Quarry Co. and at South Orange by M. L. Kernan Quarry. Part of the output was sold to nearby communities for use in road maintenance and repair. Crude vermiculite, imported from Africa, was exfoliated at the Newark plant of Vermiculite Industrial Corp. for use in insulation and plaster, and as an aggregate in ultralightweight concrete. A limited quantity of crude gypsum was calcined at the Newark plant of Barrett Division, Allied Chemical Corp., and transferred to the company plaster board plant at Edgewater, Bergen County. In March, the Newark plant was dismantled and sold; production facilities were replaced by a newly constructed calcining plant adjacent to the Edgewater plant.

Iron oxide pigment (hydrated ferric oxide) was produced at the Newark plant of E. I. duPont de Nemours & Co., Inc. Ronson Metals Corp., successor to New Process Metals, Inc. (Newark), continued to produce individual rare-earth metals, ferrocerium, and misch metal for lighter flints. The company continued research to improve methods of separating the rare-earth elements and on the metallurgy of the individual metals. Crucible Steel Co. of America made special steel in arc-melting and induction furnaces at its Spaulding Works, Harrison.

Digitized by Google

**Gloucester.**—Production of sand and gravel was reported from four operations, at Bridgeport, Downer, Mt. Royal, and Gibbstown. Output of sand and gravel declined 9 percent from a high of 418,000 tons in 1959. Dredging was the principal method used to extract sand and gravel in the county. A small quantity was sold as unprepared material. Inversand Co. recovered greensand marl from its pit near Sewell; the glauconite (natural zeolite) content of the greensand was used to soften water for domestic and industrial use. Joseph Bauder & Sons (Franklinville) recovered oystershell for use as poultry grit. Freeport Sulphur Co. recovered byproduct sulfur at its Eagle Point (Westville) plant. Mobil Oil Co. also recovered byproduct sulfur at its Paulsboro refinery. Shieldalloy Corp., Newfield, used the thermite process in manufacturing ferroalloys of titanium, vanadium, columbium, columbium-tantalum, and other metals.

**Hudson.**—Koppers Co., Inc., produced coke and coal chemicals at its Kearney plant, which had 165 Koppers and 65 Koppers-Becker slot-type byproduct coke ovens. The company also recovered hydrogen sulfide by the hot-vacuum process at its nearby Seaboard plant.

**Hunterdon.**—Basalt for use chiefly as concrete aggregate and roadstone was produced by Lambertville Quarry Co. (Lambertville) and Houdaille Construction Materials, Inc. (Oldwick). Granite for concrete roadstone and riprap and miscellaneous stone for rough dimension stone were also produced during 1960.

**Mercer.**—Diabase (traprock) was quarried near Pennington by the Pennington Quarry Co., and basalt was mined by inmates of the Mercer County Workhouse (Trenton). The output from both quarries was used as concrete aggregate and roadstone. Golding-Keene Co. (Trenton) ground potash feldspar from crude ores produced at its mines in New Hampshire and Quebec, Canada. The ground material was sold for use in enamel, tile, insulators and pottery, and as an abrasive in soap. Principal markets were in Massachusetts, New Jersey, and Connecticut. Golding-Keene Co. sold its Trenton plant October 24, 1960; after that date customers were supplied from its New Hampshire grinding plant. Columbian Carbon Co. (Trenton) continued to manufacture black, brown, red, and yellow iron oxide pigments by chemical treatment of scrap iron. Crude vermiculite from out of State was exfoliated at a plant in Trenton.

**Middlesex.**—Middlesex County continued as the leading clay-producing area, supplying 66 percent of the State tonnage. County output of 438,000 tons, a 5-percent decrease from 1959, was mainly miscellaneous clay used for manufacturing heavy clay products and lightweight aggregate. Most of the fire clay produced in the county was used in manufacturing a variety of refractory products. Production was reported by 12 companies, mainly along the Atlantic seaboard.

The combined output of eight sand and gravel producers in the county totaled 777,000 tons, a 19-percent increase over 1959. Output, mainly construction sand, was used for building and paving purposes. Industrial sands in limited quantity were produced for blast, molding, engine, and other uses. Sand and gravel was transported from plants by truck, waterway, and railroad.

Anlin Co. recovered byproduct sulfur by the modified Claus process of gas purification at Perth Amboy. Perlite expanded by Coralux

615629—61——44

Digitized by Google

Perlite Corp., Metuchen, was sold for use in acoustical plaster and ultralightweight concrete. Columbian Carbon Co. (Monmouth Junction) and Stabilized Pigments, Inc. (New Brunswick), continued to calcine copperas to produce a red iron oxide pigment. National Lead Co. (Sayreville) manufactured titanium dioxide, white lead, red lead, and litharge at its Perth Amboy plant. American Smelting & Refining Co. continued to produce zinc chloride at its Perth Amboy plant. The refractories division of the Carborundum Co. (Perth Amboy) produced synthetic mullite from alumina and silica by treating these raw materials in a high-temperature kiln. The mullite was used in manufacturing brick, block, and special shapes for use principally as refractories in high-temperature applications at steel mills and glass plants.

Federated Metals Division of American Smelting and Refining Co. (Perth Amboy) smelted and refined foreign and domestic copper matte and concentrates. Electrolytic copper; oxygen-free copper; refined gold, silver, and platinum-group metals; selenium; tellurium; metal powders; and solders were produced at the Carteret plant of United States Metals Refining Co., a unit of American Metal Climax, Inc. Coppers, brass, bronze, and cupronickel tubing and pipe were produced at the new plant of Phelps Dodge Copper Products Corp. in South Brunswick. Production of aluminum castings was started late in 1960 at a new die-casting plant, part of the Edison Works of Aluminum Co. of America (Metuchen). This large modern facility was planned to supplant gradually the company smaller plants at Garwood (Union County), and Bridgeport (Conn.). Metal and Thermit Corp., Carteret, manufactured ferroboron and ferrotitanium by the thermite process.

**Monmouth.**—Production of sand and gravel from eight operations, mainly along the Atlantic seaboard, totaled 883,000 tons, a 23-percent increase over 1959 and a 4-percent increase over the previous high in 1955. Building sand and gravel and paving gravel, sold to local and State government agencies, were the principal types produced.

**Morris.**—Alan Wood Steel Co. continued to mine and beneficiate iron ore at its Scrub Oaks mine near Dover. The concentrate was shipped to the company steel plant at Conshohocken, Pa. Shahmoon Industries, Inc., did not operate its Mt. Hope iron-ore mine but made shipments from stock during 1960. Alan Wood Steel Co. continued to ship mine waste and mill tailings for use as concrete aggregate and roadstone. Shahmoon Industries, Inc., opened a new granite quarry for production of aggregate. Samuel Braen's Sons mined and prepared granite for use as riprap, concrete aggregate, and roadstone at its Riverdale Quarry. The Richard Mine plant (Wharton) of Wharton Sand & Stone Co. ceased operating when the granite mine tailing from the idle Richard Mine had been consumed. Morris County continued to rank second in valuation of sand and gravel output among the 15 producing counties in the State. Output from eight operations totaled 2,219,901 tons a 22-percent increase over 1959 and a 2-percent increase over the previous high in 1956. Ninety-six percent of the sand and gravel produced was processed and sold for building and paving uses. Logansville Pottery, Inc., mined clay near Bernardville for use in manufacturing flowerpots.

Digitized by Google

**Ocean.**—Despite a decline in both tonnage and value, Ocean County ranked third in valuation of sand and gravel production in 1960. The output, as in the past, was used mainly for building and paving materials. New Jersey Pulverizing Co. near Bayville produced industrial sands for molding, blast, engine, and other industrial uses as well as a quantity of ground sand for abrasive, filler, and foundry purposes. Glidden Co. completed its pilot-plant work for recovering ilmenite. Construction of a concentrating plant, scheduled for completion in 1962, was planned. The plant was to be built in Jackson Township near Ridgeway. Output of ilmenite concentrate from the new plant will be shipped by rail to the company's titanium dioxide plant in Baltimore, Md. Byproduct sand and gravel will be sold locally.

**Passaic.**—Passaic County continued to be the second largest source of crushed stone in the State although the value of production was 8 percent below 1959. The reduced value was caused by lower prices; the tonnage was about the same as in 1959. Basalt was produced by Samuel Braen's Sons (Haledon and Hawthorne), Sowerbutt Quarries (Prospect Park), Union Building & Construction Corp. (Clifton), Great Notch Corp. (Little Falls), and Houdaille Construction Materials, Inc. (Montclair). Most of the basalt produced was for concrete and roadstone, but part of the output was used for riprap and roofing granules. Passaic Crushed Stone Co., Inc., produced concrete aggregate and roadstone from gneiss mined at a quarry near Pompton Lakes. Sand and gravel, chiefly for structural materials, was processed at four plants near Wayne. Miscellaneous clay for manufacturing brick was produced by Paterson Brick Co. (Wayne).

PerAlex of New Jersey, Inc., Paterson, expanded crude perlite, mined in Nevada, for use in lightweight concrete and acoustical plaster, and as a soil conditioner. Natural roofing granules for mineral-surfaced roofing and siding were produced by H. B. Reed Corp. (Passaic) and Great Notch Granule Co. (Little Falls). Facilities for producing beryllium oxide ceramic materials were expanded at National Beryllia Corporation's Haskell plant. Rare-earth metals and compounds were produced by Davison Chemical Division of W. R. Grace & Co., Pompton Plains.

**Salem.**—A. W. Davis Lumber Co. discontinued its sand and gravel operations December 15. Only a limited quantity of building sand was produced by the company during 1960.

**Somerset.**—Basalt production of 4.3 million tons valued at $9.4 million made Somerset County the leading stone-producing county in the State. Tonnage was lower than in 1959, but value was about the same because of increased prices. Basalt was mined at six quarries: Houdaille Construction Materials, Inc. (Millington and Bound Brook), Fanwood Stone Crushing & Quarry Co. (Watchung), Kingston Traprock Co. (Kingston), Somerset Crushed Stone, Inc. (Bernardsville), and Dockwatch Quarry Pit, Inc. (Martinsville). Output was sold mostly for concrete aggregate and roadstone, but quantities were also used for riprap and railroad ballast. Peapack Limestone Quarry Co., Inc., was inactive. Miscellaneous clay was produced by New Jersey Shale Brick & Tile Corp. (Somerville) and Natco Corp. (Middlebush). Output was used for manufacturing building brick and other heavy clay products. Mt. Bethel Humus Co. (Mt. Bethel)

Digitized by Google

produced humus peat for sale in bulk. Industrial Insulation Division of Johns-Manville Corp. (Manville) expanded perlite for use in manufacturing pipe insulation and for loose fill. The crude material was mined in Colorado by Johns-Manville Perlite Corp.

Central Commercial Co. produced natural and artificially colored roofing granules at its Bound Brook plant.

**Sussex.**—Farber White Limestone Co. (Franklin) and Limestone Products Corp. of America (Newton) mined, crushed, ground, and sized limestone for a wide variety of uses. On a basis of tonnage consumption, the principal uses were for agstone, concrete aggregate, roadstone, and as a filler in flooring, rubber, and asphalt. The limestone was also used in manufacturing lime, as an additive in livestock feed, for poultry grit, filter medium, and roofing granules. Limestone Products Corp. burned limestone at its Lime Crest plant and produced hydrated lime for use in construction and agricultural and chemical applications. The principal consuming areas for the hydrated lime were New Jersey, New York, and Pennsylvania; small quantities were shipped to Connecticut, Maine, Massachusetts, and Vermont. The Sterling Hill mine (zinc) near Ogdensburg was idle but shipments of manganiferous residuum were made from stockpiles at the Palmerton (Pa.) smelter.

The combined sand and gravel output of four companies totaled 226,000 tons, a 70-percent increase over 1959. Reed-sedge peat was produced from bogs and sold packaged and in bulk by Hyper-Humus Co. (Newton); bulk peat sales only were reported by Netcong Natural Products (Stanhope). Becmo, Inc., produced and sold uranium ore from a deposit in the southern part of the county. Old mine dumps near Franklin continued to attract thousands of amateur gem and mineral collectors. Specimens collected were chiefly calcite, franklinite, willemite, and zincite.

**Union.**—Basalt was mined, crushed, and screened by Houdaille Construction Materials, Inc., at its Summit plant for use as concrete aggregate and roadstone. Hydrogen sulfide was recovered by diethanolamine treatment at the Bayway refinery of Esso Standard Oil Co. The gas shipped to a nearby plant of General Chemical Div., Allied Chemical Corp., where sulfur was recovered and used by General Chemical. Certified Industries Products, Inc., Hillside, expanded perlite, mined in Colorado, for use in acoustical plaster and concrete aggregate, and as a soil conditioner.

**Warren.**—Alan Wood Steel Co. mined and beneficiated magnetite ore at its Washington mine to supply part of the iron-ore requirements of its steel plant at Conshohocken, Pa. Houdaille Construction Materials, Inc. (Carpenterville), and Steckel Concrete Co. (Phillipsburg) processed structural sand and gravel materials, and Van Horn Sand & Gravel Co. (Belvidere), using portable equipment, produced only gravel for construction purposes. Royal Green Marble Co. (Phillipsburg) quarried and crushed marble exclusively for terrazzo. The Port Murray clay pit and brick plant of Natco Corp. was active during the year after being idle in 1959. Tamarock Humus Co. (Buttzville) recovered peat from a nearby bog for bulk sales. Magnesium compounds, including acetate, chloride, nitrate, oxide, sulfate, and phosphate, were produced by J. T. Baker Chemical Co. at its Phillipsburg plant.

# The Mineral Industry of New Mexico

By F. J. Kelly,[1] William H. Kerns,[1] and D. H. Mullen [1]

THE RECOVERY of certain segments of the mineral industry of New Mexico from production cutbacks during 1957–59, was indicated by an overall 10-percent increase in the value of output for 1960 ($652.2 million), compared with 1959 ($592.5 million).

Beryllium, manganese, and molybdenum in the metals group, and fluorspar, magnesium compounds, sheet mica, perlite, pumice, and sand and gravel in the nonmetals category were the only commodities for which a lower output was recorded in 1960. The drop in total value for these products, $8.7 million, was more than offset by large production gains reported for other minerals.

The spectacular 33-percent advance in the value of metals output can be attributed to uninterrupted operations following the settlement of labor strikes that occurred in the copper industry in 1959 and to a general increase in the production of uranium ore. Metals accounted for 17 percent of the value of mineral production.

The output of mineral fuels increased 7 percent in value in 1960 as the result of greater overall production. However, the contribution of the fuels group to the total value of all mineral production dropped from 70 percent in 1959 to 68 percent.

Although the value of some nonmetals produced and sold in 1960 advanced substantially, the overall increase for this group was only 3 percent above 1959. Higher values for potash, stone, lime, and gypsum were nearly offset by a $6.1 million decline in the value of sand and gravel and pumice output. The value of nonmetal production was 15 percent of the $652.2 million recorded for all minerals.

The expansion of the construction-materials segment of the minerals industry was highlighted in 1960 with the initial operation in May of a wallboard plant between Santa Fe and Albuquerque and the completion and start of operation of a second wallboard plant at Albuquerque. A new mica-grinding mill was constructed at Tesuque, and a new perlite grinding mill at No Agua replaced one destroyed by fire.

---

[8] Revised figure.

**Employment and Injuries.**—Preliminary data compiled by the Federal Bureau of Mines for employment and injuries in the mineral industries in New Mexico in 1960, excluding the petroleum industry, are shown in table 2. The uranium and potash industries each furnished approximately one-third of the total man-hours worked (excluding the petroleum industry). Nonferrous metal mines and smelters supplied approximately one-quarter of the total. Uranium mines reported 14 fatal injuries and over half the nonfatal injuries; potash mines reported the State's only other fatality and one-third of the nonfatal injuries.

**Legislation and Government Programs.**—The Office of Minerals Exploration (OME) signed a contract on January 27 with Tri-State Metals Corp. to explore for beryl and tantalum. OME was to participate to the extent of 50 percent of approved costs not to exceed $23,360.

One small shipment of hand-cobbed mica was made to the Government purchase depot at Custer, S. Dak. Contracts for the purchase of uranium oxide concentrate from two of the State's six processing plants were revised by the Atomic Energy Commission (AEC) to extend the termination date to December 31, 1966, and stipulated the quantities of concentrates to be purchased.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

The value of the mineral fuels (carbon dioxide, coal, helium, natural gas, natural gas liquids, and petroleum) was 7 percent greater than in 1959 and represented 68 percent of the total value of all mineral production in the State.

**Carbon Black.**—Carbon black was produced from natural gas at three plants in Lea County. The quantity of carbon black recovered was 4 percent below that of 1959, and 47.7 billion cubic feet of natural gas was consumed.

**Carbon Dioxide.**—Production of carbon dioxide from wells in Harding County increased 23 percent in quantity and 15 percent in value over that of 1959. The gas was marketed to consumers as dry ice and liquid carbon dioxide.

**Coal.**—Production of coal, from 19 mines (18 underground, 1 strip) in 5 counties, was double that of 1959. Output from the Koehler mine in Colfax County, operated by the Kaiser Steel Corp. supplied the increase. The Pittsburg & Midway Coal Co., Pittsburg, Kans., began stripping overburden from a coalbed west of Gallup. Coal production was scheduled to begin January 1962; output will be used at a 110-megawatt thermal-electric generating plant at Joseph City, Ariz., to be built by Arizona Public Service Co. The plant will consume an estimated 380,000 tons of coal annually. Official approval was granted by the U.S. Department of the Interior for constructing a 350-megawatt thermal-electric generating plant on the Navajo Indian Reservation. Arizona Public Service Co. will build and operate the plant, to be named the Four Corners powerplant, on a 1,250-acre site, 10 miles southeast of Shiprock, leased from the Navajo Tribal Council. Fuel for the plant will be mined by Utah Construction & Mining Co. from 24,320 acres of undeveloped tribal lands which were leased from the tribal council and which contain a large reserve of sub-bituminous coal. Coal requirements were expected to be 4,200 tons a day; the Navajo tribe was to receive a royalty of 15 cents a ton, based on a minimum production of 800,000 tons in 1963, increasing to 2.5 million tons in 1975.

**Helium.**—The helium plant at Shiprock, operated by the Federal Bureau of Mines, was active throughout the year; helium recovered from natural gas was more than double that of 1959.

**TABLE 3.—Coal production, by counties**

(Excludes mines producing less than 1,000 short tons)

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Average value per ton [1] | Short tons | Average value per ton [1] |
| Colfax | 82,359 | $6.29 | 212,114 | $6.10 |
| McKinley | 50,316 | 4.62 | 69,584 | 5.44 |
| Rio Arriba | 7,830 | 5.91 | 7,398 | 5.58 |
| Sandoval | 1,245 | 3.11 | 1,457 | 6.50 |
| San Juan | 6,800 | 5.40 | 4,209 | 5.75 |
| Total | 148,550 | 5.64 | 294,762 | 5.93 |

[1] Value received or charged f.o.b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked as estimated by producer at average prices that might have been received if the coal had been sold commercially.)

**Natural Gas.**—Marketed natural gas from oil wells and dry gas wells was 8 percent greater than in 1959. Production came from 13,476 oil wells and 6,047 gas wells. Southeastern counties supplied 55 percent of the output. Although 64 percent of production was from dry gas wells, 83 percent of the total output was processed at natural gas plants for recovering natural gas liquids. Data published by the

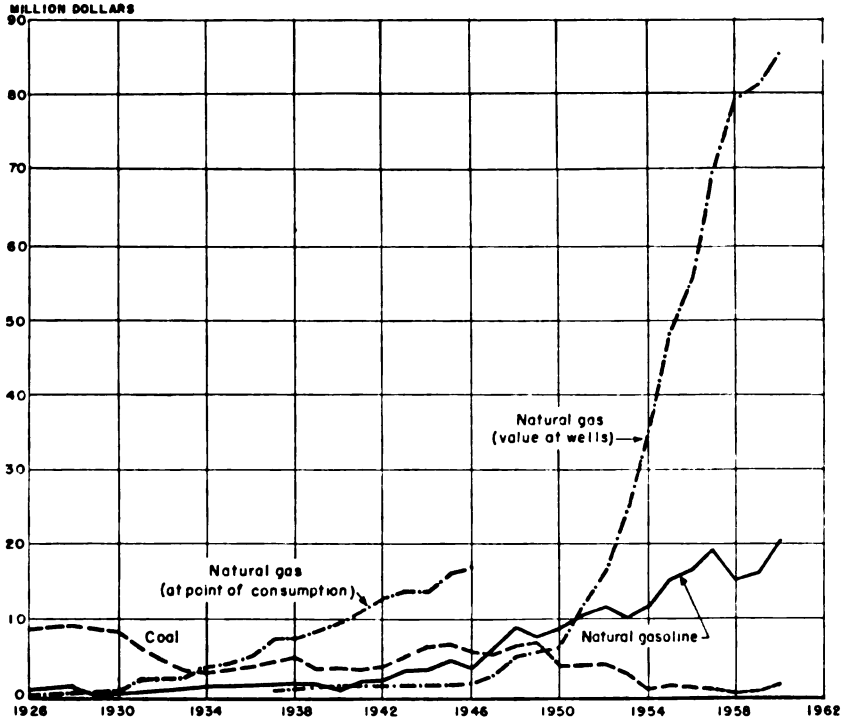

FIGURE 2.—Value of natural gas, natural gasoline, and coal in New Mexico, 1926–60.

ducers shipped their material by truck (79 percent) and railroad (21 percent).

Miscellaneous clay, used exclusively for manufacturing building brick, was produced near Winslow Junction by the New Jersey Division of Alliance Clay Product Co. Ward Sand and Materials Co., Delair, produced plastic fire clay and miscellaneous clay for use in refractories. The Camden coke plant of Public Service Electric & Gas Co. had been abandoned on May 14, 1959, and production of coke and byproduct coal chemicals discontinued. New Jersey Zinc Co. produced titanium dioxide (titanium white) at its Gloucester City pigment plant, where expanded facilities were completed in 1960.

**Cape May.**—Northwest Magnesite Co. produced refractory magnesia from sea water and dolomite at its Cape May plant. Tuckahoe Sand and Gravel Co. and Courtland Sand and Gravel Co. processed building sand and gravel near Tuckahoe and Cape May Court House, respectively. John F. Gandy, using portable equipment, mined sand and gravel near Marmora for highway construction. All of the material was shipped to consumers by truck.

**Cumberland.**—Cumberland County continued to be the leading sand and gravel producing county and supplied 42 percent of the State's total valuation of sand and gravel. Output of sand and gravel totaled 2,438,796 short tons, a 12-percent increase over 1959. Production was reported from 14 operations in the county and consisted mainly of molding and glass sand. Blast, fire, filter, and engine sand as well as building, paving, and other sand and gravel also were produced. National Glass Sand Corp. and Pennsylvania Glass Sand Corp., both of Millville, and Port Silica Sand Co., Inc., Port Elizabeth, produced ground sand that was used as foundry, abrasive, and filler sand, and for enamel, glass, pottery, porcelain, and other purposes. Daniel Goff Co., Inc. (Millville), mined plastic fire clay for use as a binder for foundry sand. William Edge discontinued the grinding of oystershell near Dorchester.

**Essex.**—Basalt for construction material and riprap was mined at West Orange by Orange Quarry Co. and at South Orange by M. L. Kernan Quarry. Part of the output was sold to nearby communities for use in road maintenance and repair. Crude vermiculite, imported from Africa, was exfoliated at the Newark plant of Vermiculite Industrial Corp. for use in insulation and plaster, and as an aggregate in ultralightweight concrete. A limited quantity of crude gypsum was calcined at the Newark plant of Barrett Division, Allied Chemical Corp., and transferred to the company plaster board plant at Edgewater, Bergen County. In March, the Newark plant was dismantled and sold; production facilities were replaced by a newly constructed calcining plant adjacent to the Edgewater plant.

Iron oxide pigment (hydrated ferric oxide) was produced at the Newark plant of E. I. duPont de Nemours & Co., Inc. Ronson Metals Corp., successor to New Process Metals, Inc. (Newark), continued to produce individual rare-earth metals, ferrocerium, and misch metal for lighter flints. The company continued research to improve methods of separating the rare-earth elements and on the metallurgy of the individual metals. Crucible Steel Co. of America made special steel in arc-melting and induction furnaces at its Spaulding Works, Harrison.

Digitized by Google

**Gloucester.**—Production of sand and gravel was reported from four operations, at Bridgeport, Downer, Mt. Royal, and Gibbstown. Output of sand and gravel declined 9 percent from a high of 418,000 tons in 1959. Dredging was the principal method used to extract sand and gravel in the county. A small quantity was sold as unprepared material. Inversand Co. recovered greensand marl from its pit near Sewell; the glauconite (natural zeolite) content of the greensand was used to soften water for domestic and industrial use. Joseph Bauder & Sons (Franklinville) recovered oystershell for use as poultry grit. Freeport Sulphur Co. recovered byproduct sulfur at its Eagle Point (Westville) plant. Mobil Oil Co. also recovered byproduct sulfur at its Paulsboro refinery. Shieldalloy Corp., Newfield, used the thermite process in manufacturing ferroalloys of titanium, vanadium, columbium, columbium-tantalum, and other metals.

**Hudson.**—Koppers Co., Inc., produced coke and coal chemicals at its Kearney plant, which had 165 Koppers and 65 Koppers-Becker slot-type byproduct coke ovens. The company also recovered hydrogen sulfide by the hot-vacuum process at its nearby Seaboard plant.

**Hunterdon.**—Basalt for use chiefly as concrete aggregate and roadstone was produced by Lambertville Quarry Co. (Lambertville) and Houdaille Construction Materials, Inc. (Oldwick). Granite for concrete roadstone and riprap and miscellaneous stone for rough dimension stone were also produced during 1960.

**Mercer.**—Diabase (traprock) was quarried near Pennington by the Pennington Quarry Co., and basalt was mined by inmates of the Mercer County Workhouse (Trenton). The output from both quarries was used as concrete aggregate and roadstone. Golding-Keene Co. (Trenton) ground potash feldspar from crude ores produced at its mines in New Hampshire and Quebec, Canada. The ground material was sold for use in enamel, tile, insulators and pottery, and as an abrasive in soap. Principal markets were in Massachusetts, New Jersey, and Connecticut. Golding-Keene Co. sold its Trenton plant October 24, 1960; after that date customers were supplied from its New Hampshire grinding plant. Columbian Carbon Co. (Trenton) continued to manufacture black, brown, red, and yellow iron oxide pigments by chemical treatment of scrap iron. Crude vermiculite from out of State was exfoliated at a plant in Trenton.

**Middlesex.**—Middlesex County continued as the leading clay-producing area, supplying 66 percent of the State tonnage. County output of 438,000 tons, a 5-percent decrease from 1959, was mainly miscellaneous clay used for manufacturing heavy clay products and lightweight aggregate. Most of the fire clay produced in the county was used in manufacturing a variety of refractory products. Production was reported by 12 companies, mainly along the Atlantic seaboard.

The combined output of eight sand and gravel producers in the county totaled 777,000 tons, a 19-percent increase over 1959. Output, mainly construction sand, was used for building and paving purposes. Industrial sands in limited quantity were produced for blast, molding, engine, and other uses. Sand and gravel was transported from plants by truck, waterway, and railroad.

Anlin Co. recovered byproduct sulfur by the modified Claus process of gas purification at Perth Amboy. Perlite expanded by Coralux

Perlite Corp., Metuchen, was sold for use in acoustical plaster and ultralightweight concrete. Columbian Carbon Co. (Monmouth Junction) and Stabilized Pigments, Inc. (New Brunswick), continued to calcine copperas to produce a red iron oxide pigment. National Lead Co. (Sayreville) manufactured titanium dioxide, white lead, red lead, and litharge at its Perth Amboy plant. American Smelting & Refining Co. continued to produce zinc chloride at its Perth Amboy plant. The refractories division of the Carborundum Co. (Perth Amboy) produced synthetic mullite from alumina and silica by treating these raw materials in a high-temperature kiln. The mullite was used in manufacturing brick, block, and special shapes for use principally as refractories in high-temperature applications at steel mills and glass plants.

Federated Metals Division of American Smelting and Refining Co. (Perth Amboy) smelted and refined foreign and domestic copper matte and concentrates. Electrolytic copper; oxygen-free copper; refined gold, silver, and platinum-group metals; selenium; tellurium; metal powders; and solders were produced at the Carteret plant of United States Metals Refining Co., a unit of American Metal Climax, Inc. Coppers, brass, bronze, and cupronickel tubing and pipe were produced at the new plant of Phelps Dodge Copper Products Corp. in South Brunswick. Production of aluminum castings was started late in 1960 at a new die-casting plant, part of the Edison Works of Aluminum Co. of America (Metuchen). This large modern facility was planned to supplant gradually the company smaller plants at Garwood (Union County), and Bridgeport (Conn.). Metal and Thermit Corp., Carteret, manufactured ferroboron and ferrotitanium by the thermite process.

**Monmouth.**—Production of sand and gravel from eight operations, mainly along the Atlantic seaboard, totaled 883,000 tons, a 23-percent increase over 1959 and a 4-percent increase over the previous high in 1955. Building sand and gravel and paving gravel, sold to local and State government agencies, were the principal types produced.

**Morris.**—Alan Wood Steel Co. continued to mine and beneficiate iron ore at its Scrub Oaks mine near Dover. The concentrate was shipped to the company steel plant at Conshohocken, Pa. Shahmoon Industries, Inc., did not operate its Mt. Hope iron-ore mine but made shipments from stock during 1960. Alan Wood Steel Co. continued to ship mine waste and mill tailings for use as concrete aggregate and roadstone. Shahmoon Industries, Inc., opened a new granite quarry for production of aggregate. Samuel Braen's Sons mined and prepared granite for use as riprap, concrete aggregate, and roadstone at its Riverdale Quarry. The Richard Mine plant (Wharton) of Wharton Sand & Stone Co. ceased operating when the granite mine tailing from the idle Richard Mine had been consumed. Morris County continued to rank second in valuation of sand and gravel output among the 15 producing counties in the State. Output from eight operations totaled 2,219,901 tons a 22-percent increase over 1959 and a 2-percent increase over the previous high in 1956. Ninety-six percent of the sand and gravel produced was processed and sold for building and paving uses. Logansville Pottery, Inc., mined clay near Bernardville for use in manufacturing flowerpots.

Digitized by Google

**Ocean.**—Despite a decline in both tonnage and value, Ocean County ranked third in valuation of sand and gravel production in 1960. The output, as in the past, was used mainly for building and paving materials. New Jersey Pulverizing Co. near Bayville produced industrial sands for molding, blast, engine, and other industrial uses as well as a quantity of ground sand for abrasive, filler, and foundry purposes. Glidden Co. completed its pilot-plant work for recovering ilmenite. Construction of a concentrating plant, scheduled for completion in 1962, was planned. The plant was to be built in Jackson Township near Ridgeway. Output of ilmenite concentrate from the new plant will be shipped by rail to the company's titanium dioxide plant in Baltimore, Md. Byproduct sand and gravel will be sold locally.

**Passaic.**—Passaic County continued to be the second largest source of crushed stone in the State although the value of production was 8 percent below 1959. The reduced value was caused by lower prices; the tonnage was about the same as in 1959. Basalt was produced by Samuel Braen's Sons (Haledon and Hawthorne), Sowerbutt Quarries (Prospect Park), Union Building & Construction Corp. (Clifton), Great Notch Corp. (Little Falls), and Houdaille Construction Materials, Inc. (Montclair). Most of the basalt produced was for concrete and roadstone, but part of the output was used for riprap and roofing granules. Passaic Crushed Stone Co., Inc., produced concrete aggregate and roadstone from gneiss mined at a quarry near Pompton Lakes. Sand and gravel, chiefly for structural materials, was processed at four plants near Wayne. Miscellaneous clay for manufacturing brick was produced by Paterson Brick Co. (Wayne).

PerAlex of New Jersey, Inc., Paterson, expanded crude perlite, mined in Nevada, for use in lightweight concrete and acoustical plaster, and as a soil conditioner. Natural roofing granules for mineral-surfaced roofing and siding were produced by H. B. Reed Corp. (Passaic) and Great Notch Granule Co. (Little Falls). Facilities for producing beryllium oxide ceramic materials were expanded at National Beryllia Corporation's Haskell plant. Rare-earth metals and compounds were produced by Davison Chemical Division of W. R. Grace & Co., Pompton Plains.

**Salem.**—A. W. Davis Lumber Co. discontinued its sand and gravel operations December 15. Only a limited quantity of building sand was produced by the company during 1960.

**Somerset.**—Basalt production of 4.3 million tons valued at $9.4 million made Somerset County the leading stone-producing county in the State. Tonnage was lower than in 1959, but value was about the same because of increased prices. Basalt was mined at six quarries: Houdaille Construction Materials, Inc. (Millington and Bound Brook), Fanwood Stone Crushing & Quarry Co. (Watchung), Kingston Traprock Co. (Kingston), Somerset Crushed Stone, Inc. (Bernardsville), and Dockwatch Quarry Pit, Inc. (Martinsville). Output was sold mostly for concrete aggregate and roadstone, but quantities were also used for riprap and railroad ballast. Peapack Limestone Quarry Co., Inc., was inactive. Miscellaneous clay was produced by New Jersey Shale Brick & Tile Corp. (Somerville) and Natco Corp. (Middlebush). Output was used for manufacturing building brick and other heavy clay products. Mt. Bethel Humus Co. (Mt. Bethel)

Digitized by Google

produced humus peat for sale in bulk. Industrial Insulation Division of Johns-Manville Corp. (Manville) expanded perlite for use in manufacturing pipe insulation and for loose fill. The crude material was mined in Colorado by Johns-Manville Perlite Corp.

Central Commercial Co. produced natural and artificially colored roofing granules at its Bound Brook plant.

**Sussex.**—Farber White Limestone Co. (Franklin) and Limestone Products Corp. of America (Newton) mined, crushed, ground, and sized limestone for a wide variety of uses. On a basis of tonnage consumption, the principal uses were for agstone, concrete aggregate, roadstone, and as a filler in flooring, rubber, and asphalt. The limestone was also used in manufacturing lime, as an additive in livestock feed, for poultry grit, filter medium, and roofing granules. Limestone Products Corp. burned limestone at its Lime Crest plant and produced hydrated lime for use in construction and agricultural and chemical applications. The principal consuming areas for the hydrated lime were New Jersey, New York, and Pennsylvania; small quantities were shipped to Connecticut, Maine, Massachusetts, and Vermont. The Sterling Hill mine (zinc) near Ogdensburg was idle but shipments of manganiferous residuum were made from stockpiles at the Palmerton (Pa.) smelter.

The combined sand and gravel output of four companies totaled 226,000 tons, a 70-percent increase over 1959. Reed-sedge peat was produced from bogs and sold packaged and in bulk by Hyper-Humus Co. (Newton); bulk peat sales only were reported by Netcong Natural Products (Stanhope). Becmo, Inc., produced and sold uranium ore from a deposit in the southern part of the county. Old mine dumps near Franklin continued to attract thousands of amateur gem and mineral collectors. Specimens collected were chiefly calcite, franklinite, willemite, and zincite.

**Union.**—Basalt was mined, crushed, and screened by Houdaille Construction Materials, Inc., at its Summit plant for use as concrete aggregate and roadstone. Hydrogen sulfide was recovered by diethanolamine treatment at the Bayway refinery of Esso Standard Oil Co. The gas shipped to a nearby plant of General Chemical Div., Allied Chemical Corp., where sulfur was recovered and used by General Chemical. Certified Industries Products, Inc., Hillside, expanded perlite, mined in Colorado, for use in acoustical plaster and concrete aggregate, and as a soil conditioner.

**Warren.**—Alan Wood Steel Co. mined and beneficiated magnetite ore at its Washington mine to supply part of the iron-ore requirements of its steel plant at Conshohocken, Pa. Houdaille Construction Materials, Inc. (Carpenterville), and Steckel Concrete Co. (Phillipsburg) processed structural sand and gravel materials, and Van Horn Sand & Gravel Co. (Belvidere), using portable equipment, produced only gravel for construction purposes. Royal Green Marble Co. (Phillipsburg) quarried and crushed marble exclusively for terrazzo. The Port Murray clay pit and brick plant of Natco Corp. was active during the year after being idle in 1959. Tamarock Humus Co. (Buttzville) recovered peat from a nearby bog for bulk sales. Magnesium compounds, including acetate, chloride, nitrate, oxide, sulfate, and phosphate, were produced by J. T. Baker Chemical Co. at its Phillipsburg plant.

# The Mineral Industry of New Mexico

By F. J. Kelly,[1] William H. Kerns,[1] and D. H. Mullen [1]

THE RECOVERY of certain segments of the mineral industry of New Mexico from production cutbacks during 1957–59, was indicated by an overall 10-percent increase in the value of output for 1960 ($652.2 million), compared with 1959 ($592.5 million).

Beryllium, manganese, and molybdenum in the metals group, and fluorspar, magnesium compounds, sheet mica, perlite, pumice, and sand and gravel in the nonmetals category were the only commodities for which a lower output was recorded in 1960. The drop in total value for these products, $8.7 million, was more than offset by large production gains reported for other minerals.

The spectacular 33-percent advance in the value of metals output can be attributed to uninterrupted operations following the settlement of labor strikes that occurred in the copper industry in 1959 and to a general increase in the production of uranium ore. Metals accounted for 17 percent of the value of mineral production.

The output of mineral fuels increased 7 percent in value in 1960 as the result of greater overall production. However, the contribution of the fuels group to the total value of all mineral production dropped from 70 percent in 1959 to 68 percent.

Although the value of some nonmetals produced and sold in 1960 advanced substantially, the overall increase for this group was only 3 percent above 1959. Higher values for potash, stone, lime, and gypsum were nearly offset by a $6.1 million decline in the value of sand and gravel and pumice output. The value of nonmetal production was 15 percent of the $652.2 million recorded for all minerals.

The expansion of the construction-materials segment of the minerals industry was highlighted in 1960 with the initial operation in May of a wallboard plant between Santa Fe and Albuquerque and the completion and start of operation of a second wallboard plant at Albuquerque. A new mica-grinding mill was constructed at Tesuque, and a new perlite grinding mill at No Agua replaced one destroyed by fire.

[3] Excludes fire clay; included with "Value of items that cannot be disclosed."
[4] Weight not recorded.
[5] Less than $1,000.
[6] Preliminary figure.
[7] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.
[8] Revised figure.

**Employment and Injuries.**—Preliminary data compiled by the Federal Bureau of Mines for employment and injuries in the mineral industries in New Mexico in 1960, excluding the petroleum industry, are shown in table 2. The uranium and potash industries each furnished approximately one-third of the total man-hours worked (excluding the petroleum industry). Nonferrous metal mines and smelters supplied approximately one-quarter of the total. Uranium mines reported 14 fatal injuries and over half the nonfatal injuries; potash mines reported the State's only other fatality and one-third of the nonfatal injuries.

**Legislation and Government Programs.**—The Office of Minerals Exploration (OME) signed a contract on January 27 with Tri-State Metals Corp. to explore for beryl and tantalum. OME was to participate to the extent of 50 percent of approved costs not to exceed $23,360.

One small shipment of hand-cobbed mica was made to the Government purchase depot at Custer, S. Dak. Contracts for the purchase of uranium oxide concentrate from two of the State's six processing plants were revised by the Atomic Energy Commission (AEC) to extend the termination date to December 31, 1966, and stipulated the quantities of concentrates to be purchased.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

The value of the mineral fuels (carbon dioxide, coal, helium, natural gas, natural gas liquids, and petroleum) was 7 percent greater than in 1959 and represented 68 percent of the total value of all mineral production in the State.

**Carbon Black.**—Carbon black was produced from natural gas at three plants in Lea County. The quantity of carbon black recovered was 4 percent below that of 1959, and 47.7 billion cubic feet of natural gas was consumed.

**Carbon Dioxide.**—Production of carbon dioxide from wells in Harding County increased 23 percent in quantity and 15 percent in value over that of 1959. The gas was marketed to consumers as dry ice and liquid carbon dioxide.

**Coal.**—Production of coal, from 19 mines (18 underground, 1 strip) in 5 counties, was double that of 1959. Output from the Koehler mine in Colfax County, operated by the Kaiser Steel Corp. supplied the increase. The Pittsburg & Midway Coal Co., Pittsburg, Kans., began stripping overburden from a coalbed west of Gallup. Coal production was scheduled to begin January 1962; output will be used at a 110-megawatt thermal-electric generating plant at Joseph City, Ariz., to be built by Arizona Public Service Co. The plant will consume an estimated 380,000 tons of coal annually. Official approval was granted by the U.S. Department of the Interior for constructing a 350-megawatt thermal-electric generating plant on the Navajo Indian Reservation. Arizona Public Service Co. will build and operate the plant, to be named the Four Corners powerplant, on a 1,250-acre site, 10 miles southeast of Shiprock, leased from the Navajo Tribal Council. Fuel for the plant will be mined by Utah Construction & Mining Co. from 24,320 acres of undeveloped tribal lands which were leased from the tribal council and which contain a large reserve of sub-bituminous coal. Coal requirements were expected to be 4,200 tons a day; the Navajo tribe was to receive a royalty of 15 cents a ton, based on a minimum production of 800,000 tons in 1963, increasing to 2.5 million tons in 1975.

**Helium.**—The helium plant at Shiprock, operated by the Federal Bureau of Mines, was active throughout the year; helium recovered from natural gas was more than double that of 1959.

**TABLE 3.—Coal production, by counties**

(Excludes mines producing less than 1,000 short tons)

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Average value per ton [1] | Short tons | Average value per ton [1] |
| Colfax | 82,359 | $6.29 | 212,114 | $6.10 |
| McKinley | 50,316 | 4.62 | 69,584 | 5.44 |
| Rio Arriba | 7,830 | 5.91 | 7,398 | 5.58 |
| Sandoval | 1,245 | 3.11 | 1,457 | 6.50 |
| San Juan | 6,800 | 5.40 | 4,209 | 5.75 |
| Total | 148,550 | 5.64 | 294,762 | 5.93 |

[1] Value received or charged f.o.b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked as estimated by producer at average prices that might have been received if the coal had been sold commercially.)

**Natural Gas.**—Marketed natural gas from oil wells and dry gas wells was 8 percent greater than in 1959. Production came from 13,476 oil wells and 6,047 gas wells. Southeastern counties supplied 55 percent of the output. Although 64 percent of production was from dry gas wells, 83 percent of the total output was processed at natural gas plants for recovering natural gas liquids. Data published by the

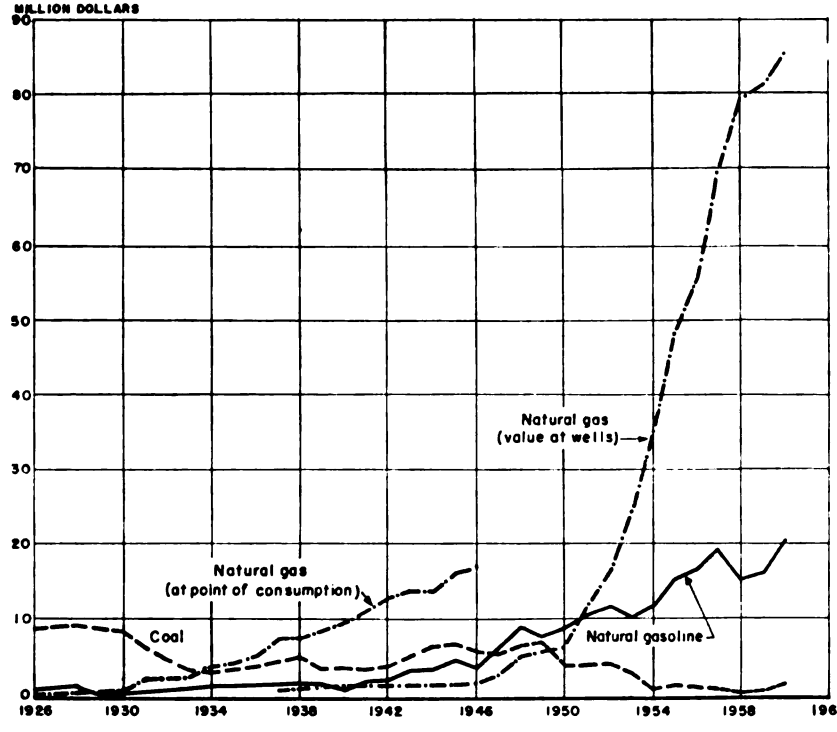

FIGURE 2.—Value of natural gas, natural gasoline, and coal in New Mexico, 1926–60.

Digitized by Google

New Mexico Oil and Gas Conservation Commission [2] showed a total production of 821 billion cubic feet of gas—293.4 billion cubic feet from oil wells and 528.5 billion cubic feet from gas wells.

**Natural Gas Liquids.**—Natural gasoline and cycle products, butane, and propane recovered from 26 processing plants increased 18 percent in quantity and 25 percent in value compared with 1959. Natural gas from oilfields in southeastern and northwestern counties, totaling 662.5 billion cubic feet, was processed with the recovery of natural gasoline and isopentane (7.3 million barrels), butane (6.4 million), propane (7.8 million), butane–propane mixture (0.5 million), and isobutane (0.7 million). Residual gas was used for plant fuel (42.3 billion cubic feet), lease fuel (4 billion), manufacture of carbon black (48 billion, of which 29 billion was residue gas and 19 billion was from other sources), sales to pipelines (601.7 billion), and repressuring (9 billion). Skelly Oil Co. completed and began operating a new $3 million gas-treatment plant near Loco Hills in Eddy County in May. Pan American Petroleum Corp. completed its Empire Abo gas-treatment plant 13 miles southeast of Artesia in November. The plant was designed to process 20 million cubic feet of gas a day; initial compressor capacity was 10 million cubic feet. Gas for processing came from 146 wells in the Empire Abo field.

**Petroleum.**—Petroleum production again exceeded 100 million barrels and increased 2 percent above that of 1959. Output was from 14,286 wells—12,840 in the southeastern counties (Chaves, Eddy, Lea, and Roosevelt) and 1,446 in the northwestern counties (McKinley, Rio Arriba, Sandoval, and San Juan). Major production, 86 percent of the total, came from the southeastern counties. The number of wells completed (1,850) was below that of 1959 (2,077), but the total footage drilled was greater. Exploratory drilling resulted in 38 discoveries (30 oil, 8 gas) from 250 wells completed for a success ratio of 15.20 percent. Development drilling was 87.25 percent successful with 984 oil wells and 412 gas wells from 1,600 wells completed.

**TABLE 4.—Crude petroleum production, by counties [1]**

(Thousand barrels)

| County | 1959 | 1960 [2] | Principal fields in 1960 in order of production |

## METALS

**Beryllium.**—Exploration and development was conducted at the Harding mine, Taos County, but no shipments were made.

**Copper.**—Copper production increased 70 percent in quantity (27,600 tons) and 77 percent in value ($18.8 million) compared with 1959, as a result of a major increase in output from the State's leading copper producer, Chino mine, operated by Chino Mines Division, Kennecott Copper Corp. The entire operation, except for leaching of dump material, had been idled by a labor strike from early August to late December 1959. The value of copper produced increased more than the quantity because the weighted average price for copper rose from 30.7 cents per pound for 1959 to 32.1 cents for 1960. Three mines, Chino and Bayard (Continental) in Grant County and Bonney-Miser's Chest in Hidalgo County, supplied 98 percent of copper production in the State in 1960.

Major developments at the Chino operation included starting of construction on a $2 million skip hoist on the side of the open-pit mine to lift the ore and waste material from the pit, enlargement and improvement of the precipitation system to remove copper from waste material, continuation of the stripping program to extend the mining area of the open pit, and completion of a new 16,000-kw. powerplant.

[1] Operations at various cleanups not counted as producing mines.
[2] Does not include tonnage of precipitates shipped.
[3] Less than 1 ton.

**Gold.**—Five mines, Chino and Bayard (Continental), Grant County, and Atwood-Henry Clay, Bonney-Miser's Chest, and Eighty-Five in Hidalgo County, supplied 97 percent of the gold production. More than half of the output was recovered as a byproduct of copper ore from the Chino, Bayard, and Bonney-Miser's Chest mines. The remainder came chiefly from gold-silver ore from the Atwood-Henry Clay and Eighty-Five mines.

**Iron Ore.**—Magnetite ore containing 65 percent iron was produced from the Kearney Iron Pit in Grant County by White & Mathis and shipped to Clarence Moore, Albuquerque, for use as a high-density concrete aggregate.

**Lead.**—Three mines, Linchburg in Socorro County and American and Hanover in Grant County, accounted for 89 percent of the lead production. Output more than doubled, mainly as a result of in-

Digitized by Google

produced humus peat for sale in bulk. Industrial Insulation Division of Johns-Manville Corp. (Manville) expanded perlite for use in manufacturing pipe insulation and for loose fill. The crude material was mined in Colorado by Johns-Manville Perlite Corp.

Central Commercial Co. produced natural and artificially colored roofing granules at its Bound Brook plant.

**Sussex.**—Farber White Limestone Co. (Franklin) and Limestone Products Corp. of America (Newton) mined, crushed, ground, and sized limestone for a wide variety of uses. On a basis of tonnage consumption, the principal uses were for agstone, concrete aggregate, roadstone, and as a filler in flooring, rubber, and asphalt. The limestone was also used in manufacturing lime, as an additive in livestock feed, for poultry grit, filter medium, and roofing granules. Limestone Products Corp. burned limestone at its Lime Crest plant and produced hydrated lime for use in construction and agricultural and chemical applications. The principal consuming areas for the hydrated lime were New Jersey, New York, and Pennsylvania; small quantities were shipped to Connecticut, Maine, Massachusetts, and Vermont. The Sterling Hill mine (zinc) near Ogdensburg was idle but shipments of manganiferous residuum were made from stockpiles at the Palmerton (Pa.) smelter.

The combined sand and gravel output of four companies totaled 226,000 tons, a 70-percent increase over 1959. Reed-sedge peat was produced from bogs and sold packaged and in bulk by Hyper-Humus Co. (Newton); bulk peat sales only were reported by Netcong Natural Products (Stanhope). Becmo, Inc., produced and sold uranium ore from a deposit in the southern part of the county. Old mine dumps near Franklin continued to attract thousands of amateur gem and mineral collectors. Specimens collected were chiefly calcite, franklinite, willemite, and zincite.

**Union.**—Basalt was mined, crushed, and screened by Houdaille Construction Materials, Inc., at its Summit plant for use as concrete aggregate and roadstone. Hydrogen sulfide was recovered by diethanolamine treatment at the Bayway refinery of Esso Standard Oil Co. The gas shipped to a nearby plant of General Chemical Div., Allied Chemical Corp., where sulfur was recovered and used by General Chemical. Certified Industries Products, Inc., Hillside, expanded perlite, mined in Colorado, for use in acoustical plaster and concrete aggregate, and as a soil conditioner.

**Warren.**—Alan Wood Steel Co. mined and beneficiated magnetite ore at its Washington mine to supply part of the iron-ore requirements of its steel plant at Conshohocken, Pa. Houdaille Construction Materials, Inc. (Carpenterville), and Steckel Concrete Co. (Phillipsburg) processed structural sand and gravel materials, and Van Horn Sand & Gravel Co. (Belvidere), using portable equipment, produced only gravel for construction purposes. Royal Green Marble Co. (Phillipsburg) quarried and crushed marble exclusively for terrazzo. The Port Murray clay pit and brick plant of Natco Corp. was active during the year after being idle in 1959. Tamarock Humus Co. (Buttzville) recovered peat from a nearby bog for bulk sales. Magnesium compounds, including acetate, chloride, nitrate, oxide, sulfate, and phosphate, were produced by J. T. Baker Chemical Co. at its Phillipsburg plant.

# The Mineral Industry of New Mexico

By F. J. Kelly,[1] William H. Kerns,[1] and D. H. Mullen [1]

THE RECOVERY of certain segments of the mineral industry of New Mexico from production cutbacks during 1957–59, was indicated by an overall 10-percent increase in the value of output for 1960 ($652.2 million), compared with 1959 ($592.5 million).

Beryllium, manganese, and molybdenum in the metals group, and fluorspar, magnesium compounds, sheet mica, perlite, pumice, and sand and gravel in the nonmetals category were the only commodities for which a lower output was recorded in 1960. The drop in total value for these products, $8.7 million, was more than offset by large production gains reported for other minerals.

The spectacular 33-percent advance in the value of metals output can be attributed to uninterrupted operations following the settlement of labor strikes that occurred in the copper industry in 1959 and to a general increase in the production of uranium ore. Metals accounted for 17 percent of the value of mineral production.

The output of mineral fuels increased 7 percent in value in 1960 as the result of greater overall production. However, the contribution of the fuels group to the total value of all mineral production dropped from 70 percent in 1959 to 68 percent.

Although the value of some nonmetals produced and sold in 1960 advanced substantially, the overall increase for this group was only 3 percent above 1959. Higher values for potash, stone, lime, and gypsum were nearly offset by a $6.1 million decline in the value of sand and gravel and pumice output. The value of nonmetal production was 15 percent of the $652.2 million recorded for all minerals.

The expansion of the construction-materials segment of the minerals industry was highlighted in 1960 with the initial operation in May of a wallboard plant between Santa Fe and Albuquerque and the completion and start of operation of a second wallboard plant at Albuquerque. A new mica-grinding mill was constructed at Tesuque, and a new perlite grinding mill at No Agua replaced one destroyed by fire.

**Union.**—Basalt was mined, crushed, and screened by Houdaille Construction Materials, Inc., at its Summit plant for use as concrete aggregate and roadstone. Hydrogen sulfide was recovered by diethanolamine treatment at the Bayway refinery of Esso Standard Oil Co. The gas shipped to a nearby plant of General Chemical Div., Allied Chemical Corp., where sulfur was recovered and used by General Chemical. Certified Industries Products, Inc., Hillside, expanded perlite, mined in Colorado, for use in acoustical plaster and concrete aggregate, and as a soil conditioner.

**Warren.**—Alan Wood Steel Co. mined and beneficiated magnetite ore at its Washington mine to supply part of the iron-ore requirements of its steel plant at Conshohocken, Pa. Houdaille Construction Materials, Inc. (Carpenterville), and Steckel Concrete Co. (Phillipsburg) processed structural sand and gravel materials, and Van Horn Sand & Gravel Co. (Belvidere), using portable equipment, produced only gravel for construction purposes. Royal Green Marble Co. (Phillipsburg) quarried and crushed marble exclusively for terrazzo. The Port Murray clay pit and brick plant of Natco Corp. was active during the year after being idle in 1959. Tamarock Humus Co. (Buttzville) recovered peat from a nearby bog for bulk sales. Magnesium compounds, including acetate, chloride, nitrate, oxide, sulfate, and phosphate, were produced by J. T. Baker Chemical Co. at its Phillipsburg plant.

# The Mineral Industry of New Mexico

By F. J. Kelly,[1] William H. Kerns,[1] and D. H. Mullen [1]

THE RECOVERY of certain segments of the mineral industry of New Mexico from production cutbacks during 1957–59, was indicated by an overall 10-percent increase in the value of output for 1960 ($652.2 million), compared with 1959 ($592.5 million).

Beryllium, manganese, and molybdenum in the metals group, and fluorspar, magnesium compounds, sheet mica, perlite, pumice, and sand and gravel in the nonmetals category were the only commodities for which a lower output was recorded in 1960. The drop in total value for these products, $8.7 million, was more than offset by large production gains reported for other minerals.

The spectacular 33-percent advance in the value of metals output can be attributed to uninterrupted operations following the settlement of labor strikes that occurred in the copper industry in 1959 and to a general increase in the production of uranium ore. Metals accounted for 17 percent of the value of mineral production.

The output of mineral fuels increased 7 percent in value in 1960 as the result of greater overall production. However, the contribution of the fuels group to the total value of all mineral production dropped from 70 percent in 1959 to 68 percent.

Although the value of some nonmetals produced and sold in 1960 advanced substantially, the overall increase for this group was only 3 percent above 1959. Higher values for potash, stone, lime, and gypsum were nearly offset by a $6.1 million decline in the value of sand and gravel and pumice output. The value of nonmetal production was 15 percent of the $652.2 million recorded for all minerals.

The expansion of the construction-materials segment of the minerals industry was highlighted in 1960 with the initial operation in May of a wallboard plant between Santa Fe and Albuquerque and the completion and start of operation of a second wallboard plant at Albuquerque. A new mica-grinding mill was constructed at Tesuque, and a new perlite grinding mill at No Agua replaced one destroyed by fire.

[8] Revised figure.

**Employment and Injuries.**—Preliminary data compiled by the Federal Bureau of Mines for employment and injuries in the mineral industries in New Mexico in 1960, excluding the petroleum industry, are shown in table 2. The uranium and potash industries each furnished approximately one-third of the total man-hours worked (excluding the petroleum industry). Nonferrous metal mines and smelters supplied approximately one-quarter of the total. Uranium mines reported 14 fatal injuries and over half the nonfatal injuries; potash mines reported the State's only other fatality and one-third of the nonfatal injuries.

**Legislation and Government Programs.**—The Office of Minerals Exploration (OME) signed a contract on January 27 with Tri-State Metals Corp. to explore for beryl and tantalum. OME was to participate to the extent of 50 percent of approved costs not to exceed $23,360.

One small shipment of hand-cobbed mica was made to the Government purchase depot at Custer, S. Dak. Contracts for the purchase of uranium oxide concentrate from two of the State's six processing plants were revised by the Atomic Energy Commission (AEC) to extend the termination date to December 31, 1966, and stipulated the quantities of concentrates to be purchased.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

The value of the mineral fuels (carbon dioxide, coal, helium, natural gas, natural gas liquids, and petroleum) was 7 percent greater than in 1959 and represented 68 percent of the total value of all mineral production in the State.

**Carbon Black.**—Carbon black was produced from natural gas at three plants in Lea County. The quantity of carbon black recovered was 4 percent below that of 1959, and 47.7 billion cubic feet of natural gas was consumed.

**Carbon Dioxide.**—Production of carbon dioxide from wells in Harding County increased 23 percent in quantity and 15 percent in value over that of 1959. The gas was marketed to consumers as dry ice and liquid carbon dioxide.

**Coal.**—Production of coal, from 19 mines (18 underground, 1 strip) in 5 counties, was double that of 1959. Output from the Koehler mine in Colfax County, operated by the Kaiser Steel Corp. supplied the increase. The Pittsburg & Midway Coal Co., Pittsburg, Kans., began stripping overburden from a coalbed west of Gallup. Coal production was scheduled to begin January 1962; output will be used at a 110-megawatt thermal-electric generating plant at Joseph City, Ariz., to be built by Arizona Public Service Co. The plant will consume an estimated 380,000 tons of coal annually. Official approval was granted by the U.S. Department of the Interior for constructing a 350-megawatt thermal-electric generating plant on the Navajo Indian Reservation. Arizona Public Service Co. will build and operate the plant, to be named the Four Corners powerplant, on a 1,250-acre site, 10 miles southeast of Shiprock, leased from the Navajo Tribal Council. Fuel for the plant will be mined by Utah Construction & Mining Co. from 24,320 acres of undeveloped tribal lands which were leased from the tribal council and which contain a large reserve of sub-bituminous coal. Coal requirements were expected to be 4,200 tons a day; the Navajo tribe was to receive a royalty of 15 cents a ton, based on a minimum production of 800,000 tons in 1963, increasing to 2.5 million tons in 1975.

**Helium.**—The helium plant at Shiprock, operated by the Federal Bureau of Mines, was active throughout the year; helium recovered from natural gas was more than double that of 1959.

**TABLE 3.—Coal production, by counties**

(Excludes mines producing less than 1,000 short tons)

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Average value per ton [1] | Short tons | Average value per ton [1] |
| Colfax | 82,359 | $6.29 | 212,114 | $6.10 |
| McKinley | 50,316 | 4.62 | 69,584 | 5.44 |
| Rio Arriba | 7,830 | 5.91 | 7,398 | 5.58 |
| Sandoval | 1,245 | 3.11 | 1,457 | 6.50 |
| San Juan | 6,800 | 5.40 | 4,209 | 5.75 |
| Total | 148,550 | 5.64 | 294,762 | 5.93 |

[1] Value received or charged f.o.b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked as estimated by producer at average prices that might have been received if the coal had been sold commercially.)

**Natural Gas.**—Marketed natural gas from oil wells and dry gas wells was 8 percent greater than in 1959. Production came from 13,476 oil wells and 6,047 gas wells. Southeastern counties supplied 55 percent of the output. Although 64 percent of production was from dry gas wells, 83 percent of the total output was processed at natural gas plants for recovering natural gas liquids. Data published by the

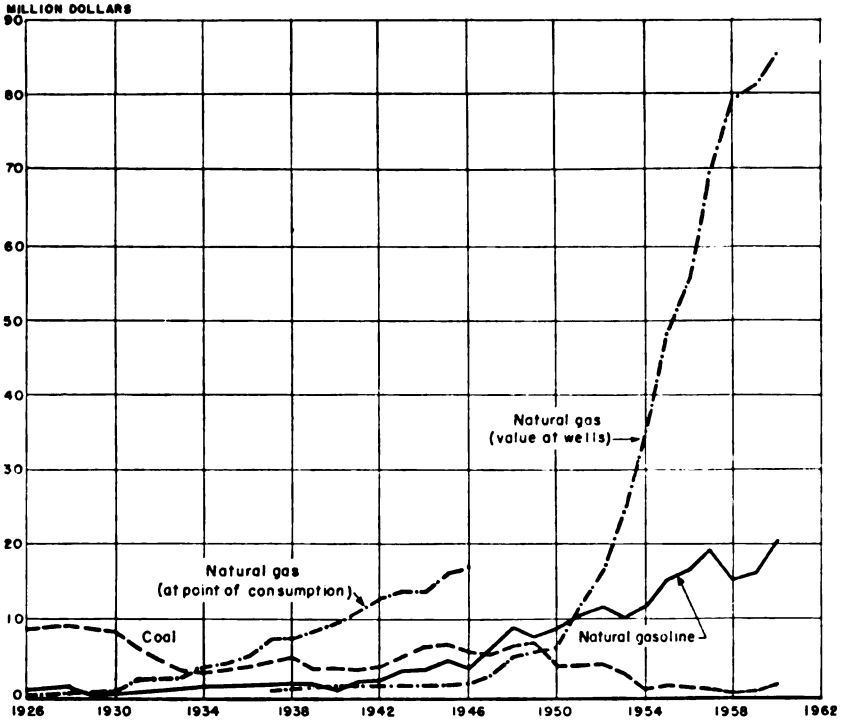

FIGURE 2.—Value of natural gas, natural gasoline, and coal in New Mexico, 1926–60.

Digitized by Google

New Mexico Oil and Gas Conservation Commission [2] showed a total production of 821 billion cubic feet of gas—293.4 billion cubic feet from oil wells and 528.5 billion cubic feet from gas wells.

**Natural Gas Liquids.**—Natural gasoline and cycle products, butane, and propane recovered from 26 processing plants increased 18 percent in quantity and 25 percent in value compared with 1959. Natural gas from oilfields in southeastern and northwestern counties, totaling 662.5 billion cubic feet, was processed with the recovery of natural gasoline and isopentane (7.3 million barrels), butane (6.4 million), propane (7.8 million), butane–propane mixture (0.5 million), and isobutane (0.7 million). Residual gas was used for plant fuel (42.3 billion cubic feet), lease fuel (4 billion), manufacture of carbon black (48 billion, of which 29 billion was residue gas and 19 billion was from other sources), sales to pipelines (601.7 billion), and repressuring (9 billion). Skelly Oil Co. completed and began operating a new $3 million gas-treatment plant near Loco Hills in Eddy County in May. Pan American Petroleum Corp. completed its Empire Abo gas-treatment plant 13 miles southeast of Artesia in November. The plant was designed to process 20 million cubic feet of gas a day; initial compressor capacity was 10 million cubic feet. Gas for processing came from 146 wells in the Empire Abo field.

**Petroleum.**—Petroleum production again exceeded 100 million barrels and increased 2 percent above that of 1959. Output was from 14,286 wells—12,840 in the southeastern counties (Chaves, Eddy, Lea, and Roosevelt) and 1,446 in the northwestern counties (McKinley, Rio Arriba, Sandoval, and San Juan). Major production, 86 percent of the total, came from the southeastern counties. The number of wells completed (1,850) was below that of 1959 (2,077), but the total footage drilled was greater. Exploratory drilling resulted in 38 discoveries (30 oil, 8 gas) from 250 wells completed for a success ratio of 15.20 percent. Development drilling was 87.25 percent successful with 984 oil wells and 412 gas wells from 1,600 wells completed.

## METALS

**Beryllium.**—Exploration and development was conducted at the Harding mine, Taos County, but no shipments were made.

**Copper.**—Copper production increased 70 percent in quantity (27,600 tons) and 77 percent in value ($18.8 million) compared with 1959, as a result of a major increase in output from the State's leading copper producer, Chino mine, operated by Chino Mines Division, Kennecott Copper Corp. The entire operation, except for leaching of dump material, had been idled by a labor strike from early August to late December 1959. The value of copper produced increased more than the quantity because the weighted average price for copper rose from 30.7 cents per pound for 1959 to 32.1 cents for 1960. Three mines, Chino and Bayard (Continental) in Grant County and Bonney-Miser's Chest in Hidalgo County, supplied 98 percent of copper production in the State in 1960.

[1] Includes recoverable metal content of gravel washed (placer operations), ore milled, old tailings or slimes re-treated, and ore, old tailings, old slag, or copper precipitates shipped to smelters during the calendar year indicated.
[2] Does not include gravel washed or tonnage of precipitates shipped.
[3] Data not available.

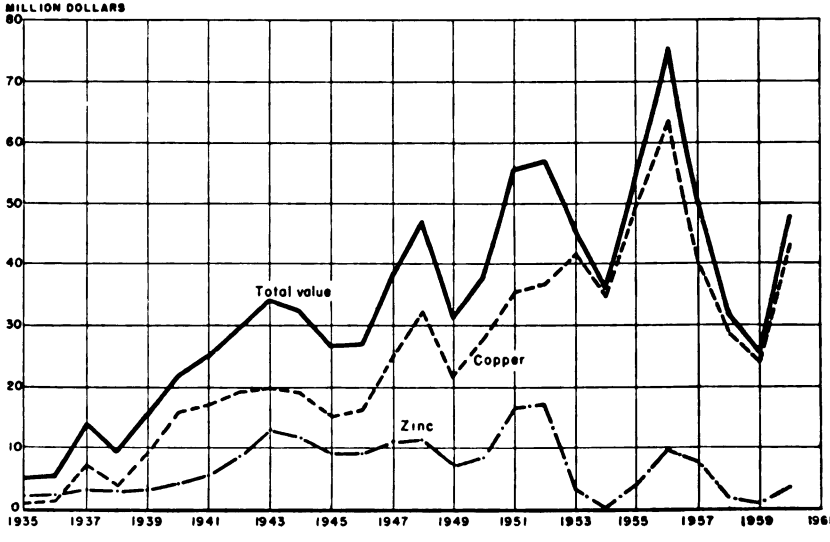

FIGURE 3.—Value of mine production of copper and zinc and total value of gold, silver, copper, lead, and zinc in New Mexico, 1935–60. The value of gold, silver, and lead produced annually has been relatively small.

Digitized by Google

Major developments at the Chino operation included starting of construction on a $2 million skip hoist on the side of the open-pit mine to lift the ore and waste material from the pit, enlargement and improvement of the precipitation system to remove copper from waste material, continuation of the stripping program to extend the mining area of the open pit, and completion of a new 16,000-kw. powerplant.

| 1959 | 39,688 | 24,368,432 | 829 | 190,670 | 4,636 | 1,066,280 | 25,879,642 |

[1] Operations at various cleanups not counted as producing mines.
[2] Does not include tonnage of precipitates shipped.
[3] Less than 1 ton.

**Gold.**—Five mines, Chino and Bayard (Continental), Grant County, and Atwood-Henry Clay, Bonney-Miser's Chest, and Eighty-Five in Hidalgo County, supplied 97 percent of the gold production. More than half of the output was recovered as a byproduct of copper ore from the Chino, Bayard, and Bonney-Miser's Chest mines. The remainder came chiefly from gold-silver ore from the Atwood-Henry Clay and Eighty-Five mines.

**Iron Ore.**—Magnetite ore containing 65 percent iron was produced from the Kearney Iron Pit in Grant County by White & Mathis and shipped to Clarence Moore, Albuquerque, for use as a high-density concrete aggregate.

**Lead.**—Three mines, Linchburg in Socorro County and American and Hanover in Grant County, accounted for 89 percent of the lead production. Output more than doubled, mainly as a result of in-

| Grand total | 5,423 | 303,903 | 134,576,000 | 3,992,000 | 27,540,000 |

[1] Includes lead-barite ore concentrate.

creased production from the Linchburg mine, owned by Empire Zinc Division, The New Jersey Zinc Co., and operated by L. A. Patten, lessee.

**Manganese Ore and Concentrate.**—When the quota was filled under the Government manganese ore and concentrate carlot-purchase program on August 5, 1959, the State's manganese industry came to a near standstill. In 1960, shipments of manganese ore were reduced to zero. Luck Mining Co. shipped ferruginous manganese ore containing 11 percent manganese and 32 percent iron from the Boston Hill mine in Grant County to The Colorado Fuel and Iron Corp. steel plant at Pueblo, Colo.

**Molybdenum.**—The entire production of molybdenum came from molybdenum concentrate produced by Chino Mines at its Chino concentrator at Hurley, Grant County, as a byproduct of copper ores.

Digitized by Google

The Molybdenum Corp. of America continued for the fifth year an exploration and development program, partly financed by a Defense Minerals Exploration Administration (DMEA) contract, at the Questa mine in Taos County. Work consisted of drifting, crosscutting, and diamond drilling. The company announced that the work had confirmed the existence of a large molybdenum deposit of major significance but that no decision would be made for mining the ore until the exploration program was completed. The 50-ton-per-day mill at Questa could be expanded to 200 tons by adding new crushing capacity.

**Silver.**—Silver production was almost double that of 1959. Output from the six leading silver-producing mines supplied 89 percent of the total. These mines in order of descending production of silver were the Eighty-Five and Atwood-Henry Clay (Hidalgo County), Linchburg (Socorro), Bonney-Miser's Chest (Hidalgo), and American and Chino (Grant). Half of the output came from gold-silver and silver ores; one-quarter came from copper ore; and one-quarter from lead, lead-zinc, and zinc ores. A small quantity was recovered as a byproduct of lead-barite ore.

**Uranium.**—Production of uranium ore, from 78 operations in 5 counties (McKinley 65, Valencia 9, San Juan 2, and 1 each in Sierra and Socorro), was 3.8 million tons, an increase of 16 percent over 1959. The average grade of ore shipped was unchanged—0.21 percent $U_3O_8$ (4.2 pounds per ton). The six processing plants were operated the entire year. Contracts for the purchase of uranium oxide concentrate at two of the plants were amended by the Atomic Energy Commission (AEC). The contract with Homestake–Sapins Partners was extended to December 31, 1966, and provided for the delivery of approximately 4 million pounds of uranium oxide concentrate between July 1, 1960, and April 1, 1962, and 10.7 million pounds between April 1, 1962, and December 31, 1966. It also provided for processing ores from qualified independent producers. The contract with Kermac Nuclear Fuels Corp. was amended to provide for delivery of approximately 31 million pounds of uranium oxide concentrate between November 1, 1960, and December 31, 1966, and for processing ores produced by independent operators. At yearend the contract with Homestake-New Mexico Partners had not been extended beyond April 1, 1962; however, negotiations were in progress.

**Vanadium.**—Some uranium ores in the Carrizo Mountains of San Juan County contained significant amounts of vanadium and were shipped to Durango, Colo., for processing, where vanadium was recovered as a byproduct. The quantity recovered was 53 percent greater than in 1959. Also, the installation of a vanadium-recovery unit at the Navajo uranium plant of Kerr-McGee Oil Industries, Inc., at Shiprock was completed late in 1959; operation began early in 1960.

**Zinc.**—Zinc production increased twofold over that of 1959. Output came mostly from the two leading zinc-producing mines, Hanover and Linchburg. Of the total, 83 percent was recovered from material classed as zinc ore and 16 percent from lead-zinc ores.

Digitized by Google

## NONMETALS

**Barite.**—Galbar, Inc., continued to mine barite-lead ore from its Mex–Tex mines near Bingham. The company shipped 492 tons of ground barite for use as a constituent in oil-well drilling mud.

**Cement.**—Shipments of portland and masonry cements nearly doubled in 1960 with the first full year of operation at the Tijeras plant of Ideal Cement Co. Although some portland cement was sold in contiguous States, the principal market was in New Mexico. A 1.25-million-barrel addition to the cement plant was completed and placed in operation in December 1960. The expansion consisted of a 375-foot kiln and auxiliary equipment.

**Clays.**—A number of factors affected clay production in New Mexico in 1960, resulting in a 24-percent increase in the output of miscellaneous clay or shale and a 50-percent decrease in production of fire clay. Reduced production of miscellaneous clay by Kinney Brick Co., Inc., Albuquerque, and El Paso Brick Co. near El Paso, Tex., was more than offset by clay mined and used by Ideal Cement Co. in manufacturing cement. U.S. Mining Corp. (formerly Olsen Mud Service Co.) and W. M. Snyder, operating the Blanco Clay pit, reported the production of small quantities of miscellaneous clay. Fire-clay output declined because of reduced production from clay pits operated by Phelps Dodge Corp. and Gallup Brick & Tile Co.

**Fluorspar.**—No fluorspar was produced or shipped from stock during 1960.

**Gem Stones.**—The value of gem and ornamental stones collected remained virtually the same as in 1959. Luna County was the principal source of material collected, and agate furnished most of the total value.

**Gypsum.**—The first gypsum building products manufactured at the Kaiser Gypsum Co., Inc., Rosario plant were shipped on May 24. During the third quarter, American Gypsum Co. began trial runs at its Albuquerque wallboard plant, and actual operations began in late December. Kaiser Gypsum mined its own gypsum. White Mesa Gypsum Corp. (partly owned by American Gypsum Co.) supplied crude gysum to the Albuquerque wallboard plant. Duke City Gravel Products Co. of Albuquerque mined gypsum for use at the Tijeras plant of Ideal Cement Co. Output was 55,000 tons valued at $193,000. No gypsum was mined in 1959.

**Lime.**—Kennecott Copper Corp. operated its Chino limekiln and used 36,000 tons of lime in the processing of copper ores.

**Magnesium Compounds.**—The Carlsbad plant of International Minerals & Chemical Corp. (IMC) produced the only magnesium compounds in the State. These compounds, recovered as a byproduct of potash refining, were consumed by the electrical, fertilizer, uranium, and chemical industries.

**Mica.**—The recovery of sheet mica from hand-cobbed mine production declined. Scrap-mica production increased significantly. L. W. Tietgen produced the hand-cobbed mica, and Los Compadres Mica Co. ground scrap mica at its Ojo Caliente mill. The feed for this mill came principally from old mine dumps near Ojo. The ground mica was sold for use in manufacturing roofing paper. Clute Corp.

Digitized by Google

constructed a mica grinding plant at Tesuque. Although no ground mica was shipped during 1960, test work indicated the possibility of shipments beginning early in 1961. Sericite mica from mines north of Tesuque will provide the mill feed, and output will be ground for the paint and oil-well drilling industries.

**TABLE 10.—Mica sold or used by producers**

[1] Sold to the Government through GSA.
[2] Figure withheld to avoid disclosing individual company confidential data.

**Perlite.**—New Mexico was the leading producer of perlite in the United States, supplying 77 percent of the total output. The Seven Hills of Taos area was the principal producing region; mining and milling operations were conducted by Great Lakes Carbon Corp., Johns-Manville Perlite Corp., and United Perlite Corp. After a fire destroyed the mill of Johns-Manville Perlite Corp., a working agreement between Johns-Manville and Great Lakes Carbon supplied ground perlite to Johns-Manville customers until the mill could be rebuilt. A new plant, with a rated annual capacity of 150,000 tons of processed material, was completed and placed in operation late in December. Great Lakes Carbon Corp. formulated plans to shut down its Socorro mine, mill, and expanding plant, and to center all mining and grinding operations at No Agua. The Socorro expanding

**TABLE 11.—Crude perlite sold or used by producers**

| Year | Short tons | Value (thousands) |
|---|---|---|
| 1956 | 167,705 | $1,271 |
| 1957 | 187,259 | 1,568 |
| 1958 | 202,046 | 1,790 |
| 1959 | 240,642 | 2,121 |
| 1960 | 240,593 | 2,119 |

Digitized by Google

furnaces were to be moved to Colorado, where a larger expanding plant was to be erected at the Antonito railhead. United States Gypsum Co. continued to mine and mill perlite at its Grants operation at about the same rate reported in 1959.

**Potash.**—Mine production of potash-bearing ores (sylvinite and langbeinite) rose to 15.1 million tons, containing 2.8 million tons of potash salts. These totals are 8 and 10 percent greater, respectively, than 1959 output. Southwest Potash Corp. recorded the largest percentage increase in mine production, chiefly because of ore shipments to National Potash Co. The average $K_2O$ content of ore mined in New Mexico rose from 18.57 percent in 1959 to 18.85 percent. From this ore, 4.1 million tons of potash, containing 2.4 million tons of $K_2O$, was recovered. Total stocks of potash products held by producers rose 10 percent to 458,252 tons. Shipments of potash (from Eddy and Lea Counties) reached 4.1 million tons (2.4 million tons, $K_2O$ equivalent) valued at $78.7 million. The average price for material sold declined from $20.08 per ton in 1959 to $19.24.

Five major potash producers in the Carlsbad area and one at Searles Lake, Calif., established a foundation for international potash research to develop programs for efficient and beneficial use of potash.

Mining on the 800-foot level of the IMC potash mine, inactive since 1948, was resumed. The company installed a new-type shuttle car on the 900-foot level. The new car was lower and wider than older cars but carried the same quantity of ore.

Work continued on two shafts at a new production site for Duval Sulphur & Potash Co. A 14-foot hoisting shaft and a 9-foot escape shaft were nearing completion by yearend. The two 1,000-foot concrete-lined shafts will develop two sources of sylvite ore and will open new ore reserves discovered by surface drilling. The company reported that the new ore body is distinct from the ore body being mined.

Southwest Potash Corp. announced a $3 million expansion program for its Carlsbad operation. It also planned to construct a $7 million nitrate of potash and chlorine plant at Vicksburg, Miss. Muriate of potash produced at Carlsbad was to be shipped to the Mississippi plant.

**TABLE 12.—Potassium salts production and sales**

(Thousand short tons)

| Year | Crude salts: [1] mine production | | Marketable potassium salts | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | Production | | | Sales | | |
| | Gross weight | $K_2O$ equivalent | Gross weight | $K_2O$ equivalent | Value [2] (thousands) | Gross weight | $K_2O$ equivalent | Value (thousands) |
| 1956 | 11,941 | 2,305 | 3,384 | 1,997 | $75,122 | 3,279 | 1,931 | $72,802 |
| 1957 | 12,893 | 2,430 | 3,528 | 2,080 | 77,197 | 3,353 | 1,977 | 73,243 |

**Pumice.**—Sales of crude and prepared pumice and scoria declined 26 percent in volume and 19 percent in value from 1959. A 28-percent drop in the use of pumice and scoria in manufacturing building block and a 24-percent decrease in the demand for railroad ballast were the major causes for the decline in sales. The Santa Fe mill of James H. Rhodes & Co. continued to prepare pumice for use as cleansing compounds, abrasives, acoustic plaster, and other uses such as water filtration, catalysts, matches, and paint. Scoria was the most important product mined under this classification, and block manufacturing consumed the entire output. Twin Mountain Rock Co. (Union County), Volcanic Cinder Co. (Dona Ana), Lava-Pumice, Inc. (Sandoval), Edgar D. Otto & Son, Inc. (Bernalillo), and Crego Block Co., Inc. (Santa Fe), were the chief producers of scoria. Pumice was mined and processed by General Pumice Corp. (Rio Arriba County), Pyramid Pumice Co., Inc. (Sandoval), and Copar Pumice Co. (Santa Fe).

**Salt.**—The continued growth of the salt industry was shown by an 8-percent increase in output—reaching 39,000 tons valued at $331,000. The Quemado solar-evaporation facility of Curtis Salt Co. was purchased by the Rocky Mountain Salt Co. in June. The salt harvest from this operation, 8 percent above that of 1959, was sold to feed dealers, water-softener manufacturers, State and county highway departments, and cattle and sheep ranchers in Arizona and New Mexico. The Carlsbad region of Eddy County continued to be the principal source of salt. The processing of the salt tailings from potash refining resulted in production of 18 percent more rock salt than in 1959. Salt Supply Co., New Mexico Salt Co., and Pioneer Salt Co. were the major producers; the livestock industry was the principal consumer.

**Sand and Gravel.**—Continued reduction in mileage under construction on the Federal interstate highway system again caused a substantial decline in the output of sand and gravel. Production of aggregate dropped 40 percent, to 7.4 million tons. Of the 31 counties producing sand and gravel in 1959 and 1960, only McKinley, Roosevelt, San Juan, Santa Fe, and Sierra Counties recorded small gains in output. There were 112 commercial and 40 Government-and-contractor operations in 1959, but in 1960 the number of operations dropped to 71 and 36, respectively. Bernalillo County led in output, supplying 28 percent of the total production. From July 1, 1956, to December 31, 1960, New Mexico completed [3] 197.3 miles of road to full or acceptable interstate standards and improved 94 miles to standards adequate for existing traffic, for a total of 291.3 miles open to traffic. On the basis of this mileage, the State ranked 14th. However, in terms of work in progress on the interstate system, New Mexico ranked 42d, with 104.5 miles in construction, engineering, or right-of-way status. New Mexico had completed to full or acceptable interstate standards only 20 percent of the 1,003 miles of highway allocated to the State.

**Stone.**—A substantial increase in the production of crushed miscellaneous stone by the New Mexico State Highway Commission and crushed limestone used for manufacturing cement and lime by Ideal Cement Co. and Kennecott Copper Corp. largely accounted for the nearly threefold increase in output of all types of stone quarried. Bernalillo and Lea Counties led in output. Ideal Cement Co. was the major producer in Bernalillo County. The New Mexico State Highway Commission reported producing 410,000 tons of crushed miscellaneous stone used in road construction in Lea County.

**Sulfur.**—El Paso Natural Gas Co. closed its sulfur recovery plant at Eunice Nov. 30, 1960. No production or shipments of sulfur were reported from this plant during the year. Pan American Petroleum Corp. placed a 12-ton-per-day sulfur-recovery unit in operation at its Empire Abo gasoline plant 13 miles southeast of Artesia. Shipments were substantially greater than in 1959.

**Vermiculite.**—Southwest Vermiculite Co. exfoliated vermiculite at its plant in Albuquerque. Sales were 47 percent greater than in 1959, and lightweight aggregate was the principal use for the mill output. The company continued to use crude vermiculite from Libby, Mont.

## REVIEW BY COUNTIES

**Bernalillo.**—Cement output and clay and limestone used in manufacturing cement provided most of the income from mining and mineral processing in the county. Ideal Cement Co. operated its Tijeras plant throughout the year and reported completion of its No. 2 kiln and auxiliary equipment in December. Kinney Brick Co., Inc., supplied the entire miscellaneous clay output and used it for brick or other heavy clay products manufacture. Scoria for use in manufacturing building block and associated products was mined by Edgar D. Otto & Son, Inc., and Lavaland Heights Block Co. Sand and gravel production was reported from 15 operations that produced 2.1 million tons of aggregate; Albuquerque Gravel Products Co. and Springer Transfer Co., Inc., and contractors for the State highway department were the principal producers. Duke City Gravel Products Co. supplied crude gypsum to Ideal Cement Co. for use as a cement retarder.

**Chaves.**—Petroleum production from 702 wells was 11 percent below that of 1959; natural gas was recovered from 2 wells. Of 32 exploratory wells drilled, 2 were successful. Fifty development wells were completed, but only 35 were successful.

W. M. Snyder reactivated the Blanca clay pit and produced 75 tons of miscellaneous clay.

**Colfax.**—Coal production was more than double that of 1959 and furnished 81 percent of the total of all mineral output. The increase resulted from greater production by Kaiser Steel Corp. at the Koehler mine on the Raton seam. The entire production at the Koehler was washed; 94 percent of the output was shipped to California for manufacturing coke at Kaiser's Fontana steel plant. Rodman Coal Co. operated the Sonchar mine on the Old Yankee seam, and Julius Seidel operated the Franks mine on the Sugarite seam.

**Dona Ana.**—Associated Materials Co., Maynez Block Co., and Volcanic Cinder Co. supplied all the scoria mined. El Paso Brick Co. continued to be the only producer of clay. Building and paving sand and gravel totaling 293,500 tons was mined by three commercial operators and two governmental contractors. No shipments of manganese ore and concentrate were reported.

**Eddy.**—As in 1959, increased sales of petroleum and potash furnished nearly all the $15.1 million rise in value of mineral output.

Petroleum production, from 3,255 wells, exceeded 11 million barrels and was 42 percent above that of 1959. Natural gas was produced from 50 wells. Sixty exploratory wells were completed, of which 10 (7 oil, 2 condensate, and 1 gas) were successful. From 410 development wells completed, there were 315 oil, 4 condensate, and 11 gas wells.

Four natural gas plants recovered natural gasoline, butane, and propane. Throughput exceeded 7 billion cubic feet of gas, from which 297,000 barrels of natural gasoline, 48,000 barrels of butane, and 228,000 barrels of propane were recovered. Three billion cubic feet of residual gas was marketed through pipelines to consumers. Continental Oil Co. operated its 17,000-barrel-per-day refinery at Artesia,

**TABLE 17.—Value of mineral production in New Mexico, by counties[1]**

| County | 1959 | 1960[2] | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Bernalillo | $4,954,799 | $6,364,524 | Cement, sand and gravel, stone, clays, gypsum, pumice, gem stones. |
| Catron | 303,625 | 38,422 | Sand and gravel, salt, gem stones. |
| Chaves[3] | 12,917,600 | 11,062,962 | Petroleum, sand and gravel, stone, clays, gem stones. |
| Colfax | 1,036,955 | 1,422,502 | Coal, sand and gravel, stone. |
| Curry | 162,800 | 96,473 | Stone, sand and gravel. |
| De Baca | 83,500 | 226,392 | Do. |
| Dona Ana | 845,811 | 525,339 | Sand and gravel, pumice, clays. |
| Eddy[4] | 93,244,773 | 108,373,611 | Potassium salts, petroleum, magnesium compounds, salt, sand and gravel, stone. |
| Grant | 26,428,748 | 46,093,287 | Copper, zinc, molybdenum, lime, manganiferous ore, lead, sand and gravel, gold, silver, stone, iron ore, pumice, gem stones. |
| Guadalupe | 448,845 | 59,300 | Sand and gravel. |
| Harding | (5) | (5) | Sand and gravel, carbon dioxide (natural). |
| Hidalgo | 991,698 | 1,945,201 | Copper, silver, gold, lead, sand and gravel, clays, gem stones. |
| Lea[4] | 230,733,978 | 227,546,168 | Petroleum, potassium salts, stone, sand and gravel. |
| Lincoln | 66,405 | 63,352 | Stone, sand and gravel, gem stones, silver. |
| Luna | 484,665 | 45,010 | Sand and gravel, gem stones. |
| McKinley[3] | 39,662,610 | 49,191,539 | Uranium ore, coal, sand and gravel, petroleum, clays, gem stones. |
| Mora | 118,431 | 112,400 | Sand and gravel, stone. |
| Otero | 1,076,200 | 331,490 | Sand and gravel, stone, copper, gold, silver. |
| Quay | 112,830 | 92,500 | Sand and gravel. |
| Rio Arriba[4] | 3,345,132 | 3,067,710 | Petroleum, sand and gravel, pumice, coal, gem stones, mica (scrap). |
| Roosevelt[3] | 1,629,900 | 3,795,674 | Petroleum, sand and gravel, stone. |
| Sandoval[3] | 237,627 | 261,311 | Pumice, sand and gravel, petroleum, gypsum, coal, copper, gem stones, silver, lead. |
| San Juan[4] | [6] 38,254,270 | 40,620,000 | Petroleum, helium, sand and gravel, coal, vanadium, uranium ore, gem stones. |
| San Miguel | 165,550 | 129,680 | Sand and gravel, stone. |
| Santa Fe | 537,350 | 948,786 | Sand and gravel, pumice, gypsum, copper, gold, silver, gem stones. |
| Sierra | 422,382 | 84,222 | Copper, lead, sand and gravel, zinc, silver, gem stones, uranium ore. |
| Socorro | 2,073,645 | 1,153,005 | Zinc, lead, perlite, sand and gravel, silver, copper, barite, gold, stone, gem stones, uranium ore. |
| Taos | 1,755,891 | (5) | Perlite, sand and gravel. |
| Torrance | 618,932 | 111,200 | Sand and gravel. |
| Union | 815,660 | 292,752 | Pumice, sand and gravel. |
| Valencia | (5) | (5) | Uranium ore, perlite, sand and gravel, stone, gem stones. |
| Undistributed[7] | [6] 129,702,325 | 151,525,506 | |
| Total[8] | [6] 592,535,000 | 652,200,000 | |

[1] Los Alamos is not listed because no production was reported.
[2] Petroleum value is preliminary.

[6] Revised figure.
[7] Includes natural gas, natural gas liquids, and some sand and gravel (1960), gem stones, and mica (scrap and sheet—1960), and values indicated by footnote 5.
[8] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime and marketed potassium compounds.

and Pan American Petroleum Corp. recovered byproduct elemental sulfur at its Empire Abo gasoline plant.

Mines and refineries near Carlsbad produced most of the State's output of potash.

**Grant.**—Copper output supplied 90 percent of the value of mineral production. Most of the copper, all of the molybdenum, and part of the gold and silver output came from ore produced from the Chino open-pit copper mine at Santa Rita operated by Chino Mines Division, Kennecott Copper Corp. In its annual report, the company stated that 7.3 million tons of ore was mined and milled at the Chino operation in 1960, compared with 4.5 million tons in 1959. Copper produced at Chino from all sources, including that recovered from

Digitized by Google

the ore milled and material leached, was 62,725 tons, compared with 37,535 tons in 1959. In 1960, the mine operated 12 months, whereas it was closed 5 months in 1959 because of a labor strike. Installation of a $2 million skip hoist, expected to be completed in October 1961, was begun in 1960. The new hoist will permit removal of 18,000 tons of material daily up a 30° incline from the lower levels of the open pit (600 feet deep at present); it will also allow the use of truck haulage and eliminate almost 9 miles of railroad. Stripping to extend the mining area of the open pit was continued, and the 16,000-kilowatt powerplant was completed. Chino enlarged and improved its leaching and precipitation system for recovering copper from mine dumps. In 1960, 19,000 tons of low-cost copper was recovered by this system, 20 percent more than in 1959. The leaching operation had been active throughout 1959 despite the labor strike.

Bayard (Continental) mine, owned by the United States Smelting Refining and Mining Co., the second largest copper producer in the county and the third largest in the State, was operated by lessees, Patten & Galassini and L. A. Patten. According to the owner, the Bayard mill processed 89,695 tons of copper ore from the Bayard mine during the year. No zinc ore was mined; however, the workings were maintained for future mining should the price of zinc improve.

The Hanover mine, operated by the Empire Zinc Division of The New Jersey Zinc Co., was the principal zinc producer in the county and State. The Hanover mill was operated throughout the year on ore supplied from the Hanover mine and from the Linchburg mine (Socorro County) owned by the company and operated by lessee, L. A. Patten.

Of the remaining 12 mines, where gold, silver, copper, lead, or zinc was produced, the Paola (Mathis & White) and Zuniga (Douglas B. White) were the chief copper producers, and the American mine (Gibralter Minerals Co.) was the county's leading lead producer. In addition, 32 operations recovered copper from the water of Santa Rita Creek below the Chino Santa Rita open-pit copper mine, by precipitation.

After a 3-year shutdown, the Kearney zinc mine near Hanover and the Peru concentrator near Deming were reactivated as a joint venture between Hydrometals, Inc. (parent company of Peru Mining Co.), and American Zinc, Lead and Smelting Co. The Kearney mine was dewatered, all drifts were cleaned, and pipelines and powerlines were replaced. An extensive underground development program, consisting of several thousand feet of drifting and raising and a considerable amount of underground and surface diamond drilling, was completed. Some diamond drilling also was done at the company's Pewabic zinc mine nearby. Mining at the Kearney mine was to begin early in 1961.

Magnetite ore was produced from the Kearney iron pit by White & Mathis and shipped to Clarance Moore, Albuquerque, for use as a high-density concrete aggregate. Ferruginous manganese ore containing 32 percent iron and 11 percent manganese was produced from the Boston Hill mine by the Luck Mining Co. and shipped to The Colorado Fuel and Iron Corp., Pueblo, Colo.

Digitized by Google

**Hidalgo.**—Copper output, mostly from the Bonney-Miser's Chest mines of Banner Mining Co., the State's second largest copper producer, supplied 84 percent of the county's total value of mineral production. In addition, byproduct gold and silver was recovered from the ore produced from these mines. According to the company annual report, the mines were operated the full year at near capacity, producing 79,726 tons of ore, an increase of 34,880 tons over 1959. The metal content of the 6,640 tons of concentrate produced from the ore milled in 1960 was 888 ounces of gold, 34,615 ounces of silver, and 3,752,248 pounds of copper. Exploration and development work during the year included 1,757 feet of drifting, 174 feet of raising, 1,130 feet of diamond drilling, and 92 feet of shaft-sinking. Late in 1960 sinking operations were begun at the Bonney shaft below the 1,560-foot level to bring the 1,700-foot level into production during 1961.

Brannan & Fuller produced gold-silver ore containing some recoverable copper and lead from the Atwood-Henry Clay and Eighty-Five mines near Lordsburg and shipped it to the American Smelting and Refining Co. (Asarco), El Paso, Tex., copper smelter. The Henry Clay shaft was deepened from the 700 to the 800 level and an additional 50 feet was sunk for sump purposes.

**Lea.**—Petroleum output from 8,830 wells was 3 percent below that of 1959. However, the county continued to lead in petroleum production with 71 percent of the total, led in production of natural gas (from 1,212 wells) with 51 percent of the total. Exploratory drilling resulted in 69 completed wells, of which 14 (10 oil, 3 condensate, 1 gas) were successful. Of the 493 development wells completed, 417 were oil wells, 5 were condensate wells, and 9 were gas wells. Natural gas was processed at 21 extraction plants and 1 fractionation plant. Throughput was 399 billion cubic feet of gas, from which 7 million barrels of natural gasoline, 5 million barrels of butane, and 2 million barrels of propane were recovered; 303 billion cubic feet of residual gas was marketed through pipelines to consumers. Three plants used 48 million cubic feet of natural gas for producing carbon black. Famariss Oil & Refining Co. operated its 1,700-barrel-per-day refinery at Monument.

National Potash Co. mined and refined potash at its facilities southeast of Carlsbad. It continued to purchase ore from Southwest Potash Corp. in Eddy County for blending with its Lea County ore. No salt-processing operations were reported.

**Luna.**—The value of mineral production declined substantially below that of 1959 because of inactivity in the manganese industry. This industry had been at a virtual standstill since 1959, when the quota was filled under the Government carlot manganese ore and concentrate purchase program.

**McKinley.**—McKinley County led in production of uranium ore, and output in 1960 was 27 percent greater than in 1959. Many of the production difficulties caused by underground water were solved, and production was near capacity at the 65 mining operations. Kermac Nuclear Fuels Corp. and Phillips Petroleum Co. operated processing mills in the Ambrosia Lake area. Major mine producers included Kermac Nuclear Fuels Corp., Phillips Petroleum Co., Homestake-Sapin Partners, The Hidden Splendor Mining Co. (formerly Rio De

Digitized by Google

Oro Mines, Inc.), Ambrosia Lake Uranium Co., Homestake Mining Co.-Lance Corp., and Calumet & Hecla, Inc.

A new method in shaft sinking was developed by Kermac Nuclear Fuels Corp., using oil-well techniques and equipment. Previously, several ventilation shafts were sunk by drilling a pilot hole and reaming to a diameter of 44 inches with a specially constructed bit. The shaft being sunk on one of the company properties was 90 inches in diameter. It was the first time a rotary well rig had been used for so large a shaft.

Coal output during the year came from eight mines and was 38 percent above that of 1959. Major production was by Navajo Tribal Enterprises, operating the Window Rock underground mine, and Roberts Coal Co., operating the Roberts strip mine. Petroleum production from 55 wells declined 9 percent. Ten exploratory wells were completed, of which 2 were successful. Of 8 development wells completed, 2 were successful. Drilling totaled 30,529 feet. El Paso Natural Gas Co. operated its fractionation plant at Wingate, processing natural gas liquids from company-owned plants in Utah and northwestern New Mexico and from its 9,000-barrel-per-day Cinzia refinery near Gallup.

**Rio Arriba.**—Coal production from the Caranta No. 2 and New mine, operated by Caranta Brothers, Inc., and the Rainbow mine, operated by Inez Erler, was 6 percent below that of 1959. Petroleum production from 132 wells was 1 percent above that of 1959. Natural gas was produced from 1,183 wells. Fifteen exploratory wells were completed, of which 4 (3 oil, 1 gas) were successful; and of 194 development wells completed, 184 (27 oil, 4 condensate, 153 gas) were successful. Southern Union Gas Co. produced natural gas at its plant in Lybrook. Throughput was 14 billion cubic feet of gas, from which 79,934 barrels of natural gasoline, 131,072 of butane, and 241,106 of propane were recovered; 13.8 billion cubic feet of residual gas was marketed through company pipelines to consumers.

No hand-cobbed mica was mined, although some scrap mica was produced by Mineral Resources Co., Inc. Los Compadres Mica Co. at its Ojo Caliente grinding mill produced ground mica for a roofing paper manufacturer; mill feed was obtained by working mine dumps. General Pumice Corp. continued to mine pumice from its Cullum mine. The pumice was used by building-block manufacturers and a pumice grinding plant at Santa Fe.

**Roosevelt.**—Petroleum production from 53 wells rose to 1.2 million barrels and was more than double that of 1959. Eight exploratory wells were drilled and completed; three were successful. Of the 32 development wells completed, 29 were producers.

**Sandoval.**—Pumice, sand and gravel, and gypsum furnished 79 percent of the $261,000 value of total mineral output. For the first time in the history of the county, commercial quantities of crude gypsum were mined. White Mesa Gypsum Corp. produced gypsum from a deposit near San Ysidro and shipped it to the American Gypsum Co. wallboard plant at Albuquerque.

Coal production from the Padilla underground mine was 17 percent above that of 1959. Petroleum production from 14 wells and natural gas production from 1 well were approximately the same as in 1959.

Digitized by Google

Four exploratory wells and five development wells were completed; three of the development wells were producers.

The closing of the Government purchase program eliminated the market for manganese ore, and no mines were active. No uranium ore was produced at the Warm Springs mine. Five tons of copper and a small quantity of lead and silver were recovered from ore produced from the San Miguel mine.

**San Juan.**—San Juan County ranked second in petroleum production, from 1,245 wells, and in natural gas output, from 3,598 wells. Petroleum output was 5 percent above that of 1959. Thirty-six exploratory wells were completed (3 successful). Of 408 development wells completed, 158 oil wells, 28 condensate wells, and 196 gas wells were successful. Natural gas was processed at the Southern Union Gas Co. Kutz Canyon plant and at the El Paso Natural Gas Co. San Juan plant. Gas intake at the plants was 310.4 billion cubic feet of gas, from which 2.7 million barrels of natural gasoline, 3.3 million barrels of butane, and 3 million barrels of propane were recovered. Residual gas (285 billion cubic feet) was marketed through company-owned pipelines to consumers. Beeline Refining Co., Division of Frontier Refining Co., operated a 1,400-barrel-per-day refinery at Farmington; and Plateau, Inc., operated a 2,500-barrel-per-day refinery at Bloomfield.

The Federal Bureau of Mines operated the Navajo helium plant at Shiprock. Helium-bearing natural gas was obtained from wells in the Hogback field. The quantity of helium shipped was nearly three times greater than in 1959; the plant was operated for only 5 months in 1959.

Coal production from the Hogback No. 11 mine operated by Frank Pashlakai, the Hogback No. 12A mine operated by Simpson Coal Co., and the Hogback No. 13 mine operated by George R. Simpson & Hollis L. Tate was 38 percent below that of 1959. House heating with coal had declined substantially because of the availability of oil at a competitive price. Uranium ore, containing a significant quantity of vanadium, was shipped to a mill at Durango, Colo., for processing. Kerr-McGee Oil Industries, Inc., processed ores from deposits in Arizona at its Navajo uranium mill at Shiprock. A new vanadium-recovery unit, installation of which was completed late in 1959, was operated throughout the year.

**Santa Fe.**—Increased production of sand and gravel and the addition of gypsum to the list of commercial minerals produced in the county raised the total value of mineral output to $949,000. Four commercial operations produced 202,000 tons of sand and gravel, and construction crews and contractors for the AEC and the State highway department supplied 274,000 tons of aggregate. Kaiser Gypsum Co. mined crude gypsum adjacent to its Rosario wallboard plant, which was the first operation of its kind in the State. Pumice and scoria production was 29,400 tons, compared with 35,600 tons in 1959. Copar Pumice Co., Inc., was the major producer; its plant was near Espanola. Crego Block Co., Inc., mined and consumed scoria in the manufacture of building blocks. James H. Rhodes & Co. operated its Santa Fe grinding plant, using crude pumice mined by General Pumice Corp. (Rio Arriba County).

Digitized by Google

Small quantities of copper ore containing gold and silver were shipped to Asarco (El Paso, Tex.) copper smelter from two mines operated by Tom B. Scartaccini and Greenrock Mining Co.

**Sierra.**—The county's entire lead and zinc and most of the silver and copper output came from ore shipped to the Asarco (El Paso, Tex.) lead and copper smelters from the Prospectors Delight mine operated by Sierra Minerals & Milling Corp. Small quantities of copper and silver ore were produced and marketed by L. W. Cady and Wittie & McDonald, respectively. No manganese ore was mined or shipped. Uranium ore from the Pitchblend Watercan mine was shipped to a plant at Ambrosia Lake for processing.

**Socorro.**—After leading the State with output of manganese ore valued at $1.4 million in 1959, the manganese mines in Socorro County were inactive during 1960 because of the termination of the Government manganese purchase program. Five mines produced gold, silver, copper, lead, and zinc. L. A. Patten, operating the Linchburg mine under lease from Empire Zinc, was by far the leading producer. The lead-zinc ore produced was shipped to the Empire Zinc Hanover mill for concentration.

Galbar, Inc., treated lead-barite ore from the Mex-Tex mine near Bingham at its mill south of San Antonio and produced barite and lead concentrates. The lead concentrate, containing a small quantity of silver, was shipped to the Asarco (El Paso, Tex.) lead smelter.

Small quantities of gold, silver, copper, lead, and zinc also were recovered from ores produced from the Copper Gold No. 10, Queen Group, and Waldo mines. Uranium ore from the Lucky Don Sec. 35 mine was shipped to a plant at Ambrosia Lake for processing.

The perlite mine, mill, and expanding plant of Great Lakes Carbon Corp. were operative, but by yearend plans had been formulated to shut down the operation and concentrate production at the company's No Agua (Taos County) facilities.

**Taos.**—Perlite from the No Agua area (Seven Hills of Taos) operations of Great Lakes Carbon Corp., Johns-Manville Perlite Corp., and United Perlite Corp. supplied most of the mineral production in the county. A contractor for the State department of highways produced some sand and gravel for road use. No beryl, copper, or gold was mined during the year.

**Valencia.**—Uranium ore production, from nine operations, was 8 percent below that of 1959, but the county continued to be the leading producer. The decline was largely because operations at the Jackpile mine, operated by The Anaconda Company, were curtailed to adjust the recovery of uranium oxide at its mill at Bluewater to the requirements of the revised purchase contract with AEC. Anaconda reported that exploration and development of the Laguna concession had disclosed an ore body larger than that at the Jackpile mine. The new ore body, called the Paguate, was reported to be higher grade than the Jackpile, but cannot be mined until after 1966 because of AEC regulations. St. Anthony Uranium Unit, American Metal Climax, Inc., operated the M 6 mine, formerly called the Cebolleta Grant mine. Rare Metals Corp. began production at its San Mateo mine.

Digitized by Google

Homestake-New Mexico Partners operated its 750-ton-per-day mill, and Homestake-Sapin Partners operated the adjacent 1,500-ton-per-day mill throughout the year.

United States Gypsum Co. operated its Grants perlite mine and grinding plant, but at a lower level of activity. The crushed perlite was shipped to co-owned expanding plants throughout the United States.

# The Mineral Industry of New York

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the New York State Science Service.**

By Joseph Krickich,[1] Robert W. Metcalf,[1] and Madaline P. Stewart[2]

MINERAL output in New York in 1960 established a new high of $254.7 million, 9 percent greater than 1959, and $10.6 million more than 1957, the previous record year. Among noteworthy developments were gains in output of metals, mainly zinc, iron ore, and titanium concentrate. In addition, heavier demands by the construction industry resulted in larger output of cement, stone, and sand and gravel. Construction of the $720-million Niagara Power project and highway construction throughout the State had favorable effects upon New York's mineral industry. Nationally, the State ranked fifth in cement shipments, fourth in salt, and sixth in gypsum.

**TABLE 1.—Mineral production in New York[1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays.....thousand short tons.. | 1,310 | $1,714 | 1,172 | $1,717 |
| Emery.....short tons.. | 8,555 | 150 | 8,169 | 142 |
| Gem stones.....| (W) | 8 | (W) | 9 |
| Gypsum.....thousand short tons.. | 919 | 4,663 | 755 | 3,928 |
| Iron ore (usable)...thousand long tons, gross weight.. | 2,044 | 28,050 | 2,484 | $2,377 |
| Lead (recoverable content of ores, etc.)....short tons.. | 481 | 111 | 775 | 181 |
| Natural gas.....million cubic feet.. | 2,915 | 889 | 4,990 | 1,542 |

## REVIEW BY COUNTIES

**Bernalillo.**—Cement output and clay and limestone used in manufacturing cement provided most of the income from mining and mineral processing in the county. Ideal Cement Co. operated its Tijeras plant throughout the year and reported completion of its No. 2 kiln and auxiliary equipment in December. Kinney Brick Co., Inc., supplied the entire miscellaneous clay output and used it for brick or other heavy clay products manufacture. Scoria for use in manufacturing building block and associated products was mined by Edgar D. Otto & Son, Inc., and Lavaland Heights Block Co. Sand and gravel production was reported from 15 operations that produced 2.1 million tons of aggregate; Albuquerque Gravel Products Co. and Springer Transfer Co., Inc., and contractors for the State highway department were the principal producers. Duke City Gravel Products Co. supplied crude gypsum to Ideal Cement Co. for use as a cement retarder.

**Chaves.**—Petroleum production from 702 wells was 11 percent below that of 1959; natural gas was recovered from 2 wells. Of 32 exploratory wells drilled, 2 were successful. Fifty development wells were completed, but only 35 were successful.

W. M. Snyder reactivated the Blanca clay pit and produced 75 tons of miscellaneous clay.

**Colfax.**—Coal production was more than double that of 1959 and furnished 81 percent of the total of all mineral output. The increase resulted from greater production by Kaiser Steel Corp. at the Koehler mine on the Raton seam. The entire production at the Koehler was washed; 94 percent of the output was shipped to California for manufacturing coke at Kaiser's Fontana steel plant. Rodman Coal Co. operated the Sonchar mine on the Old Yankee seam, and Julius Seidel operated the Franks mine on the Sugarite seam.

**Dona Ana.**—Associated Materials Co., Maynez Block Co., and Volcanic Cinder Co. supplied all the scoria mined. El Paso Brick Co. continued to be the only producer of clay. Building and paving sand and gravel totaling 293,500 tons was mined by three commercial operators and two governmental contractors. No shipments of manganese ore and concentrate were reported.

**Eddy.**—As in 1959, increased sales of petroleum and potash furnished nearly all the $15.1 million rise in value of mineral output.

Petroleum production, from 3,255 wells, exceeded 11 million barrels and was 42 percent above that of 1959. Natural gas was produced from 50 wells. Sixty exploratory wells were completed, of which 10 (7 oil, 2 condensate, and 1 gas) were successful. From 410 development wells completed, there were 315 oil, 4 condensate, and 11 gas wells.

Four natural gas plants recovered natural gasoline, butane, and propane. Throughput exceeded 7 billion cubic feet of gas, from which 297,000 barrels of natural gasoline, 48,000 barrels of butane, and 228,000 barrels of propane were recovered. Three billion cubic feet of residual gas was marketed through pipelines to consumers. Continental Oil Co. operated its 17,000-barrel-per-day refinery at Artesia,

and Pan American Petroleum Corp. recovered byproduct elemental sulfur at its Empire Abo gasoline plant.

Mines and refineries near Carlsbad produced most of the State's output of potash.

**Grant.**—Copper output supplied 90 percent of the value of mineral production. Most of the copper, all of the molybdenum, and part of the gold and silver output came from ore produced from the Chino open-pit copper mine at Santa Rita operated by Chino Mines Division, Kennecott Copper Corp. In its annual report, the company stated that 7.3 million tons of ore was mined and milled at the Chino operation in 1960, compared with 4.5 million tons in 1959. Copper produced at Chino from all sources, including that recovered from

Digitized by Google

the ore milled and material leached, was 62,725 tons, compared with 37,535 tons in 1959. In 1960, the mine operated 12 months, whereas it was closed 5 months in 1959 because of a labor strike. Installation of a $2 million skip hoist, expected to be completed in October 1961, was begun in 1960. The new hoist will permit removal of 18,000 tons of material daily up a 30° incline from the lower levels of the open pit (600 feet deep at present); it will also allow the use of truck haulage and eliminate almost 9 miles of railroad. Stripping to extend the mining area of the open pit was continued, and the 16,000-kilowatt powerplant was completed. Chino enlarged and improved its leaching and precipitation system for recovering copper from mine dumps. In 1960, 19,000 tons of low-cost copper was recovered by this system, 20 percent more than in 1959. The leaching operation had been active throughout 1959 despite the labor strike.

Bayard (Continental) mine, owned by the United States Smelting Refining and Mining Co., the second largest copper producer in the county and the third largest in the State, was operated by lessees, Patten & Galassini and L. A. Patten. According to the owner, the Bayard mill processed 89,695 tons of copper ore from the Bayard mine during the year. No zinc ore was mined; however, the workings were maintained for future mining should the price of zinc improve.

The Hanover mine, operated by the Empire Zinc Division of The New Jersey Zinc Co., was the principal zinc producer in the county and State. The Hanover mill was operated throughout the year on ore supplied from the Hanover mine and from the Linchburg mine (Socorro County) owned by the company and operated by lessee, L. A. Patten.

Of the remaining 12 mines, where gold, silver, copper, lead, or zinc was produced, the Paola (Mathis & White) and Zuniga (Douglas B. White) were the chief copper producers, and the American mine (Gibralter Minerals Co.) was the county's leading lead producer. In addition, 32 operations recovered copper from the water of Santa Rita Creek below the Chino Santa Rita open-pit copper mine, by precipitation.

After a 3-year shutdown, the Kearney zinc mine near Hanover and the Peru concentrator near Deming were reactivated as a joint venture between Hydrometals, Inc. (parent company of Peru Mining Co.), and American Zinc, Lead and Smelting Co. The Kearney mine was dewatered, all drifts were cleaned, and pipelines and powerlines were replaced. An extensive underground development program, consisting of several thousand feet of drifting and raising and a considerable amount of underground and surface diamond drilling, was completed. Some diamond drilling also was done at the company's Pewabic zinc mine nearby. Mining at the Kearney mine was to begin early in 1961.

Magnetite ore was produced from the Kearney iron pit by White & Mathis and shipped to Clarance Moore, Albuquerque, for use as a high-density concrete aggregate. Ferruginous manganese ore containing 32 percent iron and 11 percent manganese was produced from the Boston Hill mine by the Luck Mining Co. and shipped to The Colorado Fuel and Iron Corp., Pueblo, Colo.

Digitized by Google

**Hidalgo.**—Copper output, mostly from the Bonney-Miser's Chest mines of Banner Mining Co., the State's second largest copper producer, supplied 84 percent of the county's total value of mineral production. In addition, byproduct gold and silver was recovered from the ore produced from these mines. According to the company annual report, the mines were operated the full year at near capacity, producing 79,726 tons of ore, an increase of 34,880 tons over 1959. The metal content of the 6,640 tons of concentrate produced from the ore milled in 1960 was 888 ounces of gold, 34,615 ounces of silver, and 3,752,248 pounds of copper. Exploration and development work during the year included 1,757 feet of drifting, 174 feet of raising, 1,130 feet of diamond drilling, and 92 feet of shaft-sinking. Late in 1960 sinking operations were begun at the Bonney shaft below the 1,560-foot level to bring the 1,700-foot level into production during 1961.

Brannan & Fuller produced gold-silver ore containing some recoverable copper and lead from the Atwood-Henry Clay and Eighty-Five mines near Lordsburg and shipped it to the American Smelting and Refining Co. (Asarco), El Paso, Tex., copper smelter. The Henry Clay shaft was deepened from the 700 to the 800 level and an additional 50 feet was sunk for sump purposes.

**Lea.**—Petroleum output from 8,830 wells was 3 percent below that of 1959. However, the county continued to lead in petroleum production with 71 percent of the total, led in production of natural gas (from 1,212 wells) with 51 percent of the total. Exploratory drilling resulted in 69 completed wells, of which 14 (10 oil, 3 condensate, 1 gas) were successful. Of the 493 development wells completed, 417 were oil wells, 5 were condensate wells, and 9 were gas wells. Natural gas was processed at 21 extraction plants and 1 fractionation plant. Throughput was 399 billion cubic feet of gas, from which 7 million barrels of natural gasoline, 5 million barrels of butane, and 2 million barrels of propane were recovered; 303 billion cubic feet of residual gas was marketed through pipelines to consumers. Three plants used 48 million cubic feet of natural gas for producing carbon black. Famariss Oil & Refining Co. operated its 1,700-barrel-per-day refinery at Monument.

National Potash Co. mined and refined potash at its facilities southeast of Carlsbad. It continued to purchase ore from Southwest Potash Corp. in Eddy County for blending with its Lea County ore. No salt-processing operations were reported.

**Luna.**—The value of mineral production declined substantially below that of 1959 because of inactivity in the manganese industry. This industry had been at a virtual standstill since 1959, when the quota was filled under the Government carlot manganese ore and concentrate purchase program.

**McKinley.**—McKinley County led in production of uranium ore, and output in 1960 was 27 percent greater than in 1959. Many of the production difficulties caused by underground water were solved, and production was near capacity at the 65 mining operations. Kermac Nuclear Fuels Corp. and Phillips Petroleum Co. operated processing mills in the Ambrosia Lake area. Major mine producers included Kermac Nuclear Fuels Corp., Phillips Petroleum Co., Homestake-Sapin Partners, The Hidden Splendor Mining Co. (formerly Rio De

Digitized by Google

Oro Mines, Inc.), Ambrosia Lake Uranium Co., Homestake Mining Co.-Lance Corp., and Calumet & Hecla, Inc.

A new method in shaft sinking was developed by Kermac Nuclear Fuels Corp., using oil-well techniques and equipment. Previously, several ventilation shafts were sunk by drilling a pilot hole and reaming to a diameter of 44 inches with a specially constructed bit. The shaft being sunk on one of the company properties was 90 inches in diameter. It was the first time a rotary well rig had been used for so large a shaft.

Coal output during the year came from eight mines and was 38 percent above that of 1959. Major production was by Navajo Tribal Enterprises, operating the Window Rock underground mine, and Roberts Coal Co., operating the Roberts strip mine. Petroleum production from 55 wells declined 9 percent. Ten exploratory wells were completed, of which 2 were successful. Of 8 development wells completed, 2 were successful. Drilling totaled 30,529 feet. El Paso Natural Gas Co. operated its fractionation plant at Wingate, processing natural gas liquids from company-owned plants in Utah and northwestern New Mexico and from its 9,000-barrel-per-day Cinzia refinery near Gallup.

**Rio Arriba.**—Coal production from the Caranta No. 2 and New mine, operated by Caranta Brothers, Inc., and the Rainbow mine, operated by Inez Erler, was 6 percent below that of 1959. Petroleum production from 132 wells was 1 percent above that of 1959. Natural gas was produced from 1,183 wells. Fifteen exploratory wells were completed, of which 4 (3 oil, 1 gas) were successful; and of 194 development wells completed, 184 (27 oil, 4 condensate, 153 gas) were successful. Southern Union Gas Co. produced natural gas at its plant in Lybrook. Throughput was 14 billion cubic feet of gas, from which 79,934 barrels of natural gasoline, 131,072 of butane, and 241,106 of propane were recovered; 13.8 billion cubic feet of residual gas was marketed through company pipelines to consumers.

No hand-cobbed mica was mined, although some scrap mica was produced by Mineral Resources Co., Inc. Los Compadres Mica Co. at its Ojo Caliente grinding mill produced ground mica for a roofing paper manufacturer; mill feed was obtained by working mine dumps. General Pumice Corp. continued to mine pumice from its Cullum mine. The pumice was used by building-block manufacturers and a pumice grinding plant at Santa Fe.

**Roosevelt.**—Petroleum production from 53 wells rose to 1.2 million barrels and was more than double that of 1959. Eight exploratory wells were drilled and completed; three were successful. Of the 32 development wells completed, 29 were producers.

**Sandoval.**—Pumice, sand and gravel, and gypsum furnished 79 percent of the $261,000 value of total mineral output. For the first time in the history of the county, commercial quantities of crude gypsum were mined. White Mesa Gypsum Corp. produced gypsum from a deposit near San Ysidro and shipped it to the American Gypsum Co. wallboard plant at Albuquerque.

Coal production from the Padilla underground mine was 17 percent above that of 1959. Petroleum production from 14 wells and natural gas production from 1 well were approximately the same as in 1959.

Digitized by Google

Four exploratory wells and five development wells were completed; three of the development wells were producers.

The closing of the Government purchase program eliminated the market for manganese ore, and no mines were active. No uranium ore was produced at the Warm Springs mine. Five tons of copper and a small quantity of lead and silver were recovered from ore produced from the San Miguel mine.

**San Juan.**—San Juan County ranked second in petroleum production, from 1,245 wells, and in natural gas output, from 3,598 wells. Petroleum output was 5 percent above that of 1959. Thirty-six exploratory wells were completed (3 successful). Of 408 development wells completed, 158 oil wells, 28 condensate wells, and 196 gas wells were successful. Natural gas was processed at the Southern Union Gas Co. Kutz Canyon plant and at the El Paso Natural Gas Co. San Juan plant. Gas intake at the plants was 310.4 billion cubic feet of gas, from which 2.7 million barrels of natural gasoline, 3.3 million barrels of butane, and 3 million barrels of propane were recovered. Residual gas (285 billion cubic feet) was marketed through company-owned pipelines to consumers. Beeline Refining Co., Division of Frontier Refining Co., operated a 1,400-barrel-per-day refinery at Farmington; and Plateau, Inc., operated a 2,500-barrel-per-day refinery at Bloomfield.

The Federal Bureau of Mines operated the Navajo helium plant at Shiprock. Helium-bearing natural gas was obtained from wells in the Hogback field. The quantity of helium shipped was nearly three times greater than in 1959; the plant was operated for only 5 months in 1959.

Coal production from the Hogback No. 11 mine operated by Frank Pashlakai, the Hogback No. 12A mine operated by Simpson Coal Co., and the Hogback No. 13 mine operated by George R. Simpson & Hollis L. Tate was 38 percent below that of 1959. House heating with coal had declined substantially because of the availability of oil at a competitive price. Uranium ore, containing a significant quantity of vanadium, was shipped to a mill at Durango, Colo., for processing. Kerr-McGee Oil Industries, Inc., processed ores from deposits in Arizona at its Navajo uranium mill at Shiprock. A new vanadium-recovery unit, installation of which was completed late in 1959, was operated throughout the year.

**Santa Fe.**—Increased production of sand and gravel and the addition of gypsum to the list of commercial minerals produced in the county raised the total value of mineral output to $949,000. Four commercial operations produced 202,000 tons of sand and gravel, and construction crews and contractors for the AEC and the State highway department supplied 274,000 tons of aggregate. Kaiser Gypsum Co. mined crude gypsum adjacent to its Rosario wallboard plant, which was the first operation of its kind in the State. Pumice and scoria production was 29,400 tons, compared with 35,600 tons in 1959. Copar Pumice Co., Inc., was the major producer; its plant was near Espanola. Crego Block Co., Inc., mined and consumed scoria in the manufacture of building blocks. James H. Rhodes & Co. operated its Santa Fe grinding plant, using crude pumice mined by General Pumice Corp. (Rio Arriba County).

Digitized by Google

Small quantities of copper ore containing gold and silver were shipped to Asarco (El Paso, Tex.) copper smelter from two mines operated by Tom B. Scartaccini and Greenrock Mining Co.

**Sierra.**—The county's entire lead and zinc and most of the silver and copper output came from ore shipped to the Asarco (El Paso, Tex.) lead and copper smelters from the Prospectors Delight mine operated by Sierra Minerals & Milling Corp. Small quantities of copper and silver ore were produced and marketed by L. W. Cady and Wittie & McDonald, respectively. No manganese ore was mined or shipped. Uranium ore from the Pitchblend Watercan mine was shipped to a plant at Ambrosia Lake for processing.

**Socorro.**—After leading the State with output of manganese ore valued at $1.4 million in 1959, the manganese mines in Socorro County were inactive during 1960 because of the termination of the Government manganese purchase program. Five mines produced gold, silver, copper, lead, and zinc. L. A. Patten, operating the Linchburg mine under lease from Empire Zinc, was by far the leading producer. The lead-zinc ore produced was shipped to the Empire Zinc Hanover mill for concentration.

Galbar, Inc., treated lead-barite ore from the Mex-Tex mine near Bingham at its mill south of San Antonio and produced barite and lead concentrates. The lead concentrate, containing a small quantity of silver, was shipped to the Asarco (El Paso, Tex.) lead smelter.

Small quantities of gold, silver, copper, lead, and zinc also were recovered from ores produced from the Copper Gold No. 10, Queen Group, and Waldo mines. Uranium ore from the Lucky Don Sec. 35 mine was shipped to a plant at Ambrosia Lake for processing.

The perlite mine, mill, and expanding plant of Great Lakes Carbon Corp. were operative, but by yearend plans had been formulated to shut down the operation and concentrate production at the company's No Agua (Taos County) facilities.

**Taos.**—Perlite from the No Agua area (Seven Hills of Taos) operations of Great Lakes Carbon Corp., Johns-Manville Perlite Corp., and United Perlite Corp. supplied most of the mineral production in the county. A contractor for the State department of highways produced some sand and gravel for road use. No beryl, copper, or gold was mined during the year.

**Valencia.**—Uranium ore production, from nine operations, was 8 percent below that of 1959, but the county continued to be the leading producer. The decline was largely because operations at the Jackpile mine, operated by The Anaconda Company, were curtailed to adjust the recovery of uranium oxide at its mill at Bluewater to the requirements of the revised purchase contract with AEC. Anaconda reported that exploration and development of the Laguna concession had disclosed an ore body larger than that at the Jackpile mine. The new ore body, called the Paguate, was reported to be higher grade than the Jackpile, but cannot be mined until after 1966 because of AEC regulations. St. Anthony Uranium Unit, American Metal Climax, Inc., operated the M 6 mine, formerly called the Cebolleta Grant mine. Rare Metals Corp. began production at its San Mateo mine.

Digitized by Google

Homestake-New Mexico Partners operated its 750-ton-per-day mill, and Homestake-Sapin Partners operated the adjacent 1,500-ton-per-day mill throughout the year.

United States Gypsum Co. operated its Grants perlite mine and grinding plant, but at a lower level of activity. The crushed perlite was shipped to co-owned expanding plants throughout the United States.

# The Mineral Industry of New York

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the New York State Science Service.**

By Joseph Krickich,[1] Robert W. Metcalf,[1] and Madaline P. Stewart[2]

MINERAL output in New York in 1960 established a new high of $254.7 million, 9 percent greater than 1959, and $10.6 million more than 1957, the previous record year. Among noteworthy developments were gains in output of metals, mainly zinc, iron ore, and titanium concentrate. In addition, heavier demands by the construction industry resulted in larger output of cement, stone, and sand and gravel. Construction of the $720-million Niagara Power project and highway construction throughout the State had favorable effects upon New York's mineral industry. Nationally, the State ranked fifth in cement shipments, fourth in salt, and sixth in gypsum.

**TABLE 1.—Mineral production in New York[1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays—thousand short tons | 1,310 | $1,714 | 1,172 | $1,717 |
| Emery—short tons | 8,555 | 150 | 8,169 | 142 |
| Gem stones | (W) | 8 | (W) | 9 |
| Gypsum—thousand short tons | 919 | 4,663 | 755 | 3,928 |
| Iron ore (usable)—thousand long tons, gross weight | 2,044 | 28,050 | 2,484 | 32,377 |
| Lead (recoverable content of ores, etc.)—short tons | 481 | 111 | 775 | 181 |
| Natural gas—million cubic feet | 2,915 | 889 | 4,990 | 1,542 |
| Peat—short tons | 12,875 | 138 | 10,042 | 146 |
| Petroleum (crude)—thousand 42-gallon barrels | 1,970 | 8,353 | [3] 1,801 | [3] 8,357 |

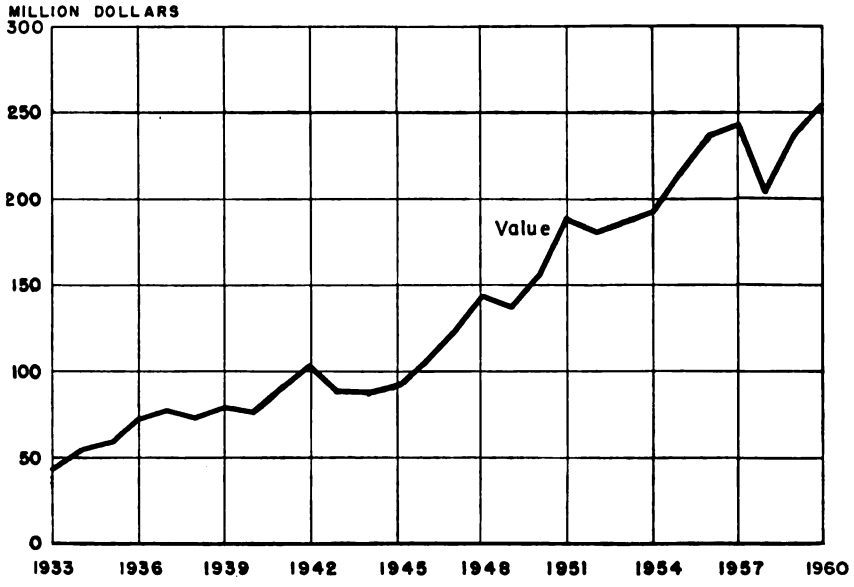

FIGURE 1.—Total value of mineral production in New York, 1933–60.

**Employment and Injuries.**—Injury record in metal and nonmetal mineral industries in the State improved over the preceding year. One less fatality and 53 fewer nonfatal injuries were recorded. Statewide, the number of injuries per million man-hours decreased 20 percent. The most notable improvements were at quarries and mills and at clay mines.

**TABLE 2.—Employment and injuries in selected mineral industries [1]**

| Industry | Men working daily | Man-hours worked | Fatal injuries | Nonfatal injuries | Injuries per million man-hours |
|---|---|---|---|---|---|
| 1959: | | | | | |
| Cement | 1,764 | 4,365,532 | | 19 | 4.55 |
| Clays [2] | 77 | 130,242 | | 5 | 38.39 |
| Coke ovens and smelters | 1,981 | 4,381,008 | 1 | 99 | 22.83 |
| Metal mines and mills | 1,972 | 3,181,578 | 1 | 32 | 10.37 |
| Nonmetal mines [3] | 753 | 1,644,305 | | 28 | 17.03 |
| Quarries and mills [4] | 2,390 | 4,903,300 | | 134 | 27.33 |
| Sand and gravel | 1,785 | 3,323,271 | 1 | 57 | 17.45 |
| Total | 10,722 | 21,929,236 | 3 | 374 | 17.37 |
| 1960: [5] | | | | | |
| Cement | 1,901 | 4,341,562 | 1 | 37 | 8.75 |
| Clays [2] | 92 | 145,960 | | | |
| Coke ovens and smelters | 1,727 | 4,898,257 | | 120 | 24.50 |
| Metal mines and mills | 2,301 | 3,935,933 | 1 | 42 | 10.92 |
| Nonmetal mines [3] | 705 | 1,495,253 | | 37 | 24.74 |
| Quarries and mills [4] | 2,699 | 5,457,140 | | 64 | 11.73 |
| Sand and gravel [6] | 1,857 | 3,053,581 | | 21 | 6.88 |
| Total | 11,282 | 23,327,686 | 2 | 321 | 13.85 |

[1] Production employees.
[2] Mines only.
[3] Includes emery, garnet, gypsum, salt, talc, mineral pigments and wollastonite.
[4] Includes lime plants having no quarry operations.
[5] Preliminary figures.
[6] Commercial producers only.

**Trends and Developments.**—The New York State Power Authority continued constructing the Niagara Power project at Niagara Falls. Scheduled for completion in 1962, power will start flowing to industry early in 1961 on an increasing scale until full production is reached. The first of the 13 giant water wheel generators was installed by yearend. Each of these generators weighs over 500 tons and has a rated capacity of 150,000 k.w. Many new facilities, especially in the chemical and metallurgical industries were planned to utilize the new power that will become available.

The Strategic Materials Corp. large-scale pilot plant demonstrated the electrical processing of steel from waste copper slag in December. From about 25.5 tons of slag this process was said to yield 1 ton of steel, 25 pounds of copper, 150 tons of zinc oxide, and other by-products. The first domestic smelter to use the new process was planned for Anaconda, Mont., where the Anaconda Copper Company has an accumulated pile of waste copper slag, totaling about 40 million tons. This slag analyzes about 33 percent iron, 0.6 percent copper, and 2 percent zinc.

A large user of the newly available electric power at Niagara Falls will be Hooker Chemical Corp. This firm planned a $10-million installation of Hoechst-Uhde mercury-type electrolytic cells during 1960–61 to increase its capacity to manufacture caustic soda, caustic potash, and chlorine. Other companies were attracted to this area or were expanding existing plants because of the ready availability of low-cost power and favorable industrial climate. One of those was the $3-million highly automated powdered-iron facility of Pyron Co., a unit of the Amco Division of American Metal Climax, Inc. This firm produced iron powder for structural parts, especially for the automobile industry.

The use of the oxygen-lance burning process created a serious red-oxide dust problem in many iron- and steel-producing areas. A $5 million dust control program was underway at yearend by Bethlehem Steel Co. in the Niagara Falls area. The installation of electrostatic precipitators was expected to reduce reddish oxide dust dissemination by 98 percent at the company's plants in Lackawanna, South Buffalo, West Seneca, Orchard Park, and Hamburg.

Reynolds Metals Co., one of two primary aluminum producers at Massena, St. Lawrence County, completed installing its $88 million reduction plant. Two additional potlines were installed during the year to complete the 100,000-ton plant (one potline rated at 33,000 tons was put on stream in late 1959).

Toward yearend, seven New York utility companies—Niagara-Mohawk Power Corp., Syracuse; Long Island Lighting Co., Mineola, Long Island; New York State Electric Gas Corp., Binghamton; Consolidated Edison Co. of New York, New York City; Rochester Gas and Electric Corp., Rochester; Central Hudson Gas and Electric Corp., Poughkeepsie; and Orange and Rockland Utilities, Inc., Nyack—joined with General Electric Co. and General Atomics Division of General Dynamics Corp. to sponsor research on nuclear reactors aimed at making nuclear-generated power competitive with steam-generated power. The seven utilities will contribute $5.75 million of a total $8 million construction cost for a boiling-water reactor to be built

615629—61——46

Digitized by Google

the ore milled and material leached, was 62,725 tons, compared with 37,535 tons in 1959. In 1960, the mine operated 12 months, whereas it was closed 5 months in 1959 because of a labor strike. Installation of a $2 million skip hoist, expected to be completed in October 1961, was begun in 1960. The new hoist will permit removal of 18,000 tons of material daily up a 30° incline from the lower levels of the open pit (600 feet deep at present); it will also allow the use of truck haulage and eliminate almost 9 miles of railroad. Stripping to extend the mining area of the open pit was continued, and the 16,000-kilowatt powerplant was completed. Chino enlarged and improved its leaching and precipitation system for recovering copper from mine dumps. In 1960, 19,000 tons of low-cost copper was recovered by this system, 20 percent more than in 1959. The leaching operation had been active throughout 1959 despite the labor strike.

Bayard (Continental) mine, owned by the United States Smelting Refining and Mining Co., the second largest copper producer in the county and the third largest in the State, was operated by lessees, Patten & Galassini and L. A. Patten. According to the owner, the Bayard mill processed 89,695 tons of copper ore from the Bayard mine during the year. No zinc ore was mined; however, the workings were maintained for future mining should the price of zinc improve.

The Hanover mine, operated by the Empire Zinc Division of The New Jersey Zinc Co., was the principal zinc producer in the county and State. The Hanover mill was operated throughout the year on ore supplied from the Hanover mine and from the Linchburg mine (Socorro County) owned by the company and operated by lessee, L. A. Patten.

Of the remaining 12 mines, where gold, silver, copper, lead, or zinc was produced, the Paola (Mathis & White) and Zuniga (Douglas B. White) were the chief copper producers, and the American mine (Gibralter Minerals Co.) was the county's leading lead producer. In addition, 32 operations recovered copper from the water of Santa Rita Creek below the Chino Santa Rita open-pit copper mine, by precipitation.

After a 3-year shutdown, the Kearney zinc mine near Hanover and the Peru concentrator near Deming were reactivated as a joint venture between Hydrometals, Inc. (parent company of Peru Mining Co.), and American Zinc, Lead and Smelting Co. The Kearney mine was dewatered, all drifts were cleaned, and pipelines and powerlines were replaced. An extensive underground development program, consisting of several thousand feet of drifting and raising and a considerable amount of underground and surface diamond drilling, was completed. Some diamond drilling also was done at the company's Pewabic zinc mine nearby. Mining at the Kearney mine was to begin early in 1961.

Magnetite ore was produced from the Kearney iron pit by White & Mathis and shipped to Clarance Moore, Albuquerque, for use as a high-density concrete aggregate. Ferruginous manganese ore containing 32 percent iron and 11 percent manganese was produced from the Boston Hill mine by the Luck Mining Co. and shipped to The Colorado Fuel and Iron Corp., Pueblo, Colo.

Digitized by Google

**Hidalgo.**—Copper output, mostly from the Bonney-Miser's Chest mines of Banner Mining Co., the State's second largest copper producer, supplied 84 percent of the county's total value of mineral production. In addition, byproduct gold and silver was recovered from the ore produced from these mines. According to the company annual report, the mines were operated the full year at near capacity, producing 79,726 tons of ore, an increase of 34,880 tons over 1959. The metal content of the 6,640 tons of concentrate produced from the ore milled in 1960 was 888 ounces of gold, 34,615 ounces of silver, and 3,752,248 pounds of copper. Exploration and development work during the year included 1,757 feet of drifting, 174 feet of raising, 1,130 feet of diamond drilling, and 92 feet of shaft-sinking. Late in 1960 sinking operations were begun at the Bonney shaft below the 1,560-foot level to bring the 1,700-foot level into production during 1961.

Brannan & Fuller produced gold-silver ore containing some recoverable copper and lead from the Atwood-Henry Clay and Eighty-Five mines near Lordsburg and shipped it to the American Smelting and Refining Co. (Asarco), El Paso, Tex., copper smelter. The Henry Clay shaft was deepened from the 700 to the 800 level and an additional 50 feet was sunk for sump purposes.

**Lea.**—Petroleum output from 8,830 wells was 3 percent below that of 1959. However, the county continued to lead in petroleum production with 71 percent of the total, led in production of natural gas (from 1,212 wells) with 51 percent of the total. Exploratory drilling resulted in 69 completed wells, of which 14 (10 oil, 3 condensate, 1 gas) were successful. Of the 493 development wells completed, 417 were oil wells, 5 were condensate wells, and 9 were gas wells. Natural gas was processed at 21 extraction plants and 1 fractionation plant. Throughput was 399 billion cubic feet of gas, from which 7 million barrels of natural gasoline, 5 million barrels of butane, and 2 million barrels of propane were recovered; 303 billion cubic feet of residual gas was marketed through pipelines to consumers. Three plants used 48 million cubic feet of natural gas for producing carbon black. Famariss Oil & Refining Co. operated its 1,700-barrel-per-day refinery at Monument.

National Potash Co. mined and refined potash at its facilities southeast of Carlsbad. It continued to purchase ore from Southwest Potash Corp. in Eddy County for blending with its Lea County ore. No salt-processing operations were reported.

**Luna.**—The value of mineral production declined substantially below that of 1959 because of inactivity in the manganese industry. This industry had been at a virtual standstill since 1959, when the quota was filled under the Government carlot manganese ore and concentrate purchase program.

**McKinley.**—McKinley County led in production of uranium ore, and output in 1960 was 27 percent greater than in 1959. Many of the production difficulties caused by underground water were solved, and production was near capacity at the 65 mining operations. Kermac Nuclear Fuels Corp. and Phillips Petroleum Co. operated processing mills in the Ambrosia Lake area. Major mine producers included Kermac Nuclear Fuels Corp., Phillips Petroleum Co., Homestake-Sapin Partners, The Hidden Splendor Mining Co. (formerly Rio De

Of the 493 development wells completed, 417 were oil wells, 5 were condensate wells, and 9 were gas wells. Natural gas was processed at 21 extraction plants and 1 fractionation plant. Throughput was 399 billion cubic feet of gas, from which 7 million barrels of natural gasoline, 5 million barrels of butane, and 2 million barrels of propane were recovered; 303 billion cubic feet of residual gas was marketed through pipelines to consumers. Three plants used 48 million cubic feet of natural gas for producing carbon black. Famariss Oil & Refining Co. operated its 1,700-barrel-per-day refinery at Monument.

National Potash Co. mined and refined potash at its facilities southeast of Carlsbad. It continued to purchase ore from Southwest Potash Corp. in Eddy County for blending with its Lea County ore. No salt-processing operations were reported.

**Luna.**—The value of mineral production declined substantially below that of 1959 because of inactivity in the manganese industry. This industry had been at a virtual standstill since 1959, when the quota was filled under the Government carlot manganese ore and concentrate purchase program.

**McKinley.**—McKinley County led in production of uranium ore, and output in 1960 was 27 percent greater than in 1959. Many of the production difficulties caused by underground water were solved, and production was near capacity at the 65 mining operations. Kermac Nuclear Fuels Corp. and Phillips Petroleum Co. operated processing mills in the Ambrosia Lake area. Major mine producers included Kermac Nuclear Fuels Corp., Phillips Petroleum Co., Homestake-Sapin Partners, The Hidden Splendor Mining Co. (formerly Rio De

Digitized by Google

Oro Mines, Inc.), Ambrosia Lake Uranium Co., Homestake Mining Co.-Lance Corp., and Calumet & Hecla, Inc.

A new method in shaft sinking was developed by Kermac Nuclear Fuels Corp., using oil-well techniques and equipment. Previously, several ventilation shafts were sunk by drilling a pilot hole and reaming to a diameter of 44 inches with a specially constructed bit. The shaft being sunk on one of the company properties was 90 inches in diameter. It was the first time a rotary well rig had been used for so large a shaft.

Coal output during the year came from eight mines and was 38 percent above that of 1959. Major production was by Navajo Tribal Enterprises, operating the Window Rock underground mine, and Roberts Coal Co., operating the Roberts strip mine. Petroleum production from 55 wells declined 9 percent. Ten exploratory wells were completed, of which 2 were successful. Of 8 development wells completed, 2 were successful. Drilling totaled 30,529 feet. El Paso Natural Gas Co. operated its fractionation plant at Wingate, processing natural gas liquids from company-owned plants in Utah and northwestern New Mexico and from its 9,000-barrel-per-day Cinzia refinery near Gallup.

**Rio Arriba.**—Coal production from the Caranta No. 2 and New mine, operated by Caranta Brothers, Inc., and the Rainbow mine, operated by Inez Erler, was 6 percent below that of 1959. Petroleum production from 132 wells was 1 percent above that of 1959. Natural gas was produced from 1,183 wells. Fifteen exploratory wells were completed, of which 4 (3 oil, 1 gas) were successful; and of 194 development wells completed, 184 (27 oil, 4 condensate, 153 gas) were successful. Southern Union Gas Co. produced natural gas at its plant in Lybrook. Throughput was 14 billion cubic feet of gas, from which 79,934 barrels of natural gasoline, 131,072 of butane, and 241,106 of propane were recovered; 13.8 billion cubic feet of residual gas was marketed through company pipelines to consumers.

No hand-cobbed mica was mined, although some scrap mica was produced by Mineral Resources Co., Inc. Los Compadres Mica Co. at its Ojo Caliente grinding mill produced ground mica for a roofing paper manufacturer; mill feed was obtained by working mine dumps. General Pumice Corp. continued to mine pumice from its Cullum mine. The pumice was used by building-block manufacturers and a pumice grinding plant at Santa Fe.

**Roosevelt.**—Petroleum production from 53 wells rose to 1.2 million barrels and was more than double that of 1959. Eight exploratory wells were drilled and completed; three were successful. Of the 32 development wells completed, 29 were producers.

**Sandoval.**—Pumice, sand and gravel, and gypsum furnished 79 percent of the $261,000 value of total mineral output. For the first time in the history of the county, commercial quantities of crude gypsum were mined. White Mesa Gypsum Corp. produced gypsum from a deposit near San Ysidro and shipped it to the American Gypsum Co. wallboard plant at Albuquerque.

Coal production from the Padilla underground mine was 17 percent above that of 1959. Petroleum production from 14 wells and natural gas production from 1 well were approximately the same as in 1959.

Digitized by Google

Four exploratory wells and five development wells were completed; three of the development wells were producers.

The closing of the Government purchase program eliminated the market for manganese ore, and no mines were active. No uranium ore was produced at the Warm Springs mine. Five tons of copper and a small quantity of lead and silver were recovered from ore produced from the San Miguel mine.

**San Juan.**—San Juan County ranked second in petroleum production, from 1,245 wells, and in natural gas output, from 3,598 wells. Petroleum output was 5 percent above that of 1959. Thirty-six exploratory wells were completed (3 successful). Of 408 development wells completed, 158 oil wells, 28 condensate wells, and 196 gas wells were successful. Natural gas was processed at the Southern Union Gas Co. Kutz Canyon plant and at the El Paso Natural Gas Co. San Juan plant. Gas intake at the plants was 310.4 billion cubic feet of gas, from which 2.7 million barrels of natural gasoline, 3.3 million barrels of butane, and 3 million barrels of propane were recovered. Residual gas (285 billion cubic feet) was marketed through company-owned pipelines to consumers. Beeline Refining Co., Division of Frontier Refining Co., operated a 1,400-barrel-per-day refinery at Farmington; and Plateau, Inc., operated a 2,500-barrel-per-day refinery at Bloomfield.

The Federal Bureau of Mines operated the Navajo helium plant at Shiprock. Helium-bearing natural gas was obtained from wells in the Hogback field. The quantity of helium shipped was nearly three times greater than in 1959; the plant was operated for only 5 months in 1959.

Coal production from the Hogback No. 11 mine operated by Frank Pashlakai, the Hogback No. 12A mine operated by Simpson Coal Co., and the Hogback No. 13 mine operated by George R. Simpson & Hollis L. Tate was 38 percent below that of 1959. House heating with coal had declined substantially because of the availability of oil at a competitive price. Uranium ore, containing a significant quantity of vanadium, was shipped to a mill at Durango, Colo., for processing. Kerr-McGee Oil Industries, Inc., processed ores from deposits in Arizona at its Navajo uranium mill at Shiprock. A new vanadium-recovery unit, installation of which was completed late in 1959, was operated throughout the year.

**Santa Fe.**—Increased production of sand and gravel and the addition of gypsum to the list of commercial minerals produced in the county raised the total value of mineral output to $949,000. Four commercial operations produced 202,000 tons of sand and gravel, and construction crews and contractors for the AEC and the State highway department supplied 274,000 tons of aggregate. Kaiser Gypsum Co. mined crude gypsum adjacent to its Rosario wallboard plant, which was the first operation of its kind in the State. Pumice and scoria production was 29,400 tons, compared with 35,600 tons in 1959. Copar Pumice Co., Inc., was the major producer; its plant was near Espanola. Crego Block Co., Inc., mined and consumed scoria in the manufacture of building blocks. James H. Rhodes & Co. operated its Santa Fe grinding plant, using crude pumice mined by General Pumice Corp. (Rio Arriba County).

Digitized by Google

Small quantities of copper ore containing gold and silver were shipped to Asarco (El Paso, Tex.) copper smelter from two mines operated by Tom B. Scartaccini and Greenrock Mining Co.

**Sierra.**—The county's entire lead and zinc and most of the silver and copper output came from ore shipped to the Asarco (El Paso, Tex.) lead and copper smelters from the Prospectors Delight mine operated by Sierra Minerals & Milling Corp. Small quantities of copper and silver ore were produced and marketed by L. W. Cady and Wittie & McDonald, respectively. No manganese ore was mined or shipped. Uranium ore from the Pitchblend Watercan mine was shipped to a plant at Ambrosia Lake for processing.

**Socorro.**—After leading the State with output of manganese ore valued at $1.4 million in 1959, the manganese mines in Socorro County were inactive during 1960 because of the termination of the Government manganese purchase program. Five mines produced gold, silver, copper, lead, and zinc. L. A. Patten, operating the Linchburg mine under lease from Empire Zinc, was by far the leading producer. The lead-zinc ore produced was shipped to the Empire Zinc Hanover mill for concentration.

Galbar, Inc., treated lead-barite ore from the Mex-Tex mine near Bingham at its mill south of San Antonio and produced barite and lead concentrates. The lead concentrate, containing a small quantity of silver, was shipped to the Asarco (El Paso, Tex.) lead smelter.

Small quantities of gold, silver, copper, lead, and zinc also were recovered from ores produced from the Copper Gold No. 10, Queen Group, and Waldo mines. Uranium ore from the Lucky Don Sec. 35 mine was shipped to a plant at Ambrosia Lake for processing.

The perlite mine, mill, and expanding plant of Great Lakes Carbon Corp. were operative, but by yearend plans had been formulated to shut down the operation and concentrate production at the company's No Agua (Taos County) facilities.

**Taos.**—Perlite from the No Agua area (Seven Hills of Taos) operations of Great Lakes Carbon Corp., Johns-Manville Perlite Corp., and United Perlite Corp. supplied most of the mineral production in the county. A contractor for the State department of highways produced some sand and gravel for road use. No beryl, copper, or gold was mined during the year.

**Valencia.**—Uranium ore production, from nine operations, was 8 percent below that of 1959, but the county continued to be the leading producer. The decline was largely because operations at the Jackpile mine, operated by The Anaconda Company, were curtailed to adjust the recovery of uranium oxide at its mill at Bluewater to the requirements of the revised purchase contract with AEC. Anaconda reported that exploration and development of the Laguna concession had disclosed an ore body larger than that at the Jackpile mine. The new ore body, called the Paguate, was reported to be higher grade than the Jackpile, but cannot be mined until after 1966 because of AEC regulations. St. Anthony Uranium Unit, American Metal Climax, Inc., operated the M 6 mine, formerly called the Cebolleta Grant mine. Rare Metals Corp. began production at its San Mateo mine.

Digitized by Google

Homestake-New Mexico Partners operated its 750-ton-per-day mill, and Homestake-Sapin Partners operated the adjacent 1,500-ton-per-day mill throughout the year.

United States Gypsum Co. operated its Grants perlite mine and grinding plant, but at a lower level of activity. The crushed perlite was shipped to co-owned expanding plants throughout the United States.

# The Mineral Industry of New York

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the New York State Science Service.**

By Joseph Krickich,[1] Robert W. Metcalf,[1] and Madaline P. Stewart[2]

MINERAL output in New York in 1960 established a new high of $254.7 million, 9 percent greater than 1959, and $10.6 million more than 1957, the previous record year. Among noteworthy developments were gains in output of metals, mainly zinc, iron ore, and titanium concentrate. In addition, heavier demands by the construction industry resulted in larger output of cement, stone, and sand and gravel. Construction of the $720-million Niagara Power project and highway construction throughout the State had favorable effects upon New York's mineral industry. Nationally, the State ranked fifth in cement shipments, fourth in salt, and sixth in gypsum.

**TABLE 1.—Mineral production in New York[1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays.....thousand short tons.. | 1,310 | $1,714 | 1,172 | $1,717 |
| Emery.....short tons.. | 8,555 | 150 | 8,169 | 142 |
| Gem stones..... | (W) | 8 | (W) | 9 |
| Gypsum.....thousand short tons.. | 919 | 4,603 | 756 | 3,928 |
| Iron ore (usable)...thousand long tons, gross weight.. | 2,044 | 28,050 | 2,484 | 32,377 |
| Lead (recoverable content of ores, etc.)....short tons.. | 481 | 111 | 775 | 181 |
| Natural gas.....million cubic feet.. | 2,915 | 889 | 4,990 | 1,542 |
| Peat.....short tons.. | 12,875 | 138 | 10,042 | 146 |
| Petroleum (crude).....thousand 42-gallon barrels.. | 1,970 | 8,353 | [3] 1,801 | [3] 8,357 |
| Salt.....thousand short tons.. | 4,011 | 30,958 | 4,008 | 30,763 |
| Sand and gravel.....do.... | 27,944 | 31,415 | 30,687 | 35,152 |
| Silver (recoverable content of ores, etc.) thousand troy ounces.. | 52 | 47 | 49 | 45 |
| Stone.....thousand short tons.. | 29,640 | 46,556 | 29,802 | 46,955 |
| Zinc (recoverable content of ores, etc.)....short tons.. | 43,464 | 9,997 | 66,364 | 17,122 |
| Value of items that cannot be disclosed: Abrasive garnet, beryl (1960), lime, talc, titanium concentrate, and wollastonite..... | ---- | 76,904 | ---- | 81,831 |
| Total New York[4].....| ---- | [5] 234,642 | ---- | 254,713 |

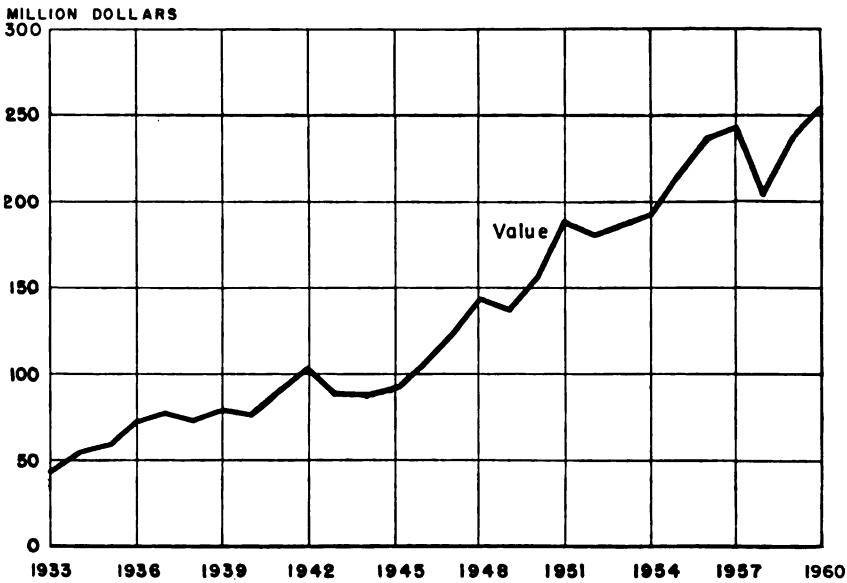

FIGURE 1.—Total value of mineral production in New York, 1933–60.

**Employment and Injuries.**—Injury record in metal and nonmetal mineral industries in the State improved over the preceding year. One less fatality and 53 fewer nonfatal injuries were recorded. Statewide, the number of injuries per million man-hours decreased 20 percent. The most notable improvements were at quarries and mills and at clay mines.

**TABLE 2.—Employment and injuries in selected mineral industries [1]**

| Industry | Men working daily | Man-hours worked | Fatal injuries | Nonfatal injuries | Injuries per million man-hours |
|---|---|---|---|---|---|
| 1959: | | | | | |
| Cement | 1,764 | 4,365,532 | ---- | 19 | 4.55 |
| Clays [2] | 77 | 130,242 | ---- | 5 | 38.39 |
| Coke ovens and smelters | 1,981 | 4,381,008 | 1 | 99 | 22.83 |
| Metal mines and mills | 1,972 | 3,181,578 | 1 | 32 | 10.37 |
| Nonmetal mines [3] | 753 | 1,644,305 | ---- | 28 | 17.03 |
| Quarries and mills [4] | 2,390 | 4,903,300 | ---- | 134 | 27.33 |
| Sand and gravel | 1,785 | 3,323,271 | 1 | 57 | 17.45 |
| Total | 10,722 | 21,929,236 | 3 | 374 | 17.37 |
| 1960: [5] | | | | | |
| Cement | 1,901 | 4,341,562 | 1 | 37 | 8.75 |
| Clays [2] | 92 | 145,960 | ---- | ---- | ---- |
| Coke ovens and smelters | 1,727 | 4,898,257 | ---- | 120 | 24.50 |
| Metal mines and mills | 2,301 | 3,935,933 | 1 | 42 | 10.92 |
| Nonmetal mines [3] | 705 | 1,495,253 | ---- | 37 | 24.74 |
| Quarries and mills [4] | 2,699 | 5,457,140 | ---- | 64 | 11.73 |
| Sand and gravel [6] | 1,857 | 3,053,581 | ---- | 21 | 6.88 |
| Total | 11,282 | 23,327,686 | 2 | 321 | 13.85 |

[1] Production employees.
[2] Mines only.
[3] Includes emery, garnet, gypsum, salt, talc, mineral pigments and wollastonite.
[4] Includes lime plants having no quarry operations.

**Trends and Developments.**—The New York State Power Authority continued constructing the Niagara Power project at Niagara Falls. Scheduled for completion in 1962, power will start flowing to industry early in 1961 on an increasing scale until full production is reached. The first of the 13 giant water wheel generators was installed by yearend. Each of these generators weighs over 500 tons and has a rated capacity of 150,000 k.w. Many new facilities, especially in the chemical and metallurgical industries were planned to utilize the new power that will become available.

The Strategic Materials Corp. large-scale pilot plant demonstrated the electrical processing of steel from waste copper slag in December. From about 25.5 tons of slag this process was said to yield 1 ton of steel, 25 pounds of copper, 150 tons of zinc oxide, and other by-products. The first domestic smelter to use the new process was planned for Anaconda, Mont., where the Anaconda Copper Company has an accumulated pile of waste copper slag, totaling about 40 million tons. This slag analyzes about 33 percent iron, 0.6 percent copper, and 2 percent zinc.

A large user of the newly available electric power at Niagara Falls will be Hooker Chemical Corp. This firm planned a $10-million installation of Hoechst-Uhde mercury-type electrolytic cells during 1960–61 to increase its capacity to manufacture caustic soda, caustic potash, and chlorine. Other companies were attracted to this area or were expanding existing plants because of the ready availability of low-cost power and favorable industrial climate. One of those was the $3-million highly automated powdered-iron facility of Pyron Co., a unit of the Amco Division of American Metal Climax, Inc. This firm produced iron powder for structural parts, especially for the automobile industry.

The use of the oxygen-lance burning process created a serious red-oxide dust problem in many iron- and steel-producing areas. A $5 million dust control program was underway at yearend by Bethlehem Steel Co. in the Niagara Falls area. The installation of electrostatic precipitators was expected to reduce reddish oxide dust dissemination by 98 percent at the company's plants in Lackawanna, South Buffalo, West Seneca, Orchard Park, and Hamburg.

Reynolds Metals Co., one of two primary aluminum producers at Massena, St. Lawrence County, completed installing its $88 million reduction plant. Two additional potlines were installed during the year to complete the 100,000-ton plant (one potline rated at 33,000 tons was put on stream in late 1959).

Toward yearend, seven New York utility companies—Niagara-Mohawk Power Corp., Syracuse; Long Island Lighting Co., Mineola, Long Island; New York State Electric Gas Corp., Binghamton; Consolidated Edison Co. of New York, New York City; Rochester Gas and Electric Corp., Rochester; Central Hudson Gas and Electric Corp., Poughkeepsie; and Orange and Rockland Utilities, Inc., Nyack—joined with General Electric Co. and General Atomics Division of General Dynamics Corp. to sponsor research on nuclear reactors aimed at making nuclear-generated power competitive with steam-generated power. The seven utilities will contribute $5.75 million of a total $8 million construction cost for a boiling-water reactor to be built

615629—61——46

Digitized by Google

at the General Electric Vallecitos, Calif., research center and $4.5 million toward the $8.7 million cost of a gas-cooled graphite-uranium reactor to be built by General Atomics. The participating companies organized a new company—Empire State Atomic Development Associates, Inc.—to conduct the research.

Two firms purchased abandoned brick yards along the Hudson River for conversion to the manufacture of lightweight aggregate in the New York City-Albany area. The New York Trap Rock Co., subject to the proving of adequate clay and shale reserves, was scheduled $2 million on a plant at Beacon, Dutchess County, Hudson Valley Lightweight Aggregate Co., at Glasco, Ulster County, was capitalized for $1 million. The Solite Corp. of Richmond, Va., a lightweight aggregate producer in the Southeast is one of the principals in the latter firm.

New kilns, grinding mills, packaging plants, and silos have been added to portland cement plants at Alsen, Greene County, and Glens Falls, Warren County.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

Cement.—Cement continued to be the leading mineral commodity in New York. Portland, masonry, and natural cements were produced. Production of portland cement increased 10 percent, but shipments increased only 6 percent, reflecting higher stocks at yearend. Shipments of masonry cement decreased 69,000 barrels from 1959; shipments of natural cement nearly doubled. The average value per barrel of portland cement dropped from $3.37 in 1959 to $3.32; the average value of masonry and natural cements increased from $3.57 to $3.61 and $3.50 to $3.55, respectively. In terms of value, Greene County continued to lead in cement output. Other cement-producing counties, in decreasing order of value, were Erie, Columbia, Ulster, Warren, Schoharie, and Onondaga. Natural cement was produced only in Ulster County.

Portland cement manufacturing used 2.9 million tons of limestone and 2.3 million tons of cement rock. In addition, the following tonnages of raw materials were used: Clay and shale, 351,000; gypsum, 124,000; sand and slag, 56,000; and iron materials, 24,000. Quantities of carbon black, air-entraining compounds, and grinding aids also were utilized. Types of portland cement produced included general use (types I–II), high-early-strength (type III), oil-well, portland slag, and high-sulfate-resistance (type V).

Portland cement was shipped to consumers in New York, 21 other States, the District of Columbia, and foreign countries. Sixty-six percent of the shipments went to New York, 32 percent to New England States, 1 percent to New Jersey, and 1 percent to Pennsylvania and other States. Distribution of portland cement shipments, by types of customers, were as follows: Ready-mixed concrete companies, 58 percent; highway and other contractors, 22 percent; building-material dealers, 10 percent; concrete-product manufacturers, 10 percent. Less than one-half percent was shipped to Federal, State, and

Digitized by Google

local Government agencies, and other customers. Most of the finished portland cement was shipped by truck; the remainder was shipped by rail and water. Of the total shipments, 87 percent were in bulk; the remainder were in containers, mainly paper bags.

Annual finished-cement capacity in the State was 24,381,000 barrels, a 589,000 barrels increase over 1959. Fifty-six percent of the capacity was wet-process and 44 percent was dry-process. Cement plants used 464 million kw.-hr. of electrical energy, of which 89 percent was purchased from public utility companies.

During the year, Lehigh Portland Cement Co. began operating a new 400-foot kiln at its Alsen plant. The kiln replaced four 125-foot kilns that had been installed in 1939. Two kilns installed in 1953 were retained. Other improvements at the plant included new raw and finished grinding mills, 20 new cement storage silos, a scale house and hoppers for loading trucks, and a truck garage.

At the Alsen plant of North American Cement Corp., 10 silos, each with 18,000 barrel capacity, were erected. The company resumed barge shipments in addition to its regular rail and truck shipments.

Early in 1960, a new $3 million finish grinding mill was completed at the Glens Falls plant of Glens Falls Portland Cement Co., Division of The Flintkote Co. A new $75,000 laboratory also was completed. In addition, construction was begun on a $2.3 million packaging and bulk loading department.

**Clays.**—Output of miscellaneous clay and shale decreased mainly because of a 20-percent drop in demand for raw material used in manufacturing building brick. Decreased demand for clays in cement, pottery, stoneware, and artificial abrasives also was reported for the year. Clay and shale for manufacturing lightweight aggregate totaled 204,000 tons, a 20-percent increase over 1959. The increase reflected a continuing trend toward greater use of the material for concrete masonry units and other structural applications. Clay production was centered mostly in Erie, Albany, Ulster, Orange, and Onondaga Counties. There were 24 active operations in 12 counties compared with 20 operations in 10 counties in 1959.

**Emery.**—Three emery mines in Westchester County continued to produce the entire U.S. output of emery. Output declined in 1960. The ore was shipped to consumers in New York and Massachusetts for processing and sold as aggregate for heavy-duty nonslip floors and for general abrasive uses.

**Garnet.**—New York continued as the leading garnet-producing State. Abrasive garnet was mined in Essex and Warren Counties. Garnet produced in Warren County was used in manufacturing sandpaper and for grinding and polishing glass; garnet (andradite) recovered as a byproduct of wollastonite mining in Essex County, was used in sand blasting and for polishing glass.

**Gem Stones.**—Quarries and mine dumps continued to attract thousands of gem collectors. Various mineral specimens including garnet, quartz, hematite, and magnetite were collected. Warren County was the leading area for gem material and mineral specimens.

**Graphite, Manufactured.**—Great Lakes Carbon Corp. and National Carbon Co., Division of Union Carbide Corp., manufactured graphite

Digitized by Google

at Niagara Falls (Niagara County). Output was used in anodes, electrodes, lubricants, and foundry and other specialties.

**Gypsum.**—Output of crude gypsum from five underground mines decreased 18 percent. Nationally, New York ranked sixth in crude production compared with fifth in 1959, but continued to lead in producing calcined gypsum. Seven plants calcined gypsum in Bronx, Erie, Genesee, Monroe, Richmond, and Rockland Counties. Most of the crude gypsum mined in Erie, Genesee, and Monroe Counties was calcined and processed at nearby company-owned plants for use in manufacturing building materials such as plaster and gypsum lath. Some was used as a cement retarder.

**TABLE 3.—Crude gypsum production**

(Thousand short tons and thousand dollars)

| Year | Active mines | Quantity | Value | Year | Active mines | Quantity | Value |
|---|---|---|---|---|---|---|---|
| 1951-55 (average) | 5 | 1,155 | $3,949 | 1958 | 5 | 834 | $3,869 |
| 1956 | 5 | 1,140 | 4,817 | 1959 | 5 | 919 | 4,663 |
| 1957 | 5 | 864 | 3,749 | 1960 | 5 | 755 | 3,928 |

**Lime.**—The quantity and value of lime produced declined from the record high of 1959. Output consisted chiefly of quicklime produced in Erie, Niagara, and Onondaga Counties for chemical and industrial applications. Small quantities of hydrated lime for agricultural, chemical, and industrial uses were produced in Clinton County. Eighty-eight percent of the State output was captive; the remainder was sold chiefly to consumers in New York and the New England States. Some lime was exported to Canada.

**Magnesium Compounds.**—Carborundum Metals Co., Division of the Carborundum Co., recovered magnesium chloride as a byproduct of zirconium production at its Akron (Erie County) plant.

**Nitrogen Compounds.**—Atmospheric nitrogen was recovered at Niagara Falls (Niagara County) by E. I. du Pont de Nemours & Co., Inc., and Olin-Mathieson Chemical Corp. The nitrogen was used in making anhydrous ammonia which was used in fertilizers, explosives, and numerous other chemical and industrial applications.

**Perlite.**—Perlite was expanded at six plants—three in Erie County and one each Bronx, Genesee, and Onondaga Counties from crude material shipped from western States. Production dropped from 21,000 tons in 1959 to 18,000 in 1960; value decreased from $995,000 to $886,000. Eighty-five percent of the output was used for building plaster; the remainder was used for loosefill insulation, concrete aggregate, soil conditioner, filler, filtering, and other uses.

**Salt.**—New York continued to rank second in value among the 16 salt-producing States. Total salt production was virtually the same as in 1959. Decreased output of evaporated salt and brine was recorded; rock salt output increased. Rock salt was used mainly for manufacturing chlorine and for controlling ice on highways. Evaporated salt, recovered mainly by the vacuum-pan process, was used mostly for manufacturing chemicals. Salt was produced in Livingston, Onondaga, Schuyler, Tompkins, and Wyoming Counties. Brine

Digitized by Google

recovered in Onondaga County was used exclusively for manufacturing chemicals.

In December, International Salt Co. announced that it would close the Ludlowville refinery and consolidate its production equipment with that of the Watkins Glen Refinery by mid-1962. During the year, the company introduced the use of pneumatic-tired vehicles at its underground Retsof mine as part of its plan to convert from mine railroad haulage to trackless mining at the mine. In addition, the company expected to drive a slope to a lower bed of rock salt early in 1961.[8]

**TABLE 4.—Salt sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951-55 (average) | 3,490 | $19,724 | 1958 | 3,896 | $30,609 |
| 1956 | 3,873 | 27,545 | 1959 | 4,011 | 30,958 |
| 1957 | 3,691 | 28,002 | 1960 | 4,008 | 30,763 |

**Sand and Gravel.**—Output of sand and gravel increased for the second consecutive year, reflecting continued construction activity throughout the State. Most of the increase was by Government-and-contractor operations and consisted chiefly of paving and fill material used for road construction, maintenance, and repair. Commercial sand and gravel output increased 3 percent chiefly because of increased demand for paving and fill material. Demands for all other sand and gravel decreased.

A total of 356 commercial operators (43 more than in 1959) were active. One plant produced over 2 million tons, and two others produced over 1 million tons of sand and gravel. In addition, 7 plants produced between 500,000 and 1 million tons: 145—100,000 to 499,999 tons; 88—25,000 to 99,999 tons; and 113—less than 25,000 tons. Commercial sand and gravel was shipped by truck (85 percent), water (13 percent), and railroad and other (2 percent). Eighty-six percent of the commercial sand and gravel output was processed material compared with 48 percent of Government-and-contractor production.

Sand and gravel was produced in 57 of the 62 counties in the State. The five leading counties, in decreasing order of output, were Suffolk, Nassau, Erie, Monroe, and Rockland.

**Stone.**—Stone output increased for the second consecutive year, reflecting increased demand for crushed stone used as aggregate in the construction industry. Demand for crushed and broken stone for concrete aggregate rose, and output of stone for riprap, agstone, and other uses also increased. Demand for crushed stone for flux and railroad ballast decreased. Although dimension stone output decreased in tonnage, it increased 9-percent in value. Stone was quarried in 40 counties.

Limestone supplied 91 percent of the total stone output and consisted entirely of crushed and broken stone used chiefly for concrete aggregate and roadstone. All major uses except flux and railroad

Digitized by Google

ballast increased. Niagara County continued as the leading limestone-producing area; over 5.5 million tons of limestone was produced for use as riprap, concrete aggregate, stone sand, and dike filter material on the Niagara Power project. Other leading limestone-producing areas were, in decreasing order of output, Onondaga, Dutchess, Greene, Ulster, and Columbia Counties. Limestone was produced by Government-and-contractor operations in Erie, Jefferson, Lewis, and St. Lawrence Counties.

Basalt (traprock), produced in Rockland County, continued as the State's second ranking stone although output decreased. Crushed and broken basalt was marketed as riprap, concrete aggregate and roadstone, railroad ballast, and for other uses.

Sandstone, sold both as dimension and crushed stone, continued to rank third. The quantity of dimension sandstone produced was about the same as in 1959, but the value increased 9 percent. Dimension sandstone was sold mainly for construction, sawed and dressed architectural stone, curbing, and flagging. Part of the apparent increase in crushed and broken sandstone output resulted from increased statistical coverage of the industry. Crushed sandstone was used chiefly for riprap and concrete aggregate. Sandstone was produced in 10 counties, led by Delaware, Sullivan, and Broome Counties, in decreasing order of value.

Granite replaced slate as the fourth ranking stone. Dimension granite for construction and architectural uses, curbing, and flagging was produced in Westchester County. Crushed granite for concrete aggregate and other uses was produced in Warren County.

Output of slate fell sharply owing to the closing of a roofing-granule plant in Washington County, the center of the State's slate industry. Dismantling of the plant was begun. Demand for dimension slate, used mainly for roofing and flagging, increased slightly.

Miscellaneous stone was produced in Clinton and Rensselaer Counties; marble was produced in Dutchess, St. Lawrence, and Westchester Counties. Miscellaneous stone was used chiefly for concrete aggregate; marble was used mainly for terrazzo and cast stone.

**TABLE 7.—Crushed and broken limestone sold or used by producers, by uses**

(Thousand short tons and thousand dollars)

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Riprap | 109 | $159 | 245 | $357 |
| Concrete aggregate and roadstone | 17,198 | 26,735 | 18,328 | 28,745 |
| Fluxing stone | 78 | 145 | 78 | 170 |
| Agricultural | 463 | 2,288 | 499 | 1,466 |
| Railroad ballast | 431 | 633 | 400 | 647 |
| Cement and lime | 5,245 | 4,965 | 5,544 | 5,213 |
| Miscellaneous uses | 2,176 | 4,169 | 1,881 | 3,224 |
| Total | 25,700 | 39,094 | 26,975 | 39,822 |

**Talc.**—New York continued as the leading talc-producing State. Two companies operated three underground mines in St. Lawrence County and ground talc at nearby company-owned mills. The ground

Digitized by Google

talc was used principally in ceramics and paint manufacturing; other uses were in manufacturing paper, building materials, rubber, floor and wall tile, and various other purposes.

## METALS

**Aluminum.**—The Reynolds Metals Co. placed the second of 3 potlines in operation during the year at its reduction plant at Massena, St. Lawrence County. The third was installed but not in operation at the end of the year. The first potline was put on stream in 1959. All three potlines were of 33,000-ton primary-reduction capacity. Combined total capacity of Reynolds Metals Co. and Aluminum Company of America (the operator of the other large reduction plant at Massena) represented about 10 percent of the U.S. primary aluminum production potential. Production of aluminum in 1960 increased substantially over that of 1959.

**Beryllium.**—General Astrometals Corp., with offices, plant, and laboratory at Yonkers was organized to produce and sell beryllium metal and other beryllium products under license from Pechiney of France. At first, the company will receive beryllium flake or powder from Pechiney, but later may refine ore concentrates in its Yonkers plant. It will also produce cements and ceramics for high temperature and nuclear applications. Production was expected to start early in 1961.

For the first time a small quantity of beryl was gathered in New York, at the Bedford quarries, Westchester County, and sold through General Services Administration.

**Ferroalloys.**—Shipments of ferroalloys declined 22 percent to 137,000 short tons valued at $31.4 million. The value of shipments was the lowest in recent years and production was less than in 1959. Large decreases in production and value of shipments of ferrochromium alloys and silvery pig iron were the chief contributing factors. Shipments of ferrotitanium alloys also were smaller. On the other hand, shipments of ferromanganese, silicomanganese, ferrotungsten, and ferrocolumbium gained substantially. Ferroalloys shipped included, in addition to the aforementioned, ferrosilicon and other silicon alloys, ferrovanadium, ferroboron, ferroaluminum, zirconium alloy, and ferrotantalum-columbium. Included among ferrochromium

TABLE 8.—Ferroalloy producers in 1960

| Company | Location | Type of furnace | Ferroalloys produced [1] |
|---|---|---|---|
| Hanna Furnace Corp. | Erie County, Buffalo | Blast | Silvery pig iron. |
| Pittsburgh Metallurgical Co. | Niagara County, Niagara Falls. | Electric | FeMn, SiMn, FeSi, FeCr, silvery pig iron. |
| Titanium Alloy Mfg. Div. of National Lead Co. | do | do | FeTi, FeB, FeZr, other ferroalloys. |
| Union Carbide Metals Co. | do | do | FeMn, FeCr, FeTi, FeW, FeB, FeCb, FeCbTa, SiMn, FeSi. |
| Vanadium Corp. of America | do | do | FeMn, FeSi, FeCr, FeTi, other ferroalloys, SiMn. |
| Transition Metals & Chemical Co. | Ulster County, Wallkill. | Thermit | FeCb. |

[1] Symbols: FeMn, ferromanganese; SiMn, silicomanganese; FeSi, ferrosilicon; FeCr, ferrochromium; FeTi, ferrotitanium; FeW, ferrotungsten; FeB, ferroboron; FeCb, ferrocolumbium; FeCbTa, ferrocolumbium-tantalum; FeZr, ferrozirconium.

Digitized by Google

alloys were ferrochromium and chromium briquets, chromium alloy V–5, and ferrochromium silicon.

**Iron and Steel.**—Pig iron production and shipments increased compared with 1959. Over 75 percent of the production was basic pig iron; other types, in decreasing order of production, were malleable, foundry, low phosphorus, Bessemer, and direct casting. Over 4.5 million tons of iron ore (84 percent domestic, 16 percent foreign) was received at New York plants. Foreign ores came from Canada (mainly Labrador), Chile, Liberia, and Peru. Manganiferous ore was shipped from Brazil and Labrador. Other raw materials consumed in blast furnaces included limestone and dolomite, mill cinder and roll scale, flue dust, open-hearth and Bessemer slag, coke, and ferrous scrap. Five firms operated blast furnaces (6 plants—17 stacks), four in Erie County, and one each in Niagara and Rensselaer Counties. Steel was produced at nine plants: three open-hearth and six electric. All open-hearth furnaces were in Erie County.

**Iron and Steel Scrap.**—Consumption of ferrous scrap and pig iron totaled over 6.5 million tons, 9 percent greater than in 1959. Slightly more than half was pig iron. Consumption of scrap was 6 percent higher than in 1959, and pig iron 13 percent higher. At yearend stocks of ferrous scrap in the hands of consumers had dropped over 160,000 tons (22 percent), whereas pig iron stocks had risen nearly 195,000 tons (62 percent), compared with stocks at the end of 1959.

**Iron Ore.**—Shipments of usable iron ore totaled 2.5 million long tons valued at $32.4 million, 21 percent higher than in 1959. Most of the ore produced was magnetite; a small quantity was hematite used for pigment. Agglomerate comprised over 80 percent of the shipments, and the remainder was concentrate. The hematite was processed by drying and pulverizing before shipment. The agglomerated material was largely sinter. As in 1959, magnetite was mined by three companies from three mines in Essex County and one each in Clinton and St. Lawrence Counties. The hematite was produced at one underground mine in Oneida County. About 85 percent of the magnetite was mined from open pits.

**Lead.**—After 2 low years, production of lead recovered to the highest point since 1957. Output came from the Balmat mine in St. Lawrence County.

National Lead Co. produced red lead and litharge at a plant in Brooklyn. Black lead oxide was manufactured by Electric Auto-Lite Battery Corp., Niagara Falls.

**TABLE 9.—Mine production of silver, lead, and zinc, in terms of recoverable metals**

| Year | Mines producing | Material sold or treated (short tons) | Silver | | Lead | | Zinc | | Total value (thousands) |
|---|---|---|---|---|---|---|---|---|---|
| | | | Troy ounces | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) | |
| 1951–55 (average) | 2 | 579,434 | 44,520 | $40 | 1,256 | $378 | 46,086 | $12,360 | $12,778 |
| 1956 | 2 | 657,445 | 84,158 | 76 | 1,608 | 505 | 59,111 | 16,196 | 16,777 |
| 1957 | 2 | 660,638 | 63,880 | 58 | 1,667 | 477 | 64,659 | 15,001 | 15,536 |

TABLE 10.—Mine production of silver, lead, and zinc in 1960, by months, in terms of recoverable metals

| Month | Silver (troy ounces) | Lead (short tons) | Zinc (short tons) | Month | Silver (troy ounces) | Lead (short tons) | Zinc (short tons) |
|---|---|---|---|---|---|---|---|
| January | 4,939 | 61 | 5,588 | August | 3,912 | 34 | 5,746 |
| February | 4,379 | 51 | 5,914 | September | 4,522 | 34 | 5,321 |
| March | 4,515 | 76 | 6,061 | October | | 61 | 5,299 |
| April | 4,628 | 64 | 5,532 | November | 4,720 | 134 | 4,458 |
| May | 4,544 | 63 | 5,938 | December | 4,615 | 127 | 4,991 |
| June | 4,626 | 33 | 5,679 | | | | |
| July | 3,924 | 37 | 5,837 | Total | 49,324 | 775 | 66,364 |

**Silver.**—Production of silver was 4 percent less than in 1959. Output was recovered as a byproduct of lead-zinc ore from the Balmat mine, St. Lawrence County.

**Titanium Concentrate (Ilmenite).**—Production and shipments of ilmenite were substantially greater. The titanium concentrate, used mostly for pigments, was recovered from a mill treating titaniferous magnetite ore at Tahawus, Essex County.

**Uranium.**—Carborundum Co., Niagara Falls, began synthesizing and fabricating uranium carbide and plutonium carbide, which were combined into a new fuel for nuclear power reactors.

**Zinc.**—New York was second in zinc production. After a year in which a 4-months strike occurred, tonnage and value of recoverable zinc both rose to new highs. Production totaled 66,364 tons valued at $17,122,000—3 percent higher in quantity than the previous peak year, 1957. Production came from the Balmat and Edwards mines in St. Lawrence County.

**Zirconium.**—No commercial zircon was produced in New York; however, zirconium sponge and various zirconium products were manufactured. Production of zirconium-sponge metal by Carborundum Metals Corp., Division of Carborundum Corp., Akron (Erie County) contributed to the 1960 record output. Union Carbide Metals Co., continued to manufacture zirconium ferroalloys at its Niagara Falls plant. Zirconium oxide was made by Norton Co., and Titanium Alloy Manufacturing Division, National Lead Co., both in Niagara Falls, and a new producer in 1960, Harbison-Carborundum Corp., Falconer, Chautauqua County. Output totaled 13,813,000 pounds. Harbison-Carborundum Corp. and Corhart Refractories Co., Corning, Steuben County, were two of the major producers of zircon and zirconia refractories. Zirconium tetrachloride was produced in the Niagara Falls area by Stauffer Chemical Co.

## MINERAL FUELS

**Coke and Coal Chemicals.**—Production of oven-coke totaled 3.1 million short tons valued at $52.9 million, a small increase in both quantity and value over 1959, but much less than in other years. New York was the 6th largest producing State in 1960, compared with 7th in 1959. Average value per ton was $17.21, $0.30 higher than in 1959. Three companies produced coke and coal chemicals at one merchant and two furnace plants in Erie County.

Digitized by Google

Of the 3.5 million tons of coke used in New York, 415,000 tons was received from other States. Of this total, 94 percent was destined for blast furnaces, and most of the remainder went to foundries and other industrial plants; less than 1 percent was used for residential heating, about the same percentage as the national average. In addition to coke used in New York, nearly 240,000 tons of coke breeze was destined for New York consumption.

TABLE 11.—Number, type, and capacities of coke-oven plants, Dec. 31, 1960

| Company | Location | Classification of plant | Number and type of ovens | Annual coke capacity (thousand short tons) |
|---|---|---|---|---|
| Allied Chemical Corp. | Erie County: Buffalo | Merchant | 60 Semet-Solvay | 326 |
| Bethlehem Steel Co. | Lackawanna | Furnace | 171 Koppers-Becker<br>60 Semet-Solvay<br>304 Wilputte | 2,952 |
| Donner-Hanna Coke Corp. | Buffalo | do. | 184 Koppers<br>60 Koppers-Becker | 1,022 |

**Fuel Briquets and Packaged Fuel.**—No production or consumption of fuel briquets or packaged fuel in New York was reported in 1960. Export of fuel briquets through the Buffalo customs district rose slightly to 2,078 short tons. No fuel briquets were exported through the St. Lawrence custom district. A small quantity, however, was exported from New York City.

**Natural Gas.**—Natural gas output rose 71 percent to 4,990 million cubic feet and came mostly from wells in Oriskany and Medina sandstones. According to the American Gas Association, the proved reserve of natural gas at yearend was 96,201 million cubic feet, a reduction of more than 10 billion cubic feet from 1959. Of the total reserve, 62 percent was stored in underground reservoirs; virtually all the remainder was in nonassociated storage, such as free gas not in contact with crude oil in reservoirs.

Oil and gas companies were active in exploration and leasing. Of the 15 natural gas field wells completed during the year, 4 were 1,250 to 2,500 feet deep and 11 were 2,500 to 3,000 feet deep; of the 13 gas wildcats, 5 were drilled to depths of 1,250 to 2,500 feet; 6—2,500 to 3,750 feet; and 2—5,000 to 7,500 feet.

**Peat.**—Peat was produced by three companies in three counties, the same as in 1959—Orange, Seneca, and Westchester. The value of output rose 5 percent to $146,000 although the quantity produced dropped 22 percent. Moss, reed-sedge, and humus peat were produced. Sales were largely in bulk, although a sizable quantity was packaged before sale. Producers reported that consumption of peat in New York totaled 38,903 short tons, compared with 34,709 tons in 1959.

**Petroleum.**—Production of petroleum decreased 9 percent in quantity, but remained at about the same value, resulting in a 9-percent rise in average value per barrel. The average quoted value of crude oil in New York in 1960 was $4.69 per barrel, except for Allegany County, where producers received 8 cents less. Most of the petroleum was produced in southwestern New York, in Allegany, Cattaraugus,

Digitized by Google

and Steuben Counties. The number of productive wells at yearend was estimated to be 18,579. Of these, 14,000 were artificial lift oil wells, 1,090 were gas wells, and 5 were condensate gas wells. Pennsylvania refineries continued to process virtually all of the New York crude oil.

The proved reserve of crude petroleum at the end of 1960, as calculated by the American Petroleum Institute, was 32.4 million barrels, about 2 percent less than in 1959. Because there were no extensions or revisions in existing fields and no new discoveries, the reduction in proved reserve represented 1960 production. New York ranked 23d among crude oil-producing States.

All the new wells drilled during the year were cable-tool wells. The average depth was 1,697 feet. All field oil wells and service wells were drilled to comparatively shallow depths—1,250 to 2,500 feet. All except one of the dry field wells were also in the 1,250 to 2,500 feet range. No crude oil wildcats were reported. Most of the dry wildcat wells ranged from 2,500 to 7,500 feet in depth and one was drilled deeper than 7,500 feet.

Refineries and cracking plants increased capacity slightly to 90,500 barrels and 32,300 barrels of crude petroleum per day compared with 90,000 and 31,800 barrels per day, respectively, in 1959. Frontier Oil Refining Corp., Division of Ashland Oil & Refining Co., at Tonawanda, Erie County; and Mobile Oil Co., with plants in Buffalo, Erie County, and in Brooklyn, Kings County, operated during the year. The plants at Tonawanda and Buffalo were skimming, cracking, and asphalt plants; the other had skimming and cracking facilities only. The Gulf Oil Co., skimming plant at Gulfport (Richmond County), closed in 1959, was discontinued.

**TABLE 12.—Petroleum production**

Texaco, Inc., employed about 1,000 persons at its Beacon (Dutchess County), research laboratory. Fundamental and applied research on the use of fuels, lubricants, and greases, and nuclear research, petrochemical and process development, and improvement of existing and development of new products were undertaken.

## REVIEW BY COUNTIES

Mineral output was reported from all except five counties. Value of mineral production increased in 34 of the 57 mineral-producing counties. The largest increase in value ($13.8 million) was in St. Lawrence County and was attributable chiefly to increased output of zinc and iron ore. St. Lawrence, Erie, Onondaga, Essex, and Greene Counties, in decreasing order of value, were the principal producers.

**Albany.**—Callanan Road Improvement Co. produced limestone for riprap, blast-furnace flux, concrete aggregate, and railroad ballast at South Bethlehem. A limited quantity of dimension sandstone, used for flagging and rough-dressed construction work, was produced near East Berne. Sand and gravel, used mainly for building and paving, was recovered by three producers. Albany Gravel Co., Inc., the leading producer, recovered material from pits near Albany, Bethlehem, and Colonie. James H. Maloy, Inc., produced gravel near Albany. Processed molding sand was recovered from pits in Selkirk and Slingerland, by Whitehead Bros. Co.

Albany County dropped to second place among the State's clay-producing counties. Output of miscellaneous clay decreased from 250,000 to 228,000 tons. Powell & Minnock Brick Works, Inc., Sutton & Suderly Brick Co., and Roah Hook Brick Co., all near Coeymans, mined miscellaneous clay for manufacturing building brick. Northern Lightweight Aggregates, Inc. (Cohoes), mined shale for manufacturing expanded lightweight aggregate by the rotary kiln process. Rex Clay Products Co., Inc., mined clay near Albany for use in manufacturing artificial abrasives, pottery, and flowerpots.

**Allegany.**—Sand and gravel was produced by Alfred Atlas Gravel and Sand Corp. and Buffalo Slag Co., Inc. (both near Alfred), Nick Codispoti (Belmont), and Thomas Moogan (Friendship). Output was processed mainly for building and paving purposes.

**Bronx.**—National Gypsum Co. produced calcined gypsum at its Bronx plant. The company also expanded perlite shipped from Colorado for use in manufacturing building plaster. The material was shipped mostly to other company plants for manufacturing building plaster; the remainder was used at the Bronx plant.

**Broome.**—Commercial sand and gravel output increased and consisted chiefly of processed building and paving material. Producers were Barney and Dickenson, Inc., Winnie and Son, Inc., Bob Murphy, Inc., all near Vestal, and Binghamton Sand & Crushed Stone Corp. and Weber's Sand and Gravel, both near Binghamton. Corbisello Quarries produced crushed and broken sandstone for concrete aggregate and riprap near Binghamton. Dimension sandstone (bluestone) was quarried and shipped to Delaware County for fabrication. Mis-

TABLE 14.—Value of mineral production in New York, by counties[1 2 3]

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Albany | (4) | (4) | Stone, sand and gravel, clays. |
| Allegany | $733,266 | $395,059 | Sand and gravel. |
| Broome | (4) | (4) | Sand and gravel, stone, clays. |
| Cattaraugus | 763,721 | 827,940 | Sand and gravel. |
| Cayuga | (4) | (4) | Stone, sand and gravel. |
| Chautauqua | 275,943 | 309,369 | Sand and gravel. |
| Chemung | (4) | 235,975 | Sand and gravel, clays. |
| Chenango | 147,447 | (4) | Sand and gravel. |
| Clinton | (4) | (4) | Iron ore, sand and gravel, stone, lime. |
| Columbia | (4) | (4) | Cement, sand and gravel, stone, clays. |
| Cortland | 142,996 | ---------- | |
| Delaware | 727,467 | (4) | Stone, sand and gravel. |
| Dutchess | (4) | (4) | Stone, sand and gravel, clays. |
| Erie | 22,287,034 | 21,430,132 | Cement, stone, gypsum, sand and gravel, lime, clays. |
| Essex | (4) | (4) | Iron ore, ilmenite, wollastonite, sand and gravel, garnet. |
| Franklin | 250,732 | (4) | Sand and gravel, stone. |
| Fulton | 90,585 | 77,157 | Sand and gravel. |
| Genesee | (4) | 2,981,712 | Gypsum, stone, sand and gravel. |
| Greene | (4) | (4) | Cement, stone, sand and gravel, clays. |
| Hamilton | 28,858 | 5,000 | Sand and gravel. |
| Herkimer | (4) | (4) | Stone, sand and gravel, gem stones. |
| Jefferson | (4) | (4) | Stone, sand and gravel. |
| Lewis | (4) | (4) | Do. |
| Livingston | (4) | (4) | Salt, sand and gravel, stone. |
| Madison | 433,699 | (4) | Stone, sand and gravel. |
| Monroe | 2,995,933 | 3,184,620 | Stone, sand and gravel, gypsum. |
| Montgomery | (4) | (4) | Stone, sand and gravel. |
| Nassau | 7,674,693 | 7,413,033 | Sand and gravel, clays. |
| Niagara | 8,581,940 | 10,693,100 | Stone, lime, sand and gravel. |
| Oneida | 2,970,962 | 2,561,882 | Stone, sand and gravel, iron ore, gem stones. |
| Onondaga | (4) | (4) | Lime, salt, cement, stone, sand and gravel, clays. |
| Ontario | (4) | (4) | Stone, sand and gravel. |
| Orange | 1,630,244 | 1,432,480 | Sand and gravel, clays, stone, peat. |
| Orleans | (4) | (4) | Stone, sand and gravel. |
| Oswego | (4) | (4) | Sand and gravel. |
| Otsego | (4) | (4) | Stone, sand and gravel. |
| Putnam | (4) | (4) | Stone, sand and gravel, gem stones. |
| Queens | ---------- | 6,282 | Sand and gravel. |
| Rensselaer | (4) | (4) | Stone, sand and gravel. |
| Rockland | (4) | (4) | Do. |
| St. Lawrence | 27,678,013 | 41,489,959 | Iron ore, zinc, talc, sand and gravel, stone, lead, silver. |
| Saratoga | (4) | (4) | Sand and gravel, stone. |
| Schenectady | 445,329 | (4) | Sand and gravel. |
| Schoharie | (4) | (4) | Cement, stone, clays, sand and gravel. |
| Schuyler | (4) | (4) | Salt, sand and gravel. |
| Seneca | (4) | (4) | Peat, sand and gravel. |
| Steuben | 533,762 | (4) | Sand and gravel. |
| Suffolk | 6,440,796 | 6,719,375 | Do. |
| Sullivan | (4) | (4) | Stone, sand and gravel. |
| Tioga | (4) | 300,306 | Sand and gravel. |
| Tompkins | (4) | (4) | Salt, sand and gravel, stone. |
| Ulster | (4) | (4) | Cement, stone, sand and gravel, clays. |
| Warren | (4) | (4) | Cement, garnet, stone, sand and gravel, gem stones. |
| Washington | 891,704 | 431,456 | Stone, sand and gravel. |
| Wayne | (4) | (4) | Do. |
| Westchester | 765,100 | 773,812 | Stone, emery, sand and gravel, peat, beryl. |
| Wyoming | (4) | (4) | Salt, stone. |
| Yates | 20,300 | 6,300 | Sand and gravel. |
| Undistributed [5] | 148,131,448 | 153,438,020 | |
| Total | 234,642,000 | 254,713,000 | |

[1] Bronx, Kings, New York, and Richmond Counties are not listed because no production was reported.
[2] Fuels, including natural gas and petroleum, not listed by counties, value included with "Undistributed."
[3] Excludes value of clays and stone used in manufacturing lime and cement.
[4] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[5] Includes natural gas and petroleum, some gem stones and sand and gravel (1960) that cannot be assigned to specific counties, and value indicated by footnote 4.

cellaneous clay for manufacturing building brick was produced by Binghamton Brick Co., Inc. (Binghamton).

**Cattaraugus.**—Commercial production of sand and gravel totaled 684,000 tons, a 9-percent increase over 1959. Eight pits, three near Allegany and one each near Franklinville, Gowanda, Limestone,

Digitized by Google

Onoville, and Red House were active. Output consisted mainly of processed building and paving material and was shipped to consumers principally by truck. Limited quantities of sand were produced for filtration and ice control.

**Cayuga.**—General Crushed Stone Co. (Auburn) quarried and crushed limestone for concrete aggregate, roadstone, riprap, and asphalt filler. Processed sand and gravel, used chiefly for building and paving, was produced at Auburn by J. J. Harrington and Jay W. Robinson & Son. Stanley Jablonski produced bank-run gravel for fill near Mentz.

**Chautauqua.**—Production of commercial sand and gravel came principally from pits near Bemus Point, Irving, Jamestown, and Stow. Output was used mainly for building and paving.

**Chemung.**—Commercial sand and gravel, used chiefly for building and paving, was produced by Dalrymple Gravel & Contracting Co., Inc. (Elmira), Elmira Transit Mix, Inc. (Horseheads), and Frank Treat (Breesport). Miscellaneous clay for manufacturing building brick was produced by Consolidated Brick Co. (Horseheads).

**Chenango.**—Commercial sand and gravel was produced by B&B Builders Supplies, Inc. (Greene), and Bundy Concrete Co. (Sherburne). Output consisted chiefly of building material.

**Clinton.**—Magnetite iron ore was mined by Republic Steel Corp. at its Chateaugay underground and open-pit mine near Dannemora (Lyon Mountain). Because of reduced demand for steel, this mine was closed from June 10 through October 3 and from November 12 to the end of the year. Sinter was consumed mostly in manufacturing pig iron and steel. A small quantity of concentrate was prepared. At the mine, a fairly active exploration and development program was carried out, which included raising, tunneling, drifting, cross cutting, and percussion drilling. In the open-pit part of the mine, a sizable quantity of overburden was removed. Open-pit mining was done on two benches, averaging 30 feet high and 70 feet wide. Gneiss (miscellaneous stone) was recovered from tailings and sold as concrete aggregate, railroad ballast, and stone sand.

International Lime & Stone Corp. (Chazy) continued to produce limestone for construction, agricultural, and metallurgical purposes and for manufacturing lime at its nearby plant. Quicklime and hydrated lime were produced for a variety of chemical, industrial, and agricultural uses. Lime output was consumed in New York, New England States, and Canada. Plattsburgh Quarries, Inc. (formerly Lancaster Development Corp.), quarried limestone near Plattsburgh for concrete aggregate and roadstone. Sand and gravel, mainly for building and paving, was produced by Bero Construction Corp. (Morrisonville). The company also produced sand for fill and ice control and gravel for drainage use.

**Columbia.**—Columbia County continued to rank third among cement-producing counties. Lone Star Cement Corp. (Greenport) and Universal Atlas Cement Division of United States Steel Corp. (Hudson) produced portland and masonry cements, using chiefly limestone and clays mined nearby as raw materials. Most of the finished cement was shipped to consumers in New York and New England States. Catskill Mountain Stone Corp. quarried limestone at Hudson for use

Digitized by Google

as concrete aggregate and roadstone. Sand for paving and ice control and gravel for paving was produced at pits near Claverack, Copake, Hudson, and Livingston. Columbia Sand & Gravel (Claverack) was renamed Cairo Ready-Mix.

**Cortland.**—The Cortland sand and gravel operations of Cortland Ready Mix, Inc. (formerly Cortland Ready Mix Concrete), was idle in 1960.

**Delaware.**—Delaware County continued to lead in value of sandstone (bluestone) production. Output was valued at $838,000—a 17-percent increase over 1959. Except for a limited quantity of broken stone used for riprap, county output consisted of dimension stone for construction and architectural purposes, curbing, and flagging. Fabricating yards processed stone quarried in Delaware County, surrounding New York counties, and bordering Pennsylvania counties. Bluestone fabricators were W. R. Strong & Son and Willis Hankins (both near Deposit), Johnston & Rhodes Bluestone Co. (East Branch), Paul Thompkins Estate (Hancock), and American Bluestone Co. (Masonville). The stone was used in constructing schools, churches, hospitals, dams, and other buildings in New York and Connecticut. Sand and gravel came from Government-and-contractor operations.

**Dutchess.**—The county continued to lead in value of commercial limestone. New York Trap Rock Corp. (New Hamburg) and Dutchess Quarry & Supply Co., Inc. (Pleasant Valley), produced limestone used chiefly for concrete aggregate and roadstone. White Marble Corp. produced marble near Wingdale. Commercial production of sand and gravel totaled 490,000 tons—a 16-percent increase over 1959. Output consisted chiefly of building and paving material and was recovered from 13 operations. Dennings Point Brick Works, Inc., mined clay and shale from pits near Beacon and used it for manufacturing building brick.

**Erie.**—Portland and masonry cements were produced at Buffalo by Lehigh Portland Cement Co. and Penn-Dixie Cement Corp. Raw materials used at these cement plants included limestone, shale, clay, gypsum, sand, iron ore, mill scale, and pyrite sinter. Finished cement was shipped mostly to consumers in New York and Pennsylvania. Output of limestone by commercial producers totaled 1.4 million tons, 4 percent greater than in 1959. Most of the limestone was crushed for use by the construction industries. Producers were Buffalo Crushed Stone Corp. (Bowmansville), County Line Stone Co., Inc., (Akron), Federal Crushed Stone Corp. (Cheektowaga), and Lancaster Stone Products Corp. (Lancaster). Substantial quantities of limestone were produced under contract to the State of New York, Department of Public Works, and used chiefly as backfill for sewers.

Universal Atlas Cement Co., Bestwall Gypsum Co., and National Gypsum Co. mined crude gypsum underground near Clarence Center. Universal Atlas shipped its output to company-owned plants for use as a portland cement retarder. Bestwall Gypsum Co. shipped the crude gypsum to its Akron, N.Y., plant where it was calcined and processed into finished building materials. The company also expanded crude perlite shipped from Nevada and Colorado. National

Digitized by Google

Gypsum Co. calcined the crude gypsum and expanded crude perlite shipped from other States at its nearby plant. Buffalo Perlite Corp. (Cheektowaga) expanded perlite shipped from western States. The expanded perlite was used mainly as plaster aggregate; quantities also were used for loose-fill insulation, concrete aggregate, soil conditioning, filler, and filter purposes.

The county continued to rank third in tonnage and value of commercial sand and gravel. Output, by 9 producers, totaled 1.3 million tons compared with 1.7 million tons in 1959. Seventy-seven percent of the county output was processed material, and all was shipped by truck. Quicklime for metallurgical purposes was produced at the Buffalo plant of Kelley Island New York Corp. Erie County ranked first in clay production. Clay, principally for manufacturing building brick, was mined and processed near Lakeview and West Falls. Anchor Concrete Products, Inc. (Jewettsville), produced lightweight aggregate by the rotary kiln process from miscellaneous clay mined nearby. Substantial quantities of clay were mined for manufacturing cement. Small quantities were mined near Buffalo for manufacturing flowerpots.

**Essex.**—The Republic Steel Corp. Fisher Hill and Old Bed-Harmony mines near Mineville operated only in the first half of the year because of the lessened demand for steel. About 250 miners were idled. Approximately an equal number of men were employed at the company Troy plant, where most of the sinter and concentrate was consumed. Regular and random pillars were used to support openings at the Fisher Hill mine. At the Old Bed-Harmony mines 90 percent of the ore was mined by sublevel stoping and the remainder by open stoping, using casual pillars. Exploration and development at the Fisher Hill mine consisted of raising and drifting; at the Old Bed-Harmony mines it consisted of raising, drifting, and diamond and percussion drilling. The ore from the Fisher Hill mine was treated at the same plant where the Old Bed-Harmony ore was processed. National Lead Co. operated the MacIntyre underground titaniferous magnetite mine at Tahawas, the second largest iron ore mine in New York. The ore was processed by heavy-medium separation, flotation, magnetic separation, and sintering. Sizable tonnages of ilmenite also were recovered at Tahawas. Iron ore produced in Essex County was used chiefly for pig iron and steel, cement, and as a heavy-medium in mineral dressing separation.

Cabot Minerals Division, Cabot Corp. (formerly Cabot Carbon Co.), mined wollastonite and byproduct abrasive garnet (andradite) at its Willsboro mines. The wollastonite was crushed and ground for use as a filler in paints, ceramics, and plastics. Adirondack Development Corp. began exploratory drilling near Lewis on a newly discovered wollastonite deposit. Development was expected to begin in 1961. Sand and gravel was recovered from pits near Elizabethtown, Keesville, and Saranac Lake. Output consisted mainly of processed material for building and paving.

**Franklin.**—Commercial output of sand and gravel totaled 114,000 tons and came from pits near Bombay, Malone, St. Regis Falls, and Westville. Sandstone for rough construction in flagging was quarried near Malone by Adirondack Stone Quarries, Inc. Dressed architec-

615629—61——47

talc was used principally in ceramics and paint manufacturing; other uses were in manufacturing paper, building materials, rubber, floor and wall tile, and various other purposes.

## METALS

**Aluminum.**—The Reynolds Metals Co. placed the second of 3 potlines in operation during the year at its reduction plant at Massena, St. Lawrence County. The third was installed but not in operation at the end of the year. The first potline was put on stream in 1959. All three potlines were of 33,000-ton primary-reduction capacity. Combined total capacity of Reynolds Metals Co. and Aluminum Company of America (the operator of the other large reduction plant at Massena) represented about 10 percent of the U.S. primary aluminum production potential. Production of aluminum in 1960 increased substantially over that of 1959.

**Beryllium.**—General Astrometals Corp., with offices, plant, and laboratory at Yonkers was organized to produce and sell beryllium metal and other beryllium products under license from Pechiney of France. At first, the company will receive beryllium flake or powder from Pechiney, but later may refine ore concentrates in its Yonkers plant. It will also produce cements and ceramics for high temperature and nuclear applications. Production was expected to start early in 1961.

For the first time a small quantity of beryl was gathered in New York, at the Bedford quarries, Westchester County, and sold through General Services Administration.

**Ferroalloys.**—Shipments of ferroalloys declined 22 percent to 137,000 short tons valued at $31.4 million. The value of shipments was the lowest in recent years and production was less than in 1959. Large decreases in production and value of shipments of ferrochromium alloys and silvery pig iron were the chief contributing factors. Shipments of ferrotitanium alloys also were smaller. On the other hand, shipments of ferromanganese, silicomanganese, ferrotungsten, and ferrocolumbium gained substantially. Ferroalloys shipped included, in addition to the aforementioned, ferrosilicon and other silicon alloys, ferrovanadium, ferroboron, ferroaluminum, zirconium alloy, and ferrotantalum-columbium. Included among ferrochromium

TABLE 8.—Ferroalloy producers in 1960

| Company | Location | Type of furnace | Ferroalloys produced [1] |
|---|---|---|---|
| Hanna Furnace Corp. | Erie County, Buffalo | Blast | Silvery pig iron. |
| Pittsburgh Metallurgical Co. | Niagara County, Niagara Falls. | Electric | FeMn, SiMn, FeSi, FeCr, silvery pig iron. |
| Titanium Alloy Mfg. Div. of National Lead Co. | do | do | FeTi, FeB, FeZr, other ferroalloys. |
| Union Carbide Metals Co. | do | do | FeMn, FeCr, FeTi, FeW, FeB, FeCb, FeCbTa, SiMn, FeSi. |
| Vanadium Corp. of America | do | do | FeMn, FeSi, FeCr, FeTi, other ferroalloys, SiMn. |
| Transition Metals & Chemical Co. | Ulster County, Wallkill | Thermit | FeCb. |

[1] Symbols: FeMn, ferromanganese; SiMn, silicomanganese; FeSi, ferrosilicon; FeCr, ferrochromium; FeTi, ferrotitanium; FeW, ferrotungsten; FeB, ferroboron; FeCb, ferrocolumbium; FeCbTa, ferrocolumbium-tantalum; FeZr, ferrozirconium.

Digitized by Google

alloys were ferrochromium and chromium briquets, chromium alloy V–5, and ferrochromium silicon.

**Iron and Steel.**—Pig iron production and shipments increased compared with 1959. Over 75 percent of the production was basic pig iron; other types, in decreasing order of production, were malleable, foundry, low phosphorus, Bessemer, and direct casting. Over 4.5 million tons of iron ore (84 percent domestic, 16 percent foreign) was received at New York plants. Foreign ores came from Canada (mainly Labrador), Chile, Liberia, and Peru. Manganiferous ore was shipped from Brazil and Labrador. Other raw materials consumed in blast furnaces included limestone and dolomite, mill cinder and roll scale, flue dust, open-hearth and Bessemer slag, coke, and ferrous scrap. Five firms operated blast furnaces (6 plants—17 stacks), four in Erie County, and one each in Niagara and Rensselaer Counties. Steel was produced at nine plants: three open-hearth and six electric. All open-hearth furnaces were in Erie County.

**Iron and Steel Scrap.**—Consumption of ferrous scrap and pig iron totaled over 6.5 million tons, 9 percent greater than in 1959. Slightly more than half was pig iron. Consumption of scrap was 6 percent higher than in 1959, and pig iron 13 percent higher. At yearend stocks of ferrous scrap in the hands of consumers had dropped over 160,000 tons (22 percent), whereas pig iron stocks had risen nearly 195,000 tons (62 percent), compared with stocks at the end of 1959.

**Iron Ore.**—Shipments of usable iron ore totaled 2.5 million long tons valued at $32.4 million, 21 percent higher than in 1959. Most of the ore produced was magnetite; a small quantity was hematite used for pigment. Agglomerate comprised over 80 percent of the shipments, and the remainder was concentrate. The hematite was processed by drying and pulverizing before shipment. The agglomerated material was largely sinter. As in 1959, magnetite was mined by three companies from three mines in Essex County and one each in Clinton and St. Lawrence Counties. The hematite was produced at one underground mine in Oneida County. About 85 percent of the magnetite was mined from open pits.

**Lead.**—After 2 low years, production of lead recovered to the highest point since 1957. Output came from the Balmat mine in St. Lawrence County.

National Lead Co. produced red lead and litharge at a plant in Brooklyn. Black lead oxide was manufactured by Electric Auto-Lite Battery Corp., Niagara Falls.

**TABLE 9.—Mine production of silver, lead, and zinc, in terms of recoverable metals**

| Year | Mines producing | Material sold or treated (short tons) | Silver | | Lead | | Zinc | | Total value (thousands) |
|---|---|---|---|---|---|---|---|---|---|
| | | | Troy ounces | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) | |
| 1951–55 (average) | 2 | 579,434 | 44,520 | $40 | 1,256 | $378 | 46,086 | $12,360 | $12,778 |
| 1956 | 2 | 657,445 | 84,158 | 76 | 1,608 | 505 | 59,111 | 16,196 | 16,777 |

| 1951–55 (average) | 2 | 579,434 | 44,520 | $40 | 1,256 | $378 | 46,086 | $12,360 | $12,778 |
| 1956 | 2 | 657,445 | 84,158 | 76 | 1,608 | 505 | 59,111 | 16,196 | 16,777 |
| 1957 | 2 | 660,638 | 63,880 | 58 | 1,667 | 477 | 64,659 | 15,001 | 15,536 |
| 1958 | 2 | 563,644 | 66,738 | 60 | 579 | 136 | 53,014 | 10,815 | 11,011 |
| 1959 | 2 | 438,769 | 51,588 | 47 | 481 | 111 | 43,464 | 9,997 | 10,155 |
| 1960 | 2 | 701,197 | 49,324 | 45 | 775 | 181 | 66,364 | 17,122 | 17,348 |

Digitized by Google

talc was used principally in ceramics and paint manufacturing; other uses were in manufacturing paper, building materials, rubber, floor and wall tile, and various other purposes.

## METALS

**Aluminum.**—The Reynolds Metals Co. placed the second of 3 potlines in operation during the year at its reduction plant at Massena, St. Lawrence County. The third was installed but not in operation at the end of the year. The first potline was put on stream in 1959. All three potlines were of 33,000-ton primary-reduction capacity. Combined total capacity of Reynolds Metals Co. and Aluminum Company of America (the operator of the other large reduction plant at Massena) represented about 10 percent of the U.S. primary aluminum production potential. Production of aluminum in 1960 increased substantially over that of 1959.

**Beryllium.**—General Astrometals Corp., with offices, plant, and laboratory at Yonkers was organized to produce and sell beryllium metal and other beryllium products under license from Pechiney of France. At first, the company will receive beryllium flake or powder from Pechiney, but later may refine ore concentrates in its Yonkers plant. It will also produce cements and ceramics for high temperature and nuclear applications. Production was expected to start early in 1961.

For the first time a small quantity of beryl was gathered in New York, at the Bedford quarries, Westchester County, and sold through General Services Administration.

**Ferroalloys.**—Shipments of ferroalloys declined 22 percent to 137,000 short tons valued at $31.4 million. The value of shipments was the lowest in recent years and production was less than in 1959. Large decreases in production and value of shipments of ferrochromium alloys and silvery pig iron were the chief contributing factors. Shipments of ferrotitanium alloys also were smaller. On the other hand, shipments of ferromanganese, silicomanganese, ferrotungsten, and ferrocolumbium gained substantially. Ferroalloys shipped included, in addition to the aforementioned, ferrosilicon and other silicon alloys, ferrovanadium, ferroboron, ferroaluminum, zirconium alloy, and ferrotantalum-columbium. Included among ferrochromium

**TABLE 8.—Ferroalloy producers in 1960**

| Company | Location | Type of furnace | Ferroalloys produced [1] |
|---|---|---|---|
| Hanna Furnace Corp. | Erie County, Buffalo | Blast | Silvery pig iron. |
| Pittsburgh Metallurgical Co. | Niagara County, Niagara Falls. | Electric | FeMn, SiMn, FeSi, FeCr, silvery pig iron. |
| Titanium Alloy Mfg. Div. of National Lead Co. | do | do | FeTi, FeB, FeZr, other ferroalloys. |
| Union Carbide Metals Co. | do | do | FeMn, FeCr, FeTi, FeW, FeB, FeCb, FeCbTa, SiMn, FeSi. |
| Vanadium Corp. of America | do | do | FeMn, FeSi, FeCr, FeTi, other ferroalloys, SiMn. |
| Transition Metals & Chemical Co. | Ulster County, Wallkill. | Thermit | FeCb. |

[1] Symbols: FeMn, ferromanganese; SiMn, silicomanganese; FeSi, ferrosilicon; FeCr, ferrochromium; FeTi, ferrotitanium; FeW, ferrotungsten; FeB, ferroboron; FeCb, ferrocolumbium; FeCbTa, ferrocolumbium-tantalum; FeZr, ferrozirconium.

Digitized by Google

alloys were ferrochromium and chromium briquets, chromium alloy V–5, and ferrochromium silicon.

**Iron and Steel.**—Pig iron production and shipments increased compared with 1959. Over 75 percent of the production was basic pig iron; other types, in decreasing order of production, were malleable, foundry, low phosphorus, Bessemer, and direct casting. Over 4.5 million tons of iron ore (84 percent domestic, 16 percent foreign) was received at New York plants. Foreign ores came from Canada (mainly Labrador), Chile, Liberia, and Peru. Manganiferous ore was shipped from Brazil and Labrador. Other raw materials consumed in blast furnaces included limestone and dolomite, mill cinder and roll scale, flue dust, open-hearth and Bessemer slag, coke, and ferrous scrap. Five firms operated blast furnaces (6 plants—17 stacks), four in Erie County, and one each in Niagara and Rensselaer Counties. Steel was produced at nine plants: three open-hearth and six electric. All open-hearth furnaces were in Erie County.

**Iron and Steel Scrap.**—Consumption of ferrous scrap and pig iron totaled over 6.5 million tons, 9 percent greater than in 1959. Slightly more than half was pig iron. Consumption of scrap was 6 percent higher than in 1959, and pig iron 13 percent higher. At yearend stocks of ferrous scrap in the hands of consumers had dropped over 160,000 tons (22 percent), whereas pig iron stocks had risen nearly 195,000 tons (62 percent), compared with stocks at the end of 1959.

**Iron Ore.**—Shipments of usable iron ore totaled 2.5 million long tons valued at $32.4 million, 21 percent higher than in 1959. Most of the ore produced was magnetite; a small quantity was hematite used for pigment. Agglomerate comprised over 80 percent of the shipments, and the remainder was concentrate. The hematite was processed by drying and pulverizing before shipment. The agglomerated material was largely sinter. As in 1959, magnetite was mined by three companies from three mines in Essex County and one each in Clinton and St. Lawrence Counties. The hematite was produced at one underground mine in Oneida County. About 85 percent of the magnetite was mined from open pits.

**Lead.**—After 2 low years, production of lead recovered to the highest point since 1957. Output came from the Balmat mine in St. Lawrence County.

National Lead Co. produced red lead and litharge at a plant in Brooklyn. Black lead oxide was manufactured by Electric Auto-Lite Battery Corp., Niagara Falls.

**TABLE 9.—Mine production of silver, lead, and zinc, in terms of recoverable metals**

| Year | Mines producing | Material sold or treated (short tons) | Silver | | Lead | | Zinc | | Total value (thousands) |
|---|---|---|---|---|---|---|---|---|---|
| | | | Troy ounces | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) | |
| 1951–55 (average) | 2 | 579,434 | 44,520 | $40 | 1,256 | $378 | 46,086 | $12,360 | $12,778 |
| 1956 | 2 | 657,445 | 84,158 | 76 | 1,608 | 505 | 59,111 | 16,196 | 16,777 |
| 1957 | 2 | 660,638 | 63,880 | 58 | 1,667 | 477 | 64,659 | 15,001 | 15,536 |
| 1958 | 2 | 563,644 | 66,738 | 60 | 579 | 136 | 53,014 | 10,815 | 11,011 |

TABLE 10.—Mine production of silver, lead, and zinc in 1960, by months, in terms of recoverable metals

| Month | Silver (troy ounces) | Lead (short tons) | Zinc (short tons) | Month | Silver (troy ounces) | Lead (short tons) | Zinc (short tons) |
|---|---|---|---|---|---|---|---|
| January | 4,939 | 61 | 5,588 | August | 3,912 | 34 | 5,746 |
| February | 4,379 | 51 | 5,914 | September | 4,522 | 34 | 5,321 |
| March | 4,515 | 76 | 6,061 | October | -------- | 61 | 5,299 |
| April | 4,628 | 64 | 5,532 | November | 4,720 | 134 | 4,458 |
| May | 4,544 | 63 | 5,938 | December | 4,615 | 127 | 4,991 |
| June | 4,626 | 33 | 5,679 | | | | |
| July | 3,924 | 37 | 5,837 | Total | 49,324 | 775 | 66,364 |

Silver.—Production of silver was 4 percent less than in 1959. Output was recovered as a byproduct of lead-zinc ore from the Balmat mine, St. Lawrence County.

Titanium Concentrate (Ilmenite).—Production and shipments of ilmenite were substantially greater. The titanium concentrate, used mostly for pigments, was recovered from a mill treating titaniferous magnetite ore at Tahawus, Essex County.

Uranium.—Carborundum Co., Niagara Falls, began synthesizing and fabricating uranium carbide and plutonium carbide, which were combined into a new fuel for nuclear power reactors.

Zinc.—New York was second in zinc production. After a year in which a 4-months strike occurred, tonnage and value of recoverable zinc both rose to new highs. Production totaled 66,364 tons valued at $17,122,000—3 percent higher in quantity than the previous peak year, 1957. Production came from the Balmat and Edwards mines in St. Lawrence County.

Zirconium.—No commercial zircon was produced in New York; however, zirconium sponge and various zirconium products were manufactured. Production of zirconium-sponge metal by Carborundum Metals Corp., Division of Carborundum Corp., Akron (Erie County) contributed to the 1960 record output. Union Carbide Metals Co., continued to manufacture zirconium ferroalloys at its Niagara Falls plant. Zirconium oxide was made by Norton Co., and Titanium Alloy Manufacturing Division, National Lead Co., both in Niagara Falls, and a new producer in 1960, Harbison-Carborundum Corp., Falconer, Chautauqua County. Output totaled 13,813,000 pounds. Harbison-Carborundum Corp. and Corhart Refractories Co., Corning, Steuben County, were two of the major producers of zircon and zirconia refractories. Zirconium tetrachloride was produced in the Niagara Falls area by Stauffer Chemical Co.

## MINERAL FUELS

Coke and Coal Chemicals.—Production of oven-coke totaled 3.1 million short tons valued at $52.9 million, a small increase in both quantity and value over 1959, but much less than in other years. New York was the 6th largest producing State in 1960, compared with 7th in 1959. Average value per ton was $17.21, $0.30 higher than in 1959. Three companies produced coke and coal chemicals at one merchant and two furnace plants in Erie County.

Digitized by Google

Of the 3.5 million tons of coke used in New York, 415,000 tons was received from other States. Of this total, 94 percent was destined for blast furnaces, and most of the remainder went to foundries and other industrial plants; less than 1 percent was used for residential heating, about the same percentage as the national average. In addition to coke used in New York, nearly 240,000 tons of coke breeze was destined for New York consumption.

TABLE 11.—Number, type, and capacities of coke-oven plants, Dec. 31, 1960

| Company | Location | Classification of plant | Number and type of ovens | Annual coke capacity (thousand short tons) |
|---|---|---|---|---|
| Allied Chemical Corp. | Erie County: Buffalo | Merchant | 60 Semet-Solvay | 326 |
| Bethlehem Steel Co. | Lackawanna | Furnace | 171 Koppers-Becker<br>60 Semet-Solvay<br>304 Wilputte | 2,952 |
| Donner-Hanna Coke Corp. | Buffalo | do. | 184 Koppers<br>66 Koppers-Becker | 1,022 |

**Fuel Briquets and Packaged Fuel.**—No production or consumption of fuel briquets or packaged fuel in New York was reported in 1960. Export of fuel briquets through the Buffalo customs district rose slightly to 2,078 short tons. No fuel briquets were exported through the St. Lawrence custom district. A small quantity, however, was exported from New York City.

**Natural Gas.**—Natural gas output rose 71 percent to 4,990 million cubic feet and came mostly from wells in Oriskany and Medina sandstones. According to the American Gas Association, the proved reserve of natural gas at yearend was 96,201 million cubic feet, a reduction of more than 10 billion cubic feet from 1959. Of the total reserve, 62 percent was stored in underground reservoirs; virtually all the remainder was in nonassociated storage, such as free gas not in contact with crude oil in reservoirs.

Oil and gas companies were active in exploration and leasing. Of the 15 natural gas field wells completed during the year, 4 were 1,250 to 2,500 feet deep and 11 were 2,500 to 3,000 feet deep; of the 13 gas wildcats, 5 were drilled to depths of 1,250 to 2,500 feet; 6—2,500 to 3,750 feet; and 2—5,000 to 7,500 feet.

**Peat.**—Peat was produced by three companies in three counties, the same as in 1959—Orange, Seneca, and Westchester. The value of output rose 5 percent to $146,000 although the quantity produced dropped 22 percent. Moss, reed-sedge, and humus peat were produced. Sales were largely in bulk, although a sizable quantity was packaged before sale. Producers reported that consumption of peat in New York totaled 38,903 short tons, compared with 34,709 tons in 1959.

**Petroleum.**—Production of petroleum decreased 9 percent in quantity, but remained at about the same value, resulting in a 9-percent rise in average value per barrel. The average quoted value of crude oil in New York in 1960 was $4.69 per barrel, except for Allegany County, where producers received 8 cents less. Most of the petroleum was produced in southwestern New York, in Allegany, Cattaraugus,

Digitized by Google

and Steuben Counties. The number of productive wells at yearend was estimated to be 18,579. Of these, 14,000 were artificial lift oil wells, 1,090 were gas wells, and 5 were condensate gas wells. Pennsylvania refineries continued to process virtually all of the New York crude oil.

The proved reserve of crude petroleum at the end of 1960, as calculated by the American Petroleum Institute, was 32.4 million barrels, about 2 percent less than in 1959. Because there were no extensions or revisions in existing fields and no new discoveries, the reduction in proved reserve represented 1960 production. New York ranked 23d among crude oil-producing States.

All the new wells drilled during the year were cable-tool wells. The average depth was 1,697 feet. All field oil wells and service wells were drilled to comparatively shallow depths—1,250 to 2,500 feet. All except one of the dry field wells were also in the 1,250 to 2,500 feet range. No crude oil wildcats were reported. Most of the dry wildcat wells ranged from 2,500 to 7,500 feet in depth and one was drilled deeper than 7,500 feet.

Refineries and cracking plants increased capacity slightly to 90,500 barrels and 32,300 barrels of crude petroleum per day compared with 90,000 and 31,800 barrels per day, respectively, in 1959. Frontier Oil Refining Corp., Division of Ashland Oil & Refining Co., at Tonawanda, Erie County; and Mobile Oil Co., with plants in Buffalo, Erie County, and in Brooklyn, Kings County, operated during the year. The plants at Tonawanda and Buffalo were skimming, cracking, and asphalt plants; the other had skimming and cracking facilities only. The Gulf Oil Co., skimming plant at Gulfport (Richmond County), closed in 1959, was discontinued.

**TABLE 12.—Petroleum production**

(Thousand barrels and thousand dollars)

| Year | Quantity | Value | Average value per barrel | Year | Quantity | Value | Average value per barrel |
|---|---|---|---|---|---|---|---|
| 1951-55 (average) | 3,691 | $14,728 | $3.99 | 1958 | 1,763 | $7,457 | $4.23 |

Texaco, Inc., employed about 1,000 persons at its Beacon (Dutchess County), research laboratory. Fundamental and applied research on the use of fuels, lubricants, and greases, and nuclear research, petrochemical and process development, and improvement of existing and development of new products were undertaken.

## REVIEW BY COUNTIES

Mineral output was reported from all except five counties. Value of mineral production increased in 34 of the 57 mineral-producing counties. The largest increase in value ($13.8 million) was in St. Lawrence County and was attributable chiefly to increased output of zinc and iron ore. St. Lawrence, Erie, Onondaga, Essex, and Greene Counties, in decreasing order of value, were the principal producers.

**Albany.**—Callanan Road Improvement Co. produced limestone for riprap, blast-furnace flux, concrete aggregate, and railroad ballast at South Bethlehem. A limited quantity of dimension sandstone, used for flagging and rough-dressed construction work, was produced near East Berne. Sand and gravel, used mainly for building and paving, was recovered by three producers. Albany Gravel Co., Inc., the leading producer, recovered material from pits near Albany, Bethlehem, and Colonie. James H. Maloy, Inc., produced gravel near Albany. Processed molding sand was recovered from pits in Selkirk and Slingerland, by Whitehead Bros. Co.

Albany County dropped to second place among the State's clay-producing counties. Output of miscellaneous clay decreased from 250,000 to 228,000 tons. Powell & Minnock Brick Works, Inc., Sutton & Suderly Brick Co., and Roah Hook Brick Co., all near Coeymans, mined miscellaneous clay for manufacturing building brick. Northern Lightweight Aggregates, Inc. (Cohoes), mined shale for manufacturing expanded lightweight aggregate by the rotary kiln process. Rex Clay Products Co., Inc., mined clay near Albany for use in manufacturing artificial abrasives, pottery, and flowerpots.

**Allegany.**—Sand and gravel was produced by Alfred Atlas Gravel and Sand Corp. and Buffalo Slag Co., Inc. (both near Alfred), Nick Codispoti (Belmont), and Thomas Moogan (Friendship). Output was processed mainly for building and paving purposes.

**Bronx.**—National Gypsum Co. produced calcined gypsum at its Bronx plant. The company also expanded perlite shipped from Colorado for use in manufacturing building plaster. The material was shipped mostly to other company plants for manufacturing building plaster; the remainder was used at the Bronx plant.

**Broome.**—Commercial sand and gravel output increased and consisted chiefly of processed building and paving material. Producers were Barney and Dickenson, Inc., Winnie and Son, Inc., Bob Murphy, Inc., all near Vestal, and Binghamton Sand & Crushed Stone Corp. and Weber's Sand and Gravel, both near Binghamton. Corbisello Quarries produced crushed and broken sandstone for concrete aggregate and riprap near Binghamton. Dimension sandstone (bluestone) was quarried and shipped to Delaware County for fabrication. Mis-

| Total | 234,642,000 | 254,713,000 | |

[1] Bronx, Kings, New York, and Richmond Counties are not listed because no production was reported.
[2] Fuels, including natural gas and petroleum, not listed by counties, value included with "Undistributed."
[3] Excludes value of clays and stone used in manufacturing lime and cement.
[4] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[5] Includes natural gas and petroleum, some gem stones and sand and gravel (1960) that cannot be assigned to specific counties, and value indicated by footnote 4.

cellaneous clay for manufacturing building brick was produced by Binghamton Brick Co., Inc. (Binghamton).

**Cattaraugus.**—Commercial production of sand and gravel totaled 684,000 tons, a 9-percent increase over 1959. Eight pits, three near Allegany and one each near Franklinville, Gowanda, Limestone,

Digitized by Google

Onoville, and Red House were active. Output consisted mainly of processed building and paving material and was shipped to consumers principally by truck. Limited quantities of sand were produced for filtration and ice control.

**Cayuga.**—General Crushed Stone Co. (Auburn) quarried and crushed limestone for concrete aggregate, roadstone, riprap, and asphalt filler. Processed sand and gravel, used chiefly for building and paving, was produced at Auburn by J. J. Harrington and Jay W. Robinson & Son. Stanley Jablonski produced bank-run gravel for fill near Mentz.

**Chautauqua.**—Production of commercial sand and gravel came principally from pits near Bemus Point, Irving, Jamestown, and Stow. Output was used mainly for building and paving.

**Chemung.**—Commercial sand and gravel, used chiefly for building and paving, was produced by Dalrymple Gravel & Contracting Co., Inc. (Elmira), Elmira Transit Mix, Inc. (Horseheads), and Frank Treat (Breesport). Miscellaneous clay for manufacturing building brick was produced by Consolidated Brick Co. (Horseheads).

**Chenango.**—Commercial sand and gravel was produced by B&B Builders Supplies, Inc. (Greene), and Bundy Concrete Co. (Sherburne). Output consisted chiefly of building material.

**Clinton.**—Magnetite iron ore was mined by Republic Steel Corp. at its Chateaugay underground and open-pit mine near Dannemora (Lyon Mountain). Because of reduced demand for steel, this mine was closed from June 10 through October 3 and from November 12 to the end of the year. Sinter was consumed mostly in manufacturing pig iron and steel. A small quantity of concentrate was prepared. At the mine, a fairly active exploration and development program was carried out, which included raising, tunneling, drifting, cross cutting, and percussion drilling. In the open-pit part of the mine, a sizable quantity of overburden was removed. Open-pit mining was done on two benches, averaging 30 feet high and 70 feet wide. Gneiss (miscellaneous stone) was recovered from tailings and sold as concrete aggregate, railroad ballast, and stone sand.

International Lime & Stone Corp. (Chazy) continued to produce limestone for construction, agricultural, and metallurgical purposes and for manufacturing lime at its nearby plant. Quicklime and hydrated lime were produced for a variety of chemical, industrial, and agricultural uses. Lime output was consumed in New York, New England States, and Canada. Plattsburgh Quarries, Inc. (formerly Lancaster Development Corp.), quarried limestone near Plattsburgh for concrete aggregate and roadstone. Sand and gravel, mainly for building and paving, was produced by Bero Construction Corp. (Morrisonville). The company also produced sand for fill and ice control and gravel for drainage use.

**Columbia.**—Columbia County continued to rank third among cement-producing counties. Lone Star Cement Corp. (Greenport) and Universal Atlas Cement Division of United States Steel Corp. (Hudson) produced portland and masonry cements, using chiefly limestone and clays mined nearby as raw materials. Most of the finished cement was shipped to consumers in New York and New England States. Catskill Mountain Stone Corp. quarried limestone at Hudson for use

Digitized by Google

as concrete aggregate and roadstone. Sand for paving and ice control and gravel for paving was produced at pits near Claverack, Copake, Hudson, and Livingston. Columbia Sand & Gravel (Claverack) was renamed Cairo Ready-Mix.

**Cortland.**—The Cortland sand and gravel operations of Cortland Ready Mix, Inc. (formerly Cortland Ready Mix Concrete), was idle in 1960.

**Delaware.**—Delaware County continued to lead in value of sandstone (bluestone) production. Output was valued at $838,000—a 17-percent increase over 1959. Except for a limited quantity of broken stone used for riprap, county output consisted of dimension stone for construction and architectural purposes, curbing, and flagging. Fabricating yards processed stone quarried in Delaware County, surrounding New York counties, and bordering Pennsylvania counties. Bluestone fabricators were W. R. Strong & Son and Willis Hankins (both near Deposit), Johnston & Rhodes Bluestone Co. (East Branch), Paul Thompkins Estate (Hancock), and American Bluestone Co. (Masonville). The stone was used in constructing schools, churches, hospitals, dams, and other buildings in New York and Connecticut. Sand and gravel came from Government-and-contractor operations.

**Dutchess.**—The county continued to lead in value of commercial limestone. New York Trap Rock Corp. (New Hamburg) and Dutchess Quarry & Supply Co., Inc. (Pleasant Valley), produced limestone used chiefly for concrete aggregate and roadstone. White Marble Corp. produced marble near Wingdale. Commercial production of sand and gravel totaled 490,000 tons—a 16-percent increase over 1959. Output consisted chiefly of building and paving material and was recovered from 13 operations. Dennings Point Brick Works, Inc., mined clay and shale from pits near Beacon and used it for manufacturing building brick.

**Erie.**—Portland and masonry cements were produced at Buffalo by Lehigh Portland Cement Co. and Penn-Dixie Cement Corp. Raw materials used at these cement plants included limestone, shale, clay, gypsum, sand, iron ore, mill scale, and pyrite sinter. Finished cement was shipped mostly to consumers in New York and Pennsylvania. Output of limestone by commercial producers totaled 1.4 million tons, 4 percent greater than in 1959. Most of the limestone was crushed for use by the construction industries. Producers were Buffalo Crushed Stone Corp. (Bowmansville), County Line Stone Co., Inc., (Akron), Federal Crushed Stone Corp. (Cheektowaga), and Lancaster Stone Products Corp. (Lancaster). Substantial quantities of limestone were produced under contract to the State of New York, Department of Public Works, and used chiefly as backfill for sewers.

Universal Atlas Cement Co., Bestwall Gypsum Co., and National Gypsum Co. mined crude gypsum underground near Clarence Center. Universal Atlas shipped its output to company-owned plants for use as a portland cement retarder. Bestwall Gypsum Co. shipped the crude gypsum to its Akron, N.Y., plant where it was calcined and processed into finished building materials. The company also expanded crude perlite shipped from Nevada and Colorado. National

Digitized by Google

Gypsum Co. calcined the crude gypsum and expanded crude perlite shipped from other States at its nearby plant. Buffalo Perlite Corp. (Cheektowaga) expanded perlite shipped from western States. The expanded perlite was used mainly as plaster aggregate; quantities also were used for loose-fill insulation, concrete aggregate, soil conditioning, filler, and filter purposes.

The county continued to rank third in tonnage and value of commercial sand and gravel. Output, by 9 producers, totaled 1.3 million tons compared with 1.7 million tons in 1959. Seventy-seven percent of the county output was processed material, and all was shipped by truck. Quicklime for metallurgical purposes was produced at the Buffalo plant of Kelley Island New York Corp. Erie County ranked first in clay production. Clay, principally for manufacturing building brick, was mined and processed near Lakeview and West Falls. Anchor Concrete Products, Inc. (Jewettsville), produced lightweight aggregate by the rotary kiln process from miscellaneous clay mined nearby. Substantial quantities of clay were mined for manufacturing cement. Small quantities were mined near Buffalo for manufacturing flowerpots.

**Essex.**—The Republic Steel Corp. Fisher Hill and Old Bed-Harmony mines near Mineville operated only in the first half of the year because of the lessened demand for steel. About 250 miners were idled. Approximately an equal number of men were employed at the company Troy plant, where most of the sinter and concentrate was consumed. Regular and random pillars were used to support openings at the Fisher Hill mine. At the Old Bed-Harmony mines 90 percent of the ore was mined by sublevel stoping and the remainder by open stoping, using casual pillars. Exploration and development at the Fisher Hill mine consisted of raising and drifting; at the Old Bed-Harmony mines it consisted of raising, drifting, and diamond and percussion drilling. The ore from the Fisher Hill mine was treated at the same plant where the Old Bed-Harmony ore was processed. National Lead Co. operated the MacIntyre underground titaniferous magnetite mine at Tahawas, the second largest iron ore mine in New York. The ore was processed by heavy-medium separation, flotation, magnetic separation, and sintering. Sizable tonnages of ilmenite also were recovered at Tahawas. Iron ore produced in Essex County was used chiefly for pig iron and steel, cement, and as a heavy-medium in mineral dressing separation.

Cabot Minerals Division, Cabot Corp. (formerly Cabot Carbon Co.), mined wollastonite and byproduct abrasive garnet (andradite) at its Willsboro mines. The wollastonite was crushed and ground for use as a filler in paints, ceramics, and plastics. Adirondack Development Corp. began exploratory drilling near Lewis on a newly discovered wollastonite deposit. Development was expected to begin in 1961. Sand and gravel was recovered from pits near Elizabethtown, Keesville, and Saranac Lake. Output consisted mainly of processed material for building and paving.

**Franklin.**—Commercial output of sand and gravel totaled 114,000 tons and came from pits near Bombay, Malone, St. Regis Falls, and Westville. Sandstone for rough construction in flagging was quarried near Malone by Adirondack Stone Quarries, Inc. Dressed architec-

615629—61——47

Digitized by Google

tural sandstone was quarried and fabricated near Burke. The sandstone quarried at Malone was used in constructing buildings in Pennsylvania, New York, and Massachusetts.

**Fulton.**—Commercial output of sand and gravel totaled 62,000 tons, compared with 73,000 tons in 1959. Seven producers, mainly near Gloversville, Broadalbin, and Johnstown, were active.

**Genesee.**—United States Gypsum Co. produced crude and calcined gypsum at its Oakfield plant. Limestone used chiefly for concrete aggregate and railroad ballast was quarried by General Crushed Stone Co. (North Le Roy), Genesee Stone Products Corp. (Stafford), and LeRoy Lime and Crushed Stone Corp. (Le Roy). Sand and gravel used chiefly for structural purposes was produced by Frey Sand and Gravel Corp. (Alexander), and Batavia Washed Sand & Gravel Co., Inc., Western New York Gravel & Concrete Corp., and B. R. DeWitt, Inc., all near Batavia.

**Greene.**—Greene County continued to lead in value of cement output. Alpha Portland Cement Co. (Catskill), Lehigh Portland Cement Co., and North American Cement Corp. (both near Alsen) produced portland and masonry cements. These companies also quarried limestone nearby as the main cement raw material. In addition, North American Cement Corp. mined clay near its cement plant. Gypsum, iron ore, and shale also were used as cement raw materials. The finished cement was shipped mostly to consumers in New York and New England. A small quantity was exported. Sandstone was quarried and crushed for concrete aggregate and roadstone near Cairo by Catskill Mountain Stone Co., Inc. Whitehead Bros. Co. produced molding sand near Catskill and Coxsackie, and Coxsackie Sand & Gravel Co., Inc. (Coxsackie), produced building and paving sand.

**Hamilton.**—Sand and gravel was produced by Government-and-contractor operations.

**Herkimer.**—General Crushed Stone Co. produced limestone for aggregate, agstone, and asphalt filler at its Jordanville quarry. The limestone quarry of Newport Quarries Corp. (Newport) was idle for the second consecutive year. Material Sand and Gravel Corp. (Gravesville) produced sand and gravel principally for building purposes. Quartz crystals were recovered as mineral specimens near Middleville.

**Jefferson.**—Limestone for concrete aggregate, agstone, asphalt filler, and railroad ballast was quarried at Watertown by General Crushed Stone Co. The highway departments of the towns of Cape Vincent and Hounsfield produced limestone for concrete aggregate and roadstone. Multi-Color Sandstone Co. quarried stone for flagging and architectural uses at Redwood. Commercial output of sand and gravel totaled 237,000 tons, a 58-percent increase over 1959. Seven producers, mainly near Adams, Belleville, Gouverneur, and Watertown, were active.

**Lewis.**—Limestone, used chiefly as an industrial filler, was quarried and crushed by Carbola Chemical Co., Inc. (Natural Bridge). The highway department of the town of Lowville quarried and crushed limestone for concrete aggregate and roadstone. Commercial production of sand for ice control and gravel for paving was reported near Lowville.

Digitized by Google

**Livingston.**—Livingston County continued to lead in salt production. Output of rock salt from the Retsof underground mine of the International Salt Co. was used mainly in manufacturing chemicals (principally chlorine) and for controlling ice on highways. Rock salt was shipped to consumers principally in New York and other northeastern States; some was exported to Canada. Sand and gravel, principally for building purposes, was recovered from pits near Avon, Conesus, Dansville, and Scottsville. Limestone for concrete aggregate and asphalt filler was quarried near Rochester by General Crushed Stone Co.

**Madison.**—Limestone was quarried by Munnsville Limestone Corp. (Munnsville) and Worlock Stone Co., Inc. (Perryville). Sand and gravel was produced from pits near Hamilton and Canastota.

**Monroe.**—Dolomite Products Co. quarried limestone near Gates and Penfield. Output was used for concrete aggregate and agstone. Limestone also was quarried by Central Materials Corp. at Brockport. Sand and gravel output, by 12 producers, totaled 1.1 million tons compared with 850,000 tons in 1959, and was used mainly for building and paving material. Fifty-four percent of the county output was processed material and the entire output shipped to consumers by truck. Ruberoid Co. mined gypsum at Wheatland and shipped it to Caledonia for processing into gypsum building products.

**Montgomery.**—Cushing Stone Co., Inc., and Crushed Rock Products, Inc., both near Amsterdam, produced limestone for the construction industry. St. Johnsville Supply Co., Inc. (St. Johnsville), processed sand and gravel, chiefly for building and paving material.

**Nassau.**—Although tonnage and value both dropped, Nassau County remained second in sand and gravel output. A total of 5.4 million tons was produced compared with 5.6 million tons in 1959. Value decreased 4 percent. Output, from eight operations, consisted entirely of processed material used mainly for building and paving purposes and was shipped to consumers principally by truck and barge. Nassau Brick Co., Inc. (Farmingdale), mined clay for manufacturing brick.

**Niagara.**—Production of limestone for the Niagara Power project totaled 5.5 million tons, compared with 3.2 million tons in 1959. Limestone, which was dug from a mile-long channel, was crushed at a nearby aggregate plant. Output from the crushing plant was used chiefly for concrete. Quantities also were used as riprap and as dike filter material. In addition, limestone was produced by three commercial producers, Niagara Stone Division, Olsker-McLain Industries, Inc. (Niagara Falls); Frontier Stone Products, Inc., (Lockport); and Royalton Stone Corp. (Gasport). Gasport Sand & Gravel Co., Inc. (Lockport), produced processed sand and gravel used mainly as structural material.

**Oneida.**—Eastern Rock Products, Inc., produced limestone for aggregate, agstone, railroad ballast, and riprap at at its Prospect No. 6 and Oriskany Falls No. 5 quarries. Commercial sand and gravel output totaled 596,000 tons, compared with 643,000 tons in 1959. Output came from 10 operations and consisted chiefly of processed material for building, paving, and molding purposes. Clinton Metallic Paint Co. mined crude red iron oxide pigment (hematite) from its Brim

Digitized by Google

field underground mine near Clinton. Output increased in 1960 and was consumed in making red paints. Mining was by longwall (longface) methods, with entry by vertical shafts. Dynamite was used as the blasting agent. Specimens of hematite were obtained by a mineral collector near Clinton. The Utica plant of Zonolite Co. continued to be the only plant exfoliating vermiculite in the State. Crude material shipped from company-owned mines in Montana and South Carolina was processed at the plant.

**Onondaga.**—Onondaga County ranked second in value of production of commercial limestone. Limestone for highway construction and maintenance was produced at the Jamesville quarry of General Crushed Stone Co. Solvay Process Division, Allied Chemical Corp., quarried limestone at Jamesville for use mainly in manufacturing quicklime for producing alkalies. Some was used as concrete aggregate, agstone, and railroad ballast. In addition, the company operated wells at Tully and a plant in Syracuse for producing evaporated salt and brine. The brine was used with the lime in manufacturing soda ash. The evaporated salt, produced in vacuum pans, was used mainly for manufacturing chemicals. Portland and masonry cements were produced at Jamesville by Alpha Portland Cement Co. The company mined shale nearby for use as a cement raw material. Other raw materials included limestone (cement rock), sand, gypsum, and iron ore. The entire output of portland and masonry cements was shipped to consumers within the State, chiefly by truck in bulk.

Commercial production of sand and gravel totaled 856,000 tons, compared with 824,000 in 1959. Sixty-six percent of the output was processed material, used chiefly for structural and paving material. Twelve operations were active, compared with nine in 1959.

Onondaga Brick Corp. (Warners) produced lightweight aggregate by the sintering process from shale mined nearby. Red clay for manufacturing pottery and flowerpots was mined near Camillus by Syracuse Pottery Co., Inc. The Cicero clay pit of Syracuse Brick Corp. was idle during the year. Minerals Processing Corp. (Syracuse) expended perlite shipped from Colorado and Utah. The expanded perlite was used principally for soil conditioning and as a plaster and concrete aggregate.

**Ontario.**—General Crushed Stone Co. produced limestone for highway and railroad construction and maintenance at Geneva. Commercial output of sand and gravel totaled 369,000 tons, a 44-percent increase over 1959. Production was centered near Clifton Springs, Geneva, Manchester, Oaks Corners, Phelps, and Victor.

**Orange.**—Commercial sand and gravel output was reported from nine operations and totaled 647,000 tons, a 6-percent decrease below 1959. Ninety-seven percent of the county output was processed. Sand and gravel was used principally for structural and paving purposes. Jova Brick Works mined clay near Roseton for manufacturing building brick. Limestone for concrete aggregate and roadstone was quarried by Dutchess Quarry & Supply Co. Inc. (Goshen). Reed-sedge peat was recovered from a bog near Tuxedo by Sterling Forest Peat Co., Inc. The output was sold in packages and in bulk.

**Orleans.**—Limestone for concrete aggregate and roadstone was produced at Clarendon by Clarendon Stone Co., Inc. Sand and gravel

Digitized by Google

production by commercial operations increased 14 percent and consisted chiefly of bank-run material. Production was centered near Albion, Barre, Medina, and Shelby.

**Oswego.**—Commercial sand and gravel was recovered from pits near Lacona and Oswego. Molding sand was produced near Pulaski.

**Otsego.**—Limestone for concrete aggregate and roadstone was quarried at Richfield Springs by Barrett Division, Allied Chemical Corp. Sandstone (bluestone) for construction and architectural uses was quarried near Oneonta. Sand and gravel was produced by Seward Gravel Co. (Milford) and Unadilla Concrete Products Co. (Unadilla).

**Putnam.**—Patterson Mineral Corp. (Patterson) quarried limestone for mineral filler and agstone. Sand and gravel was produced by Leemac Sand & Stone Corp. (Phillipstown) and Harlem Valley Crusher Co., Inc. (Patterson). Specimens of magnetite were gathered by an amateur gem collector near Brewsters.

**Queens.**—The Long Island Railroad Co. produced engine sand and railroad ballast gravel near Jamaica.

**Rensselaer.**—Miscellaneous stone for concrete aggregate and roadstone was quarried at the Campbell Mountain quarry (Cropseyville) of Fitzgerald Bros. Construction Co., Inc. Commercial sand and gravel output totaled 237,000 tons, compared with 205,000 tons in 1959. Material was recovered from seven pits. The clay pit of Champlain Brick Co. (Mechanicville) was inactive during the year.

**Richmond.**—United States Gypsum Co. calcined gypsum at its New Brighton plant for manufacturing finished building products.

**Rockland.**—Rockland County ranked second in value of stone produced. New York Trap Rock Co. produced limestone at Tompkins Cove and quarried basalt at Haverstraw and West Nyack. It was the major producer of basalt in the State. Output from these quarries was marketed as concrete aggregate, roadstone, stone sand, and riprap. Most of the company's output from the Tompkins Cove and Haverstraw quarries was shipped by barge to consumers in the metropolitan New York area; most of the West Nyack quarry output was transported by truck. Suffern Stone Co. (Suffern) also quarried basalt for concrete aggregate.

Sand and gravel output totaled 943,000 tons, a 36-percent increase over 1959. Producers were Graney Building Material Corp. (Sparkill), Mt. Ivy Sand & Gravel Co., Inc. (Mt. Ivy), Ramapo Sand & Gravel Corp. (Hillburn), Ward Pavements, Inc. (Thiells), and Elinor Allison (Stony Point). Crude gypsum was calcined and processed into finished building products at the Stony Point plant of United States Gypsum Co.

**St. Lawrence.**—The largest iron ore mine in New York in 1960 was the Benson open-pit mine near Star Lake in southern St. Lawrence County, operated by Jones & Laughlin Steel Corp. This mine was active the entire year. Mining was conducted on three benches averaging 50 feet high and 700 feet wide. In addition to the ore handled, more than 4 million long tons of overburden was removed. The concentrate and sinter produced was consumed mostly for pig iron and steel. About the middle of the year, Jones & Laughlin began building new crushing, screening, and cooling facilities for the sinter

Digitized by Google

plant. The new facilities, being installed by Dravo Corp., Pittsburgh, included a vertical shaft stationary cooler, the first of its type in the United States. The capacity of this unit is rated at 3,800 gross tons per day. The crusher, cooler, and auxiliary equipment will serve the two 6-foot-wide sinter machines already in use.

Zinc, lead, and silver were recovered from the Balmat mine and zinc was recovered from the Edwards mine, operated by St. Joseph Lead Co. Both mines were in production the entire year. Safety records improved for each mine and were better than the national average for underground metal mines in both frequency and severity ratios. The Edwards surface operations had completed 5 years without a lost-time accident. After a long series of tests of mechanical flotation machines that indicated savings in power and reagent costs and higher zinc recovery, the zinc flotation circuit in the Balmat mill was completely converted to this method of treatment and was performing satisfactorily at yearend. Exploration and development at the Edwards mine consisted of 1,883 feet of raising, 3,763 feet of drifting, and 6,994 feet of underground diamond drilling. Development at the Balmat mine consisted of 36 feet of shaft sinking, 6,190 feet of raising, 10,583 feet of drifting, and 28,861 feet of underground diamond drilling. Zinc concentrate from both mines was shipped to the St. Joseph Lead Co. smelter at Josephtown, Pa., for recovery of zinc. Lead concentrate from the Balmat mine and lead residue from the Josephtown smelter were shipped to the company Herculaneum (Mo.) smelter for recovery of lead and silver.

International Talc Co., Inc., mined crude talc from underground mines near Balmat and Talcville. Gouverneur Talc Co., Inc., mined crude talc from its underground mine at Balmat. Both companies operated crushing and grinding plants. Ground talc was sold for a variety of uses. Commercial sand and gravel production dropped slightly from 1959. Most of the output was prepared material for the construction industry and came from pits near Colton, Fine, Gouverneur, Nicholville, Potsdam, and Rossie.

Barrett Division, Allied Chemical Corp. (Norwood), and McConville, Inc. (Ogdensburg), produced limestone used chiefly for concrete aggregate and roadstone. The St. Lawrence County Highway Department also quarried limestone for road maintenance and repair. Balducci Crushed Stone Co. (Gouverneur) produced marble for agstone and concrete aggregate.

**Saratoga.**—Commercial sand and gravel output totaled 175,000 tons, compared with 186,000 tons in 1959. Output consisted chiefly of processed molding sand and was shipped by rail and truck to consumers. Ten operations were active during the year. Glens Falls Portland Cement Co., Division of The Flintkote Co., quarried limestone at Glens Falls for its cement plant in Warren County. Limestone for concrete aggregate, riprap, and agstone was produced by Pallette Stone Corp. (Saratoga Springs).

**Schenectady.**—Output of commercial sand and gravel increased and came from operations near Rotterdam, Schenectady and Scotia. The material was used principally for structural purposes.

**Schoharie.**—North American Cement Co. produced portland and masonry cements at its Howes Cave plant. Limestone and shale

Digitized by Google

(mined nearby), gypsum, and iron ore were used as cement raw materials. Finished cement was shipped to consumers mainly in New York and New England. Output was shipped principally by truck in bulk. Other limestone producers were Cobleskill Stone Products Division, Allied Materials Corp. (Cobleskill), and Masick Soil Conservation Co. and Schoharie Stone Corp., both near Schoharie. Paving gravel was produced by the New York State Department of Public Works.

**Schuyler.**—International Salt Co., Inc., and Watkins Salt Co., Inc., both near Watkins Glen, produced evaporated salt mostly by the vacuum-pan process. Some of the salt was sold in pressed blocks. Output was used chiefly by the chemical industry in New York and other northeastern States. Limited quantities were exported to Canada and other foreign countries. D. & T. Franzese Bros. produced sand and gravel near Watkins Glen.

**Seneca.**—Finger Lakes Peat Moss Co., Inc., recovered moss peat from bogs near Junius. Output was sold in bulk. Crews of the Seneca County Highway Department produced sand for ice control and gravel for paving.

**Steuben.**—Commercial sand and gravel production was reported near Bath, Cohocton, and Corning. Output decreased from 1959.

**Suffolk.**—Suffolk County continued to rank first in sand and gravel production. Although commercial output (5.6 million tons) decreased 6 percent in quantity, the value increased to $6.7 million, compared with $6.4 million in 1959. Of 23 active sand and gravel producers, 4 produced over 500,000 tons. One of these produced over 1 million tons. Ninety percent of the commercial output was processed material, compared with 88 percent in 1959. The material was shipped to consumers by truck, water, and rail transportation.

**Sullivan.**—Concrete aggregate and stone sand were produced from sandstone quarried by Sullivan Highway Products Co. at its Bridgeville and Kenoza Lake quarries. Sandstone (bluestone) produced in the county was shipped to Delaware County for fabrication as architectural stone and flagging. Sand and gravel was produced near Liberty, Masten Lake, Mongaup Valley, and Summitville. The entire county output was shipped to consumers by truck, mainly as processed material for building and paving.

**Tioga.**—Sand and gravel, mainly for building and paving, was produced by Central Materials Corp. (Tioga), Herman E. Bunce (Barton), C. & C. Ready-Mix Corp. (Owego), and A. O. Swanson (Waverly).

**Tompkins.**—Cayuga Rock Salt Co., Inc., recovered rock salt from an underground mine near Myers for use mostly in ice removal on highways and by the chemical industry, mainly within the State. Evaporated salt was produced at the Ludlowville refinery of International Salt Co., Inc. The salt was recovered in vacuum pans; some was sold in pressed blocks. Evaporated salt was sold to a wide variety of consuming industries, mainly in New York and other northeastern States.

Finger Lakes Stone Co., Inc., produced dimension sandstone (mainly architectural) at its University quarry near Dryden. Out-

Digitized by Google

put was used in school construction in Ithaca and bridge construction in Niagara Falls. Rumsey-Ithaca Corp. and University Sand & Gravel, both near Ithaca, processed sand and gravel, chiefly for building purposes.

**Ulster.**—Hudson Cement Co. Division, Colonial Sand and Stone Co., Inc., produced portland cement at its Kingston plant. Limestone quarried nearby was the principal cement raw material. Finished portland cement was shipped mainly to consumers in New York for ready-mixed concrete. Century Mfg. Co., Inc., produced natural and masonry cements from stone quarried nearby. Masonry cement was shipped to consumers in New York, New Jersey, Pennsylvania, Connecticut, and Rhode Island. Callanan Road Improvement Co. produced limestone for concrete aggregate and roadstone at its No. 3 plant near Esopus. Output was shipped to consumers mainly by barge.

Sand and gravel used mainly as structural and paving material was produced by Dutchess Quarry & Supply Co., Inc. (Wawarsing), Hurley Sand & Gravel Co., Inc. (Hurley), James J. Van Vliet & Son, Inc. (Marlboro), and James Ricker, Inc. (Connelly). Ulster County was the third largest clay-producing county. Hutton Co. and Star Brick Corp., both near Kingston, mined miscellaneous clay for manufacturing building brick.

**Warren.**—Glens Falls Portland Cement Co., Division of The Flintkote Co., produced portland and masonry cements at its Glens Falls plant, mainly from limestone (cement rock) quarried in Saratoga County. Gypsum, sand, and iron ore also were used as cement raw materials. Finished cement was shipped to consumers principally by truck and in bulk. Limestone was quarried near Glens Falls by Jointa Lime Co., Inc. Warren Aggregates, Inc., quarried and crushed granite near Chestertown for use as asphalt aggregate and stone sand, and processed building and paving sand.

Abrasive garnet was mined and processed at the North Creek plant of Barton Mines Corp. The refined garnet was used in manufacturing sandpaper and for grinding and polishing glass and metal lapping. The county continued to lead in the value of gem and mineral specimens collected. Crude and finished garnets valued at nearly $4,000 were recovered and processed near North Creek.

**Washington.**—The New York slate industry continued to be centered in Washington County. Production was reported from 11 operations and was centered mainly near Granville, Middle Granville, and Whitehall. Output was used chiefly as roofing and flagging material. The production of ground slate for manufacturing natural and artificially colored roofing granules was discontinued when the Central Commercial Co. plant closed at the end of 1959. The plant was being dismantled. Bank-run gravel was produced from pits near Clemons, Fort Ann, and Eagle Bridge. Bank-run sand used for ice control was recovered from a pit near Hebron.

**Wayne.**—Limestone for concrete aggregate and agstone was quarried near Sodus by General Crushed Stone Co. Commercial sand and gravel was recovered from pits near Galen, Macedon, and Palmyra. The output was mostly bank-run material used for general construction work.

Digitized by Google

**Westchester.**—Lake Street Granite Quarry, Inc. (White Plains), and DiRienzo Bros. and Baratta & D'Amato (both near Yonkers) quarried dimension granite mainly for construction work. Dolomitic marble was quarried and crushed at the Thornwood plant of Universal Marble Products Corp. The crushed stone was used mainly for terrazzo, cast stone, stucco, and agricultural lime. DiRubbo & Ellis mined emery at the Kingston mine near Croton. Output was used for general abrasive purposes. DeLuca Emery mine produced emery from mines near Croton and Peekskill for use as aggregate in heavy-duty nonslip floors and pavements.

Sand and gravel was recovered at five operations, principally near Somers and Peekskill. Most of the output was processed material; all of the output was shipped to consumers by truck. Humus peat was produced near Armonk by Stone Age Humus Corp. A very small quantity of beryl, recovered at the Bedford feldspar quarries (inactive for many years), was sold through GSA.

**Wyoming.**—Morton Salt Co. produced evaporated salt by open-pan processes at its Silver Springs plant. Some of the salt was sold in pressed blocks. Sawed and dressed architectural sandstone (bluestone) was produced at the Ambluco quarry (Portageville) of American Bluestone Co. The stone was used in constructing interiors of schools in New York City and other buildings in Buffalo.

**Yates.**—Road maintenance crews of the town of Jerusalem produced sand and gravel.

# The Mineral Industry of North Carolina

**This chapter has been prepared under a cooperative agreement for collecting mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Geological Survey of North Carolina.**

By James L. Vallely,[1] Jasper L. Stuckey,[2] and Mildred E. Rivers[3]

MINERAL production set a new record for North Carolina in 1960 of nearly $45 million, exceeding the previous peak year of 1954 by $3.3 million and 1959 by $4.2 million. In order of value, stone, sand and gravel, copper, feldspar, mica, clays, and tungsten were the principal minerals mined. North Carolina was first in the Nation in producing feldspar, sheet and scrap mica, olivine, and lithium minerals, second in tungsten, and third in talc production.

Metals accounted for 12 percent of the total value. Output of copper increased more than 25 percent; tungsten mining was resumed; and byproduct lead, gold, and silver were recovered in considerable quantities. Lithium production was much lower than in 1959. Stone increased in tonnage and value; sand and gravel was up 2 percent in tonnage but was little changed in value; and feldspar, mica, talc, and pyrophyllite decreased in tonnage and value.

**TABLE 1.—Mineral production in North Carolina[1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Abrasive stones[2]—thousand short tons | (3) | $5 | (4) | $2 |
| Clays[1]—do | 2,524 | 1,522 | 2,476 | 1,548 |
| Feldspar—do | (5) | (5) | 271 | 2,781 |
| Gem stones | (4) | 9 | (4) | 4 |
| Gold (recoverable content of ores, etc.)—troy ounces | 965 | 34 | 1,826 | 64 |
| Lead—short tons | | | 424 | 99 |
| Mica: | | | | |
| Scrap—thousand short tons | 48 | 1,212 | 47 | 1,100 |
| Sheet—pounds | 505,623 | 1,755 | 430,193 | 1,411 |
| Sand and gravel—thousand short tons | 8,580 | 7,426 | 8,801 | 7,453 |
| Silver (recoverable content of ores, etc.)—troy ounces | 16,319 | 15 | 212,368 | 192 |
| Stone—thousand short tons | 12,859 | 20,302 | 14,721 | 23,296 |
| Talc and pyrophyllite—do | 127 | 647 | 101 | 549 |
| Value of items that cannot be disclosed: Abrasive stone (millstones, 1959), asbestos, copper, feldspar (1959), iron ore, kaolin, lithium minerals, olivine, tungsten, and values indicated by footnote 6 | | 7,862 | | 6,469 |
| Total North Carolina | | 40,789 | | 44,968 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Grinding pebbles and tubemill liners (1959) and millstones (1960).
[3] Less than 1,000 tons.
[4] Weight not recorded.
[5] Excludes kaolin; included with "Value of items that cannot be disclosed."
[6] Figure withheld to avoid disclosing individual company confidential data.

tural sandstone was quarried and fabricated near Burke. The sandstone quarried at Malone was used in constructing buildings in Pennsylvania, New York, and Massachusetts.

**Fulton.**—Commercial output of sand and gravel totaled 62,000 tons, compared with 73,000 tons in 1959. Seven producers, mainly near Gloversville, Broadalbin, and Johnstown, were active.

**Genesee.**—United States Gypsum Co. produced crude and calcined gypsum at its Oakfield plant. Limestone used chiefly for concrete aggregate and railroad ballast was quarried by General Crushed Stone Co. (North Le Roy), Genesee Stone Products Corp. (Stafford), and LeRoy Lime and Crushed Stone Corp. (Le Roy). Sand and gravel used chiefly for structural purposes was produced by Frey Sand and Gravel Corp. (Alexander), and Batavia Washed Sand & Gravel Co., Inc., Western New York Gravel & Concrete Corp., and B. R. DeWitt, Inc., all near Batavia.

**Greene.**—Greene County continued to lead in value of cement output. Alpha Portland Cement Co. (Catskill), Lehigh Portland Cement Co., and North American Cement Corp. (both near Alsen) produced portland and masonry cements. These companies also quarried limestone nearby as the main cement raw material. In addition, North American Cement Corp. mined clay near its cement plant. Gypsum, iron ore, and shale also were used as cement raw materials. The finished cement was shipped mostly to consumers in New York and New England. A small quantity was exported. Sandstone was quarried and crushed for concrete aggregate and roadstone near Cairo by Catskill Mountain Stone Co., Inc. Whitehead Bros. Co. produced molding sand near Catskill and Coxsackie, and Coxsackie Sand & Gravel Co., Inc. (Coxsackie), produced building and paving sand.

**Hamilton.**—Sand and gravel was produced by Government-and-contractor operations.

**Herkimer.**—General Crushed Stone Co. produced limestone for aggregate, agstone, and asphalt filler at its Jordanville quarry. The limestone quarry of Newport Quarries Corp. (Newport) was idle for the second consecutive year. Material Sand and Gravel Corp. (Gravesville) produced sand and gravel principa[illegible]ilding purposes. Quartz crystals were recovered as mine[illegible] near Middleville.

**Jefferson.**—Limestone for concrete aggregat[illegible] and railroad ballast was quarried at Wat[illegible] Stone Co. The highway departments o[illegible] and Hounsfield produced limestone for[illegible] stone. Multi-Color Sandstone Co. qu[illegible] architectural uses at Redwood. Comm[illegible] totaled 237,000 tons, a 58-percent in[illegible] ducers, mainly near Adams, Bellevill[illegible] were active.

**Lewis.**—Limestone, used chiefly as a[illegible] and crushed by Carbola Chemical C[illegible] highway department of the town of [illegible] limestone for concrete aggregate an[illegible] duction of sand for ice control and [illegible] near Lowville.

Digitized by Google

**Livingston.**—Livingston County continued to lead in salt production. Output of rock salt from the Retsof underground mine of the International Salt Co. was used mainly in manufacturing chemicals (principally chlorine) and for controlling ice on highways. Rock salt was shipped to consumers principally in New York and other northeastern States; some was exported to Canada. Sand and gravel, principally for building purposes, was recovered from pits near Avon, Conesus, Dansville, and Scottsville. Limestone for concrete aggregate and asphalt filler was quarried near Rochester by General Crushed Stone Co.

**Madison.**—Limestone was quarried by Munnsville Limestone Corp. (Munnsville) and Worlock Stone Co., Inc. (Perryville). Sand and gravel was produced from pits near Hamilton and Canastota.

**Monroe.**—Dolomite Products Co. quarried limestone near Gates and Penfield. Output was used for concrete aggregate and agstone. Limestone also was quarried by Central Materials Corp. at Brockport. Sand and gravel output, by 12 producers, totaled 1.1 million tons compared with 850,000 tons in 1959, and was used mainly for building and paving material. Fifty-four percent of the county output was processed material and the entire output shipped to consumers by truck. Ruberoid Co. mined gypsum at Wheatland and shipped it to Caledonia for processing into gypsum building products.

**Montgomery.**—Cushing Stone Co., Inc., and Crushed Rock Products, Inc., both near Amsterdam, produced limestone for the construction industry. St. Johnsville Supply Co., Inc. (St. Johnsville), processed sand and gravel, chiefly for building and paving material.

**Nassau.**—Although tonnage and value both dropped, Nassau County remained second in sand and gravel output. A total of 5.4 million tons was produced compared with 5.6 million tons in 1959. Value decreased 4 percent. Output, from eight operations, consisted entirely of processed material used mainly for building and paving purposes and was shipped to consumers principally by truck and barge. Nassau Brick Co., Inc. (Farmingdale), mined clay for manufacturing brick.

**Niagara.**—Production of limestone for the Niagara Power project totaled 5.5 million tons, compared with 3.2 million tons in 1959. Limestone, which was dug from a mile-long channel, was crushed at a nearby aggregate plant. Output from the crushing plant was used chiefly for concrete. Quantities also were used as riprap and as dike filter material. In addition, limestone was produced by three commercial producers, Niagara Stone Division, Olsker-McLain Industries, Inc. (Niagara Falls); Frontier Stone Products, Inc., (Lockport); and Royalton Stone Corp. (Gasport). Gasport Sand & Gravel Co., Inc. (Lockport), produced processed sand and gravel used mainly as structural material.

**Oneida.**—Eastern Rock Products, Inc., produced limestone for aggregate, agstone, railroad ballast, and riprap at at its Prospect No. 6 and Oriskany Falls No. 5 quarries. Commercial sand and gravel output totaled 596,000 tons, compared with 643,000 tons in 1959. Output came from 10 operations and consisted chiefly of processed material for building, paving, and molding purposes. Clinton Metallic Paint mined crude red iron oxide pigment (hematite) from its Brim

Co. produced molding sand near Catskill and Coxsackie, and Coxsackie Sand & Gravel Co., Inc. (Coxsackie), produced building and paving sand.

**Hamilton.**—Sand and gravel was produced by Government-and-contractor operations.

**Herkimer.**—General Crushed Stone Co. produced limestone for aggregate, agstone, and asphalt filler at its Jordanville quarry. The limestone quarry of Newport Quarries Corp. (Newport) was idle for the second consecutive year. Material Sand and Gravel Corp. (Gravesville) produced sand and gravel principally for building purposes. Quartz crystals were recovered as mineral specimens near Middleville.

**Jefferson.**—Limestone for concrete aggregate, agstone, asphalt filler, and railroad ballast was quarried at Watertown by General Crushed Stone Co. The highway departments of the towns of Cape Vincent and Hounsfield produced limestone for concrete aggregate and roadstone. Multi-Color Sandstone Co. quarried stone for flagging and architectural uses at Redwood. Commercial output of sand and gravel totaled 237,000 tons, a 58-percent increase over 1959. Seven producers, mainly near Adams, Belleville, Gouverneur, and Watertown, were active.

**Lewis.**—Limestone, used chiefly as an industrial filler, was quarried and crushed by Carbola Chemical Co., Inc. (Natural Bridge). The highway department of the town of Lowville quarried and crushed limestone for concrete aggregate and roadstone. Commercial production of sand for ice control and gravel for paving was reported near Lowville.

Commercial sand and gravel output totaled 596,000 tons, compared with 643,000 tons in 1959. Output came from 10 operations and consisted chiefly of processed material for building, paving, and molding purposes. Clinton Metallic Paint Co. mined crude red iron oxide pigment (hematite) from its Brim

Digitized by Google

field underground mine near Clinton. Output increased in 1960 and was consumed in making red paints. Mining was by longwall (longface) methods, with entry by vertical shafts. Dynamite was used as the blasting agent. Specimens of hematite were obtained by a mineral collector near Clinton. The Utica plant of Zonolite Co. continued to be the only plant exfoliating vermiculite in the State. Crude material shipped from company-owned mines in Montana and South Carolina was processed at the plant.

**Onondaga.**—Onondaga County ranked second in value of production of commercial limestone. Limestone for highway construction and maintenance was produced at the Jamesville quarry of General Crushed Stone Co. Solvay Process Division, Allied Chemical Corp., quarried limestone at Jamesville for use mainly in manufacturing quicklime for producing alkalies. Some was used as concrete aggregate, agstone, and railroad ballast. In addition, the company operated wells at Tully and a plant in Syracuse for producing evaporated salt and brine. The brine was used with the lime in manufacturing soda ash. The evaporated salt, produced in vacuum pans, was used mainly for manufacturing chemicals. Portland and masonry cements were produced at Jamesville by Alpha Portland Cement Co. The company mined shale nearby for use as a cement raw material. Other raw materials included limestone (cement rock), sand, gypsum, and iron ore. The entire output of portland and masonry cements was shipped to consumers within the State, chiefly by truck in bulk.

Commercial production of sand and gravel totaled 856,000 tons, compared with 824,000 in 1959. Sixty-six percent of the output was processed material, used chiefly for structural and paving material. Twelve operations were active, compared with nine in 1959.

Onondaga Brick Corp. (Warners) produced lightweight aggregate by the sintering process from shale mined nearby. Red clay for manufacturing pottery and flowerpots was mined near Camillus by Syracuse Pottery Co., Inc. The Cicero clay pit of Syracuse Brick Corp. was idle during the year. Minerals Processing Corp. (Syracuse) expended perlite shipped from Colorado and Utah. The expanded perlite was used principally for soil conditioning and as a plaster and concrete aggregate.

**Ontario.**—General Crushed Stone Co. produced limestone for highway and railroad construction and maintenance at Geneva. Commercial output of sand and gravel totaled 369,000 tons, a 44-percent increase over 1959. Production was centered near Clifton Springs, Geneva, Manchester, Oaks Corners, Phelps, and Victor.

**Orange.**—Commercial sand and gravel output was reported from nine operations and totaled 647,000 tons, a 6-percent decrease below 1959. Ninety-seven percent of the county output was processed. Sand and gravel was used principally for structural and paving purposes. Jova Brick Works mined clay near Roseton for manufacturing building brick. Limestone for concrete aggregate and roadstone was quarried by Dutchess Quarry & Supply Co. Inc. (Goshen). Reed-sedge peat was recovered from a bog near Tuxedo by Sterling Forest Peat Co., Inc. The output was sold in packages and in bulk.

**Orleans.**—Limestone for concrete aggregate and roadstone was produced at Clarendon by Clarendon Stone Co., Inc. Sand and gravel

Digitized by Google

production by commercial operations increased 14 percent and consisted chiefly of bank-run material. Production was centered near Albion, Barre, Medina, and Shelby.

**Oswego.**—Commercial sand and gravel was recovered from pits near Lacona and Oswego. Molding sand was produced near Pulaski.

**Otsego.**—Limestone for concrete aggregate and roadstone was quarried at Richfield Springs by Barrett Division, Allied Chemical Corp. Sandstone (bluestone) for construction and architectural uses was quarried near Oneonta. Sand and gravel was produced by Seward Gravel Co. (Milford) and Unadilla Concrete Products Co. (Unadilla).

**Putnam.**—Patterson Mineral Corp. (Patterson) quarried limestone for mineral filler and agstone. Sand and gravel was produced by Leemac Sand & Stone Corp. (Phillipstown) and Harlem Valley Crusher Co., Inc. (Patterson). Specimens of magnetite were gathered by an amateur gem collector near Brewsters.

**Queens.**—The Long Island Railroad Co. produced engine sand and railroad ballast gravel near Jamaica.

**Rensselaer.**—Miscellaneous stone for concrete aggregate and roadstone was quarried at the Campbell Mountain quarry (Cropseyville) of Fitzgerald Bros. Construction Co., Inc. Commercial sand and gravel output totaled 237,000 tons, compared with 205,000 tons in 1959. Material was recovered from seven pits. The clay pit of Champlain Brick Co. (Mechanicville) was inactive during the year.

**Richmond.**—United States Gypsum Co. calcined gypsum at its New Brighton plant for manufacturing finished building products.

**Rockland.**—Rockland County ranked second in value of stone produced. New York Trap Rock Co. produced limestone at Tompkins Cove and quarried basalt at Haverstraw and West Nyack. It was the major producer of basalt in the State. Output from these quarries was marketed as concrete aggregate, roadstone, stone sand, and riprap. Most of the company's output from the Tompkins Cove and Haverstraw quarries was shipped by barge to consumers in the metropolitan New York area; most of the West Nyack quarry output was transported by truck. Suffern Stone Co. (Suffern) also quarried basalt for concrete aggregate.

Sand and gravel output totaled 943,000 tons, a 36-percent increase over 1959. Producers were Graney Building Material Corp. (Sparkill), Mt. Ivy Sand & Gravel Co., Inc. (Mt. Ivy), Ramapo Sand & Gravel Corp. (Hillburn), Ward Pavements, Inc. (Thiells), and Elinor Allison (Stony Point). Crude gypsum was calcined and processed into finished building products at the Stony Point plant of United States Gypsum Co.

**St. Lawrence.**—The largest iron ore mine in New York in 1960 was the Benson open-pit mine near Star Lake in southern St. Lawrence County, operated by Jones & Laughlin Steel Corp. This mine was active the entire year. Mining was conducted on three benches averaging 50 feet high and 700 feet wide. In addition to the ore handled, more than 4 million long tons of overburden was removed. The concentrate and sinter produced was consumed mostly for pig iron and steel. About the middle of the year, Jones & Laughlin began building new crushing, screening, and cooling facilities for the sinter

Digitized by Google

plant. The new facilities, being installed by Dravo Corp., Pittsburgh, included a vertical shaft stationary cooler, the first of its type in the United States. The capacity of this unit is rated at 3,800 gross tons per day. The crusher, cooler, and auxiliary equipment will serve the two 6-foot-wide sinter machines already in use.

Zinc, lead, and silver were recovered from the Balmat mine and zinc was recovered from the Edwards mine, operated by St. Joseph Lead Co. Both mines were in production the entire year. Safety records improved for each mine and were better than the national average for underground metal mines in both frequency and severity ratios. The Edwards surface operations had completed 5 years without a lost-time accident. After a long series of tests of mechanical flotation machines that indicated savings in power and reagent costs and higher zinc recovery, the zinc flotation circuit in the Balmat mill was completely converted to this method of treatment and was performing satisfactorily at yearend. Exploration and development at the Edwards mine consisted of 1,883 feet of raising, 3,763 feet of drifting, and 6,994 feet of underground diamond drilling. Development at the Balmat mine consisted of 36 feet of shaft sinking, 6,190 feet of raising, 10,583 feet of drifting, and 28,861 feet of underground diamond drilling. Zinc concentrate from both mines was shipped to the St. Joseph Lead Co. smelter at Josephtown, Pa., for recovery of zinc. Lead concentrate from the Balmat mine and lead residue from the Josephtown smelter were shipped to the company Herculaneum (Mo.) smelter for recovery of lead and silver.

International Talc Co., Inc., mined crude talc from underground mines near Balmat and Talcville. Gouverneur Talc Co., Inc., mined crude talc from its underground mine at Balmat. Both companies operated crushing and grinding plants. Ground talc was sold for a variety of uses. Commercial sand and gravel production dropped slightly from 1959. Most of the output was prepared material for the construction industry and came from pits near Colton, Fine, Gouverneur, Nicholville, Potsdam, and Rossie.

Barrett Division, Allied Chemical Corp. (Norwood), and McConville, Inc. (Ogdensburg), produced limestone used chiefly for concrete aggregate and roadstone. The St. Lawrence County Highway Department also quarried limestone for road maintenance and repair. Balducci Crushed Stone Co. (Gouverneur) produced marble for agstone and concrete aggregate.

**Saratoga.**—Commercial sand and gravel output totaled 175,000 tons, compared with 186,000 tons in 1959. Output consisted chiefly of processed molding sand and was shipped by rail and truck to consumers. Ten operations were active during the year. Glens Falls Portland Cement Co., Division of The Flintkote Co., quarried limestone at Glens Falls for its cement plant in Warren County. Limestone for concrete aggregate, riprap, and agstone was produced by Pallette Stone Corp. (Saratoga Springs).

**Schenectady.**—Output of commercial sand and gravel increased and came from operations near Rotterdam, Schenectady and Scotia. The material was used principally for structural purposes.

**Schoharie.**—North American Cement Co. produced portland and masonry cements at its Howes Cave plant. Limestone and shale

Digitized by Google

(mined nearby), gypsum, and iron ore were used as cement raw materials. Finished cement was shipped to consumers mainly in New York and New England. Output was shipped principally by truck in bulk. Other limestone producers were Cobleskill Stone Products Division, Allied Materials Corp. (Cobleskill), and Masick Soil Conservation Co. and Schoharie Stone Corp., both near Schoharie. Paving gravel was produced by the New York State Department of Public Works.

**Schuyler.**—International Salt Co., Inc., and Watkins Salt Co., Inc., both near Watkins Glen, produced evaporated salt mostly by the vacuum-pan process. Some of the salt was sold in pressed blocks. Output was used chiefly by the chemical industry in New York and other northeastern States. Limited quantities were exported to Canada and other foreign countries. D. & T. Franzese Bros. produced sand and gravel near Watkins Glen.

**Seneca.**—Finger Lakes Peat Moss Co., Inc., recovered moss peat from bogs near Junius. Output was sold in bulk. Crews of the Seneca County Highway Department produced sand for ice control and gravel for paving.

**Steuben.**—Commercial sand and gravel production was reported near Bath, Cohocton, and Corning. Output decreased from 1959.

**Suffolk.**—Suffolk County continued to rank first in sand and gravel production. Although commercial output (5.6 million tons) decreased 6 percent in quantity, the value increased to $6.7 million, compared with $6.4 million in 1959. Of 23 active sand and gravel producers, 4 produced over 500,000 tons. One of these produced over 1 million tons. Ninety percent of the commercial output was processed material, compared with 88 percent in 1959. The material was shipped to consumers by truck, water, and rail transportation.

**Sullivan.**—Concrete aggregate and stone sand were produced from sandstone quarried by Sullivan Highway Products Co. at its Bridgeville and Kenoza Lake quarries. Sandstone (bluestone) produced in the county was shipped to Delaware County for fabrication as architectural stone and flagging. Sand and gravel was produced near Liberty, Masten Lake, Mongaup Valley, and Summitville. The entire county output was shipped to consumers by truck, mainly as processed material for building and paving.

**Tioga.**—Sand and gravel, mainly for building and paving, was produced by Central Materials Corp. (Tioga), Herman E. Bunce (Barton), C. & C. Ready-Mix Corp. (Owego), and A. O. Swanson (Waverly).

**Tompkins.**—Cayuga Rock Salt Co., Inc., recovered rock salt from an underground mine near Myers for use mostly in ice removal on highways and by the chemical industry, mainly within the State. Evaporated salt was produced at the Ludlowville refinery of International Salt Co., Inc. The salt was recovered in vacuum pans; some was sold in pressed blocks. Evaporated salt was sold to a wide variety of consuming industries, mainly in New York and other northeastern States.

Finger Lakes Stone Co., Inc., produced dimension sandstone (mainly architectural) at its University quarry near Dryden. Out-

Digitized by Google

put was used in school construction in Ithaca and bridge construction in Niagara Falls. Rumsey-Ithaca Corp. and University Sand & Gravel, both near Ithaca, processed sand and gravel, chiefly for building purposes.

**Ulster.**—Hudson Cement Co. Division, Colonial Sand and Stone Co., Inc., produced portland cement at its Kingston plant. Limestone quarried nearby was the principal cement raw material. Finished portland cement was shipped mainly to consumers in New York for ready-mixed concrete. Century Mfg. Co., Inc., produced natural and masonry cements from stone quarried nearby. Masonry cement was shipped to consumers in New York, New Jersey, Pennsylvania, Connecticut, and Rhode Island. Callanan Road Improvement Co. produced limestone for concrete aggregate and roadstone at its No. 3 plant near Esopus. Output was shipped to consumers mainly by barge.

Sand and gravel used mainly as structural and paving material was produced by Dutchess Quarry & Supply Co., Inc. (Wawarsing), Hurley Sand & Gravel Co., Inc. (Hurley), James J. Van Vliet & Son, Inc. (Marlboro), and James Ricker, Inc. (Connelly). Ulster County was the third largest clay-producing county. Hutton Co. and Star Brick Corp., both near Kingston, mined miscellaneous clay for manufacturing building brick.

**Warren.**—Glens Falls Portland Cement Co., Division of The Flintkote Co., produced portland and masonry cements at its Glens Falls plant, mainly from limestone (cement rock) quarried in Saratoga County. Gypsum, sand, and iron ore also were used as cement raw materials. Finished cement was shipped to consumers principally by truck and in bulk. Limestone was quarried near Glens Falls by Jointa Lime Co., Inc. Warren Aggregates, Inc., quarried and crushed granite near Chestertown for use as asphalt aggregate and stone sand, and processed building and paving sand.

Abrasive garnet was mined and processed at the North Creek plant of Barton Mines Corp. The refined garnet was used in manufacturing sandpaper and for grinding and polishing glass and metal lapping. The county continued to lead in the value of gem and mineral specimens collected. Crude and finished garnets valued at nearly $4,000 were recovered and processed near North Creek.

**Washington.**—The New York slate industry continued to be centered in Washington County. Production was reported from 11 operations and was centered mainly near Granville, Middle Granville, and Whitehall. Output was used chiefly as roofing and flagging material. The production of ground slate for manufacturing natural and artificially colored roofing granules was discontinued when the Central Commercial Co. plant closed at the end of 1959. The plant was being dismantled. Bank-run gravel was produced from pits near Clemons, Fort Ann, and Eagle Bridge. Bank-run sand used for ice control was recovered from a pit near Hebron.

**Wayne.**—Limestone for concrete aggregate and agstone was quarried near Sodus by General Crushed Stone Co. Commercial sand and gravel was recovered from pits near Galen, Macedon, and Palmyra. The output was mostly bank-run material used for general construction work.

Digitized by Google

**Westchester.**—Lake Street Granite Quarry, Inc. (White Plains), and DiRienzo Bros. and Baratta & D'Amato (both near Yonkers) quarried dimension granite mainly for construction work. Dolomitic marble was quarried and crushed at the Thornwood plant of Universal Marble Products Corp. The crushed stone was used mainly for terrazzo, cast stone, stucco, and agricultural lime. DiRubbo & Ellis mined emery at the Kingston mine near Croton. Output was used for general abrasive purposes. DeLuca Emery mine produced emery from mines near Croton and Peekskill for use as aggregate in heavy-duty nonslip floors and pavements.

Sand and gravel was recovered at five operations, principally near Somers and Peekskill. Most of the output was processed material; all of the output was shipped to consumers by truck. Humus peat was produced near Armonk by Stone Age Humus Corp. A very small quantity of beryl, recovered at the Bedford feldspar quarries (inactive for many years), was sold through GSA.

**Wyoming.**—Morton Salt Co. produced evaporated salt by open-pan processes at its Silver Springs plant. Some of the salt was sold in pressed blocks. Sawed and dressed architectural sandstone (bluestone) was produced at the Ambluco quarry (Portageville) of American Bluestone Co. The stone was used in constructing interiors of schools in New York City and other buildings in Buffalo.

**Yates.**—Road maintenance crews of the town of Jerusalem produced sand and gravel.

# The Mineral Industry of North Carolina

**This chapter has been prepared under a cooperative agreement for collecting mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Geological Survey of North Carolina.**

By James L. Vallely,[1] Jasper L. Stuckey,[2] and Mildred E. Rivers [3]

MINERAL production set a new record for North Carolina in 1960 of nearly $45 million, exceeding the previous peak year of 1954 by $3.3 million and 1959 by $4.2 million. In order of value, stone, sand and gravel, copper, feldspar, mica, clays, and tungsten were the principal minerals mined. North Carolina was first in the Nation in producing feldspar, sheet and scrap mica, olivine, and lithium minerals, second in tungsten, and third in talc production.

Metals accounted for 12 percent of the total value. Output of copper increased more than 25 percent; tungsten mining was resumed; and byproduct lead, gold, and silver were recovered in considerable quantities. Lithium production was much lower than in 1959. Stone increased in tonnage and value; sand and gravel was up 2 percent in tonnage but was little changed in value; and feldspar, mica, talc, and pyrophyllite decreased in tonnage and value.

**TABLE 1.—Mineral production in North Carolina [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Abrasive stones [2] thousand short tons | (3) | $5 | (3) | $2 |
| Clays [1] do. | 2,524 | 1,822 | 2,476 | 1,548 |
| Feldspar do. | (3) | (3) | 271 | 2,781 |
| Gem stones | (4) | 9 | (4) | 4 |
| Gold (recoverable content of ores, etc.) troy ounces | 965 | 34 | 1,826 | 64 |
| Lead short tons | ---------- | ---------- | 424 | 99 |
| Mica: | | | | |
| Scrap thousand short tons | 48 | 1,212 | 47 | 1,100 |
| Sheet pounds | 505,623 | 1,755 | 430,193 | 1,411 |
| Sand and gravel thousand short tons | 8,580 | 7,426 | 8,801 | 7,453 |
| Silver (recoverable content of ores, etc.) troy ounces | 16,319 | 15 | 212,368 | 192 |
| Stone thousand short tons | 12,859 | 20,302 | 14,721 | 23,296 |
| Talc and pyrophyllite do. | 127 | 647 | 101 | 549 |
| Value of items that cannot be disclosed: Abrasive stone (millstones, 1959), asbestos, copper, feldspar (1959), iron ore, kaolin, lithium minerals, olivine, tungsten, and values indicated by footnote 6 | ---------- | 7,862 | ---------- | 6,469 |
| Total North Carolina | ---------- | 40,789 | ---------- | 44,968 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Grinding pebbles and tubemill liners (1959) and millstones (1960).
[3] Less than 1,000 tons.
[4] Weight not recorded.
[5] Excludes kaolin; included with "Value of items that cannot be disclosed."
[6] Figure withheld to avoid disclosing individual company confidential data.

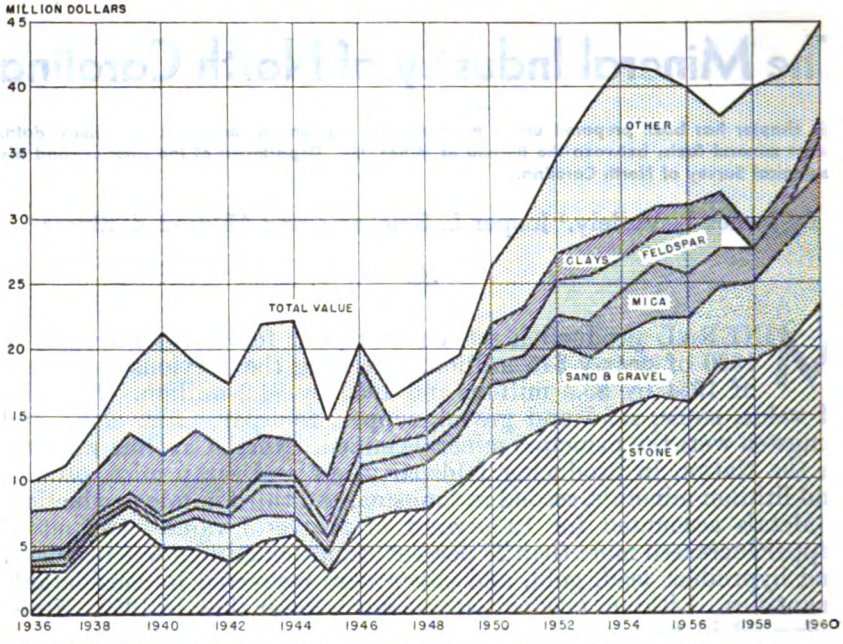

FIGURE 1.—Value of stone, sand and gravel, mica, feldspar, clays, and total value of mineral production in North Carolina, 1936–60.

**Employment and Injuries.**—Table 2 figures, except for quarries and mills, and sand and gravel mines, are not comparable for 1959 and 1960, as certain smelters and manufacturing operations are not included in 1960. Although there were 86 active quarries and mills compared with 74 in 1959, the total man-hours worked varied only slightly from the previous year. Sand and gravel mines totaled 115, 6 less than in 1959, but man-hours decreased 16 percent. Closing of many small mica mines accounted in a large measure for the decrease in man-hours worked in nonmetal mines.

Injury experience was lower than in 1959; only 2 fatalities were recorded in 1960, compared with 3 in 1959; nonfatal injuries totaled 336 against 402. Injuries per million man-hours showed improvement in all categories except sand and gravel mines where injuries per million man-hours increased from 14 in 1959 to 23 in 1960.

**Trends and Developments.**—Considerable activity in mining exploration was noted during the year. Tennessee Copper Co. began reconditioning the shaft of the old Silver Hill lead-zinc mine near Lexington preparatory to examining the mine; the Whitney Reduction Co., a new corporation, began the reopening of the old Whitney mine near Gold Hill in Cabarrus County in search of sulfide ores. Exploration and development in metal mines included: 721 feet of shaft sinking, 3,771 feet of raising, 5,151 feet of drifting and crosscutting, and 11,788 feet of diamond drilling.

Exploration drilling was underway in Beaufort County to mine phosphate rock hydraulically. Water was pumped underground through pipes in an attempt to force the phosphate to the surface

TABLE 2.—Employment and injuries in the mineral industries

| Year and Industry | Active operations | Men working daily | Average active days | Man-hours worked | Fatal injuries | Nonfatal injuries | Injuries per million man-hours |
|---|---|---|---|---|---|---|---|
| 1959: | | | | | | | |
| Nonmetal mines | 291 | 3,719 | 227 | 6,755,712 | 1 | 169 | 25 |
| Quarries and mills | 74 | 2,026 | 222 | 3,601,747 | 1 | 140 | 39 |
| Sand and gravel mines | 121 | 817 | 227 | 1,486,766 | ---------- | 21 | 14 |
| Metal mines [1] | 5 | 936 | 350 | 2,622,497 | 1 | 72 | 28 |
| Total | 491 | 7,498 | 241 | 14,466,722 | 3 | 402 | 28 |
| 1960: [2] | | | | | | | |
| Nonmetal mines | 200 | 2,432 | 261 | 5,083,807 | 2 | 115 | 23 |
| Quarries and mills | 86 | 2,080 | 217 | 3,612,592 | ---------- | 94 | 26 |
| Sand and gravel mines | 115 | 689 | 227 | 1,251,787 | ---------- | 29 | 23 |
| Metal mines | 6 | 559 | 246 | 1,100,877 | ---------- | 98 | 89 |
| Total | 407 | 5,760 | 240 | 11,049,063 | 2 | 336 | 31 |

[1] Includes aluminum smelters.
[2] Preliminary figures.

through other pipes. Phosphate beds are 30 to 40 feet thick and as deep as 150 feet below the surface.

The North Carolina Board of Conservation and Development granted a 25-year lease on State-owned lands in the southeastern part of the State to Roderick A. Stamey who planned to drill 40 oil test wells in the area.

Ideal Cement Co. announced plans to construct a 1.5-million-barrel-per-year cement plant at Wilmington on the Cape Fear River, the State's first cement plant. Florida Steel Corp. announced it would build a $3.3 million steel plant near Charlotte; furnace and rolling mill were to have a capacity of 50,000 tons of rolled sheet per year.

Triangle Brick Co. put into operation its new plant near Durham; Boren Clay Products was building a new $1 million brick plant at Pleasant Gerden; Cunningham Brick Co., Thomasville, planned a $1.3 million expansion program; and Cherokee Brick planned to increase the capacity of its Moncure plant by adding a new tunnel kiln.

**Legislation and Government Programs.**—The Government Mica Purchasing Depot under the General Services Administration (GSA) at Spruce Pine operated throughout the year. No Office of Mineral Exploration (OME) contracts were in force in 1960.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Abrasive Stones.**—Millstones were produced in Rowan County; no grinding pebbles or tubemill liners were reported in 1960.

**Asbestos.**—Powhatan Mining Co. mined amphibole asbestos in Transylvania and Yancey Counties. Production was considerably higher than in 1959.

**Clays.**—Production of kaolin increased 6 percent in tonnage, but decreased 5 percent in value; however, miscellaneous clay decreased 2 percent in tonnage and increased 2 percent in value. Harris Clay Co., in Avery County, was the only kaolin producer. Miscellaneous clay was mined by 28 companies from 32 pits in 20 counties for manu-

Digitized by Google

facturing lightweight aggregate, brick, tile, and other clay products. Principal producers were: Borden Brick & Tile Co., Boren Clay Products Co., Mount Gilead Brick Co., Pine Hall Brick & Pipe Co., Carolina Tuff-Lite Corp., and Southern Lightweight Aggregate Corp.

**Feldspar.**—Crude feldspar production, including flotation concentrates, was 271,000 long tons valued at $2.8 million, somewhat lower than in 1959. The unit value, however, increased from $10.05 to $10.27 per long ton. Flotation concentrates made up 85 percent of the total crude production. The Feldspar Corp. (Spruce Pine plant), International Minerals & Chemicals Corp. (Kona and Spruce Pine plants), and Lawson-United Feldspar & Minerals Co. (Minpro plant) mined alaskite rock and recovered feldspar concentrates in Mitchell County. Foote Mineral Co. recovered byproduct feldspar at its lithium plant in Cleveland County. Crude lump feldspar from Mitchell, Swain, Yancey, and other counties made up the balance of production.

Sales of ground feldspar were 275,000 short tons valued at $3.1 million, a decrease of 2 percent in tonnage and 5 percent in value. The value of ground feldspar for pottery changed little, but the quantity increased almost 9 percent over 1959. Glass and enamel uses declined in tonnage and value.

**Gem Stones.**—Gem stones and gem materials were collected in 18 or more counties in 1960. Among the minerals reported were: Actinolite, beryl, garnet, almandite, rhodolite, rhodonite, agate, amethyst, hyalite, corundum, sapphire, and topaz.

**Lithium.**—Foote Mineral Co. mined and processed spodumene at Kings Mountain, and Lithium Corp. of America converted spodumene to lithium chemicals at Bessemer City. Production and value declined for the second straight year primarily because of the cancellation of Atomic Energy Commission contracts in mid-1959.

Texas Gulf Sulphur Co. continued economic and engineering studies to determine whether or not to exercise its option on spodumene properties of Basic Atomics, Inc., between Lincolnton and Bessemer City, N.C.

**Mica.**—Sheet and scrap mica output declined in quantity and value from 1959. Sheet mica was down 15 percent in quantity and 20 percent in value; and scrap declined 1 percent in tonnage and 9 percent in value. Production of sheet and scrap mica was reported from 142 mines in 13 counties, compared with 218 mines in 19 counties in 1959. A considerable tonnage could not be identified by county or mine of origin. Mitchell County, with 47 mines, accounted for 53 percent of the total value of production; Avery, Cleveland, Macon, and Yancey, 44 percent; and 8 or more other counties, the remaining 3 percent. Leading producers of sheet mica were: Abernathy Mining Co. (Abernathy mine), McBee Mining Co. (McBee mine), Mitchell Lumber Co. (Banner mine), Mountain Mining Co. (Jimmy Cut mine), P & H Mining Co. (Gudger and Deer Park mines), and Sink Hole Miners (Sink Hole mine). Principal scrap producers were: Deneen Mica Co., Harris Clay Co., Industrial Mica, Inc., and Kings Mountain Mica Co., Inc. Output of ground mica was 4 percent higher, but value decreased 9 percent below 1959; 10 mica grinders were active during the year.

| Other uses [2] | 12,338 | 519,530 | 42.11 | 13,180 | 482,237 | 36.59 |
| Total | 39,195 | 2,446,912 | 62.43 | 40,891 | 2,218,605 | 54.26 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other uses."
[2] Includes joint cement and miscellaneous uses, welding rods, and well drilling compounds.

**Olivine.**—Production of olivine was lower in tonnage and value than in 1959; mines were operated by Harbison-Walker Refractories Co., Jackson County, and Wiseman Mining Co., Yancey County.

Digitized by Google

**Perlite.**—Carolina Perlite Co., Inc., expanded perlite at Gold Hill from crude material shipped into North Carolina. Tonnage and value of output has consistently increased since 1957.

**Quartz.**—Byproduct quartz was recovered from feldspar flotation plants in Mitchell County. Production data are included under stone.

**Sand and Gravel.**—Sand and gravel was the second-ranking commodity in the State in both tonnage and value of production. Commercial sand and gravel supplied 68 percent of the tonnage and 80 percent of the value, compared with 67 and 80 percent, respectively, in 1959. Commercial sand increased 9 percent in tonnage and 6 percent in value, whereas Government-and-contractor sand decreased 6 percent in both tonnage and value. Commercial gravel was up 2 percent in tonnage, but was 3 percent lower in value. However, Government-and-contractor gravel increased 29 and 51 percent in tonnage and value, respectively. Sand and gravel was produced in 80 counties. Commercial sand and gravel was produced in 13 counties; gravel only, in 5 counties; and sand only, in 13 counties. Forty-two companies operated 51 pits in 31 counties, compared with 46 pits in 30 counties in 1959. Government-and-contractor output of sand only came from 67 counties, gravel from 1 county, and sand and gravel from 5 others. Leading producers were: Becker County Sand & Gravel Co., W. R. Bonsal Co., Inc., Grove Stone & Sand Branch of B. V. Hedrick Gravel & Sand Co., lessees of B. V. Hedrick Gravel & Sand Co., McCrary Construction Service, and the State highway department.

**Stone.**—Output of stone, the principal mineral product of the State, increased 14 percent in tonnage and 15 percent in value. Crushed stone production was up 15 percent in tonnage and 17 percent in value, whereas dimension stone decreased 33 percent in quantity and 3 percent in value.

Stone was quarried in 47 counties, as follows: Granite in 32, limestone in 8, marble in 1 (Cherokee), quartz in 1 (Mitchell), slate in 2 (Davidson and Montgomery), and traprock in 10. Commercial stone, excluding quartz, was produced by 19 operators from 66 quarries—48 granite, 8 limestone, 2 slate, 7 traprock, and 1 marble. The State highway department crushed stone from 13 granite, 1 limestone, and 5 traprock quarries. Leading crushed stone producers were: W. E. Graham & Sons, a division of Vulcan Materials Co.; Superior Stone Co., a division of American Marietta Co.; and Nello L. Teer Co. Principal producers of dimension stone were: Columbia Marble Co., Harris Granite Quarries, and North Carolina Granite Co.

**Talc and Pyrophyllite.**—Combined production of crude talc and pyrophyllite decreased 21 percent in tonnage and 15 percent in value primarily because of lower sales to consumers of crude pyrophyllite. Crude talc production was little changed from 1959. Ground talc and pyrophyllite increased 3 percent in tonnage, but decreased 1 percent in value. Sawed talc (crayons) was considerably higher in tonnage, with a somewhat smaller increase in value. Ground talc was sold principally for textile use and toilet preparations. Ground pyrophyllite was used principally in ceramics, refractories, insecticides, and rubber. Talc was mined in Cherokee County and pyrophyllite in Alamance, Montgomery, Moore, Orange, and Randolph Counties.

**Vermiculite.**—Zonolite Co. operated an exfoliating plant at High Point using crude vermiculite shipped into the State.

## METALS

**Gold, Silver, Copper, and Lead.**—Copper production increased 28 percent in tonnage and 34 percent in value. Appalachian Sulphides, Inc., mined and concentrated sulfide ore from the Ore Knob mine at West Jefferson, and Tungsten Mining Corp. recovered copper and lead by flotation of accumulated tailings from its tungsten mill in Vance County. Gold and silver were recovered from the smelting of concentrates of both companies. Appalachian Sulphides, Inc., reported a reserve of 400,000 tons of ore, sufficient for less than 2 years of operation.

**Iron Ore.**—Cranberry Magnetite Corp., Avery County, continued development and produced a small tonnage of iron ore.

**Silicon.**—High-purity silicon was produced by E. I. du Pont de Nemours & Co., Inc., at Brevard.

**Tungsten.**—Tungsten Mining Corp. resumed mining at the Hamme mine in Vance County in May and maintained production for the balance of the year.

## REVIEW BY COUNTIES

Ninety-four of the 100 counties in North Carolina reported mineral production; Mitchell, Ashe, Guilford, Vance, and Cleveland were the leaders. In addition to the detailed county production listed in table

Digitized by Google

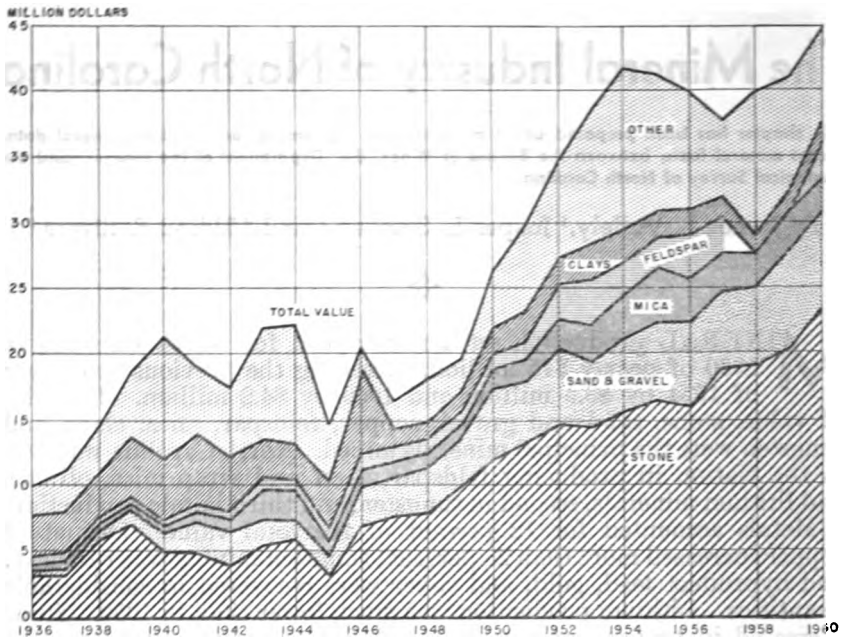

FIGURE 1.—Value of stone, sand and gravel, mica, feldspar, clays, and total value of mineral production in North Carolina, 1936–60.

**Employment and Injuries.**—Table 2 figures, except for quarries and mills, and sand and gravel mines, are not comparable for 1959 and 1960, as certain smelters and manufacturing operations are not included in 1960. Although there were 86 active quarries and mills compared with 74 in 1959, the total man-hours worked varied only slightly from the previous year. Sand and gravel mines totaled 115, 6 less than in 1959, but man-hours decreased 16 percent. Closing of many small mica mines accounted in a large measure for the decrease in man-hours worked in nonmetal mines.

Injury experience was lower than in 1959; only 2 fatalities were recorded in 1960, compared with 3 in 1959; nonfatal injuries totaled 336 against 402. Injuries per million man-hours showed improvement in all categories except sand and gravel mines where injuries per million man-hours increased from 14 in 1959 to 23 in 1960.

**Trends and Developments.**—Considerable activity in mining exploration was noted during the year. Tennessee Copper Co. began reconditioning the shaft of the old Silver Hill lead-zinc mine near Lexington preparatory to examining the mine; the Whitney Reduction Co., a new corporation, began the reopening of the old Whitney mine near Gold Hill in Cabarrus County in search of sulfide ores. Exploration and development in metal mines included: 721 feet of shaft sinking, 3,771 feet of raising, 5,151 feet of drifting and crosscutting, and 11,788 feet of diamond drilling.

Exploration drilling was underway in Beaufort County to mine phosphate rock hydraulically. Water was pumped underground through pipes in an attempt to force the phosphate to the surface

TABLE 2.—Employment and injuries in the mineral industries

| Year and Industry | Active operations | Men working daily | Average active days | Man-hours worked | Fatal injuries | Nonfatal injuries | Injuries per million man-hours |
|---|---|---|---|---|---|---|---|
| 1959: | | | | | | | |
| Nonmetal mines | 291 | 3,719 | 227 | 6,755,712 | 1 | 169 | 25 |
| Quarries and mills | 74 | 2,026 | 222 | 3,601,747 | 1 | 140 | 39 |
| Sand and gravel mines | 121 | 817 | 227 | 1,486,766 | ---------- | 21 | 14 |
| Metal mines [1] | 5 | 936 | 350 | 2,622,497 | 1 | 72 | 28 |
| Total | 491 | 7,498 | 241 | 14,466,722 | 3 | 402 | 28 |
| 1960: [2] | | | | | | | |
| Nonmetal mines | 200 | 2,432 | 261 | 5,083,807 | 2 | 115 | 23 |
| Quarries and mills | 86 | 2,080 | 217 | 3,612,592 | ---------- | 94 | 26 |
| Sand and gravel mines | 115 | 689 | 227 | 1,251,787 | ---------- | 29 | 23 |
| Metal mines | 6 | 559 | 246 | 1,100,877 | ---------- | 98 | 89 |
| Total | 407 | 5,760 | 240 | 11,049,063 | 2 | 336 | 31 |

[1] Includes aluminum smelters.
[2] Preliminary figures.

through other pipes. Phosphate beds are 30 to 40 feet thick and as deep as 150 feet below the surface.

The North Carolina Board of Conservation and Development granted a 25-year lease on State-owned lands in the southeastern part of the State to Roderick A. Stamey who planned to drill 40 oil test wells in the area.

Ideal Cement Co. announced plans to construct a 1.5-million-barrel-per-year cement plant at Wilmington on the Cape Fear River, the State's first cement plant. Florida Steel Corp. announced it would build a $3.3 million steel plant near Charlotte; furnace and rolling mill were to have a capacity of 50,000 tons of rolled sheet per year.

Triangle Brick Co. put into operation its new plant near Durham; Boren Clay Products was building a new $1 million brick plant at Pleasant Gerden; Cunningham Brick Co., Thomasville, planned a $1.3 million expansion program; and Cherokee Brick planned to increase the capacity of its Moncure plant by adding a new tunnel kiln.

**Legislation and Government Programs.**—The Government Mica Purchasing Depot under the General Services Administration (GSA) at Spruce Pine operated throughout the year. No Office of Mineral Exploration (OME) contracts were in force in 1960.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Abrasive Stones.**—Millstones were produced in Rowan County; no grinding pebbles or tubemill liners were reported in 1960.

**Asbestos.**—Powhatan Mining Co. mined amphibole asbestos in Transylvania and Yancey Counties. Production was considerably higher than in 1959.

**Clays.**—Production of kaolin increased 6 percent in tonnage, but decreased 5 percent in value; however, miscellaneous clay decreased 2 percent in tonnage and increased 2 percent in value. Harris Clay Co., in Avery County, was the only kaolin producer. Miscellaneous clay was mined by 28 companies from 32 pits in 20 counties for manu-

Digitized by Google

facturing lightweight aggregate, brick, tile, and other clay products. Principal producers were: Borden Brick & Tile Co., Boren Clay Products Co., Mount Gilead Brick Co., Pine Hall Brick & Pipe Co., Carolina Tuff-Lite Corp., and Southern Lightweight Aggregate Corp.

**Feldspar.**—Crude feldspar production, including flotation concentrates, was 271,000 long tons valued at $2.8 million, somewhat lower than in 1959. The unit value, however, increased from $10.05 to $10.27 per long ton. Flotation concentrates made up 85 percent of the total crude production. The Feldspar Corp. (Spruce Pine plant), International Minerals & Chemicals Corp. (Kona and Spruce Pine plants), and Lawson-United Feldspar & Minerals Co. (Minpro plant) mined alaskite rock and recovered feldspar concentrates in Mitchell County. Foote Mineral Co. recovered byproduct feldspar at its lithium plant in Cleveland County. Crude lump feldspar from Mitchell, Swain, Yancey, and other counties made up the balance of production.

Sales of ground feldspar were 275,000 short tons valued at $3.1 million, a decrease of 2 percent in tonnage and 5 percent in value. The value of ground feldspar for pottery changed little, but the quantity increased almost 9 percent over 1959. Glass and enamel uses declined in tonnage and value.

**Gem Stones.**—Gem stones and gem materials were collected in 18 or more counties in 1960. Among the minerals reported were: Actinolite, beryl, garnet, almandite, rhodolite, rhodonite, agate, amethyst, hyalite, corundum, sapphire, and topaz.

**Lithium.**—Foote Mineral Co. mined and processed spodumene at Kings Mountain, and Lithium Corp. of America converted spodumene to lithium chemicals at Bessemer City. Production and value declined for the second straight year primarily because of the cancellation of Atomic Energy Commission contracts in mid-1959.

Texas Gulf Sulphur Co. continued economic and engineering studies to determine whether or not to exercise its option on spodumene properties of Basic Atomics, Inc., between Lincolnton and Bessemer City, N.C.

**Mica.**—Sheet and scrap mica output declined in quantity and value from 1959. Sheet mica was down 15 percent in quantity and 20 percent in value; and scrap declined 1 percent in tonnage and 9 percent in value. Production of sheet and scrap mica was reported from 142 mines in 13 counties, compared with 218 mines in 19 counties in 1959. A considerable tonnage could not be identified by county or mine of origin. Mitchell County, with 47 mines, accounted for 53 percent of the total value of production; Avery, Cleveland, Macon, and Yancey, 44 percent; and 8 or more other counties, the remaining 3 percent. Leading producers of sheet mica were: Abernathy Mining Co. (Abernathy mine), McBee Mining Co. (McBee mine), Mitchell Lumber Co. (Banner mine), Mountain Mining Co. (Jimmy Cut mine), P & H Mining Co. (Gudger and Deer Park mines), and Sink Hole Miners (Sink Hole mine). Principal scrap producers were: Deneen Mica Co., Harris Clay Co., Industrial Mica, Inc., and Kings Mountain Mica Co., Inc. Output of ground mica was 4 percent higher, but value decreased 9 percent below 1959; 10 mica grinders were active during the year.

| Other uses [2] | 12,338 | 519,530 | 42.11 | 13,180 | 482,237 | 36.59 |
| Total | 39,195 | 2,446,912 | 62.43 | 40,891 | 2,218,605 | 54.26 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other uses."
[2] Includes joint cement and miscellaneous uses, welding rods, and well drilling compounds.

**Olivine.**—Production of olivine was lower in tonnage and value than in 1959; mines were operated by Harbison-Walker Refractories Co., Jackson County, and Wiseman Mining Co., Yancey County.

Digitized by Google

**Perlite.**—Carolina Perlite Co., Inc., expanded perlite at Gold Hill from crude material shipped into North Carolina. Tonnage and value of output has consistently increased since 1957.

**Quartz.**—Byproduct quartz was recovered from feldspar flotation plants in Mitchell County. Production data are included under stone.

**Sand and Gravel.**—Sand and gravel was the second-ranking commodity in the State in both tonnage and value of production. Commercial sand and gravel supplied 68 percent of the tonnage and 80 percent of the value, compared with 67 and 80 percent, respectively, in 1959. Commercial sand increased 9 percent in tonnage and 6 percent in value, whereas Government-and-contractor sand decreased 6 percent in both tonnage and value. Commercial gravel was up 2 percent in tonnage, but was 3 percent lower in value. However, Government-and-contractor gravel increased 29 and 51 percent in tonnage and value, respectively. Sand and gravel was produced in 80 counties. Commercial sand and gravel was produced in 13 counties; gravel only, in 5 counties; and sand only, in 13 counties. Forty-two companies operated 51 pits in 31 counties, compared with 46 pits in 30 counties in 1959. Government-and-contractor output of sand only came from 67 counties, gravel from 1 county, and sand and gravel from 5 others. Leading producers were: Becker County Sand & Gravel Co., W. R. Bonsal Co., Inc., Grove Stone & Sand Branch of B. V. Hedrick Gravel & Sand Co., lessees of B. V. Hedrick Gravel & Sand Co., McCrary Construction Service, and the State highway department.

**Stone.**—Output of stone, the principal mineral product of the State, increased 14 percent in tonnage and 15 percent in value. Crushed stone production was up 15 percent in tonnage and 17 percent in value, whereas dimension stone decreased 33 percent in quantity and 3 percent in value.

Stone was quarried in 47 counties, as follows: Granite in 32, limestone in 8, marble in 1 (Cherokee), quartz in 1 (Mitchell), slate in 2 (Davidson and Montgomery), and traprock in 10. Commercial stone, excluding quartz, was produced by 19 operators from 66 quarries—48 granite, 8 limestone, 2 slate, 7 traprock, and 1 marble. The State highway department crushed stone from 13 granite, 1 limestone, and 5 traprock quarries. Leading crushed stone producers were: W. E. Graham & Sons, a division of Vulcan Materials Co.; Superior Stone Co., a division of American Marietta Co.; and Nello L. Teer Co. Principal producers of dimension stone were: Columbia Marble Co., Harris Granite Quarries, and North Carolina Granite Co.

**Talc and Pyrophyllite.**—Combined production of crude talc and pyrophyllite decreased 21 percent in tonnage and 15 percent in value primarily because of lower sales to consumers of crude pyrophyllite. Crude talc production was little changed from 1959. Ground talc and pyrophyllite increased 3 percent in tonnage, but decreased 1 percent in value. Sawed talc (crayons) was considerably higher in tonnage, with a somewhat smaller increase in value. Ground talc was sold principally for textile use and toilet preparations. Ground pyrophyllite was used principally in ceramics, refractories, insecticides, and rubber. Talc was mined in Cherokee County and pyrophyllite in Alamance, Montgomery, Moore, Orange, and Randolph Counties.

**Vermiculite.**—Zonolite Co. operated an exfoliating plant at High Point using crude vermiculite shipped into the State.

## METALS

**Gold, Silver, Copper, and Lead.**—Copper production increased 28 percent in tonnage and 34 percent in value. Appalachian Sulphides, Inc., mined and concentrated sulfide ore from the Ore Knob mine at West Jefferson, and Tungsten Mining Corp. recovered copper and lead by flotation of accumulated tailings from its tungsten mill in Vance County. Gold and silver were recovered from the smelting of concentrates of both companies. Appalachian Sulphides, Inc., reported a reserve of 400,000 tons of ore, sufficient for less than 2 years of operation.

**Iron Ore.**—Cranberry Magnetite Corp., Avery County, continued development and produced a small tonnage of iron ore.

**Silicon.**—High-purity silicon was produced by E. I. du Pont de Nemours & Co., Inc., at Brevard.

**Tungsten.**—Tungsten Mining Corp. resumed mining at the Hamme mine in Vance County in May and maintained production for the balance of the year.

## REVIEW BY COUNTIES

Ninety-four of the 100 counties in North Carolina reported mineral production; Mitchell, Ashe, Guilford, Vance, and Cleveland were the leaders. In addition to the detailed county production listed in table

Digitized by Google

12, considerable crude feldspar and sheet and scrap mica were produced—all of undetermined county origin.

**Alamance.**—Superior Stone Co., a division of American-Marietta Co. (Burlington and Mebane quarries), and North Carolina State Highway and Public Works Commission (Bason quarry) crushed granite for concrete and roads. Boren & Harvey (Snow Camp mine) mined pyrophyllite for refractory and ceramic uses. Hanford Brick Co., Inc., mined miscellaneous clay for heavy clay products.

**Alexander.**—The State highway commission mined 47,000 tons of paving sand. Ruth P. Stanley collected a small quantity of gem stones (topaz, white sapphire, smoky quartz, rock crystals, hiddenite, and emerald).

**Alleghany.**—Ararat Products Co. crushed traprock for concrete and roads.

**Anson.**—Lessees of B. V. Hedrick (Lilesville mine), W. R. Bonsal Co. (Bonsal mine), and the State highway commission mined 1,707,000 tons of structural, paving, railroad ballast, metallurgical, and fill sand and gravel. The State highway commission crushed traprock for concrete and roads at the Sugartown and Hendley quarries.

**TABLE 12.—Value of mineral production in North Carolina, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Alamance | (2) | (2) | Granite, talc, miscellaneous clay. |
| Alexander | $14,360 | $18,417 | Sand and gravel, gem stones. |
| Alleghany | 62,030 | (2) | Traprock. |
| Anson | 2,382,641 | 1,887,129 | Sand and gravel, traprock. |
| Ashe | (2) | (2) | Copper, gold, sand and gravel, silver, mica. |
| Avery | (2) | (2) | Mica, kaolin, sand and gravel, iron ore. |
| Beaufort | (2) | (2) | Sand and gravel. |
| Bertie | 3,000 | 468 | Do. |
| Bladen | 56,000 | 68,425 | Sand and gravel, granite. |
| Brunswick | 18,000 | 4,500 | Sand and gravel. |
| Buncombe | (2) | (2) | Sand and gravel, granite. |
| Burke | (2) | 130,693 | Sand and gravel, mica, gem stones |
| Cabarrus | 103,683 | 121,392 | Granite. |
| Caldwell | (2) | 125,589 | Sand and gravel. |
| Camden | 1,050 | 900 | Do. |
| Carteret | 1,575 | 1,440 | Do. |
| Caswell | 646,948 | 588,324 | Granite, sand and gravel. |
| Catawba | (2) | (2) | Granite, miscellaneous clay, sand and gravel. |
| Chatham | 388,173 | 340,531 | Miscellaneous clay, traprock. |
| Cherokee | (2) | (2) | Marble, talc, granite, gem stones. |
| Chowan | 950 | 840 | Sand and gravel. |
| Clay | 70 | 25,626 | Do. |
| Cleveland | (2) | (2) | Lithium minerals, limestone, mica, sand and gravel, feldspar. |
| Columbus | 42,350 | 56,850 | Sand and gravel, granite. |
| Craven | (2) | (2) | Limestone, sand and gravel. |
| Cumberland | (2) | (2) | Sand and gravel, miscellaneous clay, granite. |
| Currituck | 9,030 | 5,250 | Sand and gravel. |
| Dare | 2,100 | 23,250 | Do. |
| Davidson | (2) | (2) | Sand and gravel, slate, miscellaneous clay. |
| Davie | 49,300 | 57,005 | Sand and gravel, gem stones. |
| Duplin | (2) | 2,525 | Sand and gravel. |
| Durham | (2) | (2) | Traprock, miscellaneous clay. |
| Edgecombe | 1,325 | 41,636 | Sand and gravel. |
| Forsyth | (2) | 2,334,070 | Granite, sand and gravel. |
| Franklin | 2,000 | 2,000 | Sand and gravel. |
| Gaston | (2) | (2) | Granite, sand and gravel, miscellaneous clay, mica. |
| Gates | 2,250 | 1,650 | Sand and gravel. |
| Granville | 5,332 | 6,135 | Sand and gravel, gem stones. |
| Greene | 27,000 | 24,960 | Sand and gravel. |
| Guilford | (2) | (2) | Granite, miscellaneous clay, sand and gravel. |
| Halifax | (2) | (2) | Miscellaneous clay, sand and gravel. |
| Harnett | (2) | (2) | Sand and gravel, granite, miscellaneous clay. |
| Haywood | (2) | (2) | Sand and gravel, gem stones. |
| Henderson | 342,846 | (2) | Limestone, granite, miscellaneous clay. |
| Hertford | 4,225 | 6,598 | Sand and gravel. |
| Hoke | 103,697 | (2) | Do. |
| Hyde | 740 | 450 | Do. |
| Iredell | (2) | (2) | Granite, sand and gravel, gem stones. |

**TABLE 12.—Value of mineral production in North Carolina, by counties[1]—Con.**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Jackson | (2) | (2) | Granite, olivine, mica. |
| Johnston | (2) | (2) | Traprock, sand and gravel. |
| Jones | $20,979 | (2) | Sand and gravel. |
| Lee | (2) | $312,369 | Miscellaneous clay, sand and gravel. |
| Lenoir | 133,851 | (2) | Sand and gravel. |
| Lincoln | 15,521 | 99,702 | Granite, sand and gravel, gem stones, mica. |
| Macon | (2) | (2) | Mica, granite, sand and gravel, gem stones. |
| Madison | | 2,000 | Sand and gravel. |
| Martin | 5,370 | 1,110 | Do. |
| McDowell | (2) | (2) | Sand and gravel, limestone. |
| Mecklenburg | (2) | (2) | Granite. |
| Mitchell | (2) | (2) | Feldspar, mica, sandstone, gem stones. |
| Montgomery | (2) | (2) | Miscellaneous clay, sand and gravel, slate, talc. |
| Moore | (2) | (2) | Talc, sand and gravel, miscellaneous clay, gem stones. |
| Nash | (2) | | |
| New Hanover | (2) | 34,582 | Limestone, sand and gravel. |
| Northampton | (2) | (2) | Sand and gravel. |
| Onslow | (2) | (2) | Limestone, sand and gravel. |
| Orange | (2) | (2) | Talc, granite. |
| Pamlico | 3,600 | 1,920 | Sand and gravel. |
| Pasquotank | 900 | 4,500 | Do. |
| Pender | 4,000 | 1,800 | Do. |
| Perquimans | 3,000 | 5,250 | Do. |
| Person | 9,675 | 3,697 | Do. |
| Pitt | (2) | (2) | Do. |
| Polk | 1,200 | | |
| Randolph | (2) | (2) | Granite, traprock, talc, gem stones. |
| Richmond | 4,825 | 13,250 | Sand and gravel. |
| Robeson | (2) | 98,550 | Sand and gravel, granite. |
| Rockingham | (2) | (2) | Granite, miscellaneous clay, traprock, sand and gravel. |
| Rowan | 2,079,165 | 1,958,684 | Granite, miscellaneous clay, sand and gravel, abrasive stones. |
| Rutherford | 152,189 | 172,742 | Sand and gravel, gem stones. |
| Sampson | 26,278 | 18,936 | Miscellaneous clay, sand and gravel. |
| Stanly | 267,235 | 312,506 | Miscellaneous clay, traprock. |
| Stokes | (2) | (2) | Miscellaneous clay, sand and gravel, mica. |
| Surry | (2) | (2) | Granite, traprock, sand and gravel, gem stones. |
| Swain | (2) | (2) | Limestone, granite, feldspar. |
| Transylvania | (2) | (2) | Granite, asbestos, sand and gravel, mica. |
| Union | (2) | (2) | Traprock, miscellaneous clay, sand and gravel. |
| Vance | (2) | (2) | Tungsten, granite silver, lead, copper, gold, sand and gravel. |
| Wake | (2) | (2) | Granite, sand and gravel. |
| Washington | 25,440 | 3,300 | Sand and gravel. |
| Watauga | 6,997 | (2) | Sand and gravel, gem stones. |
| Wayne | (2) | (2) | Do. |
| Wilkes | (2) | 260,029 | Granite, sand and gravel, mica, gem stones. |
| Wilson | (2) | (2) | Granite, sand and gravel. |
| Yadkin | (2) | 408,146 | Granite, limestone, sand and gravel. |
| Yancey | 302,339 | (2) | Mica, sand and gravel, olivine, asbestos, feldspar, gem stones. |
| Undistributed[3] | 33,455,261 | 35,378,256 | |
| Total | 40,789,000 | 44,968,000 | |

[1] Graham, Scotland, Tyrrell and Warren Counties are not listed because no production was reported.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Includes value of feldspar and mica that cannot be assigned to specific counties and values indicated by footnote 2.

**Ashe.**—Ashe County ranked second in value of mineral production. Appalachian Sulphides, Inc. (Ore Knob mine), recovered copper gold, and silver. B C H & W Mining Co. (Duncan mine) and Joe L. Snyder (Brown mine) mined mica. The State highway commission mined 50,000 tons of paving gravel.

**Avery.**—Mica was produced at 26 mines. The leading producers of sheet mica were Joe L. Snyder (Charlie Ridge and other mines), Dewey Watson (Abe Beam mine), J. E. Wilson (Ground Hog and other mines). The only producer of scrap mica was Harris Clay Co. (Kaolin and Gusher Knob mines.) Harris Clay Co. (Gusher Knob and Kaolin mines) mined kaolin for whiteware, floor and wall title, electrical porcelain, abrasives, plastics, and other uses.

Digitized by Google

Cranberry Magnetite Corp. continued development work and mined a small quantity of magnetite at the Cranberry mine. McCrary Construction Service and the State highway commission mined paving gravel.

**Beaufort.**—J. D. McCotter, Inc., and the State highway commission mined structural and paving sand.

**Bertie.**—The State highway commission mined 1,600 tons of paving sand.

**Bladen.**—The State highway commission mined 3,500 tons of granite and 109,000 tons of sand for concrete and roads.

**Brunswick.**—The State highway commission mined 15,000 tons of paving sand.

**Buncombe.**—Six operators mined structural, paving, and railroad ballast sand and gravel. The leading producers were Grove Stone & Sand Branch of B. V. Hedrick Gravel & Sand Co. (Grove mine) and McCrary Construction Service (Barnardsville and Swannanoa mines). Asheville Construction Co. and the State highway commission (Weaverville quarry) crushed granite for concrete and roads.

**Burke.**—McCrary Construction Service (Lake James mine), A. P. Causby Sand & Stone Co., and the State highway commission mined paving sand and gravel. Stokes Buchanan mined a small quantity of mica at the Emma mine. Herby Bolick collected a small quantity of gem stones (zeolites). Great Lakes Carbon Corp. manufactured carbon and graphite products at its plant in Morganton.

**Cabarrus.**—Lee White Gravel Pit and the State highway commission crushed 99,000 tons of granite for concrete and roads.

**Caldwell.**—Miller Bros. Co. and the State highway commission mined 124,000 tons of sand and gravel for structural and paving uses.

**Camden.**—The State highway commission mined 3,000 tons of paving sand.

**Carteret.**—The State highway commission mined 3,000 tons of paving sand.

**Caswell.**—W. E. Graham & Sons, a division of Vulcan Materials Co. (Danville quarry), and the State highway commission (Ivy Bluff quarry) crushed granite for concrete and roads. The State highway commission mined 42,000 tons of paving sand.

**Catawba.**—Superior Stone Co. (Hickory quarry) crushed granite for concrete and roads. Statesville Brick Co. mined miscellaneous clay for heavy clay products. The State highway commission mined 53,000 tons of paving sand.

**Chatham.**—Pomona Terra Cotta Co., Boren Clay Products Co. (Gulf mine), Chatham Brick and Tile Co. Inc., and Cherokee Brick Co. (Brickhaven mine) mined miscellaneous clay for heavy clay products. The State highway commission (Goldston quarry) crushed 71,000 tons of traprock for concrete and roads.

**Cherokee.**—Columbia Marble Co. (Pleasant Valley quarry) quarried dimension marble; rough block, sawed and cut interior stone; cut, dressed monumental stone; and crushed marble for terrazzo and other uses. Hitchcock Corp. (Nancy Jordan mine) and Minerals & Metals Corp. (Mulberry Gap mine) mined talc for ceramics, crayons, textiles, toilet preparations, and other uses. J. L. Colville Construction Co. and the State highway commission (Dockery quarry) crushed

Digitized by Google

granite for concrete and roads. Harley Hines collected a small quantity of mineral specimens (talc).

**Chowan.**—The State highway commission mined 2,800 tons of paving sand.

**Clay.**—Nantahala Talc & Limestone Co. mined 36,000 tons of paving gravel.

**Cleveland.**—Cleveland County ranked fifth in value of mineral production. Superior Stone Co. (Kings Mountain quarry) crushed limestone for concrete and roads. Ten mica mines were operated in 1960. The leading producer of sheet mica was Joe L. Snyder (Workman and Huskins mines). Kings Mountain Mica Co. Inc. (Patterson and Moss mines), Industrial Mica, Inc., and Foote Mineral Co. (Kings Mountain mine) produced scrap mica.

Foote Mineral Co. mined and processed lithium minerals at Kings Mountain and also produced a small quantity of crude feldspar. Lithium Corp. of America processed lithium minerals. Shelby Sand & Stone Co. and the State highway commission mined structural and paving sand.

**Columbus.**—The State highway commission mined 82,000 tons of sand and 4,700 tons of granite for concrete and roads.

**Craven.**—Superior Stone Co. (New Bern quarry) crushed limestone for concrete and roads. Southern Sand Co., Inc., and the State highway commission mined structural and paving sand.

**Cumberland.**—Becker County Sand & Gravel Co. (Fayetteville mine) and the State highway commission mined sand and gravel for structural, paving, and railroad ballast uses. Ideal Brick Co. (Linden mine) mined 54,000 tons of miscellaneous clay for heavy clay products. The State highway commission crushed 2,900 tons of granite for concrete and roads.

**Currituck.**—The State highway commission mined 18,000 tons of paving sand.

**Dare.**—The State highway commission mined 78,000 tons of paving sand.

**Davidson.**—Jacob's Creek Flagstone Co., Inc. (Flagstone quarry) quarried dimension slate for structural millstock and flagging. Cunningham Brick Co. (Thomasville mine) mined miscellaneous clay for heavy clay products. The State highway commission mined 195,000 tons of paving sand and gravel.

**Davie.**—The State highway commission mined 95,000 tons of paving sand. Ruth P. Stanley collected a small quantity of gem stones (almandite garnets).

**Duplin.**—James W. Kelley and the State highway commission mined 8,100 tons of structural, paving, and fill sand.

**Durham.**—Nello L. Teer Co. crushed traprock for concrete and roads. Borden Brick & Tile Co. and Tri-Angle Brick Co. mined miscellaneous clay for heavy clay products.

**Edgecombe.**—O. H. Woolard Sand & Gravel Co., Tar River Sand & Gravel Co., and the State highway commission mined structural, paving, and fill sand and gravel.

**Forsyth.**—W. E. Graham & Sons crushed granite for concrete and roads at the South Fork, No. 421, Piedmont, and North quarries. Paul Miller and the State highway commission mined 108,000 tons of structural and paving sand.

**Perlite.**—Carolina Perlite Co., Inc., expanded perlite at Gold Hill from crude material shipped into North Carolina. Tonnage and value of output has consistently increased since 1957.

**Quartz.**—Byproduct quartz was recovered from feldspar flotation plants in Mitchell County. Production data are included under stone.

**Sand and Gravel.**—Sand and gravel was the second-ranking commodity in the State in both tonnage and value of production. Commercial sand and gravel supplied 68 percent of the tonnage and 80 percent of the value, compared with 67 and 80 percent, respectively, in 1959. Commercial sand increased 9 percent in tonnage and 6 percent in value, whereas Government-and-contractor sand decreased 6 percent in both tonnage and value. Commercial gravel was up 2 percent in tonnage, but was 3 percent lower in value. However, Government-and-contractor gravel increased 29 and 51 percent in tonnage and value, respectively. Sand and gravel was produced in 80 counties. Commercial sand and gravel was produced in 13 counties; gravel only, in 5 counties; and sand only, in 13 counties. Forty-two companies operated 51 pits in 31 counties, compared with 46 pits in 30 counties in 1959. Government-and-contractor output of sand only came from 67 counties, gravel from 1 county, and sand and gravel from 5 others. Leading producers were: Becker County Sand & Gravel Co., W. R. Bonsal Co., Inc., Grove Stone & Sand Branch of B. V. Hedrick Gravel & Sand Co., lessees of B. V. Hedrick Gravel & Sand Co., McCrary Construction Service, and the State highway department.

**TABLE 6.—Sand and gravel sold or used by producers, by counties**

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Alamance | 2,500 | $1,250 | | |
| Alexander | 43,000 | 13,975 | 47,090 | $15,812 |

**Quartz.**—Byproduct quartz was recovered from feldspar flotation plants in Mitchell County. Production data are included under stone.

**Sand and Gravel.**—Sand and gravel was the second-ranking commodity in the State in both tonnage and value of production. Commercial sand and gravel supplied 68 percent of the tonnage and 80 percent of the value, compared with 67 and 80 percent, respectively, in 1959. Commercial sand increased 9 percent in tonnage and 6 percent in value, whereas Government-and-contractor sand decreased 6 percent in both tonnage and value. Commercial gravel was up 2 percent in tonnage, but was 3 percent lower in value. However, Government-and-contractor gravel increased 29 and 51 percent in tonnage and value, respectively. Sand and gravel was produced in 80 counties. Commercial sand and gravel was produced in 13 counties; gravel only, in 5 counties; and sand only, in 13 counties. Forty-two companies operated 51 pits in 31 counties, compared with 46 pits in 30 counties in 1959. Government-and-contractor output of sand only came from 67 counties, gravel from 1 county, and sand and gravel from 5 others. Leading producers were: Becker County Sand & Gravel Co., W. R. Bonsal Co., Inc., Grove Stone & Sand Branch of B. V. Hedrick Gravel & Sand Co., lessees of B. V. Hedrick Gravel & Sand Co., McCrary Construction Service, and the State highway department.

**Perlite.**—Carolina Perlite Co., Inc., expanded perlite at Gold Hill from crude material shipped into North Carolina. Tonnage and value of output has consistently increased since 1957.

**Quartz.**—Byproduct quartz was recovered from feldspar flotation plants in Mitchell County. Production data are included under stone.

**Sand and Gravel.**—Sand and gravel was the second-ranking commodity in the State in both tonnage and value of production. Commercial sand and gravel supplied 68 percent of the tonnage and 80 percent of the value, compared with 67 and 80 percent, respectively, in 1959. Commercial sand increased 9 percent in tonnage and 6 percent in value, whereas Government-and-contractor sand decreased 6 percent in both tonnage and value. Commercial gravel was up 2 percent in tonnage, but was 3 percent lower in value. However, Government-and-contractor gravel increased 29 and 51 percent in tonnage and value, respectively. Sand and gravel was produced in 80 counties. Commercial sand and gravel was produced in 13 counties; gravel only, in 5 counties; and sand only, in 13 counties. Forty-two companies operated 51 pits in 31 counties, compared with 46 pits in 30 counties in 1959. Government-and-contractor output of sand only came from 67 counties, gravel from 1 county, and sand and gravel from 5 others. Leading producers were: Becker County Sand & Gravel Co., W. R. Bonsal Co., Inc., Grove Stone & Sand Branch of B. V. Hedrick Gravel & Sand Co., lessees of B. V. Hedrick Gravel & Sand Co., McCrary Construction Service, and the State highway department.

**Stone.**—Output of stone, the principal mineral product of the State, increased 14 percent in tonnage and 15 percent in value. Crushed stone production was up 15 percent in tonnage and 17 percent in value, whereas dimension stone decreased 33 percent in quantity and 3 percent in value.

Stone was quarried in 47 counties, as follows: Granite in 32, limestone in 8, marble in 1 (Cherokee), quartz in 1 (Mitchell), slate in 2 (Davidson and Montgomery), and traprock in 10. Commercial stone, excluding quartz, was produced by 19 operators from 66 quarries—48 granite, 8 limestone, 2 slate, 7 traprock, and 1 marble. The State highway department crushed stone from 13 granite, 1 limestone, and 5 traprock quarries. Leading crushed stone producers were: W. E. Graham & Sons, a division of Vulcan Materials Co.; Superior Stone Co., a division of American Marietta Co.; and Nello L. Teer Co. Principal producers of dimension stone were: Columbia Marble Co., Harris Granite Quarries, and North Carolina Granite Co.

**Talc and Pyrophyllite.**—Combined production of crude talc and pyrophyllite decreased 21 percent in tonnage and 15 percent in value primarily because of lower sales to consumers of crude pyrophyllite. Crude talc production was little changed from 1959. Ground talc and pyrophyllite increased 3 percent in tonnage, but decreased 1 percent in value. Sawed talc (crayons) was considerably higher in tonnage, with a somewhat smaller increase in value. Ground talc was sold principally for textile use and toilet preparations. Ground pyrophyllite was used principally in ceramics, refractories, insecticides, and rubber. Talc was mined in Cherokee County and pyrophyllite in Alamance, Montgomery, Moore, Orange, and Randolph Counties.

**Vermiculite.**—Zonolite Co. operated an exfoliating plant at High Point using crude vermiculite shipped into the State.

## METALS

**Gold, Silver, Copper, and Lead.**—Copper production increased 28 percent in tonnage and 34 percent in value. Appalachian Sulphides, Inc., mined and concentrated sulfide ore from the Ore Knob mine at West Jefferson, and Tungsten Mining Corp. recovered copper and lead by flotation of accumulated tailings from its tungsten mill in Vance County. Gold and silver were recovered from the smelting of concentrates of both companies. Appalachian Sulphides, Inc., reported a reserve of 400,000 tons of ore, sufficient for less than 2 years of operation.

**Iron Ore.**—Cranberry Magnetite Corp., Avery County, continued development and produced a small tonnage of iron ore.

**Silicon.**—High-purity silicon was produced by E. I. du Pont de Nemours & Co., Inc., at Brevard.

**Tungsten.**—Tungsten Mining Corp. resumed mining at the Hamme mine in Vance County in May and maintained production for the balance of the year.

## REVIEW BY COUNTIES

Ninety-four of the 100 counties in North Carolina reported mineral production; Mitchell, Ashe, Guilford, Vance, and Cleveland were the leaders. In addition to the detailed county production listed in table

Digitized by Google

12, considerable crude feldspar and sheet and scrap mica were produced—all of undetermined county origin.

**Alamance.**—Superior Stone Co., a division of American-Marietta Co. (Burlington and Mebane quarries), and North Carolina State Highway and Public Works Commission (Bason quarry) crushed granite for concrete and roads. Boren & Harvey (Snow Camp mine) mined pyrophyllite for refractory and ceramic uses. Hanford Brick Co., Inc., mined miscellaneous clay for heavy clay products.

**Alexander.**—The State highway commission mined 47,000 tons of paving sand. Ruth P. Stanley collected a small quantity of gem stones (topaz, white sapphire, smoky quartz, rock crystals, hiddenite, and emerald).

**Alleghany.**—Ararat Products Co. crushed traprock for concrete and roads.

**Anson.**—Lessees of B. V. Hedrick (Lilesville mine), W. R. Bonsal Co. (Bonsal mine), and the State highway commission mined 1,707,000 tons of structural, paving, railroad ballast, metallurgical, and fill sand and gravel. The State highway commission crushed traprock for concrete and roads at the Sugartown and Hendley quarries.

**TABLE 12.—Value of mineral production in North Carolina, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Alamance | (2) | (2) | Granite, talc, miscellaneous clay. |
| Alexander | $14,360 | $18,417 | Sand and gravel, gem stones. |
| Alleghany | 62,030 | (2) | Traprock. |
| Anson | 2,382,641 | 1,887,129 | Sand and gravel, traprock. |
| Ashe | (2) | (2) | Copper, gold, sand and gravel, silver, mica. |
| Avery | (2) | (2) | Mica, kaolin, sand and gravel, iron ore. |
| Beaufort | (2) | (2) | Sand and gravel. |
| Bertie | 3,000 | 468 | Do. |
| Bladen | 56,000 | 68,425 | Sand and gravel, granite. |
| Brunswick | 18,000 | 4,500 | Sand and gravel. |
| Buncombe | (2) | (2) | Sand and gravel, granite. |
| Burke | (2) | 130,663 | Sand and gravel, mica, gem stones |
| Cabarrus | 103,683 | 121,392 | Granite. |
| Caldwell | (2) | 125,589 | Sand and gravel. |
| Camden | 1,050 | 900 | Do. |
| Carteret | 1,575 | 1,440 | Do. |
| Caswell | 646,948 | 588,321 | Granite, sand and gravel. |
| Catawba | (2) | (2) | Granite, miscellaneous clay, sand and gravel. |
| Chatham | 388,173 | 340,531 | Miscellaneous clay, traprock. |
| Cherokee | (2) | (2) | Marble, talc, granite, gem stones. |
| Chowan | 950 | 840 | Sand and gravel. |
| Clay | 70 | 25,626 | Do. |
| Cleveland | (2) | (2) | Lithium minerals, limestone, mica, sand and gravel, feldspar. |
| Columbus | 42,350 | 56,850 | Sand and gravel, granite. |
| Craven | (2) | (2) | Limestone, sand and gravel. |
| Cumberland | (2) | (2) | Sand and gravel, miscellaneous clay, granite. |
| Currituck | 9,030 | 5,250 | Sand and gravel. |
| Dare | 2,100 | 23,250 | Do. |
| Davidson | (2) | (2) | Sand and gravel, slate, miscellaneous clay. |
| Davie | 49,300 | 57,005 | Sand and gravel, gem stones. |
| Duplin | (2) | 2,525 | Sand and gravel. |
| Durham | (2) | (2) | Traprock, miscellaneous clay. |
| Edgecombe | 1,325 | 41,636 | Sand and gravel. |
| Forsyth | (2) | 2,334,070 | Granite, sand and gravel. |
| Franklin | 2,000 | 2,000 | Sand and gravel. |
| Gaston | (2) | (2) | Granite, sand and gravel, miscellaneous clay, mica. |
| Gates | 2,250 | 1,650 | Sand and gravel. |
| Granville | 5,332 | 6,135 | Sand and gravel, gem stones. |
| Greene | 27,000 | 24,900 | Sand and gravel. |
| Guilford | (2) | (2) | Granite, miscellaneous clay, sand and gravel. |
| Halifax | (2) | (2) | Miscellaneous clay, sand and gravel. |

**TABLE 12.—Value of mineral production in North Carolina, by counties[1]—Con.**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Jackson | (2) | (2) | Granite, olivine, mica. |
| Johnston | (2) | (2) | Traprock, sand and gravel. |
| Jones | $20,979 | (2) | Sand and gravel. |
| Lee | (2) | $312,369 | Miscellaneous clay, sand and gravel. |
| Lenoir | 133,851 | (2) | Sand and gravel. |
| Lincoln | 15,521 | 99,702 | Granite, sand and gravel, gem stones, mica. |
| Macon | (2) | (2) | Mica, granite, sand and gravel, gem stones. |
| Madison | ---------- | 2,000 | Sand and gravel. |
| Martin | 5,370 | 1,110 | Do. |
| McDowell | (2) | (2) | Sand and gravel, limestone. |
| Mecklenburg | (2) | (2) | Granite. |
| Mitchell | (2) | (2) | Feldspar, mica, sandstone, gem stones. |
| Montgomery | (2) | (2) | Miscellaneous clay, sand and gravel, slate, talc. |
| Moore | (2) | (2) | Talc, sand and gravel, miscellaneous clay, gem stones. |
| Nash | (2) | ---------- | |
| New Hanover | (2) | 34,582 | Limestone, sand and gravel. |
| Northampton | (2) | (2) | Sand and gravel. |
| Onslow | (2) | (2) | Limestone, sand and gravel. |
| Orange | (2) | (2) | Talc, granite. |
| Pamlico | 3,600 | 1,920 | Sand and gravel. |
| Pasquotank | 900 | 4,500 | Do. |
| Pender | 4,000 | 1,800 | Do. |
| Perquimans | 3,000 | 5,250 | Do. |
| Person | 9,675 | 3,697 | Do. |
| Pitt | (2) | (2) | Do. |
| Polk | 1,200 | ---------- | |
| Randolph | (2) | (2) | Granite, traprock, talc, gem stones. |
| Richmond | 4,825 | 13,250 | Sand and gravel. |
| Robeson | (2) | 98,550 | Sand and gravel, granite. |
| Rockingham | (2) | (2) | Granite, miscellaneous clay, traprock, sand and gravel. |
| Rowan | 2,079,165 | 1,958,684 | Granite, miscellaneous clay, sand and gravel, abrasive stones. |
| Rutherford | 152,189 | 172,742 | Sand and gravel, gem stones. |
| Sampson | 26,278 | 18,936 | Miscellaneous clay, sand and gravel. |
| Stanly | 267,235 | 312,506 | Miscellaneous clay, traprock. |
| Stokes | (2) | (2) | Miscellaneous clay, sand and gravel, mica. |
| Surry | (2) | (2) | Granite, traprock, sand and gravel, gem stones. |
| Swain | (2) | (2) | Limestone, granite, feldspar. |
| Transylvania | (2) | (2) | Granite, asbestos, sand and gravel, mica. |
| Union | (2) | (2) | Traprock, miscellaneous clay, sand and gravel. |
| Vance | (2) | (2) | Tungsten, granite silver, lead, copper, gold, sand and gravel. |
| Wake | (2) | (2) | Granite, sand and gravel. |
| Washington | 25,440 | 3,300 | Sand and gravel. |
| Watauga | 6,997 | (2) | Sand and gravel, gem stones. |
| Wayne | (2) | (2) | Do. |
| Wilkes | (2) | 260,029 | Granite, sand and gravel, mica, gem stones. |
| Wilson | (2) | (2) | Granite, sand and gravel. |
| Yadkin | (2) | 408,146 | Granite, limestone, sand and gravel. |
| Yancey | 302,339 | (2) | Mica, sand and gravel, olivine, asbestos, feldspar, gem stones. |
| Undistributed[3] | 33,455,261 | 35,378,256 | |
| Total | 40,789,000 | 44,968,000 | |

[1] Graham, Scotland, Tyrrell and Warren Counties are not listed because no production was reported.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Includes value of feldspar and mica that cannot be assigned to specific counties and values indicated by footnote 2.

**Ashe.**—Ashe County ranked second in value of mineral production. Appalachian Sulphides, Inc. (Ore Knob mine), recovered copper gold, and silver. B C H & W Mining Co. (Duncan mine) and Joe L. Snyder (Brown mine) mined mica. The State highway commission mined 50,000 tons of paving gravel.

**Avery.**—Mica was produced at 26 mines. The leading producers of sheet mica were Joe L. Snyder (Charlie Ridge and other mines), Dewey Watson (Abe Beam mine), J. E. Wilson (Ground Hog and other mines). The only producer of scrap mica was Harris Clay Co. (Kaolin and Gusher Knob mines.) Harris Clay Co. (Gusher Knob and Kaolin mines) mined kaolin for whiteware, floor and wall title, electrical porcelain, abrasives, plastics, and other uses.

Digitized by Google

Cranberry Magnetite Corp. continued development work and mined a small quantity of magnetite at the Cranberry mine. McCrary Construction Service and the State highway commission mined paving gravel.

**Beaufort.**—J. D. McCotter, Inc., and the State highway commission mined structural and paving sand.

**Bertie.**—The State highway commission mined 1,600 tons of paving sand.

**Bladen.**—The State highway commission mined 3,500 tons of granite and 109,000 tons of sand for concrete and roads.

**Brunswick.**—The State highway commission mined 15,000 tons of paving sand.

**Buncombe.**—Six operators mined structural, paving, and railroad ballast sand and gravel. The leading producers were Grove Stone & Sand Branch of B. V. Hedrick Gravel & Sand Co. (Grove mine) and McCrary Construction Service (Barnardsville and Swannanoa mines). Asheville Construction Co. and the State highway commission (Weaverville quarry) crushed granite for concrete and roads.

**Burke.**—McCrary Construction Service (Lake James mine), A. P. Causby Sand & Stone Co., and the State highway commission mined paving sand and gravel. Stokes Buchanan mined a small quantity of mica at the Emma mine. Herby Bolick collected a small quantity of gem stones (zeolites). Great Lakes Carbon Corp. manufactured carbon and graphite products at its plant in Morganton.

**Cabarrus.**—Lee White Gravel Pit and the State highway commission crushed 99,000 tons of granite for concrete and roads.

**Caldwell.**—Miller Bros. Co. and the State highway commission mined 124,000 tons of sand and gravel for structural and paving uses.

**Camden.**—The State highway commission mined 3,000 tons of paving sand.

**Carteret.**—The State highway commission mined 3,000 tons of paving sand.

**Caswell.**—W. E. Graham & Sons, a division of Vulcan Materials Co. (Danville quarry), and the State highway commission (Ivy Bluff quarry) crushed granite for concrete and roads. The State highway commission mined 42,000 tons of paving sand.

**Catawba.**—Superior Stone Co. (Hickory quarry) crushed granite for concrete and roads. Statesville Brick Co. mined miscellaneous clay for heavy clay products. The State highway commission mined 53,000 tons of paving sand.

**Chatham.**—Pomona Terra Cotta Co., Boren Clay Products Co. (Gulf mine), Chatham Brick and Tile Co. Inc., and Cherokee Brick Co. (Brickhaven mine) mined miscellaneous clay for heavy clay products. The State highway commission (Goldston quarry) crushed 71,000 tons of traprock for concrete and roads.

**Cherokee.**—Columbia Marble Co. (Pleasant Valley quarry) quarried dimension marble; rough block, sawed and cut interior stone; cut, dressed monumental stone; and crushed marble for terrazzo and other uses. Hitchcock Corp. (Nancy Jordan mine) and Minerals & Metals Corp. (Mulberry Gap mine) mined talc for ceramics, crayons, textiles, toilet preparations, and other uses. J. L. Colville Construction Co. and the State highway commission (Dockery quarry) crushed

Digitized by Google

granite for concrete and roads. Harley Hines collected a small quantity of mineral specimens (talc).

**Chowan.**—The State highway commission mined 2,800 tons of paving sand.

**Clay.**—Nantahala Talc & Limestone Co. mined 36,000 tons of paving gravel.

**Cleveland.**—Cleveland County ranked fifth in value of mineral production. Superior Stone Co. (Kings Mountain quarry) crushed limestone for concrete and roads. Ten mica mines were operated in 1960. The leading producer of sheet mica was Joe L. Snyder (Workman and Huskins mines). Kings Mountain Mica Co. Inc. (Patterson and Moss mines), Industrial Mica, Inc., and Foote Mineral Co. (Kings Mountain mine) produced scrap mica.

Foote Mineral Co. mined and processed lithium minerals at Kings Mountain and also produced a small quantity of crude feldspar. Lithium Corp. of America processed lithium minerals. Shelby Sand & Stone Co. and the State highway commission mined structural and paving sand.

**Columbus.**—The State highway commission mined 82,000 tons of sand and 4,700 tons of granite for concrete and roads.

**Craven.**—Superior Stone Co. (New Bern quarry) crushed limestone for concrete and roads. Southern Sand Co., Inc., and the State highway commission mined structural and paving sand.

**Cumberland.**—Becker County Sand & Gravel Co. (Fayetteville mine) and the State highway commission mined sand and gravel for structural, paving, and railroad ballast uses. Ideal Brick Co. (Linden mine) mined 54,000 tons of miscellaneous clay for heavy clay products. The State highway commission crushed 2,900 tons of granite for concrete and roads.

**Currituck.**—The State highway commission mined 18,000 tons of paving sand.

**Dare.**—The State highway commission mined 78,000 tons of paving sand.

**Davidson.**—Jacob's Creek Flagstone Co., Inc. (Flagstone quarry) quarried dimension slate for structural millstock and flagging. Cunningham Brick Co. (Thomasville mine) mined miscellaneous clay for heavy clay products. The State highway commission mined 195,000 tons of paving sand and gravel.

**Davie.**—The State highway commission mined 95,000 tons of paving sand. Ruth P. Stanley collected a small quantity of gem stones (almandite garnets).

**Duplin.**—James W. Kelley and the State highway commission mined 8,100 tons of structural, paving, and fill sand.

**Durham.**—Nello L. Teer Co. crushed traprock for concrete and roads. Borden Brick & Tile Co. and Tri-Angle Brick Co. mined miscellaneous clay for heavy clay products.

**Edgecombe.**—O. H. Woolard Sand & Gravel Co., Tar River Sand & Gravel Co., and the State highway commission mined structural, paving, and fill sand and gravel.

**Forsyth.**—W. E. Graham & Sons crushed granite for concrete and roads at the South Fork, No. 421, Piedmont, and North quarries. Paul Miller and the State highway commission mined 108,000 tons of structural and paving sand.

Digitized by Google

**Franklin.**—The State highway commission mined 4,000 tons of paving sand.

**Gaston.**—Superior Stone Co. crushed granite for concrete and roads. Kendrick Brick & Tile Co. (Mount Holly mine) mined miscellaneous clay for heavy clay products. Millard Townsend (Huskins mine) mined a small quantity of sheet mica. The State highway commission mined 32,000 tons of paving sand.

**Gates.**—The State highway commission mined 5,500 tons of paving sand.

**Granville.**—The State highway commission mined 10,000 tons of paving sand. Blue Ridge Minerals collected a small quantity of gem stones (agate-chalcedony and jasper).

**Greene.**—The State highway commission mined 52,000 tons of paving sand.

**Guilford.**—Guilford County ranked third in value of mineral production. Superior Stone Co. (Pomona, Jamestown, Buchanan, and McLeansville quarries) and W. E. Graham & Sons (Stokesville quarry) crushed granite for concrete and roads. Boren Clay Products Co. (Pleasant Garden mine) mined miscellaneous clay for heavy clay products. The State highway commission mined paving sand. Zonolite Co. exfoliated vermiculite at the High Point plant.

**Halifax.**—Nash Brick Co. (Ita mine) mined miscellaneous clay for heavy clay products. The State highway commission mined paving sand.

**Harnett.**—Becker County Sand & Gravel Co. (Senter mine), Nello L. Teer Co., and the State highway commission mined structural, paving, and miscellaneous sand and gravel. Norwood Brick Co. (Lillington mine) mined miscellaneous clay for heavy clay products. The State highway commission crushed granite for concrete and roads.

**Haywood.**—Sale & Alexander (Waynesville mine) mined structural and paving sand and gravel. Fred O. Scruggs collected a small quantity of gem stones (corundum sapphire).

**Henderson.**—Cogdill Limestone Co., Inc. (Cogdill quarry), and Fletcher Limestone Co. (Fletcher quarry) crushed limestone for concrete, roads, and other uses. J. L. Colville Construction Co. crushed granite for concrete and roads. Fletcher Brick Co., Inc. (Fletcher mine) mined miscellaneous clay for heavy clay products.

**Hertford.**—The State highway commission mined 22,000 tons of paving sand.

**Hoke.**—Pleasants Sand & Supply Co. (Ashley Heights mine), Cumberland Gravel & Sand Co. (Vass mine), and the State highway commission mined sand and gravel for structural and paving purposes.

**Hyde.**—The State highway commission mined 1,500 tons of paving sand.

**Iredell.**—Superior Stone Co. (Statesville quarry) crushed granite for concrete and roads. Tarheel Construction Co. and the State highway commission mined paving sand. Ruth P. Stanley and Harley Hines collected a small quantity of gem stones (zircon, pink star sapphire, actinolite in talc, and limonite).

**Jackson.**—Six mines produced mica. The leading producers of sheet mica were Roy H. Fouts (Henry and Long Branch mines) and B & H Mining Co. (Stovall mine). The only producer of scrap mica was Roy H. Fouts (Henry mine). Harbison-Walker Refractories Co. (Addie mine) mined olivine for refractories. Rock Products, Inc.,

Digitized by Google

and J. L. Colville Construction Co. crushed granite for concrete and roads.

**Johnston.**—Nello L. Teer Co. (Princeton quarry) crushed traprock for concrete and roads. The State highway commission mined 34,000 tons of paving sand.

**Jones.**—Simmons Marl & Lime Co. and the State highway commission mined paving and fill sand and gravel.

**Lee.**—Sanford Brick & Tile Co. (Colon mine), Borden Brick & Tile Co. (Sanford mine), Lee Brick & Tile Co., and Hanford Brick Co. mined miscellaneous clay for heavy clay products. The State highway commission mined 58,000 tons of paving sand.

**Lenoir.**—Barrus Construction Co. (Kinston mine) and the State highway commission mined sand and gravel for structural, paving, and fill purposes.

**Lincoln.**—Duke Power Co. crushed granite for concrete, roads, and stone sand. Edward McNeil (J. C. Willis mine) and Joe L. Snyder (Caggle mine) mined a small quantity of sheet mica. The State highway commision mined 27,000 tons of paving sand. Green's Mineral & Gift Shop collected a small quantity of gem stones (amethyst).

**Macon.**—Seventeen mines produced mica. The leading producers were Roy H. Fouts (Almond Cove mine), Jamaco Minerals Development Corp. (Lyle Knob mine), and Jess Gentry (Rock Cut and Iotla-Bowers mines). The leading producer of scrap mica was A & C Mining Co. (Sheppard Knob mine).

J. L. Colville Construction Co. crushed granite for concrete and roads. Hays Block Co. (Franklin mine) mined structural sand. R. A. Campbell, Harley Hines, and Andrew W. Reed collected small quantities of gem stones (corundum and rhodolite garnet).

**Madison.**—The State highway commission mined 2,000 tons of paving sand.

**Martin.**—The State highway commission mined 3,700 tons of paving sand.

**McDowell.**—Becker County Sand & Gravel Co. (Marion mine) and McCrary Construction Service (Woodlawn mine) mined sand and gravel for structural, paving, and railroad ballast uses. The State highway commission (Woodlawn quarry) crushed limestone for concrete and roads.

**Mecklenburg.**—Superior Stone Co. (Charlotte and Pineville quarries) crushed granite for concrete and roads.

**Mitchell.**—Mitchell County ranked first in value of mineral production. Eleven mines produced crude feldspar. The leading producers were International Minerals & Chemical Corp. (Hawkins and Kona mines), The Feldspar Corp. (Wiseman, Poteat, and Sullins mines), and Lawson-United Feldspar & Minerals Co. (Minpro mine). Forty-seven mines produced mica: 35 produced sheet only (full-trimmed and/or hand-cobbed), 6 scrap only, and 6 both sheet and scrap. The leading producers of sheet mica were McBee Mining Co. (McBee mine), Sink Hole Miners (Sink Hole mine), and Abernathy Mining Co. (Abernathy and Abernathy No. 2 mines). The leading producers of scrap mica were The Feldspar Corp. (Poteat and Wiseman mines), International Minerals & Chemical Corp. (Kona, Bartlette, and Jeff Buchanan mines), and De-Weld Mica Co. (Sparks Strip mine).

**Stone.**—Output of stone, the principal mineral product of the State, increased 14 percent in tonnage and 15 percent in value. Crushed stone production was up 15 percent in tonnage and 17 percent in value, whereas dimension stone decreased 33 percent in quantity and 3 percent in value.

Stone was quarried in 47 counties, as follows: Granite in 32, limestone in 8, marble in 1 (Cherokee), quartz in 1 (Mitchell), slate in 2 (Davidson and Montgomery), and traprock in 10. Commercial stone, excluding quartz, was produced by 19 operators from 66 quarries—48 granite, 8 limestone, 2 slate, 7 traprock, and 1 marble. The State highway department crushed stone from 13 granite, 1 limestone, and 5 traprock quarries. Leading crushed stone producers were: W. E. Graham & Sons, a division of Vulcan Materials Co.; Superior Stone Co., a division of American Marietta Co.; and Nello L. Teer Co. Principal producers of dimension stone were: Columbia Marble Co., Harris Granite Quarries, and North Carolina Granite Co.

**Talc and Pyrophyllite.**—Combined production of crude talc and pyrophyllite decreased 21 percent in tonnage and 15 percent in value primarily because of lower sales to consumers of crude pyrophyllite. Crude talc production was little changed from 1959. Ground talc and pyrophyllite increased 3 percent in tonnage, but decreased 1 percent in value. Sawed talc (crayons) was considerably higher in tonnage, with a somewhat smaller increase in value. Ground talc was sold principally for textile use and toilet preparations. Ground pyrophyllite was used principally in ceramics, refractories, insecticides, and rubber. Talc was mined in Cherokee County and pyrophyllite in Alamance, Montgomery, Moore, Orange, and Randolph Counties.

**Vermiculite.**—Zonolite Co. operated an exfoliating plant at High Point using crude vermiculite shipped into the State.

## METALS

**Gold, Silver, Copper, and Lead.**—Copper production increased 28 percent in tonnage and 34 percent in value. Appalachian Sulphides, Inc., mined and concentrated sulfide ore from the Ore Knob mine at West Jefferson, and Tungsten Mining Corp. recovered copper and lead by flotation of accumulated tailings from its tungsten mill in Vance County. Gold and silver were recovered from the smelting of concentrates of both companies. Appalachian Sulphides, Inc., reported a reserve of 400,000 tons of ore, sufficient for less than 2 years of operation.

**Iron Ore.**—Cranberry Magnetite Corp., Avery County, continued development and produced a small tonnage of iron ore.

**Silicon.**—High-purity silicon was produced by E. I. du Pont de Nemours & Co., Inc., at Brevard.

**Tungsten.**—Tungsten Mining Corp. resumed mining at the Hamme mine in Vance County in May and maintained production for the balance of the year.

**Stone.**—Output of stone, the principal mineral product of the State, increased 14 percent in tonnage and 15 percent in value. Crushed stone production was up 15 percent in tonnage and 17 percent in value, whereas dimension stone decreased 33 percent in quantity and 3 percent in value.

Stone was quarried in 47 counties, as follows: Granite in 32, limestone in 8, marble in 1 (Cherokee), quartz in 1 (Mitchell), slate in 2 (Davidson and Montgomery), and traprock in 10. Commercial stone, excluding quartz, was produced by 19 operators from 66 quarries—48 granite, 8 limestone, 2 slate, 7 traprock, and 1 marble. The State highway department crushed stone from 13 granite, 1 limestone, and 5 traprock quarries. Leading crushed stone producers were: W. E. Graham & Sons, a division of Vulcan Materials Co.; Superior Stone Co., a division of American Marietta Co.; and Nello L. Teer Co. Principal producers of dimension stone were: Columbia Marble Co., Harris Granite Quarries, and North Carolina Granite Co.

**Talc and Pyrophyllite.**—Combined production of crude talc and pyrophyllite decreased 21 percent in tonnage and 15 percent in value primarily because of lower sales to consumers of crude pyrophyllite. Crude talc production was little changed from 1959. Ground talc and pyrophyllite increased 3 percent in tonnage, but decreased 1 percent in value. Sawed talc (crayons) was considerably higher in tonnage, with a somewhat smaller increase in value. Ground talc was sold principally for textile use and toilet preparations. Ground pyrophyllite was used principally in ceramics, refractories, insecticides, and rubber. Talc was mined in Cherokee County and pyrophyllite in Alamance, Montgomery, Moore, Orange, and Randolph Counties.

**Vermiculite.**—Zonolite Co. operated an exfoliating plant at High Point using crude vermiculite shipped into the State.

## METALS

**Gold, Silver, Copper, and Lead.**—Copper production increased 28 percent in tonnage and 34 percent in value. Appalachian Sulphides, Inc., mined and concentrated sulfide ore from the Ore Knob mine at West Jefferson, and Tungsten Mining Corp. recovered copper and lead by flotation of accumulated tailings from its tungsten mill in Vance County. Gold and silver were recovered from the smelting of concentrates of both companies. Appalachian Sulphides, Inc., reported a reserve of 400,000 tons of ore, sufficient for less than 2 years of operation.

**Iron Ore.**—Cranberry Magnetite Corp., Avery County, continued development and produced a small tonnage of iron ore.

**Silicon.**—High-purity silicon was produced by E. I. du Pont de Nemours & Co., Inc., at Brevard.

**Tungsten.**—Tungsten Mining Corp. resumed mining at the Hamme mine in Vance County in May and maintained production for the balance of the year.

## REVIEW BY COUNTIES

Ninety-four of the 100 counties in North Carolina reported mineral production; Mitchell, Ashe, Guilford, Vance, and Cleveland were the leaders. In addition to the detailed county production listed in table

Digitized by Google

12, considerable crude feldspar and sheet and scrap mica were produced—all of undetermined county origin.

**Alamance.**—Superior Stone Co., a division of American-Marietta Co. (Burlington and Mebane quarries), and North Carolina State Highway and Public Works Commission (Bason quarry) crushed granite for concrete and roads. Boren & Harvey (Snow Camp mine) mined pyrophyllite for refractory and ceramic uses. Hanford Brick Co., Inc., mined miscellaneous clay for heavy clay products.

**Alexander.**—The State highway commission mined 47,000 tons of paving sand. Ruth P. Stanley collected a small quantity of gem stones (topaz, white sapphire, smoky quartz, rock crystals, hiddenite, and emerald).

**Alleghany.**—Ararat Products Co. crushed traprock for concrete and roads.

**Anson.**—Lessees of B. V. Hedrick (Lilesville mine), W. R. Bonsal Co. (Bonsal mine), and the State highway commission mined 1,707,000 tons of structural, paving, railroad ballast, metallurgical, and fill sand and gravel. The State highway commission crushed traprock for concrete and roads at the Sugartown and Hendley quarries.

**TABLE 12.—Value of mineral production in North Carolina, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Alamance | (2) | (2) | Granite, talc, miscellaneous clay. |
| Alexander | $14,360 | $18,417 | Sand and gravel, gem stones. |
| Alleghany | 62,030 | (2) | Traprock. |
| Anson | 2,382,641 | 1,887,129 | Sand and gravel, traprock. |
| Ashe | (2) | (2) | Copper, gold, sand and gravel, silver, mica. |
| Avery | (2) | (2) | Mica, kaolin, sand and gravel, iron ore. |
| Beaufort | (2) | (2) | Sand and gravel. |
| Bertie | 3,000 | 468 | Do. |
| Bladen | 56,000 | 68,425 | Sand and gravel, granite. |
| Brunswick | 18,000 | 4,500 | Sand and gravel. |
| Buncombe | (2) | (2) | Sand and gravel, granite. |
| Burke | (2) | 130,693 | Sand and gravel, mica, gem stones |
| Cabarrus | 103,683 | 121,392 | Granite. |
| Caldwell | (2) | 125,589 | Sand and gravel. |
| Camden | 1,050 | 900 | Do. |

**TABLE 12.—Value of mineral production in North Carolina, by counties[1]—Con.**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Jackson | (2) | (2) | Granite, olivine, mica. |
| Johnston | (2) | (2) | Traprock, sand and gravel. |
| Jones | $20,979 | (2) | Sand and gravel. |
| Lee | (2) | $312,369 | Miscellaneous clay, sand and gravel. |
| Lenoir | 133,851 | (2) | Sand and gravel. |
| Lincoln | 15,521 | 99,702 | Granite, sand and gravel, gem stones, mica. |
| Macon | (2) | (2) | Mica, granite, sand and gravel, gem stones. |
| Madison | | 2,000 | Sand and gravel. |
| Martin | 5,370 | 1,110 | Do. |
| McDowell | (2) | (2) | Sand and gravel, limestone. |
| Mecklenburg | (2) | (2) | Granite. |
| Mitchell | (2) | (2) | Feldspar, mica, sandstone, gem stones. |
| Montgomery | (2) | (2) | Miscellaneous clay, sand and gravel, slate, talc. |
| Moore | (2) | (2) | Talc, sand and gravel, miscellaneous clay, gem stones. |
| Nash | (2) | | |
| New Hanover | (2) | 34,582 | Limestone, sand and gravel. |
| Northampton | (2) | (2) | Sand and gravel. |
| Onslow | (2) | (2) | Limestone, sand and gravel. |
| Orange | (2) | (2) | Talc, granite. |
| Pamlico | 3,600 | 1,920 | Sand and gravel. |
| Pasquotank | 900 | 4,500 | Do. |
| Pender | 4,000 | 1,800 | Do. |
| Perquimans | 3,000 | 5,250 | Do. |
| Person | 9,675 | 3,697 | Do. |
| Pitt | (2) | (2) | Do. |
| Polk | 1,200 | | |
| Randolph | (2) | (2) | Granite, traprock, talc, gem stones. |
| Richmond | 4,825 | 13,250 | Sand and gravel. |
| Robeson | (2) | 98,550 | Sand and gravel, granite. |
| Rockingham | (2) | (2) | Granite, miscellaneous clay, traprock, sand and gravel. |
| Rowan | 2,079,165 | 1,958,684 | Granite, miscellaneous clay, sand and gravel, abrasive stones. |
| Rutherford | 152,189 | 172,742 | Sand and gravel, gem stones. |
| Sampson | 26,278 | 18,936 | Miscellaneous clay, sand and gravel. |
| Stanly | 267,235 | 312,506 | Miscellaneous clay, traprock. |
| Stokes | (2) | (2) | Miscellaneous clay, sand and gravel, mica. |
| Surry | (2) | (2) | Granite, traprock, sand and gravel, gem stones. |
| Swain | (2) | (2) | Limestone, granite, feldspar. |
| Transylvania | (2) | (2) | Granite, asbestos, sand and gravel, mica. |
| Union | (2) | (2) | Traprock, miscellaneous clay, sand and gravel. |
| Vance | (2) | (2) | Tungsten, granite silver, lead, copper, gold, sand and gravel. |
| Wake | (2) | (2) | Granite, sand and gravel. |
| Washington | 25,440 | 3,300 | Sand and gravel. |
| Watauga | 6,997 | (2) | Sand and gravel, gem stones. |
| Wayne | (2) | (2) | Do. |
| Wilkes | (2) | 260,029 | Granite, sand and gravel, mica, gem stones. |
| Wilson | (2) | (2) | Granite, sand and gravel. |
| Yadkin | (2) | 408,146 | Granite, limestone, sand and gravel. |
| Yancey | 302,339 | (2) | Mica, sand and gravel, olivine, asbestos, feldspar, gem stones. |
| Undistributed[3] | 33,455,261 | 35,378,256 | |
| Total | 40,789,000 | 44,968,000 | |

[1] Graham, Scotland, Tyrrell and Warren Counties are not listed because no production was reported.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Includes value of feldspar and mica that cannot be assigned to specific counties and values indicated by footnote 2.

**Ashe.**—Ashe County ranked second in value of mineral production. Appalachian Sulphides, Inc. (Ore Knob mine), recovered copper gold, and silver. B C H & W Mining Co. (Duncan mine) and Joe L. Snyder (Brown mine) mined mica. The State highway commission mined 50,000 tons of paving gravel.

**Avery.**—Mica was produced at 26 mines. The leading producers of sheet mica were Joe L. Snyder (Charlie Ridge and other mines), Dewey Watson (Abe Beam mine), J. E. Wilson (Ground Hog and other mines). The only producer of scrap mica was Harris Clay Co. (Kaolin and Gusher Knob mines.) Harris Clay Co. (Gusher Knob and Kaolin mines) mined kaolin for whiteware, floor and wall title, electrical porcelain, abrasives, plastics, and other uses.

Digitized by Google

Cranberry Magnetite Corp. continued development work and mined a small quantity of magnetite at the Cranberry mine. McCrary Construction Service and the State highway commission mined paving gravel.

**Beaufort.**—J. D. McCotter, Inc., and the State highway commission mined structural and paving sand.

**Bertie.**—The State highway commission mined 1,600 tons of paving sand.

**Bladen.**—The State highway commission mined 3,500 tons of granite and 109,000 tons of sand for concrete and roads.

**Brunswick.**—The State highway commission mined 15,000 tons of paving sand.

**Buncombe.**—Six operators mined structural, paving, and railroad ballast sand and gravel. The leading producers were Grove Stone & Sand Branch of B. V. Hedrick Gravel & Sand Co. (Grove mine) and McCrary Construction Service (Barnardsville and Swannanoa mines). Asheville Construction Co. and the State highway commission (Weaverville quarry) crushed granite for concrete and roads.

**Burke.**—McCrary Construction Service (Lake James mine), A. P. Causby Sand & Stone Co., and the State highway commission mined paving sand and gravel. Stokes Buchanan mined a small quantity of mica at the Emma mine. Herby Bolick collected a small quantity of gem stones (zeolites). Great Lakes Carbon Corp. manufactured carbon and graphite products at its plant in Morganton.

**Cabarrus.**—Lee White Gravel Pit and the State highway commission crushed 99,000 tons of granite for concrete and roads.

**Caldwell.**—Miller Bros. Co. and the State highway commission mined 124,000 tons of sand and gravel for structural and paving uses.

**Camden.**—The State highway commission mined 3,000 tons of paving sand.

**Carteret.**—The State highway commission mined 3,000 tons of paving sand.

**Caswell.**—W. E. Graham & Sons, a division of Vulcan Materials Co. (Danville quarry), and the State highway commission (Ivy Bluff quarry) crushed granite for concrete and roads. The State highway commission mined 42,000 tons of paving sand.

**Catawba.**—Superior Stone Co. (Hickory quarry) crushed granite for concrete and roads. Statesville Brick Co. mined miscellaneous clay for heavy clay products. The State highway commission mined 53,000 tons of paving sand.

**Chatham.**—Pomona Terra Cotta Co., Boren Clay Products Co. (Gulf mine), Chatham Brick and Tile Co. Inc., and Cherokee Brick Co. (Brickhaven mine) mined miscellaneous clay for heavy clay products. The State highway commission (Goldston quarry) crushed 71,000 tons of traprock for concrete and roads.

**Cherokee.**—Columbia Marble Co. (Pleasant Valley quarry) quarried dimension marble; rough block, sawed and cut interior stone; cut, dressed monumental stone; and crushed marble for terrazzo and other uses. Hitchcock Corp. (Nancy Jordan mine) and Minerals & Metals Corp. (Mulberry Gap mine) mined talc for ceramics, crayons, textiles, toilet preparations, and other uses. J. L. Colville Construction Co. and the State highway commission (Dockery quarry) crushed

Digitized by Google

granite for concrete and roads. Harley Hines collected a small quantity of mineral specimens (talc).

**Chowan.**—The State highway commission mined 2,800 tons of paving sand.

**Clay.**—Nantahala Talc & Limestone Co. mined 36,000 tons of paving gravel.

**Cleveland.**—Cleveland County ranked fifth in value of mineral production. Superior Stone Co. (Kings Mountain quarry) crushed limestone for concrete and roads. Ten mica mines were operated in 1960. The leading producer of sheet mica was Joe L. Snyder (Workman and Huskins mines). Kings Mountain Mica Co. Inc. (Patterson and Moss mines), Industrial Mica, Inc., and Foote Mineral Co. (Kings Mountain mine) produced scrap mica.

Foote Mineral Co. mined and processed lithium minerals at Kings Mountain and also produced a small quantity of crude feldspar. Lithium Corp. of America processed lithium minerals. Shelby Sand & Stone Co. and the State highway commission mined structural and paving sand.

**Columbus.**—The State highway commission mined 82,000 tons of sand and 4,700 tons of granite for concrete and roads.

**Craven.**—Superior Stone Co. (New Bern quarry) crushed limestone for concrete and roads. Southern Sand Co., Inc., and the State highway commission mined structural and paving sand.

**Cumberland.**—Becker County Sand & Gravel Co. (Fayetteville mine) and the State highway commission mined sand and gravel for structural, paving, and railroad ballast uses. Ideal Brick Co. (Linden mine) mined 54,000 tons of miscellaneous clay for heavy clay products. The State highway commission crushed 2,900 tons of granite for concrete and roads.

**Currituck.**—The State highway commission mined 18,000 tons of paving sand.

**Dare.**—The State highway commission mined 78,000 tons of paving sand.

**Davidson.**—Jacob's Creek Flagstone Co., Inc. (Flagstone quarry) quarried dimension slate for structural millstock and flagging. Cunningham Brick Co. (Thomasville mine) mined miscellaneous clay for heavy clay products. The State highway commission mined 195,000 tons of paving sand and gravel.

**Davie.**—The State highway commission mined 95,000 tons of paving sand. Ruth P. Stanley collected a small quantity of gem stones (almandite garnets).

**Duplin.**—James W. Kelley and the State highway commission mined 8,100 tons of structural, paving, and fill sand.

**Durham.**—Nello L. Teer Co. crushed traprock for concrete and roads. Borden Brick & Tile Co. and Tri-Angle Brick Co. mined miscellaneous clay for heavy clay products.

**Edgecombe.**—O. H. Woolard Sand & Gravel Co., Tar River Sand & Gravel Co., and the State highway commission mined structural, paving, and fill sand and gravel.

**Forsyth.**—W. E. Graham & Sons crushed granite for concrete and roads at the South Fork, No. 421, Piedmont, and North quarries. Paul Miller and the State highway commission mined 108,000 tons of structural and paving sand.

Digitized by Google

**Franklin.**—The State highway commission mined 4,000 tons of paving sand.

**Gaston.**—Superior Stone Co. crushed granite for concrete and roads. Kendrick Brick & Tile Co. (Mount Holly mine) mined miscellaneous clay for heavy clay products. Millard Townsend (Huskins mine) mined a small quantity of sheet mica. The State highway commission mined 32,000 tons of paving sand.

**Gates.**—The State highway commission mined 5,500 tons of paving sand.

**Granville.**—The State highway commission mined 10,000 tons of paving sand. Blue Ridge Minerals collected a small quantity of gem stones (agate-chalcedony and jasper).

**Greene.**—The State highway commission mined 52,000 tons of paving sand.

**Guilford.**—Guilford County ranked third in value of mineral production. Superior Stone Co. (Pomona, Jamestown, Buchanan, and McLeansville quarries) and W. E. Graham & Sons (Stokesville quarry) crushed granite for concrete and roads. Boren Clay Products Co. (Pleasant Garden mine) mined miscellaneous clay for heavy clay products. The State highway commission mined paving sand. Zonolite Co. exfoliated vermiculite at the High Point plant.

**Halifax.**—Nash Brick Co. (Ita mine) mined miscellaneous clay for heavy clay products. The State highway commission mined paving sand.

**Harnett.**—Becker County Sand & Gravel Co. (Senter mine), Nello L. Teer Co., and the State highway commission mined structural, paving, and miscellaneous sand and gravel. Norwood Brick Co. (Lillington mine) mined miscellaneous clay for heavy clay products. The State highway commission crushed granite for concrete and roads.

**Haywood.**—Sale & Alexander (Waynesville mine) mined structural and paving sand and gravel. Fred O. Scruggs collected a small quantity of gem stones (corundum sapphire).

**Henderson.**—Cogdill Limestone Co., Inc. (Cogdill quarry), and Fletcher Limestone Co. (Fletcher quarry) crushed limestone for concrete, roads, and other uses. J. L. Colville Construction Co. crushed granite for concrete and roads. Fletcher Brick Co., Inc. (Fletcher mine) mined miscellaneous clay for heavy clay products.

**Hertford.**—The State highway commission mined 22,000 tons of paving sand.

**Hoke.**—Pleasants Sand & Supply Co. (Ashley Heights mine), Cumberland Gravel & Sand Co. (Vass mine), and the State highway commission mined sand and gravel for structural and paving purposes.

**Hyde.**—The State highway commission mined 1,500 tons of paving sand.

**Iredell.**—Superior Stone Co. (Statesville quarry) crushed granite for concrete and roads. Tarheel Construction Co. and the State highway commission mined paving sand. Ruth P. Stanley and Harley Hines collected a small quantity of gem stones (zircon, pink star sapphire, actinolite in talc, and limonite).

**Jackson.**—Six mines produced mica. The leading producers of sheet mica were Roy H. Fouts (Henry and Long Branch mines) and B & H Mining Co. (Stovall mine). The only producer of scrap mica was Roy H. Fouts (Henry mine). Harbison-Walker Refractories Co. (Addie mine) mined olivine for refractories. Rock Products, Inc.,

Digitized by Google

and J. L. Colville Construction Co. crushed granite for concrete and roads.

**Johnston.**—Nello L. Teer Co. (Princeton quarry) crushed traprock for concrete and roads. The State highway commission mined 34,000 tons of paving sand.

**Jones.**—Simmons Marl & Lime Co. and the State highway commission mined paving and fill sand and gravel.

**Lee.**—Sanford Brick & Tile Co. (Colon mine), Borden Brick & Tile Co. (Sanford mine), Lee Brick & Tile Co., and Hanford Brick Co. mined miscellaneous clay for heavy clay products. The State highway commission mined 58,000 tons of paving sand.

**Lenoir.**—Barrus Construction Co. (Kinston mine) and the State highway commission mined sand and gravel for structural, paving, and fill purposes.

**Lincoln.**—Duke Power Co. crushed granite for concrete, roads, and stone sand. Edward McNeil (J. C. Willis mine) and Joe L. Snyder (Caggle mine) mined a small quantity of sheet mica. The State highway commision mined 27,000 tons of paving sand. Green's Mineral & Gift Shop collected a small quantity of gem stones (amethyst).

**Macon.**—Seventeen mines produced mica. The leading producers were Roy H. Fouts (Almond Cove mine), Jamaco Minerals Development Corp. (Lyle Knob mine), and Jess Gentry (Rock Cut and Iotla-Bowers mines). The leading producer of scrap mica was A & C Mining Co. (Sheppard Knob mine).

J. L. Colville Construction Co. crushed granite for concrete and roads. Hays Block Co. (Franklin mine) mined structural sand. R. A. Campbell, Harley Hines, and Andrew W. Reed collected small quantities of gem stones (corundum and rhodolite garnet).

**Madison.**—The State highway commission mined 2,000 tons of paving sand.

**Martin.**—The State highway commission mined 3,700 tons of paving sand.

**McDowell.**—Becker County Sand & Gravel Co. (Marion mine) and McCrary Construction Service (Woodlawn mine) mined sand and gravel for structural, paving, and railroad ballast uses. The State highway commission (Woodlawn quarry) crushed limestone for concrete and roads.

**Mecklenburg.**—Superior Stone Co. (Charlotte and Pineville quarries) crushed granite for concrete and roads.

**Mitchell.**—Mitchell County ranked first in value of mineral production. Eleven mines produced crude feldspar. The leading producers were International Minerals & Chemical Corp. (Hawkins and Kona mines), The Feldspar Corp. (Wiseman, Poteat, and Sullins mines), and Lawson-United Feldspar & Minerals Co. (Minpro mine). Forty-seven mines produced mica: 35 produced sheet only (full-trimmed and/or hand-cobbed), 6 scrap only, and 6 both sheet and scrap. The leading producers of sheet mica were McBee Mining Co. (McBee mine), Sink Hole Miners (Sink Hole mine), and Abernathy Mining Co. (Abernathy and Abernathy No. 2 mines). The leading producers of scrap mica were The Feldspar Corp. (Poteat and Wiseman mines), International Minerals & Chemical Corp. (Kona, Bartlette, and Jeff Buchanan mines), and De-Weld Mica Co. (Sparks Strip mine).

Digitized by Google

International Minerals & Chemical Corp., The Feldspar Corp., and Lawson-United Feldspar & Minerals Co. recovered crushed sandstone (quartz) from feldspar milling. Blue Ridge Minerals, Herby Bolick, Ruth P. Stanley, Roby Buchanan, and Harley Hines collected small quantities of gem stones (hyalite on matrix, actinolite in talc, massive rhodonite, almandite garnet, fluorescent calcite, and beryl).

**Montgomery.**—Mt. Gilead Brick Co. mined miscellaneous clay for heavy clay products. Jacob's Creek Flagstone Co. (Edenboro quarry) quarried dimension slate for structural millstock and flagging. T & H Clay Co. Inc. (Auman mine) mined pyrophyllite for ceramics. The State highway commission mined 75,000 tons of paving sand.

**Moore.**—Standard Mineral Co., Inc. and Carolina Pyrophyllite Co., Inc., mined pyrophyllite for ceramics, insecticides, paint, rubber, plaster, refractories, and other uses. Pleasants Sand & Supply Co., Monroe Sand Pit, Aberdeen Sand & Gravel Co., and the State highway commission mined structural, paving, and fill sand. T & H Clay Co. (Hancock mine) mined miscellaneous clay for heavy clay products. Harley Hines collected a small quantity of gem stones (pyrite in pyrophyllite).

**New Hanover.**—W. E. Graham & Sons crushed limestone for concrete and roads. Robbins Sand Pit and the State highway commission mined paving and fertilizer filler sand.

**Northampton.**—Superior Stone Co. (Garysburg mine) and the State highway commission mined structural and paving sand and gravel.

**Onslow.**—Superior Stone Co. (Belgrade quarry) crushed limestone for concrete and roads. The State highway commission mined 6,000 tons of paving sand.

**Orange.**—Piedmont Minerals Co., Inc. (Hillsboro mine), mined pyrophyllite for asphalt filler, ceramics, and refractories. Duke University, (Hillsboro quarry) quarried dimension granite for rough construction use. The State high commission (Bacon quarry) crushed granite for concrete and roads.

**Pamlico.**—The State highway commission mined 4,000 tons of paving sand.

**Pasquotank.**—The State highway commission mined 15,000 tons of paving sand.

**Pender.**—The State highway commission mined 6,000 tons of paving sand.

**Perquimans.**—The State highway commission mined 17,500 tons of paving sand.

**Person.**—The State highway commission mined 5,000 tons of paving sand.

**Pitt.**—Concrete Products Co., White Concrete Co. (Munford mine), and the State highway commission mined structural, paving, and fill sand and gravel.

**Randolph.**—The State highway commission (Glenola and Parks Cross Roads quarries) crushed granite for concrete and roads. Superior Stone Co. crushed traprock for concrete and roads. Carolina Pyrophyllite Co. (Gerhardt mine) mined pyrophyllite for ceramic and insecticide uses. Herby Bolick and Harley Hines collected a small quantity of mineral specimens (pyrophyllite).

**Richmond.**—The State highway commission (McLeod mine) mined 25,000 tons of paving sand and gravel.

Digitized by Google

**Robeson.**—The State highway commission mined 4,000 tons of granite and 161,000 tons of sand for concrete and roads.

**Rockingham.**—Superior Stone Co. (Reidsville quarry) crushed granite for concrete and roads. Webster Brick Co., Inc. (Draper mine), mined miscellaneous clay for heavy clay products. Garland W. & Morris Hall (Kings quarry) crushed traprock for concrete and roads. The State highway commission mined paving sand.

**Rowan.**—Seven quarries produced dimension granite for use as rubble, rough and dressed construction stone, rough and dressed architectural stone, rough monumental stone, paving blocks, and curbing and flagging. The leading producer was Harris Granite Quarries Co. (Collins, Balfour, and Shuping quarries). Superior Stone Co. (Woodleaf quarry) crushed granite for concrete and roads. Gardner Granite Works produced millstones.

Carolina Tufflite Co. and Isenhour Brick & Tile Co. (East Spencer mine) mined miscellaneous clay for lightweight aggregate and heavy clay products. The State highway commission mined paving sand. Carolina Perlite Co., Inc., expanded perlite at the Gold Hill plant.

**Rutherford.**—A. R. Thompson, contractor, and the State highway commission mined sand and gravel for paving and other uses. Green's Mineral and Gift Shop collected a small quantity of gem stones (fuchsite).

**Sampson.**—Crumpler Brick Co., Inc., Sampson Brick Co., Inc., and Patterson Brick Co. mined miscellaneous clay for heavy clay products. The State highway commission mined 10,000 tons of paving sand.

**Stanly.**—Southern Lightweight Aggregate Corp. (Aquadale mine), Stanly Shale Products, Inc. (Norwood mine), and Yadkin Brick Yards, Inc., mined miscellaneous clay for lightweight aggregates and heavy clay products. The State highway commission crushed traprock for concrete and roads at the McManus quarry. Carolina Aluminum Co. produced aluminum metal at Badin.

**Stokes.**—Pine Hall Brick & Pipe Co. (No. 1 mine) mined miscellaneous clay for heavy clay products. Snow Hill Mining Co. (Spencer mine), J. E. Wilson (Hawkins and Steel mines), and Preacher Mining Co. (Old Shelton mine) mined sheet mica. The State highway commission mined 140,000 tons of paving sand.

**Surry.**—North Carolina Granite Corp. (Mount Airy quarry) quarried dimension granite for rubble, rough and dressed construction stone, rough and dressed architectural stone, rough and dressed monumental stone, curbing, flagging, and paving blocks. North Carolina Granite Corp. (Mount Airy quarry) and W. E. Graham & Sons (Mt. Airy and Elkins quarries) produced granite for riprap, poultry grit, concrete, and roadstone. Ararat Products Co. crushed traprock for concrete and roads. The State highway commission mined paving sand. Ruth P. Stanley collected a small quantity of gem stones (Carnellian and oriental sapphire).

**Swain.**—Nantahala Talc & Limestone Co. (Hewitt quarry) crushed limestone for concrete, roadstone, and agstone. The Feldspar Corp. (Alexander and McCracken mines) mined crude feldspar. J. L. Colville Construction Co. crushed granite for concrete and roads.

**Transylvania.**—Macon Construction Co., Inc. (Penrose quarry), crushed granite for concrete and roads. Powhatan Mining Co. (Kilpatrick mine) mined asbestos. Siniard Brothers and Coleman Scott mined structural sand. Jeter C. Kitchen (Toxaway mine) mined

Digitized by Google

a small quantity of sheet mica. E. I. du Pont de Nemours & Co., Inc., produced high-purity silicon at Brevard.

**Union.**—Kendrick Brick & Tile Co. (Monroe mine) mined miscellaneous clay for heavy clay products. Superior Stone Co. (Bakers quarry) and the State Highway commission (Monroe quarry) crushed traprock for concrete and roads. The State highway commission mined paving sand.

**Vance.**—Vance County ranked fourth in value of mineral production. Tungsten Mining Corp. mined tungsten ore at the Hamme mine and recovered gold, silver, copper, and lead from mill tailings accumulated in previous years. W. E. Graham & Sons crushed granite for concrete, roadstone, and railroad ballast at the Greystone quarry. The State highway commission mined paving sand.

**Wake.**—Superior Stone Co. (Crabtree and Rolesville quarries) and Nello L. Teer Co. (Raleigh quarry) crushed granite for concrete, roadstone, and railroad ballast. The State highway commission mined paving sand.

**Washington.**—The State highway commission mined 11,000 tons of paving sand.

**Watauga.**—Maymead Lime Co., Inc., and the State highway commission mined paving gravel. Jesse Miller collected various types of gem stones.

**Wayne.**—Nello L. Teer Co. and the State highway commission mined structural and paving sand. Harley Hines collected a small quantity of gem stones (petrified wood).

**Wilkes.**—W. E. Graham & Sons crushed granite for concrete and roads. Joe L. Snyder (Higgins mine) mined a small quantity of sheet mica. The State highway commission mined paving sand. Blue Ridge Minerals collected a small quantity of gem stones (jasper agate).

**Wilson.**—Superior Stone Co. (Neverson and Elm City quarries) crushed granite for concrete and roads. Five mines produced structural, paving, and fill sand. The leading producers were Gray Concrete Pipe Co., Inc., and the State highway commission.

**Yadkin.**—W. E. Graham & Sons crushed granite for concrete and roads at the Cycle quarry. E. R. Short & Sons crushed limestone for concrete and roads. The State highway commission mined paving sand.

**Yancey.**—Twenty-four mines produced mica; 21 produced sheet only (full-trimmed and/or hand-cobbed), 3 scrap only. The leading producers of sheet mica were Gouge & Allan (Barber mine) and Ledford & Baker (Green Mountain mine). The leading producer of scrap mica was Deneen Mica Co. (Young Mica mine).

The Feldspar Corp. (Webb Strip mine) and Yates Laws (Anglin mine) mined crude feldspar. C. R. Wiseman mined olivine at the Wray mine. Powhatan Mining Co. mined asbestos at the Blue Rock mine. McCrary Construction Service and Yancey Sand & Gravel Co. (Fox mine) mined paving sand and gravel. Floyd Wilson and Robert A. Campbell collected various types of gem stones.

# The Mineral Industry of North Dakota

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the State Geological Survey of North Dakota.**

By D. H. Mullen [1]

NORTH DAKOTA'S 1960 mineral production was valued at $78.3 million, a gain of 16 percent over 1959. The mineral fuels—coal (lignite), natural gas, natural gas liquids, and crude petroleum—represented 91 percent of the total value of all mineral production in the State and as a group, rose 17 percent in value over the preceding year. Production gains were recorded for all of the mineral fuels. Of particular interest was the second annual increase in the output of lignite, following the steady decline that had begun in 1956.

Although exploratory and development drilling was at a lower rate than in 1959, the number of exploratory wells completed was only two less. Six new fields and a new producing horizon were discovered. Wider well spacing (160 and 320 acres) resulted in fewer development wells completed, but development of the fields was accelerated and greater production was achieved with fewer wells.

**TABLE 1.—Mineral production in North Dakota [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays [2] thousand short tons | 61 | $79 | 102 | $129 |
| Coal (lignite) do | 2,413 | 5,426 | 2,525 | 5,790 |
| Gem stones | (3) | 1 | (3) | 1 |
| Natural gas million cubic feet | 17,915 | 1,774 | 19,483 | 2,221 |
| Petroleum (crude) thousand 42-gallon barrels | 17,824 | 49,907 | [4] 21,954 | [4] 59,495 |

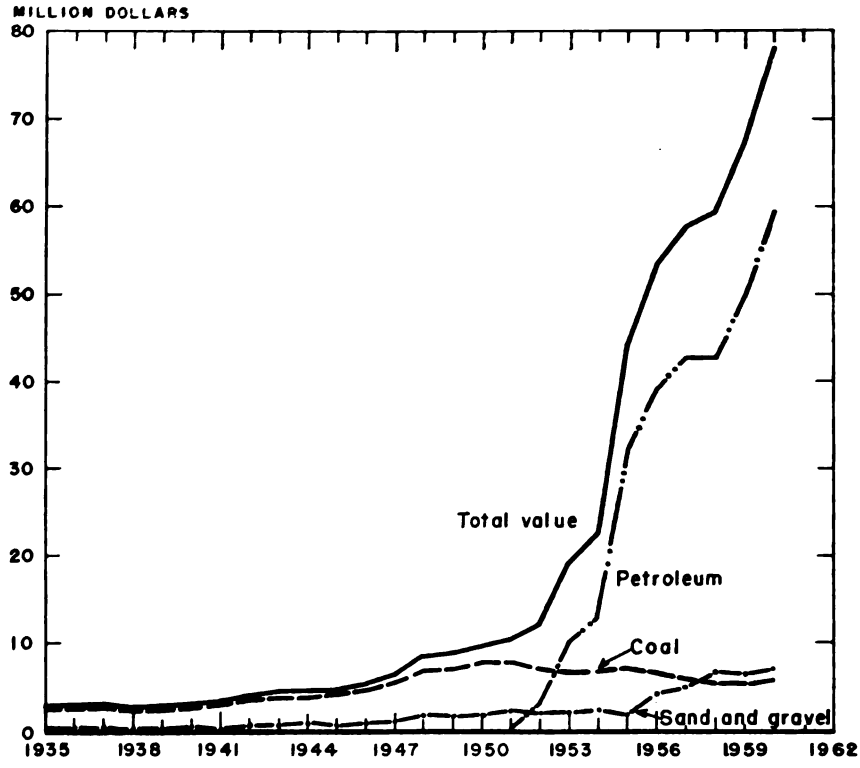

FIGURE 1—Value of sand and gravel, petroleum, and coal, and total value of mineral production in North Dakota, 1935–60.

Gains were recorded in the production and value of all of the nonmetal commodities except sand and gravel and stone. A significant development was the beginning of salt production by hydraulic mining from wells in Williams County, a mining activity that will create storage facilities for liquid-petroleum gases.

**Employment and Injuries.**—Employment and injuries data in the mineral industry, excluding petroleum, collected during the Bureau of Mines annual canvass, are shown on table 2.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

**Coal (Lignite).**—Coal production from 32 mines (31 strip, 1 underground) continued to increase, gaining 5 percent in quantity and 7 percent in value over 1959.

North Dakota Nitrogen, Inc., abandoned plans to produce nitrogen fertilizer from the lignite stored at the Garrison Dam or from natural gas. The Otter Tail Power Co. new 53.5-megawatt Hoot Lake steam-generating plant at Fergus Falls, Minn., was the largest in the United States using North Dakota lignite as fuel. Although pul-

Digitized by Google

verizing and handling equipment and boiler-furnace volume had to be larger than would be required for bituminous coal, the use of lignite resulted in a substantially lower unit-production cost. A group of five utility companies commissioned consultants to survey the power-supply needs in the general North Dakota area and to investigate the sources and availability of lignite. Midwest Electric Consumers Association discussed plans to form a giant cooperative that would include constructing five lignite-fuel, 200-megawatt steam-generating plants in North and South Dakota. The plan included using Bureau of Reclamation transmission lines and constructing a 345-kilovolt transmission line from Garrison to Watertown, S. Dak. The power generated would be marketed in parts of Montana, North and South Dakota, Minnesota, and Iowa. Generators Nos. 4 and 5 completed at the Garrison Dam brought capacity to the designed total of 400 megawatts.

**TABLE 2.—Employment and injuries in the mineral industries[1] in 1960[2]**

| Industry | Number of operations | Average number of men employed | Total man-hours worked | Injuries | | Frequency rate (injuries per million man-hours) |
|---|---|---|---|---|---|---|
| | | | | Fatal | Nonfatal | |
| Coal mines | 40 | 370 | 576,189 | 1 | 18 | 33.0 |
| Nonmetal mines | 6 | 81 | 105,016 | | 3 | 28.6 |
| Quarries | 5 | 5 | 7,888 | | | |
| Sand and gravel plants | 147 | 892 | 1,035,742 | 2 | 11 | 12.6 |
| Total | 198 | 1,348 | 1,724,835 | 3 | 32 | 20.3 |

[1] Excludes petroleum industry.
[2] Preliminary figures.

**TABLE 3.—Coal (lignite) production, by counties**

(Excludes mines producing less than 1,000 short tons)

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Average value per ton[1] | Short tons | Average value per ton[1] |
| Adams | 20,310 | $3.53 | 11,787 | $3.80 |
| Bowman | 157,609 | 1.77 | 147,279 | 1.74 |
| Burke | 399,297 | 2.33 | 406,600 | 2.27 |
| Burleigh | 14,382 | 3.31 | 14,132 | 3.33 |
| Divide | 207,370 | 2.88 | 227,720 | 2.57 |
| Dunn | 6,135 | 2.91 | 5,793 | 3.00 |
| Grant | 24,305 | 3.23 | 21,181 | 3.03 |
| Hettinger | 6,811 | 3.39 | 5,000 | 3.30 |
| McLean | 91,560 | 3.24 | 76,099 | 3.33 |
| Mercer | 925,057 | 1.95 | 1,019,039 | 2.18 |
| Morton | 24,066 | 2.50 | 21,844 | 2.59 |
| Oliver | 10,748 | 2.46 | 8,748 | 2.25 |
| Stark | 62,953 | 1.81 | 75,224 | 1.95 |
| Ward | 458,764 | 2.33 | 482,106 | 2.33 |
| Williams | 3,251 | 4.72 | 2,403 | 4.71 |
| Total | 2,412,618 | 2.25 | 2,524,955 | 2.29 |

[1] Value received or charged f.o.b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked as estimated by producer at average prices that might have been received if such coal had been sold commercially.)

Digitized by Google

Investigation into the gasification and use of lignites was continued by the Federal Bureau of Mines at the Charles R. Robertson Lignite Research Laboratory at Grand Forks. A research team at the laboratory perfected a device to produce synthesis gas that would be useful in manufacturing chemicals. A report [2] describing results of some of the research activities was published.

**Natural Gas.**—Dry natural gas from 28 wells in 2 fields in Bowman County and residual gas from the Tioga gasoline plant in Williams County were marketed through pipelines of the Montana-Dakota Utilities Co. to consumers in North and South Dakota, Montana, and Wyoming. Production of dry natural gas from Bowman County was 21 percent above that of 1959, and the quantity of residual gas marketed through pipelines increased 16 percent. According to State geologist reports,[3] total production of oil-well gas was 26.8 billion cubic feet, and that of dry natural gas was 396.3 million cubic feet.

**Natural Gas Liquids.**—Natural gasoline, butane, propane, and sulfur were recovered from oil-well gas at the Tioga gasoline plant operated by Signal Oil and Gas Co. in Williams County. Production statistics [4] compiled by the State Geological Survey showed that 17.6 billion cubic feet of gas was processed, and 21 thousand barrels of crude oil, 12.0 million gallons of natural gasoline, 21.1 million gallons of butane, 35.9 million gallons of propane, and 18,000 long tons of sulfur were recovered. Residual gas marketed through pipelines of the Montana-Dakota Utilities Co. totaled 9.3 billion cubic feet.

**Petroleum.**—Petroleum production from 1,592 wells in 77 fields in 12 counties was 23 percent above that of 1959. A total of 282 exploratory and development wells was completed, compared with 436 in 1959. Exploratory drilling proceeded at about the same rate as in 1959; only two less exploratory wells were completed. The decline was entirely in development drilling. The establishment of 160- and 320-acre spacing in some fields resulted in more rapid development of the pools, with fewer wells; 201 development wells were completed, compared with 352 in 1959. Two counties were added to those producing oil, Dunn County from the Lost Bridge field discovered late in 1959 and McHenry County from the Pratt field discovered in 1960. The State geologist [5] reported that 62 exploratory wells were completed, 7 of which were successful; 12 outpost wells completed, 5 successful; 32 extension, 23 successful; and 158 development, 122 successful. The total drilled was 1.7 million feet, compared with 2.7 million feet in 1959. The success ratio for exploratory drilling was 11.3 percent, and the overall success ratio was 59.5 percent. In addition to the discovery in McHenry County, new fields were discovered in Billings, Bottineau, Bowman, Burke, McKenzie, and Renville Counties.

## NONMETALS

**Clays.**—Miscellaneous clay for manufacturing building brick, drain-tile, other heavy clay products, and lightweight aggregate was produced in Adams, Divide, and Morton Counties. Fire clay produced in Stark County was used for manufacturing heavy clay products.

Digitized by Google

A small quantity of bentonite in Morton County—67 percent greater than in 1959—was produced for manufacturing mortar.

**Gem Stones.**—Gem stones and gem material (agate, agatized wood, chalcedony, jasper, and quartzite) were collected by individuals, mostly in Billings, Morton, and Stark Counties.

**Salt.**—Salt mining and processing began in North Dakota in June, with opening of the $2 million plant of Dakota Salt & Chemical Co. near Williston in Williams County. Salt was recovered by hydraulic mining from beds 230 feet thick at a depth of 8,000 feet. The brine pumped from the wells was processed in vacuum pans.

**Sand and Gravel.**—Sand and gravel production, from 49 of the State's 53 counties, was 13 percent below that of 1959. Production was reported by 35 commercial operators in 20 counties and at 80 Government-contractor operations in 46 counties. State and county crews produced sand and gravel in 24 counties; contractors furnished the remainder of the noncommercial production.

**TABLE 6.—Sand and gravel sold or used by producers, by classes of operations and uses**

(Thousand short tons and thousand dollars)

| Class of operation and use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Commercial operations: | | | | |
| Construction sand: | | | | |
| Building | 310 | $376 | 341 | $395 |

Digitized by Google

Commercial firms supplied 38 percent of the total production of sand and gravel, which was used for building, paving, railroad ballast, fill, and other purposes. Noncommercial production was used entirely for road construction. Major production came from Stutsman (748,800 tons), Ward (492,500 tons), Walsh (391,300 tons), McKenzie (324,300 tons), Barnes (315,500 tons), and Cavalier (314,000 tons) Counties.

Construction of the National System of Interstate and Defense Highways continued. Because the Bureau of Public Roads changed its method of reporting progress in 1960, no comparable data exist for 1959; however, a report[6] showed that from July 1, 1956, to December 31, 1960, 137.7 miles of the Interstate System had been completed to full standards; 59.3 miles had been improved to standards adequate for current traffic; 31.3 miles were under construction; and engineering and right-of-way acquisition had started on 19.5 miles. Total designated mileage of the system in North Dakota was 567.9 miles, leaving 320.1 miles to be planned and built. Under the Federal-aid program for primary, secondary, and urban highways, 1,684.1 miles were completed in 1960; and at yearend 610.5 miles were under construction.

**Stone.**—Crushed stone, produced by contractors for the State highway department for road construction, was 42 percent below that of 1959.

**Sulfur.**—Shipments of sulfur recovered from natural gas at the Tioga gasoline plant in Williams County totaled 20,339 long tons, a 45-percent increase over 1959. The value of sulfur recovered from processing plants was not included in the State totals of mineral production because the plant sources could not be determined.

**Vermiculite.**—Crude vermiculite from deposits in Montana was exfoliated at a plant in Ward County for use as insulation, lightweight aggregate, and soil conditioner.

## METALS

**Uranium.**—The Atomic Energy Commission (AEC) approved for execution a contract with the International Resources Corp. of Casper, Wyo., for the purchase of uranium concentrate derived from uraniferous lignites, subject to two conditions: (1) that the city of Bowman, site of the proposed plant, make available adequate financing for constructing the plant (estimated to cost from $2 to $3 million); and (2) that Susquehanna Western, Inc., of Edgemont, S. Dak., enter into an agreement to manage and operate the plant and to supply working capital. Initial daily capacity of the plant was to be 200 tons of crude lignite. At yearend the conditions set forth had not been met fully.

## REVIEW BY COUNTIES

**Billings.**—Petroleum production from 28 wells in 4 fields increased 30 percent compared with 1959. The major gain was from the Heath

Cranberry Magnetite Corp. continued development work and mined a small quantity of magnetite at the Cranberry mine. McCrary Construction Service and the State highway commission mined paving gravel.

**Beaufort.**—J. D. McCotter, Inc., and the State highway commission mined structural and paving sand.

**Bertie.**—The State highway commission mined 1,600 tons of paving sand.

**Bladen.**—The State highway commission mined 3,500 tons of granite and 109,000 tons of sand for concrete and roads.

**Brunswick.**—The State highway commission mined 15,000 tons of paving sand.

**Buncombe.**—Six operators mined structural, paving, and railroad ballast sand and gravel. The leading producers were Grove Stone & Sand Branch of B. V. Hedrick Gravel & Sand Co. (Grove mine) and McCrary Construction Service (Barnardsville and Swannanoa mines). Asheville Construction Co. and the State highway commission (Weaverville quarry) crushed granite for concrete and roads.

**Burke.**—McCrary Construction Service (Lake James mine), A. P. Causby Sand & Stone Co., and the State highway commission mined paving sand and gravel. Stokes Buchanan mined a small quantity of mica at the Emma mine. Herby Bolick collected a small quantity of gem stones (zeolites). Great Lakes Carbon Corp. manufactured carbon and graphite products at its plant in Morganton.

**Cabarrus.**—Lee White Gravel Pit and the State highway commission crushed 99,000 tons of granite for concrete and roads.

**Caldwell.**—Miller Bros. Co. and the State highway commission mined 124,000 tons of sand and gravel for structural and paving uses.

**Camden.**—The State highway commission mined 3,000 tons of paving sand.

**Carteret.**—The State highway commission mined 3,000 tons of paving sand.

**Caswell.**—W. E. Graham & Sons, a division of Vulcan Materials Co. (Danville quarry), and the State highway commission (Ivy Bluff quarry) crushed granite for concrete and roads. The State highway commission mined 42,000 tons of paving sand.

**Catawba.**—Superior Stone Co. (Hickory quarry) crushed granite for concrete and roads. Statesville Brick Co. mined miscellaneous clay for heavy clay products. The State highway commission mined 53,000 tons of paving sand.

**Chatham.**—Pomona Terra Cotta Co., Boren Clay Products Co. (Gulf mine), Chatham Brick and Tile Co. Inc., and Cherokee Brick Co. (Brickhaven mine) mined miscellaneous clay for heavy clay products. The State highway commission (Goldston quarry) crushed 71,000 tons of traprock for concrete and roads.

**Cherokee.**—Columbia Marble Co. (Pleasant Valley quarry) quarried dimension marble; rough block, sawed and cut interior stone; cut, dressed monumental stone; and crushed marble for terrazzo and other uses. Hitchcock Corp. (Nancy Jordan mine) and Minerals & Metals Corp. (Mulberry Gap mine) mined talc for ceramics, crayons, textiles, toilet preparations, and other uses. J. L. Colville Construction Co. and the State highway commission (Dockery quarry) crushed

Digitized by Google

granite for concrete and roads. Harley Hines collected a small quantity of mineral specimens (talc).

**Chowan.**—The State highway commission mined 2,800 tons of paving sand.

**Clay.**—Nantahala Talc & Limestone Co. mined 36,000 tons of paving gravel.

**Cleveland.**—Cleveland County ranked fifth in value of mineral production. Superior Stone Co. (Kings Mountain quarry) crushed limestone for concrete and roads. Ten mica mines were operated in 1960. The leading producer of sheet mica was Joe L. Snyder (Workman and Huskins mines). Kings Mountain Mica Co. Inc. (Patterson and Moss mines), Industrial Mica, Inc., and Foote Mineral Co. (Kings Mountain mine) produced scrap mica.

Foote Mineral Co. mined and processed lithium minerals at Kings Mountain and also produced a small quantity of crude feldspar. Lithium Corp. of America processed lithium minerals. Shelby Sand & Stone Co. and the State highway commission mined structural and paving sand.

**Columbus.**—The State highway commission mined 82,000 tons of sand and 4,700 tons of granite for concrete and roads.

**Craven.**—Superior Stone Co. (New Bern quarry) crushed limestone for concrete and roads. Southern Sand Co., Inc., and the State highway commission mined structural and paving sand.

**Cumberland.**—Becker County Sand & Gravel Co. (Fayetteville mine) and the State highway commission mined sand and gravel for structural, paving, and railroad ballast uses. Ideal Brick Co. (Linden mine) mined 54,000 tons of miscellaneous clay for heavy clay products. The State highway commission crushed 2,900 tons of granite for concrete and roads.

**Currituck.**—The State highway commission mined 18,000 tons of paving sand.

**Dare.**—The State highway commission mined 78,000 tons of paving sand.

**Davidson.**—Jacob's Creek Flagstone Co., Inc. (Flagstone quarry) quarried dimension slate for structural millstock and flagging. Cunningham Brick Co. (Thomasville mine) mined miscellaneous clay for heavy clay products. The State highway commission mined 195,000 tons of paving sand and gravel.

**Davie.**—The State highway commission mined 95,000 tons of paving sand. Ruth P. Stanley collected a small quantity of gem stones (almandite garnets).

**Duplin.**—James W. Kelley and the State highway commission mined 8,100 tons of structural, paving, and fill sand.

**Durham.**—Nello L. Teer Co. crushed traprock for concrete and roads. Borden Brick & Tile Co. and Tri-Angle Brick Co. mined miscellaneous clay for heavy clay products.

**Edgecombe.**—O. H. Woolard Sand & Gravel Co., Tar River Sand & Gravel Co., and the State highway commission mined structural, paving, and fill sand and gravel.

**Forsyth.**—W. E. Graham & Sons crushed granite for concrete and roads at the South Fork, No. 421, Piedmont, and North quarries. Paul Miller and the State highway commission mined 108,000 tons of structural and paving sand.

The leading producer of sheet mica was Joe L. Snyder (Workman and Huskins mines). Kings Mountain Mica Co. Inc. (Patterson and Moss mines), Industrial Mica, Inc., and Foote Mineral Co. (Kings Mountain mine) produced scrap mica.

Foote Mineral Co. mined and processed lithium minerals at Kings Mountain and also produced a small quantity of crude feldspar. Lithium Corp. of America processed lithium minerals. Shelby Sand & Stone Co. and the State highway commission mined structural and paving sand.

**Columbus.**—The State highway commission mined 82,000 tons of sand and 4,700 tons of granite for concrete and roads.

**Craven.**—Superior Stone Co. (New Bern quarry) crushed limestone for concrete and roads. Southern Sand Co., Inc., and the State highway commission mined structural and paving sand.

**Cumberland.**—Becker County Sand & Gravel Co. (Fayetteville mine) and the State highway commission mined sand and gravel for structural, paving, and railroad ballast uses. Ideal Brick Co. (Linden mine) mined 54,000 tons of miscellaneous clay for heavy clay products. The State highway commission crushed 2,900 tons of granite for concrete and roads.

**Currituck.**—The State highway commission mined 18,000 tons of paving sand.

**Dare.**—The State highway commission mined 78,000 tons of paving sand.

**Davidson.**—Jacob's Creek Flagstone Co., Inc. (Flagstone quarry) quarried dimension slate for structural millstock and flagging. Cunningham Brick Co. (Thomasville mine) mined miscellaneous clay for heavy clay products. The State highway commission mined 195,000 tons of paving sand and gravel.

**Davie.**—The State highway commission mined 95,000 tons of paving sand. Ruth P. Stanley collected a small quantity of gem stones (almandite garnets).

**Duplin.**—James W. Kelley and the State highway commission mined 8,100 tons of structural, paving, and fill sand.

**Durham.**—Nello L. Teer Co. crushed traprock for concrete and roads. Borden Brick & Tile Co. and Tri-Angle Brick Co. mined miscellaneous clay for heavy clay products.

**Edgecombe.**—O. H. Woolard Sand & Gravel Co., Tar River Sand & Gravel Co., and the State highway commission mined structural, paving, and fill sand and gravel.

**Forsyth.**—W. E. Graham & Sons crushed granite for concrete and roads at the South Fork, No. 421, Piedmont, and North quarries. Paul Miller and the State highway commission mined 108,000 tons of structural and paving sand.

and J. L. Colville Construction Co. crushed granite for concrete and roads.

**Johnston.**—Nello L. Teer Co. (Princeton quarry) crushed traprock for concrete and roads. The State highway commission mined 34,000 tons of paving sand.

**Jones.**—Simmons Marl & Lime Co. and the State highway commission mined paving and fill sand and gravel.

**Lee.**—Sanford Brick & Tile Co. (Colon mine), Borden Brick & Tile Co. (Sanford mine), Lee Brick & Tile Co., and Hanford Brick Co. mined miscellaneous clay for heavy clay products. The State highway commission mined 58,000 tons of paving sand.

**Lenoir.**—Barrus Construction Co. (Kinston mine) and the State highway commission mined sand and gravel for structural, paving, and fill purposes.

**Lincoln.**—Duke Power Co. crushed granite for concrete, roads, and stone sand. Edward McNeil (J. C. Willis mine) and Joe L. Snyder (Caggle mine) mined a small quantity of sheet mica. The State highway commision mined 27,000 tons of paving sand. Green's Mineral & Gift Shop collected a small quantity of gem stones (amethyst).

**Macon.**—Seventeen mines produced mica. The leading producers were Roy H. Fouts (Almond Cove mine), Jamaco Minerals Development Corp. (Lyle Knob mine), and Jess Gentry (Rock Cut and Iotla-Bowers mines). The leading producer of scrap mica was A & C Mining Co. (Sheppard Knob mine).

J. L. Colville Construction Co. crushed granite for concrete and roads. Hays Block Co. (Franklin mine) mined structural sand. R. A. Campbell, Harley Hines, and Andrew W. Reed collected small quantities of gem stones (corundum and rhodolite garnet).

**Madison.**—The State highway commission mined 2,000 tons of paving sand.

**Martin.**—The State highway commission mined 3,700 tons of paving sand.

**McDowell.**—Becker County Sand & Gravel Co. (Marion mine) and McCrary Construction Service (Woodlawn mine) mined sand and gravel for structural, paving, and railroad ballast uses. The State highway commission (Woodlawn quarry) crushed limestone for concrete and roads.

**Mecklenburg.**—Superior Stone Co. (Charlotte and Pineville quarries) crushed granite for concrete and roads.

**Mitchell.**—Mitchell County ranked first in value of mineral production. Eleven mines produced crude feldspar. The leading producers were International Minerals & Chemical Corp. (Hawkins and Kona mines), The Feldspar Corp. (Wiseman, Poteat, and Sullins mines), and Lawson-United Feldspar & Minerals Co. (Minpro mine). Forty-seven mines produced mica: 35 produced sheet only (full-trimmed and/or hand-cobbed), 6 scrap only, and 6 both sheet and scrap. The leading producers of sheet mica were McBee Mining Co. (McBee mine), Sink Hole Miners (Sink Hole mine), and Abernathy Mining Co. (Abernathy and Abernathy No. 2 mines). The leading producers of scrap mica were The Feldspar Corp. (Poteat and Wiseman mines), International Minerals & Chemical Corp. (Kona, Bartlette, and Jeff Buchanan mines), and De-Weld Mica Co. (Sparks Strip mine).

Digitized by Google

International Minerals & Chemical Corp., The Feldspar Corp., and Lawson-United Feldspar & Minerals Co. recovered crushed sandstone (quartz) from feldspar milling. Blue Ridge Minerals, Herby Bolick, Ruth P. Stanley, Roby Buchanan, and Harley Hines collected small quantities of gem stones (hyalite on matrix, actinolite in talc, massive rhodonite, almandite garnet, fluorescent calcite, and beryl).

**Montgomery.**—Mt. Gilead Brick Co. mined miscellaneous clay for heavy clay products. Jacob's Creek Flagstone Co. (Edenboro quarry) quarried dimension slate for structural millstock and flagging. T & H Clay Co. Inc. (Auman mine) mined pyrophyllite for ceramics. The State highway commission mined 75,000 tons of paving sand.

**Moore.**—Standard Mineral Co., Inc. and Carolina Pyrophyllite Co., Inc., mined pyrophyllite for ceramics, insecticides, paint, rubber, plaster, refractories, and other uses. Pleasants Sand & Supply Co., Monroe Sand Pit, Aberdeen Sand & Gravel Co., and the State highway commission mined structural, paving, and fill sand. T & H Clay Co. (Hancock mine) mined miscellaneous clay for heavy clay products. Harley Hines collected a small quantity of gem stones (pyrite in pyrophyllite).

**New Hanover.**—W. E. Graham & Sons crushed limestone for concrete and roads. Robbins Sand Pit and the State highway commission mined paving and fertilizer filler sand.

**Northampton.**—Superior Stone Co. (Garysburg mine) and the State highway commission mined structural and paving sand and gravel.

**Onslow.**—Superior Stone Co. (Belgrade quarry) crushed limestone for concrete and roads. The State highway commission mined 6,000 tons of paving sand.

**Orange.**—Piedmont Minerals Co., Inc. (Hillsboro mine), mined pyrophyllite for asphalt filler, ceramics, and refractories. Duke University, (Hillsboro quarry) quarried dimension granite for rough construction use. The State high commission (Bacon quarry) crushed granite for concrete and roads.

**Pamlico.**—The State highway commission mined 4,000 tons of paving sand.

**Pasquotank.**—The State highway commission mined 15,000 tons of paving sand.

**Pender.**—The State highway commission mined 6,000 tons of paving sand.

**Perquimans.**—The State highway commission mined 17,500 tons of paving sand.

**Person.**—The State highway commission mined 5,000 tons of paving sand.

**Pitt.**—Concrete Products Co., White Concrete Co. (Munford mine), and the State highway commission mined structural, paving, and fill sand and gravel.

**Randolph.**—The State highway commission (Glenola and Parks Cross Roads quarries) crushed granite for concrete and roads. Superior Stone Co. crushed traprock for concrete and roads. Carolina Pyrophyllite Co. (Gerhardt mine) mined pyrophyllite for ceramic and insecticide uses. Herby Bolick and Harley Hines collected a small quantity of mineral specimens (pyrophyllite).

**Richmond.**—The State highway commission (McLeod mine) mined 25,000 tons of paving sand and gravel.

Digitized by Google

**Robeson.**—The State highway commission mined 4,000 tons of granite and 161,000 tons of sand for concrete and roads.

**Rockingham.**—Superior Stone Co. (Reidsville quarry) crushed granite for concrete and roads. Webster Brick Co., Inc. (Draper mine), mined miscellaneous clay for heavy clay products. Garland W. & Morris Hall (Kings quarry) crushed traprock for concrete and roads. The State highway commission mined paving sand.

**Rowan.**—Seven quarries produced dimension granite for use as rubble, rough and dressed construction stone, rough and dressed architectural stone, rough monumental stone, paving blocks, and curbing and flagging. The leading producer was Harris Granite Quarries Co. (Collins, Balfour, and Shuping quarries). Superior Stone Co. (Woodleaf quarry) crushed granite for concrete and roads. Gardner Granite Works produced millstones.

Carolina Tufflite Co. and Isenhour Brick & Tile Co. (East Spencer mine) mined miscellaneous clay for lightweight aggregate and heavy clay products. The State highway commission mined paving sand. Carolina Perlite Co., Inc., expanded perlite at the Gold Hill plant.

**Rutherford.**—A. R. Thompson, contractor, and the State highway commission mined sand and gravel for paving and other uses. Green's Mineral and Gift Shop collected a small quantity of gem stones (fuchsite).

**Sampson.**—Crumpler Brick Co., Inc., Sampson Brick Co., Inc., and Patterson Brick Co. mined miscellaneous clay for heavy clay products. The State highway commission mined 10,000 tons of paving sand.

**Stanly.**—Southern Lightweight Aggregate Corp. (Aquadale mine), Stanly Shale Products, Inc. (Norwood mine), and Yadkin Brick Yards, Inc., mined miscellaneous clay for lightweight aggregates and heavy clay products. The State highway commission crushed traprock for concrete and roads at the McManus quarry. Carolina Aluminum Co. produced aluminum metal at Badin.

**Stokes.**—Pine Hall Brick & Pipe Co. (No. 1 mine) mined miscellaneous clay for heavy clay products. Snow Hill Mining Co. (Spencer mine), J. E. Wilson (Hawkins and Steel mines), and Preacher Mining Co. (Old Shelton mine) mined sheet mica. The State highway commission mined 140,000 tons of paving sand.

**Surry.**—North Carolina Granite Corp. (Mount Airy quarry) quarried dimension granite for rubble, rough and dressed construction stone, rough and dressed architectural stone, rough and dressed monumental stone, curbing, flagging, and paving blocks. North Carolina Granite Corp. (Mount Airy quarry) and W. E. Graham & Sons (Mt. Airy and Elkins quarries) produced granite for riprap, poultry grit, concrete, and roadstone. Ararat Products Co. crushed traprock for concrete and roads. The State highway commission mined paving sand. Ruth P. Stanley collected a small quantity of gem stones (Carnellian and oriental sapphire).

**Swain.**—Nantahala Talc & Limestone Co. (Hewitt quarry) crushed limestone for concrete, roadstone, and agstone. The Feldspar Corp. (Alexander and McCracken mines) mined crude feldspar. J. L. Colville Construction Co. crushed granite for concrete and roads.

**Transylvania.**—Macon Construction Co., Inc. (Penrose quarry), crushed granite for concrete and roads. Powhatan Mining Co. (Kilpatrick mine) mined asbestos. Siniard Brothers and Coleman Scott mined structural sand. Jeter C. Kitchen (Toxaway mine) mined

Digitized by Google

a small quantity of sheet mica. E. I. du Pont de Nemours & Co., Inc., produced high-purity silicon at Brevard.

**Union.**—Kendrick Brick & Tile Co. (Monroe mine) mined miscellaneous clay for heavy clay products. Superior Stone Co. (Bakers quarry) and the State Highway commission (Monroe quarry) crushed traprock for concrete and roads. The State highway commission mined paving sand.

**Vance.**—Vance County ranked fourth in value of mineral production. Tungsten Mining Corp. mined tungsten ore at the Hamme mine and recovered gold, silver, copper, and lead from mill tailings accumulated in previous years. W. E. Graham & Sons crushed granite for concrete, roadstone, and railroad ballast at the Greystone quarry. The State highway commission mined paving sand.

**Wake.**—Superior Stone Co. (Crabtree and Rolesville quarries) and Nello L. Teer Co. (Raleigh quarry) crushed granite for concrete, roadstone, and railroad ballast. The State highway commission mined paving sand.

**Washington.**—The State highway commission mined 11,000 tons of paving sand.

**Watauga.**—Maymead Lime Co., Inc., and the State highway commission mined paving gravel. Jesse Miller collected various types of gem stones.

**Wayne.**—Nello L. Teer Co. and the State highway commission mined structural and paving sand. Harley Hines collected a small quantity of gem stones (petrified wood).

**Wilkes.**—W. E. Graham & Sons crushed granite for concrete and roads. Joe L. Snyder (Higgins mine) mined a small quantity of sheet mica. The State highway commission mined paving sand. Blue Ridge Minerals collected a small quantity of gem stones (jasper agate).

**Wilson.**—Superior Stone Co. (Neverson and Elm City quarries) crushed granite for concrete and roads. Five mines produced structural, paving, and fill sand. The leading producers were Gray Concrete Pipe Co., Inc., and the State highway commission.

**Yadkin.**—W. E. Graham & Sons crushed granite for concrete and roads at the Cycle quarry. E. R. Short & Sons crushed limestone for concrete and roads. The State highway commission mined paving sand.

**Yancey.**—Twenty-four mines produced mica; 21 produced sheet only (full-trimmed and/or hand-cobbed), 3 scrap only. The leading producers of sheet mica were Gouge & Allan (Barber mine) and Ledford & Baker (Green Mountain mine). The leading producer of scrap mica was Deneen Mica Co. (Young Mica mine).

The Feldspar Corp. (Webb Strip mine) and Yates Laws (Anglin mine) mined crude feldspar. C. R. Wiseman mined olivine at the Wray mine. Powhatan Mining Co. mined asbestos at the Blue Rock mine. McCrary Construction Service and Yancey Sand & Gravel Co. (Fox mine) mined paving sand and gravel. Floyd Wilson and Robert A. Campbell collected various types of gem stones.

# The Mineral Industry of North Dakota

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the State Geological Survey of North Dakota.**

By D. H. Mullen [1]

NORTH DAKOTA'S 1960 mineral production was valued at $78.3 million, a gain of 16 percent over 1959. The mineral fuels—coal (lignite), natural gas, natural gas liquids, and crude petroleum—represented 91 percent of the total value of all mineral production in the State and as a group, rose 17 percent in value over the preceding year. Production gains were recorded for all of the mineral fuels. Of particular interest was the second annual increase in the output of lignite, following the steady decline that had begun in 1956.

Although exploratory and development drilling was at a lower rate than in 1959, the number of exploratory wells completed was only two less. Six new fields and a new producing horizon were discovered. Wider well spacing (160 and 320 acres) resulted in fewer development wells completed, but development of the fields was accelerated and greater production was achieved with fewer wells.

**TABLE 1.—Mineral production in North Dakota [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays [2] thousand short tons | 61 | $79 | 102 | $129 |
| Coal (lignite) do | 2,413 | 5,426 | 2,525 | 5,790 |
| Gem stones | (3) | 1 | (3) | 1 |
| Natural gas million cubic feet | 17,915 | 1,774 | 19,483 | 2,221 |
| Petroleum (crude) thousand 42-gallon barrels | 17,824 | 49,907 | [4] 21,954 | [4] 59,495 |
| Sand and gravel thousand short tons | 9,883 | 6,516 | 8,648 | 6,904 |
| Stone do | 48 | 84 | 28 | 44 |
| Value of items that cannot be disclosed: Clays (bentonite and fire clay, 1960), natural gas liquids, and salt (1960) | ---- | 3,555 | ---- | 3,691 |
| Total North Dakota | ---- | [5] 67,342 | ---- | 78,275 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Excludes bentonite and fire clay (1960); included with "Value of items that cannot be disclosed."
[3] Weight not recorded.
[4] Preliminary figure.
[5] Revised figure.

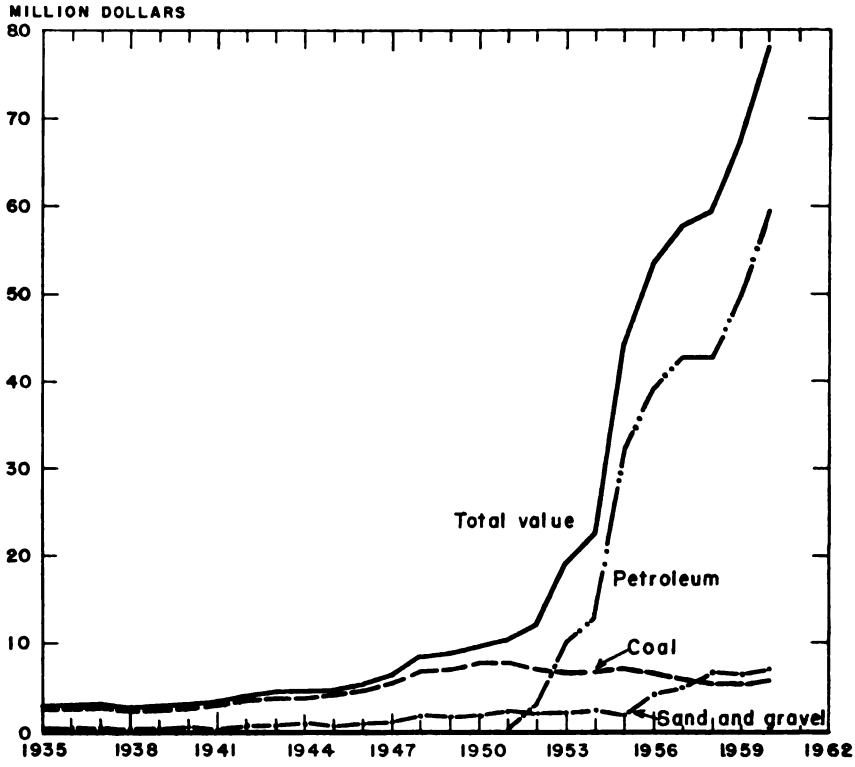

FIGURE 1—Value of sand and gravel, petroleum, and coal, and total value of mineral production in North Dakota, 1935–60.

Gains were recorded in the production and value of all of the nonmetal commodities except sand and gravel and stone. A significant development was the beginning of salt production by hydraulic mining from wells in Williams County, a mining activity that will create storage facilities for liquid-petroleum gases.

**Employment and Injuries.**—Employment and injuries data in the mineral industry, excluding petroleum, collected during the Bureau of Mines annual canvass, are shown on table 2.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

**Coal (Lignite).**—Coal production from 32 mines (31 strip, 1 underground) continued to increase, gaining 5 percent in quantity and 7 percent in value over 1959.

North Dakota Nitrogen, Inc., abandoned plans to produce nitrogen fertilizer from the lignite stored at the Garrison Dam or from natural gas. The Otter Tail Power Co. new 53.5-megawatt Hoot Lake steam-generating plant at Fergus Falls, Minn., was the largest in the United States using North Dakota lignite as fuel. Although pul-

Digitized by Google

verizing and handling equipment and boiler-furnace volume had to be larger than would be required for bituminous coal, the use of lignite resulted in a substantially lower unit-production cost. A group of five utility companies commissioned consultants to survey the power-supply needs in the general North Dakota area and to investigate the sources and availability of lignite. Midwest Electric Consumers Association discussed plans to form a giant cooperative that would include constructing five lignite-fuel, 200-megawatt steam-generating plants in North and South Dakota. The plan included using Bureau of Reclamation transmission lines and constructing a 345-kilovolt transmission line from Garrison to Watertown, S. Dak. The power generated would be marketed in parts of Montana, North and South Dakota, Minnesota, and Iowa. Generators Nos. 4 and 5 completed at the Garrison Dam brought capacity to the designed total of 400 megawatts.

**TABLE 2.—Employment and injuries in the mineral industries[1] in 1960[2]**

| Industry | Number of operations | Average number of men employed | Total man-hours worked | Injuries | | Frequency rate (injuries per million man-hours) |
|---|---|---|---|---|---|---|
| | | | | Fatal | Nonfatal | |
| Coal mines | 40 | 370 | 576,189 | 1 | 18 | 33.0 |
| Nonmetal mines | 6 | 81 | 105,016 | ---------- | 3 | 28.6 |
| Quarries | 5 | 5 | 7,888 | ---------- | ---------- | ---------- |
| Sand and gravel plants | 147 | 892 | 1,035,742 | 2 | 11 | 12.6 |
| Total | 198 | 1,348 | 1,724,835 | 3 | 32 | 20.3 |

[1] Excludes petroleum industry.
[2] Preliminary figures.

**TABLE 3.—Coal (lignite) production, by counties**

(Excludes mines producing less than 1,000 short tons)

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Average value per ton[1] | Short tons | Average value per ton[1] |
| Adams | 20,310 | $3.53 | 11,787 | $3.80 |
| Bowman | 157,609 | 1.77 | 147,279 | 1.74 |
| Burke | 399,297 | 2.33 | 406,600 | 2.27 |
| Burleigh | 14,382 | 3.31 | 14,132 | 3.33 |
| Divide | 207,370 | 2.88 | 227,720 | 2.57 |
| Dunn | 6,135 | 2.91 | 5,793 | 3.00 |
| Grant | 24,305 | 3.23 | 21,181 | 3.03 |
| Hettinger | 6,811 | 3.39 | 5,000 | 3.30 |
| McLean | 91,560 | 3.24 | 76,099 | 3.33 |
| Mercer | 925,057 | 1.95 | 1,019,039 | 2.18 |
| Morton | 24,066 | 2.50 | 21,844 | 2.59 |
| Oliver | 10,748 | 2.46 | 8,748 | 2.25 |
| Stark | 62,953 | 1.81 | 75,224 | 1.95 |
| Ward | 458,764 | 2.33 | 482,106 | 2.33 |
| Williams | 3,251 | 4.72 | 2,403 | 4.71 |
| Total | 2,412,618 | 2.25 | 2,524,955 | 2.29 |

[1] Value received or charged f.o.b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked as estimated by producer at average prices that might have been received if such coal had been sold commercially.)

Digitized by Google

Investigation into the gasification and use of lignites was continued by the Federal Bureau of Mines at the Charles R. Robertson Lignite Research Laboratory at Grand Forks. A research team at the laboratory perfected a device to produce synthesis gas that would be useful in manufacturing chemicals. A report [2] describing results of some of the research activities was published.

**Natural Gas.**—Dry natural gas from 28 wells in 2 fields in Bowman County and residual gas from the Tioga gasoline plant in Williams County were marketed through pipelines of the Montana-Dakota Utilities Co. to consumers in North and South Dakota, Montana, and Wyoming. Production of dry natural gas from Bowman County was 21 percent above that of 1959, and the quantity of residual gas marketed through pipelines increased 16 percent. According to State geologist reports,[3] total production of oil-well gas was 26.8 billion cubic feet, and that of dry natural gas was 396.3 million cubic feet.

**Natural Gas Liquids.**—Natural gasoline, butane, propane, and sulfur were recovered from oil-well gas at the Tioga gasoline plant operated by Signal Oil and Gas Co. in Williams County. Production statistics [4] compiled by the State Geological Survey showed that 17.6 billion cubic feet of gas was processed, and 21 thousand barrels of crude oil, 12.0 million gallons of natural gasoline, 21.1 million gallons of butane, 35.9 million gallons of propane, and 18,000 long tons of sulfur were recovered. Residual gas marketed through pipelines of the Montana-Dakota Utilities Co. totaled 9.3 billion cubic feet.

**Petroleum.**—Petroleum production from 1,592 wells in 77 fields in 12 counties was 23 percent above that of 1959. A total of 282 exploratory and development wells was completed, compared with 436 in 1959. Exploratory drilling proceeded at about the same rate as in 1959; only two less exploratory wells were completed. The decline was entirely in development drilling. The establishment of 160- and 320-acre spacing in some fields resulted in more rapid development of the pools, with fewer wells; 201 development wells were completed, compared with 352 in 1959. Two counties were added to those producing oil, Dunn County from the Lost Bridge field discovered late in 1959 and McHenry County from the Pratt field discovered in 1960. The State geologist [5] reported that 62 exploratory wells were completed, 7 of which were successful; 12 outpost wells completed, 5 successful; 32 extension, 23 successful; and 158 development, 122 successful. The total drilled was 1.7 million feet, compared with 2.7 million feet in 1959. The success ratio for exploratory drilling was 11.3 percent, and the overall success ratio was 59.5 percent. In addition to the discovery in McHenry County, new fields were discovered in Billings, Bottineau, Bowman, Burke, McKenzie, and Renville Counties.

## NONMETALS

**Clays.**—Miscellaneous clay for manufacturing building brick, drain-tile, other heavy clay products, and lightweight aggregate was produced in Adams, Divide, and Morton Counties. Fire clay produced in Stark County was used for manufacturing heavy clay products.

Digitized by Google

A small quantity of bentonite in Morton County—67 percent greater than in 1959—was produced for manufacturing mortar.

**Gem Stones.**—Gem stones and gem material (agate, agatized wood, chalcedony, jasper, and quartzite) were collected by individuals, mostly in Billings, Morton, and Stark Counties.

**Salt.**—Salt mining and processing began in North Dakota in June, with opening of the $2 million plant of Dakota Salt & Chemical Co. near Williston in Williams County. Salt was recovered by hydraulic mining from beds 230 feet thick at a depth of 8,000 feet. The brine pumped from the wells was processed in vacuum pans.

**Sand and Gravel.**—Sand and gravel production, from 49 of the State's 53 counties, was 13 percent below that of 1959. Production was reported by 35 commercial operators in 20 counties and at 80 Government-contractor operations in 46 counties. State and county crews produced sand and gravel in 24 counties; contractors furnished the remainder of the noncommercial production.

**TABLE 6.—Sand and gravel sold or used by producers, by classes of operations and uses**

(Thousand short tons and thousand dollars)

| Class of operation and use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Commercial operations: | | | | |
| Construction sand: | | | | |
| Building | 310 | $376 | 341 | $395 |
| Paving | 202 | 192 | 34 | 48 |
| Fill | 96 | 67 | 9 | 8 |
| Other | 2 | 1 | 1 | (1) |
| Total sand | 610 | 636 | 385 | 451 |
| Construction gravel: | | | | |
| Building | 514 | 834 | 390 | 706 |
| Paving | 3,291 | 2,132 | 2,171 | 1,224 |
| Railroad ballast | 190 | 85 | 180 | 58 |
| Fill | 44 | 21 | 106 | 42 |
| Other | 11 | 18 | 28 | 13 |
| Miscellaneous gravel | ---- | ---- | 31 | 24 |
| Total gravel | 4,050 | 3,090 | 2,906 | 2,067 |
| Total sand and gravel | 4,660 | 3,726 | 3,291 | 2,518 |
| Government-and-contractor operations: | | | | |
| Sand: | | | | |
| Building | ---- | ---- | 7 | 9 |
| Paving | 138 | 70 | 420 | 243 |
| Total sand | 138 | 70 | 427 | 252 |
| Gravel: | | | | |
| Building | 44 | 27 | 47 | 64 |
| Paving | 5,041 | 2,693 | 4,883 | 4,070 |
| Total gravel | 5,085 | 2,720 | 4,930 | 4,134 |
| Total sand and gravel | 5,223 | 2,790 | 5,357 | 4,386 |
| All operations: | | | | |
| Sand | 748 | 706 | 812 | 703 |
| Gravel | 9,135 | 5,810 | 7,836 | 6,201 |
| Grand total | 9,883 | 6,516 | 8,648 | 6,904 |

[1] Less than $1,000.

Digitized by Google

Commercial firms supplied 38 percent of the total production of sand and gravel, which was used for building, paving, railroad ballast, fill, and other purposes. Noncommercial production was used entirely for road construction. Major production came from Stutsman (748,800 tons), Ward (492,500 tons), Walsh (391,300 tons), McKenzie (324,300 tons), Barnes (315,500 tons), and Cavalier (314,000 tons) Counties.

Construction of the National System of Interstate and Defense Highways continued. Because the Bureau of Public Roads changed its method of reporting progress in 1960, no comparable data exist for 1959; however, a report[6] showed that from July 1, 1956, to December 31, 1960, 137.7 miles of the Interstate System had been completed to full standards; 59.3 miles had been improved to standards adequate for current traffic; 31.3 miles were under construction; and engineering and right-of-way acquisition had started on 19.5 miles. Total designated mileage of the system in North Dakota was 567.9 miles, leaving 320.1 miles to be planned and built. Under the Federal-aid program for primary, secondary, and urban highways, 1,684.1 miles were completed in 1960; and at yearend 610.5 miles were under construction.

**Stone.**—Crushed stone, produced by contractors for the State highway department for road construction, was 42 percent below that of 1959.

**Sulfur.**—Shipments of sulfur recovered from natural gas at the Tioga gasoline plant in Williams County totaled 20,339 long tons, a 45-percent increase over 1959. The value of sulfur recovered from processing plants was not included in the State totals of mineral production because the plant sources could not be determined.

**Vermiculite.**—Crude vermiculite from deposits in Montana was exfoliated at a plant in Ward County for use as insulation, lightweight aggregate, and soil conditioner.

## METALS

**Uranium.**—The Atomic Energy Commission (AEC) approved for execution a contract with the International Resources Corp. of Casper, Wyo., for the purchase of uranium concentrate derived from uraniferous lignites, subject to two conditions: (1) that the city of Bowman, site of the proposed plant, make available adequate financing for constructing the plant (estimated to cost from $2 to $3 million); and (2) that Susquehanna Western, Inc., of Edgemont, S. Dak., enter into an agreement to manage and operate the plant and to supply working capital. Initial daily capacity of the plant was to be 200 tons of crude lignite. At yearend the conditions set forth had not been met fully.

## REVIEW BY COUNTIES

**Billings.**—Petroleum production from 28 wells in 4 fields increased 30 percent compared with 1959. The major gain was from the Heath

[6] Bureau of Public Roads, Quarterly Report on the Federal-Aid Highway Program, Dec. 31, 1960, press release BPR 61-6, Feb. 22, 1961.

Digitized by Google

formation in the Rocky Ridge and Fryburg fields. Production from the Madison limestone increased only slightly in the Fryburg field and declined in the Scoria field. The Black Tail field was discovered in August when the No. 1 Haag well was completed at a depth of 10,259 feet. Initial production was 70 barrels of petroleum per day on pump from the Fryburg formation at a depth of 9,915 to 9,925 feet.

**Bottineau.**—Production of petroleum from 225 wells in 17 fields was 11 percent greater than in 1959, and the county ranked fourth in output. Principal producing fields were the Newburg, from the Spearfish-Charles formation; Wiley, from the Madison limestone; and the South Westhope, from the Spearfish-Charles formation. Development was extensive at the Wiley field where 17 new wells were completed and at the South Westhope where 7 producers were drilled. Four successful development wells were completed at the Newburg field, the major producing field in the county. Great Northern Railway Co. began constructing a 110-mile crude-oil pipeline, the first segment of the lines to be between the Newburg field and Minot. Other segments were to serve fields in adjacent counties. From Minot the oil was to be shipped by rail to markets in the Minneapolis-St. Paul and Duluth-Superior areas.

**Bowman.**—Dry natural gas, from 28 wells, in the Eagle sandstone of the Cedar Creek and Little Missouri fields, was marketed through pipelines of the Montana-Dakota Utilities Co. Output was 20 percent more than in 1959.

Petroleum was produced from the Red River formation of the Little Missouri field. Two development wells were completed. Two producing horizons were discovered in the Cedar Creek field. The first, completed in February, pumped 41 barrels of petroleum per day from the Red River-Ordovician formation. The second, completed in July, flowed 50 barrels per day from the Madison limestone at a depth of 8,410 feet. These discoveries were at the eastern end of the Cedar Creek field that had produced dry natural gas from the Eagle sandstone for many years.

Coal production from the Peerless strip mine operated by the Knife River Coal Mining Co. was 7 percent below that of 1959. The county ranked fifth in coal production.

**Burke.**—The county ranked third in the production of coal and petroleum. Coal mined from the Kincaid strip mine, operated by Truax-Traer Coal Co., and the Bonsness, operated by LeRoy Bonsness, was 2 percent greater than in 1959.

Petroleum production came from 236 wells in 18 fields. Production was mostly from the Rival, North Tioga, Lignite, Portal, and Flaxton fields. One new field, the Gros Ventre, was discovered in March. The first production was 40 barrels of petroleum per day on pump from the Midale member of the Madison limestone at a depth of 7,580 to 7,590 feet. The discovery was 8.5 miles east of the North Tioga field. An extension well completed late in the year was a failure. Development continued at the Portal field (11 completions, all successful), Rival (6 completions, 2 failures), North Tioga (6 completions, 4 failures), and Flaxton (6 completions, 1 failure).

**TABLE 7.—Value of mineral production in North Dakota, by counties [1]**

| County | 1959 | 1960 [2] | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Adams | $92,635 | $148,791 | Sand and gravel, coal, clays. |
| Barnes | 361,700 | 315,600 | Sand and gravel. |
| Benson | 133,400 | 92,400 | Do. |
| Billings | 1,030,100 | 1,297,900 | Petroleum, sand and gravel, gem stones. |
| Bottineau | 5,503,200 | 5,726,500 | Petroleum, sand and gravel. |
| Bowman [3] | 317,713 | 401,945 | Coal, petroleum. |
| Burke [4] | 9,161,892 | 11,824,220 | Petroleum, coal, sand and gravel. |
| Burleigh | 451,743 | 379,046 | Sand and gravel, coal. |
| Cass | 452,700 | 180,800 | Sand and gravel. |
| Cavalier | 166,600 | 254,881 | Sand and gravel, stone. |
| Dickey | 78,700 | 30,800 | Sand and gravel. |
| Divide | 1,501,356 | 2,003,710 | Petroleum, coal, sand and gravel, clays. |
| Dunn | 24,155 | 174,779 | Petroleum, sand and gravel, coal. |
| Eddy | 221,300 | (5) | Sand and gravel. |
| Emmons | 158,100 | 18,700 | Do. |
| Foster | ---------- | 7,200 | Do. |
| Golden Valley | 5,000 | 800 | Do. |
| Grand Forks | 179,400 | 194,155 | Sand and gravel, stone. |
| Grant | 83,517 | 68,141 | Coal, sand and gravel. |
| Griggs | 8,000 | 5,400 | Sand and gravel. |
| Hettinger | 30,971 | 119,000 | Sand and gravel, coal. |
| Kidder | (5) | 15,400 | Sand and gravel. |
| LaMoure | 8,300 | 23,800 | Do. |
| Logan | 117,500 | 17,500 | Do. |
| McHenry | 104,500 | (5) | Sand and gravel, petroleum. |
| McIntosh | 207,200 | 2,000 | Sand and gravel. |
| McKenzie [4] | 14,122,600 | 16,814,200 | Petroleum, sand and gravel. |
| McLean | 437,518 | 262,277 | Coal, sand and gravel. |
| Mercer | 1,837,969 | (5) | Do. |
| Morton | 303,374 | 196,988 | Clays, coal, sand and gravel, gem stones. |
| Mountrail [4] | 4,193,500 | 4,236,100 | Petroleum, sand and gravel. |
| Nelson | 30,500 | 20,500 | Sand and gravel. |
| Oliver | 74,817 | 19,682 | Coal. |
| Pembina | 86,900 | 245,320 | Sand and gravel, stone. |
| Pierce | 23,200 | 37,200 | Sand and gravel. |
| Ramsey | 56,200 | 4,500 | Do. |
| Ransom | 23,800 | 61,900 | Do. |
| Renville | 561,100 | 2,447,000 | Petroleum. |
| Richland | 80,400 | 43,673 | Sand and gravel, stone. |
| Rolette | 31,800 | 39,800 | Sand and gravel. |
| Sargent | 71,300 | 68,100 | Do. |
| Sheridan | 30,200 | 53,100 | Do. |
| Sioux | 36,200 | 101,400 | Do. |
| Stark | [6] 270,088 | 259,298 | Coal, sand and gravel, petroleum, clays, gem stones. |
| Steele | 91,500 | 98,400 | Sand and gravel. |
| Stutsman | 606,900 | 380,500 | Do. |
| Towner | 3,800 | 900 | Do. |
| Traill | 142,500 | 95,700 | Do. |
| Walsh | 119,500 | 227,700 | Do. |
| Ward | 1,436,465 | 1,644,081 | Coal, sand and gravel. |
| Wells | 148,200 | 64,700 | Sand and gravel. |
| Williams [4] | [6] 15,759,815 | 17,141,662 | Petroleum, sand and gravel, salt, coal. |
| Undistributed [7] | [6] 6,361,800 | 10,406,930 | |
| Total | [6] 67,342,000 | 78,275,000 | |

[1] Slope County is not listed because no production was reported.
[2] Value of petroleum is preliminary.
[3] Excludes natural gas.
[4] Excludes natural gas, natural gas liquids, and recovered elemental sulfur.
[5] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[6] Revised figure.
[7] Includes natural gas liquids, natural gas, some sand and gravel, stone, gem stones (1960), and values indicated by footnote 5.

Sand and gravel for building and miscellaneous uses (33,500 tons) was produced by Sandberg Sand & Gravel, and sand and gravel for paving (91,500 tons) was produced by contractors for the State highway department and the Burke County Highway Department.

**Divide.**—Petroleum production from 29 wells in 3 fields was 63 percent greater than in 1959. Gains were recorded for the Baukol-Noonan and North Tioga fields. Six successful development wells

Digitized by Google

were completed in the North Tioga field. There was no production from the Writing Rock field. Eight exploratory wells, completed in the Baukol-Noonan and Writing Rock areas, were drilled to the Madison limestone and were dry. Coal production from the Baukol-Noonan strip mine was 10 percent above that of 1959. The county ranked fourth in coal production.

Miscellaneous clay was produced by Baukol-Noonan, Inc., for manufacturing lightweight aggregate. Sand and gravel (118,000 tons) was produced by Government crews and contractors, for the State highway department, the Divide County Highway Department, and the Tartuna Air Base, for use in building and road construction.

**Dunn.**—Petroleum production came from one well in the Lost Bridge field, discovered in 1960. Three wells completed in and to the south of the field were failures. Coal production from the Pelton strip mine was 6 percent below that of 1959. Paving sand and gravel (60,300 tons) was produced by and for the State highway department.

**McHenry.**—McHenry County became the 12th to produce petroleum when the Pratt field was discovered in June. Initial production potential of the discovery well was 96 barrels per day on pump from the Mission Canyon member of the Madison limestone at a depth of 4,201 to 4,213 feet.

Sand and gravel (118,000 tons) for use in building and road construction was produced by Government crews and contractors, for the State highway department, the Divide County Highway Department, and the Tartuna Air Base.

**McKenzie.**—The county ranked second in petroleum production and fourth in sand and gravel production. Petroleum output, from 389 wells in 17 fields, was 21 percent above that of 1959. Most of the production was from the Blue Buttes, Antelope (four horizons), Charlson, and Clear Creek fields. New producing horizons (Duperow and Silurian) were discovered at the Antelope field in March. The discovery well flowed 250 barrels of petroleum per day from the Duperow at a depth of 10,728 to 10,778 feet and 79 barrels per day from the Silurian at a depth of 11,727 to 11,826 feet. Another exploratory well (field unnamed), completed in September, pumped 12 barrels of petroleum per day from the Heath sandstone at a depth of 8,140 to 8,146 feet. Development drilling included 17 completions at the Blue Buttes field with 2 failures; Antelope, 5 completions with 1 failure; Charlson, 6 completions with 2 failures; Rough Rider, 3 completions with 1 failure; and Clear Creek, 5 successful completions.

Sand and gravel for road construction (324,300 tons) was produced by the McKenzie County Highway Department and by contractors for the State highway department.

**McLean.**—Coal extraction by Burns & Wretling Coal Co., Underwood Coal Co., and Truax-Traer Coal Co., operating the Custer strip mine, was 17 percent below that of 1959. Sand and gravel for road construction (14,500 tons) was produced by contractors for the State highway department, the Federal Bureau of Reclamation, and several townships.

**Mercer.**—The county continued to lead in coal production. Output from four strip mines was 10 percent above that of 1959. Major producers were the Knife River Coal Mining Co. operating the Beulah mine, The North American Coal Corp. operating the Indian Head,

Digitized by Google

and Truax-Traer Coal Co. operating the Dakota Star. Missouri River Sand & Gravel produced sand and gravel for building, paving, and fill; contractors produced paving gravel for the State highway department.

**Morton.**—Coal production from four mines declined 9 percent below that of 1959. Major producers were Kaelberer Coal Co. and Timpe & Nilles Coal Co. Miscellaneous clay was produced by the Hebron Brick Co. for manufacturing building brick, tile, and other heavy clay products. The company also produced a small quantity of bentonite used in manufacturing prepared mortar. Molite, Inc., acquired by Baukol-Noonan, Inc., in October, produced miscellaneous clay for manufacturing lightweight aggregate. Sand and gravel for building, paving, and fill was produced by Helm Bros., Inc. Sand and gravel (46,800 tons) for building and paving was produced by the State highway department, contractors for the county highway department, the city of Mandan, and the Federal Bureau of Reclamation. Standard Oil Co. of Indiana operated its 43,000-barrel-per-day refinery at Mandan. Throughput was 14.4 million barrels of crude oil, a 6-percent increase over 1959.

**Mountrail.**—Mountrail County ranked fifth in petroleum production. Output from three fields was 5 percent above that of 1959. That part of the Tioga field lying in Mountrail County furnished 86 percent of the county production. Great Northern Railway Co. produced gravel for building and ballast.

**Renville.**—Although petroleum production, from 3 fields, increased more than fourfold over that of 1959, the gain was centralized in the Glenburn field where 25 development wells (of which 20 were successful) were completed. The field was extended into Bottineau County, where six successful development wells were completed. One well, classified as a discovery but, later combined with the Glenburn field, was completed in February. Initial production was 160 barrels of petroleum per day from the Mission Canyon formation at a depth of 4,506 to 4,517 feet. One new field, Eden Valley, was discovered in April. Initial production was 37 barrels of petroleum per day on pump from the Mission Canyon formation at a depth of 4,182 to 4,186 feet.

**Stark.**—Petroleum production from the Heath and Madison pools in the Dickinson field was 33 percent above that of 1959. The Queen City refinery at Dickinson, closed for nearly 4 years, was purchased by Pacific State Oil Co. of Billings, Mont., in bankruptcy proceedings; articles incorporating a new company, Great Plains Refinery, were filed in preparation for reopening. The corporation was authorized to issue 2.75 million shares of stock. Planning called for increasing the daily capacity of the refinery from 2,000 to 2,500 barrels. The plant was to produce jet fuel on a Government contract. Coal production from three mines was 19 percent above that of 1959. Dickinson Coal Mining Co. operated the Dickinson and Lehigh strip mines. Additional tonnage was drawn from the Walter coal mine. The entire output of the Lehigh mine was used in manufacturing briquets. Dic-Kota Clay Products Co. produced fire clay for manufacturing building brick, tile, and other heavy clay prod-

Digitized by Google

ucts. Fisher Sand & Gravel Co. produced 50,400 tons of sand and gravel for building, road construction, and fill.

**Stutsman.**—Stutsman County led in output of sand and gravel. Dakota Aggregates Co., Inc., produced building and paving sand and gravel. Contractors produced building and paving sand and gravel for the State highway department and the Federal Bureau of Reclamation.

**Walsh.**—Walsh County ranked third in production of sand and gravel. Cudmore, Spoonland, Cudmore; Minneapolis, St. Paul & Sault Ste. Marie Railroad Co.; and Ellingson Gravel Co. produced 135,800 tons of sand and gravel for building, paving, railroad ballast, and fill. Contractors produced 238,900 tons of building and paving sand and gravel for the State and county highway departments and the city of Grafton.

**Ward.**—The county ranked second in production of coal and sand and gravel. Coal output from three strip mines was 5 percent above that of 1959. Traux-Traer Coal Co. operated the Velva mine; Sawyer Fuels, Inc., the Miller mine; and Valley Coal Co., the Valley mine. Sand and gravel (171,200 tons) for road construction was produced by and for the State and county highway departments. Atlas Sand & Gravel Co. and Minot Sand and Gravel Co. produced sand and gravel for building, paving, and fill. Railroad ballast and fill material were produced by Great Northern Railway Co. and Minneapolis, St. Paul & Sault Ste. Marie Railroad Co.

**Williams.**—Williams County continued to lead in the production of petroleum, from 508 wells in 11 fields. Output was 11 percent more than in 1959. Three fields furnishing 94 percent of the total were Beaver Lodge from Mississippian (Madison), Devonian, and Silurian formations, 57 percent; Tioga from the Madison limestone, 24 percent; and Capa, also from the Madison limestone, 13 percent. Extensive prior development of these fields precluded the need for broad development drilling; of four wells completed in the Beaver Lodge field to Devonian formations, three were successful. Westland Oil Co. operated its 3,000-barrel-per-day refinery at Williston. Throughput was 620 thousand barrels of crude oil, 19 percent below that of 1959.

Signal Oil and Gas Co. operated its natural gasoline plant at Tioga. The completed 14-inch high-pressure gathering line to the plant from the Beaver Lodge area will accommodate gas from high-pressure wells expected to go into production late in 1961. The company also planned further expansion of the plant and gathering system. Oil-Chem Corp. of Dallas, Tex., announced plans to construct a $4 million natural gas plant in the McGreagor area. The plant, to employ about 40 people, will process 20 million cubic feet of gas per day and recover about equal quantities of natural gasoline and liquid-petroleum gases.

Coal production from the Black Diamond mine, the only underground operation in the State, was 26 percent below that of 1959.

Salt mining and operation of the $2 million evaporation plant at Williston by Dakota Salt and Chemical Co., a wholly owned subsidiary of General Carbon and Chemical Corp. of Lake Forest, Ill., began on June 15. The plant was officially dedicated on October 7.

Digitized by Google

The salt bed, 230 feet thick, was mined hydraulically at a depth of 8,000 feet through wells drilled to the bed. The wells were the deepest in the United States, and the salt was extremely pure. The company planned to use the caverns created by mining the salt for the storage of liquid-petroleum gases. Storage facilities for 130,000 barrels of liquid-petroleum gases will be available for lease to producers and distributors in the area. For every 50,000 tons of salt mined, storage space for about 140,000 barrels of liquid-petroleum gases is created.

Sand and gravel (144,700 tons) for road construction was produced by contractors for the State and county highway departments. Building sand and building and paving gravel were mined by George Mockel and Borsheim Builders Supply Co.

# The Mineral Industry of Ohio

By Joseph Krickich,[1] Stanley A. Feitler,[2] and Roy H. Davis[2]

THE VALUE of mineral production in Ohio in 1960 declined 2 percent from the record year, 1959, and totaled $389.8 million. The decrease was attributed mainly to lower output of bituminous coal, petroleum, and cement. Salt, natural gas, and peat, in contrast with the downward trend of other minerals in the State, increased in output and value. Expansion of the State's mineral-producing capacity continued, notably in the lime and salt industries. Ohio continued to lead the Nation in output of ferroalloys, clays and lime and was an important producer of coal, beryllium, iron and steel, and salt.

**TABLE 1.—Mineral production in Ohio[1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Abrasive stones—short tons | 1,081 | $101 | (3) | (3) |
| Cement | | | | |
| Portland—376-pound barrels | 18,140,723 | 60,560 | 16,752,121 | $58,470 |
| Masonry—do | 853,328 | 3,374 | 728,036 | 3,003 |
| Clays—thousand short tons | 5,479 | 15,346 | 5,165 | 14,325 |
| Coal—do | 35,112 | 135,729 | 33,957 | 130,877 |
| Gem stones | (3) | 2 | (3) | 3 |
| Lime—thousand short tons | 3,190 | 45,121 | 3,117 | 44,473 |
| Natural gas—million cubic feet | 34,664 | 8,042 | 36,074 | 8,477 |
| Peat—short tons | 5,813 | 73 | 6,755 | 93 |
| Petroleum (crude)—thousand 42-gallon barrels | 5,978 | 17,157 | [4] 4,960 | [4] 14,731 |
| Salt—thousand short tons | 2,858 | 20,486 | 3,108 | 24,149 |
| Sand and gravel—do | 38,694 | 45,138 | [5] 37,943 | [5] 44,979 |
| Stone[6]—do | 36,155 | 59,326 | 35,856 | 59,479 |
| Value of items that cannot be disclosed: Gypsum, dimension limestone (1960), marl (calcareous), and values indicated by footnote 2 | | 2,029 | | 1,826 |
| Total Ohio[7] | | [8] 397,326 | | 389,828 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).

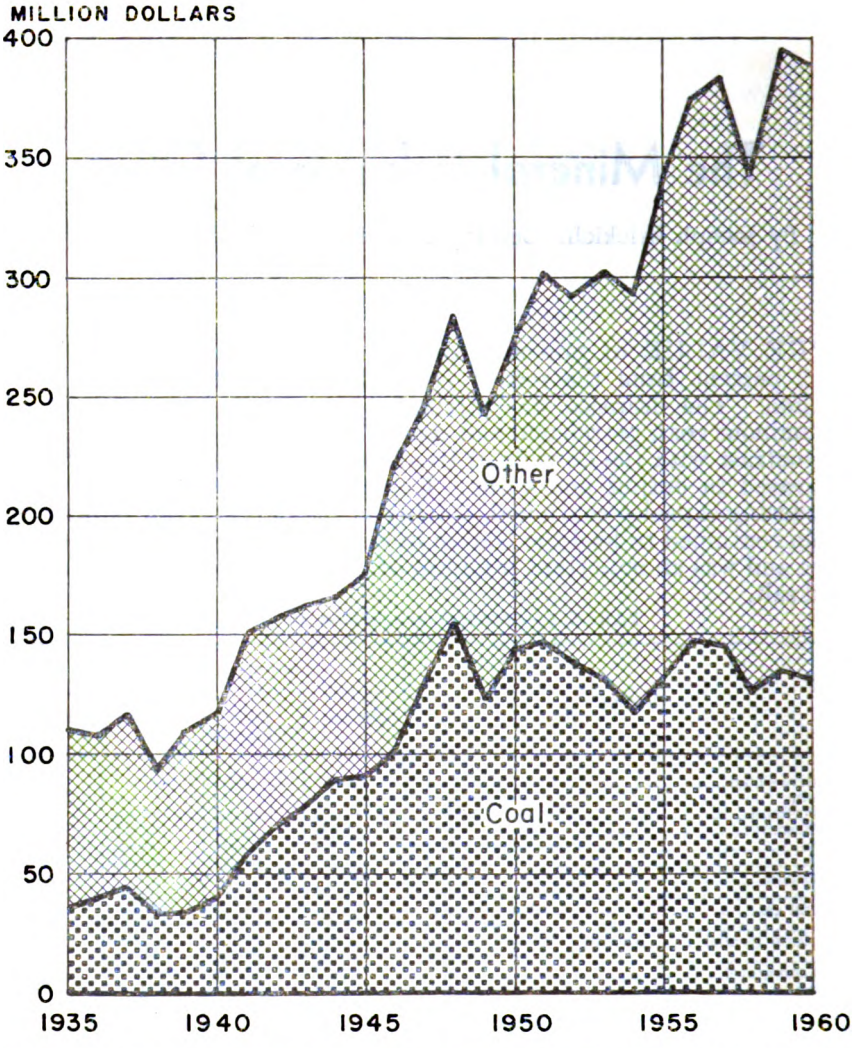

FIGURE 1.—Value of coal and total value of mineral production in Ohio, 1935–60.

Employment and Injuries.—Preliminary data for the mineral industry indicated that man-hours worked decreased in 1960 in most categories. The number of fatalities decreased to 10, but the number of injuries per million man-hours was virtually the same as in 1959. In the coal industry, fatalities per million short tons (0.24) were the lowest in the Nation, despite an increase in the number of fatalities. Of the 8 coal mine fatalities, 5 were at strip mines and 3 at underground mines (2 underground and one on the surface).

The Jonathan mine, Zanesville, operated by Columbia Cement Corp. won top honors in the nonmetal group of the 1960 National

Digitized by Google

Safety Competition. The company was awarded a Sentinels of Safety trophy. In the same group of National Safety Competition, the Ironton mine (Lawrence County) operated by Alpha Portland Cement Co. ranked fifth for the second consecutive year and worked 160,528 man-hours in 1960 without a lost-time injury. The company was awarded a Certificate of Achievement in Safety.

**TABLE 2.—Employment and injuries for selected mineral industries [1]**

| Industry | Men working daily | Man-hours worked | Fatal injuries | Nonfatal injuries | Injuries per million man-hours |
|---|---|---|---|---|---|
| 1959: | | | | | |
| Cement | 1,894 | 4,599,411 | | 12 | 2.61 |
| Clay [2] | 761 | 1,202,244 | | 42 | 34.93 |
| Coal | 9,158 | 16,042,887 | 5 | 325 | 20.57 |
| Coke ovens | 2,374 | 6,249,809 | 1 | 17 | 2.88 |
| Nonmetal mines [3] | 168 | 290,620 | | 4 | 13.76 |
| Quarries and mills [4] | 4,636 | 10,574,448 | 3 | 159 | 15.32 |

[5] Preliminary figures.
[6] Commercial producers only.

**Trends and Development.**—Expansions continued in the mineral industries of Ohio. Significant developments in the beryllium, lime, salt, aluminum, petroleum and natural gas, gypsum, and cement industries were reported. A major expansion program to increase vacuum-cast beryllium billet capacity at the Elmore plant of Brush Beryllium Co. was announced. A new lime plant to serve the steel industry in the Cleveland area was constructed. Although completion was delayed for nearly a year when water-bearing strata and high gas concentrations were found in sinking the shafts, development of an underground salt mine in the same area continued. Plans were announced to construct a plant to produce aluminum sulphate from coal-mine wastes in the eastern part of the State. Wildcat drilling for petroleum and natural gas continued at record pace throughout the State.

A new gypsum-calcining and building products plant was completed at Lorain and placed on stream in 1960. The plant will utilize crude gypsum mined outside the State. Although a cement plant in Erie County discontinued operating during the latter part of 1960, expansions and improvements in capacities and operating efficiency continued among Ohio's other cement plants.

# REVIEW BY MINERAL COMMODITIES

## NONMETALS

**Abrasive Stones.**—Production and value of grindstones decreased compared with 1959 because one less producer was active in 1960. Output came from Washington County near Constitution and from Lorain County near Kipton. Constitution Stone Co. (Washington County) discontinued operations at the end of 1959. During 1960, the plant and all equipment were scrapped.

**Cement.**—Production, shipments, and value of portland and masonry cements dropped; plants operated at 72 percent of capacity compared with 77 percent in 1959. Shipments of portland cement decreased 8 percent; stocks at mills on December 31, were 24,000 barrels higher than at the end of 1959. The average value for both portland and masonry cements increased. Greene and Lawrence, in decreasing order of value, were the leading cement-producing counties.

Approximately 4.6 million tons of limestone, cement rock, and calcareous marl were used for manufacturing portland cement. In addition, the following quantities of other raw materials were used: Clay and shale, 752,000 tons; gypsum, 136,000 tons; sand and sandstone, 41,000 tons; and iron materials 26,000 tons. The companies also used grinding aids and air-entraining compounds. Types of portland cement produced were Types I–II (general use), Type II (high-early-strength), and waterproof.

Portland cement was shipped to consumers in Ohio (75 percent), Indiana (11 percent), and West Virginia (7 percent). The remainder was shipped to Kentucky, Michigan, Pennsylvania, Virginia, and Wisconsin. Distribution of portland cement shipments, by types of customers, were as follows: Ready-mixed concrete companies, 55 percent; highway and other contractors, 18 percent; concrete product manufacturers, 16 percent; and building material dealers, 10 percent. Approximately 1 percent was shipped to Federal, State, local government agencies, and other customers. Eighty-five percent was shipped by truck; the remainder, by rail or used by the producers. Of the total shipments, 90 percent was in bulk; the remainder was in containers, mainly paper bags.

Annual finished cement capacity on December 31 was 23.5 million barrels, compared with 23.4 million barrels in 1959. Seventy-one percent of the total capacity was by the wet process and 29 percent was by the dry process. The plants reported consuming 415.1 million kilowatt hours of electrical energy, of which 53 percent was purchased from public utility companies.

Late in 1960, Medusa Portland Cement Co. permanently closed its Bay Bridge (Erie County) plant because of obsolete machinery and equipment. The plant built in 1892, was the company's first plant. Its cement storage silos were converted to a distribution facility and were to continue to serve company customers in the area. The company also had under construction a new bulk-loading station in the Cleveland area. During the year, Universal Atlas Cement Division, United States Steel Corp., installed a filtering system to recover gas and dust from its cement-making operation. The $775,000 project will necessitate lowering two stacks from 180 feet to 60 feet high.

| 1960 | 11 | 16,850 | 16,752 | 58,470 | 1,962 |

[1] Stock adjustment.

**Clays.**—Output of clays decreased compared with 1959, owing chiefly to a 6-percent drop in demand for heavy clay products (mainly building brick). In addition, demand for refractory materials used by the steel, glass, and foundry industries decreased 3 percent and clay for cement manufacture declined 10 percent. Clays used for heavy clay products, cement, and refractories supplied 93 percent of the total output. Fifty-five percent of the total was miscellaneous clay or shale; the remainder was fire clay used principally in heavy clay products and refractories. Tuscarawas and Stark Counties led and ranked second, respectively, in output among 17 fire clay-producing counties. Miscellaneous clay was produced in 43 counties; Cuyahoga and Stark Counties led in output.

**TABLE 4.—Clays sold or used by producers, by counties**

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Columbiana | (1) | (1) | 310,115 | $2,066,466 |

[2] Includes data for the following counties: Ashland, Athens, Auglaize (1960), Carroll, Darke, Erie (1960), Franklin, Greene (1960), Hancock, Harrison, Henry, Highland, Lake (1960), Lucas (1960), Mahoning, Medina, Noble, Portage, Richland, Washington (1959), Wayne, Williams, Wood, and Wyandot; clays used in cement manufacturing not apportioned by counties (1959); and data indicated by footnote 1.

Digitized by Google

**Gem Stones.**—Mines and quarries throughout the State continued to attract gem and mineral specimen collectors; value increased for the second consecutive year. Specimens recovered included calcite, celestite, flint, jasper, pyrite, selenite, and sphalerite. Wood and Summit Counties were the principal areas of mineral collecting activity.

**Gypsum.**—Production and value of crude gypsum continued to decline. Output came from two underground mines in Ottawa County, the only source of gypsum in the State. The crude material was calcined at nearby plants for use in manufacturing finished building products. In March the calcining and gypsum product plant of National Gypsum Co. at Lorain was completed. Crude gypsum mined outside the State at company-owned mines was processed at this plant during the last half of the year.

**Iron Oxide Pigments.**—Minnesota Mining & Manufacturing Co. at Copley (Summit County) produced red iron oxide pigments, principally from pyrite cinder shipped from Delaware.

**Lime.**—Total lime output decreased mainly because of decreased demand for building and refractory lime used by the construction and steel industries. Demand for lime for chemical and industrial applications increased; output of agricultural lime decreased for the seventh consecutive year. Eighty-four percent of the lime output was quicklime; the remainder was hydrated lime used chiefly by the construction industry. Twenty plants in twelve counties were active, the same as in 1959. Sandusky County continued as the leading producer, supplying 29 and 34 percent of the total tonnage and value, respectively. Most operators used shaft-type kilns; hydrators were both batch and continuous types. Anthracite and bituminous coal, coke, natural gas, producer gas, and carbon monoxide were used as fuels at plants. Lime was shipped to the District of Columbia and all States except Alaska, Hawaii, Oregon, Idaho, and Utah. Exports were made chiefly to Canada, Chile, and Mexico, with lesser amounts to Argentina, Bahama Islands, and India.

The $1.5 million lime plant of Cuyahoga Lime Co. at Cleveland was constructed and completed by the end of 1960. The 144,000-ton-per-year plant will produce quicklime in 4-shaft kilns and use natural gas as fuel. The company will use limestone quarried in Michigan and shipped by boat to the plant. Production was expected to begin early in 1961.

**TABLE 5.—Lime sold or used by producers, by uses**

(Thousand short tons and thousand dollars)

| Year | Agricultural (burned) | | Building | | Chemical and other industrial | | Refractory | | Total | |

Digitized by Google

**Perlite (Expanded).**—Crude perlite shipped from western States was expanded at plants in Cuyahoga and Summit Counties for plaster and concrete aggregate, soil conditioner, and other purposes.

**Salt.**—Total output of salt in Ohio reached a record high as production exceeded 3 million tons for the first time. Production rose 9 percent, because of increased rock salt and evaporated salt output. Brine production declined and was used by producers mainly for manufacturing chlorine and soda ash. Evaporated salt, manufactured chiefly by the vacuum pan process, was sold for a wide variety of uses; some was marketed as pressed blocks. The productive capacity of the salt industry in the State increased, and totaled 4.1 million tons. Producers operated at 75 percent of capacity, compared with 74 percent in 1959. Salt-producing counties, in decreasing order of output, were Lake, Summit, Wayne, and Meigs.

International Salt Co. continued to develop its underground salt mine near Cleveland. During the year the production and service shafts were sunk through water-bearing strata, and unexpected water and high gas concentrations were found that required extensive grouting and delayed completion of the shafts approximately a year. The company expected to reach the salt bed at 1,765 feet by the end of May 1961, and to begin limited production at the end of that year. Surface structures at the mine were completed in 1959. In 1960, the company shipped several thousand tons of bulk rock salt from its Detroit mine to the Cleveland mine to test its processing and packaging machinery. International Salt planned to use a continuous miner to recover salt at the Cleveland mine.[3]

**Sand and Gravel.**—Tonnage and value, including Government-and-contractor operations, were 2 percent and less than 1 percent lower, respectively, than the record high of 1959. Output by commercial producers decreased 3 percent. More than 31 million tons of sand and gravel was consumed in building and highway construction. Production of industrial sand amounted to 1 million tons valued at $4.1 million. Major uses were for molding, glass making, and furnace construction and repair. Industrial sand also was used in making ferrosilicon, and for railroad engines, blasting, filtration, grinding, and as a filler.

Commercial sand and gravel was produced at 357 pits; 17 less than in 1959. Three operations produced more than 1 million tons and four operations produced between 500,000 and 1 million tons. Operators washed, screened, or otherwise prepared 94 percent of the output of commercial sand and gravel and made deliveries by truck (91 percent), railroad (6 percent), and waterway (3 percent). Hamilton and Franklin Counties with more than 3.7 million tons each had the largest production. Output in Montgomery, Butler, and Portage Counties was from 2 to 3 million tons, each. These 5 counties furnished 43 percent of the sand and gravel produced in the State.

[1] Figures withheld to avoid disclosing individual company confidential data.
[2] Includes the following sands: Glass, grinding and polishing, blast, fire or furnace, engine, ferrosilicon, ground, and other; and data indicated by footnote 1.

**Slag (Iron-Blast Furnace).**—Production of processed iron-blast-furnace slag increased nearly 1 million tons over 1959 and totaled 6.4 million tons. Value increased to $12.4 million, compared with $10.7 million in 1959. Of the total processed slag, 84 percent was screened, air-cooled slag; the remainder consisted of granulated and lightweight (expanded) slag. Processing plants were chiefly near the steelmaking centers of Cleveland, Middletown, and Youngstown. Ohio continued to rank second among the 16 slag-processing States and supplied 22 percent of the National total.

**Stone.**—Value of stone production was about the same as in 1959; tonnage decreased 1 percent. Limestone furnished more than 95 percent of the quantity and over 85 percent of the value. Other types of stone mined were standstone and calcareous marl. Value of limestone for principal uses (construction, cement, and lime) changed little compared with 1959, but the value of limestone for metallurgical flux decreased 24 percent and that for agstone increased 21 percent. Consumption was lower for most other uses (glassmaking, whiting, stone sand, and asphalt filler).

Sandstone production and value changed little and, as in previous years, most of the value was in material quarried and sawed for

Digitized by Google

architectural applications and for firestone used in steelmaking furnaces. Sandstone was mined and crushed for ganister (refractory), aggregate, riprap, and other uses.

Production of calcareous marl declined in Erie County as Medusa Portland Cement Co. exhausted its deposit and discontinued mining. A small tonnage of calcareous marl was mined for agstone in Darke County.

Stone production was reported from 63 counties; 2 more than in 1959. Limestone was mined in 55 counties; Sandusky, Franklin, and Seneca, in order of decreasing tonnage, led in production.

Of the 14 counties producing sandstone, Scioto led in value and Lorain in tonnage.

**TABLE 7.—Crushed and broken limestone sold or used by producers, by uses**

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Riprap | 156,694 | $132,217 | 1,280,717 | $1,893,165 |
| Concrete aggregate and roadstone | 16,742,509 | 21,904,098 | 17,255,250 | 22,473,417 |
| Fluxing stone | 4,947,164 | 7,560,302 | 3,696,452 | 5,743,590 |
| Agriculture | 1,871,609 | 3,145,579 | 2,242,483 | 3,818,393 |
| Railroad ballast | 992,521 | 1,191,701 | 1,051,591 | 1,279,700 |
| Miscellaneous uses | 10,720,823 | 16,897,269 | 9,602,303 | 16,043,837 |
| Total | 35,431,320 | 50,831,166 | 35,128,796 | 51,252,102 |

**Sulfur (Recovered Elemental).**—Sun Oil Co. recovered elemental sulfur by catalytic oxidation of hydrogen sulphide at its Toledo refinery.

**Vermiculite (Exfoliated).**—Archer-Daniels-Midland Co., Federal Foundry Supply Division, exfoliated vermiculite at Cleveland (Cuyahoga County). Crude material shipped from Montana, Union of South Africa, and Canada was processed for loose-fill insulation and concrete and plaster aggregate.

## MINERAL FUELS

**Coal.**—Ohio continued to rank fifth in output of bituminous coal. Coal production decreased 3 percent and was 1.2 million tons less than in 1959. The average value per ton ($3.85) was slightly below that of 1959. Strip mines supplied 70 percent of output; the remainder came from underground (27 percent) and auger (3 percent) mines. A total of 470 mines producing 1,000 tons or more were active—6 less than in 1959. The active number of underground mines decreased from 159 to 149 and auger mines from 59 to 56; strip mines increased from 258 to 265.

Strip mine production was 23.9 million tons, 3 percent less than in 1959. Harrison, Jefferson, and Morgan Counties, in decreasing order of output, were the leading stripping areas. The average value per ton increased from $3.61 to $3.64. A total of 603 power shovels and draglines, 53 carryall scrapers, 524 bulldozers, and 179 power drills were used at the strip mines. Most of the diesel-powered shovels and draglines had dipper capacities of less than 3 cubic yards; 14 shovels and 7 draglines had capacities over 12 cubic yards.

Digitized by Google

Underground mines were active in 18 counties, compared with 20 counties in 1959. Belmont and Harrison Counties furnished 74 percent of the State's underground production. The average value per ton of underground coal dropped from $4.56 to $4.49 per ton. Almost the entire underground output was cut by machines; 33 percent was cut by continuous mining machines. Of the underground production, 92 percent was mechanically loaded. The number of continuous mining machines increased by 3 to 38; output increased from 2.8 million tons in 1959 to nearly 3 million tons in 1960.

Output of coal recovered by auger mining in 16 counties decreased 7 percent and totaled 867,000 tons. The average value per ton decreased from $3.43 in 1959 to $3.10. Jefferson and Harrison Counties supplied 38 percent of the auger-mined tonnage.

Coal was cleaned at 22 preparation plants (1 less than in 1959). Over 15 million tons of coal was cleaned; 47 percent by jigs, 52 percent by wet washing other than jigs, and 1 percent by pneumatic methods. Ohio coal also was processed by crushing and by treating with antifreezing and dust allaying materials. A total of 13.1 million tons of coal was crushed, and 4.7 million tons was treated, mainly with calcium chloride and oil.

Fifty-one percent of the output was shipped by rail or water, 37 percent by truck, and the remainder by other means, mainly pipeline. Coal production by captive operations furnished 12 percent of the State output.

**TABLE 8.—Bituminous coal production**

(Thousand short tons and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 35,846 | $133,516 | 1958 | 32,028 | $126,241 |
| 1956 | 38,934 | 148,650 | 1959 | 35,112 | 135,729 |
| 1957 | 36,862 | 146,134 | 1960 | 33,957 | 130,877 |

**Coke and Coal Chemicals.**—Ohio continued to rank second among the 21 oven-coke-producing States. Quantity and value of coke (8.4 million tons and $142.1 million) declined 5 and 4 percent, respectively, compared with 1959. The average value per ton increased to $16.87 from $16.73 in 1959 but still was $1.51 below the national average. Over 11.7 million tons of bituminous coal was carbonized; the coke yield increased from 71.03 percent in 1959 to 71.75 percent. Fifty-one percent of the coking coal delivered to Ohio plants came from West Virginia; the remainder came from Pennsylvania (34 percent), Kentucky (8 percent), and Virginia (7 percent). Seventy-three percent of the coal received was high-volatile, 24 percent low-volatile, and 3 percent medium-volatile. At the end of 1960, 14 plants operated 2,368 ovens (all slot type), 22 less ovens than 1959. Most of the coke output (88 percent) was consumed by producing companies, largely in blast furnaces. The remainder represented commercial sales to blast furnaces, foundries, other industrial consumers, and for residential heating. Output of coke breeze, the principal coproduct, totaled 502,000 tons valued at $3.7 million. The producing companies used 264,000 tons of coke breeze in steamplants, agglomerating plants, and for other industrial uses. Other coke coproducts included coke-

Digitized by Google

oven gas (118,426 million cubic feet), ammonium sulfate (81,000 tons), ammonium liquor ($NH_3$ content, 3,300 tons), coke-oven tar (97.1 million gallons), and crude light oil (32.2 million gallons). Over 17.1 million gallons of benzene, 3.5 million gallons of toluene, 1.3 million gallons of xylene, and 554,000 gallons of solvent naphtha were derived from the light oil.

**Fuel Briquets and Package Fuel.**—Fuel briquets consumed in Ohio totaled 42,000 tons, 15 percent less than in 1959. Production of packaged fuel at five active plants was 1,293 tons, valued at $28,000—two less plants and $61,000 less than in 1959. Ohio supplied 5 percent of the national total, and the average value per ton was 7 percent less than the national average. No fuel briquets (coal and coke) were exported from the Ohio Customs District.

**Peat.**—Production of peat increased 16 percent owing mainly to an increase in the number of active operations; 13 producers were active, 2 more than in 1959. Value also increased because more peat was sold in packages, which have a higher unit value. Of the total output, 85 percent was sold in bulk (92 percent in 1959); the remainder was sold in packages. Consumption in Ohio totaled 32,000 tons, compared with 27,000 tons in 1959. Richland, Miami, and Stark Counties, in order of decreasing output, led among the eight producing counties.

**Petroleum and Natural Gas.**—The year was highlighted by increased wildcat activities, although total well completions decreased from 1,133 to 1,099 (including 454 oil, 260 gas, 304 dry holes, and 81 service wells). Total footage was 2,764,000; the average footage declined to 2,515 from 2,576. Wildcat completions (3 oil, 11 gas, and 41 dry) increased from 39 to 55. Wildcat-well activity was reported in 30 counties; Ashtabula and Trumbull Counties with 10 and 5 wells, respectively, were the principal drilling areas. A total of 1,044 development completions were made; Wayne County led with 120 wells. Other leading areas were Ashland (81), Hocking (69), and Medina (62) Counties. Ninety-six percent of the total well completions were drilled with cable tools, compared with the United States average of 26 percent.[4]

According to American Petroleum Institute and the American Gas Association, proved reserves, December 31, were natural gas, 765,553 million cubic feet (14.65 p.s.i.a., at 60° F.); crude petroleum, 74.7 million barrels; natural gas liquids, 1.3 million barrels. Reserves of natural gas and crude petroleum increased 16,787 million cubic feet and 540,000 barrels, respectively. Natural gas liquids reserves decreased. The total capacities of active petroleum refineries and cracking plants were 436,000 and 177,000 barrels per day of crude oil and gasoline, respectively, slightly higher than in 1959. Refineries were at Canton, Cincinnati, Cleveland, Cleves, Lima, Newark, Toledo (4), and Weston.

## METALS

**Aluminum.**—Production of primary aluminum increased over 1959, but total value declined. Ormet Corp., owned jointly by Olin Mathieson Chemical Corp. and Revere Copper & Brass, Inc., pro-

[4] Oil and Gas Journal, vol. 59, No. 5, Jan. 30, 1961.

Digitized by Google

duced aluminum at its recently completed reduction plant at Omal near Clarington (Monroe County), from alumina produced at its Burnside, La., plant from imported Surinam bauxite. Annual capacity at the plant was 180,000 tons.

North American Coal Corp. announced plans to build a $1 million plant for producing aluminum sulfate from coal-mine wastes. The 40,000-ton-per-year plant would use a new process developed under a joint program with Strategic Materials Corp. Pilot-plant studies for producing aluminum sulfate from coal wastes, shales, and other raw materials were underway. Adequate reserves of coal, shale, and electric power were available at the plant site near Powhatan where the company operated coal mines. Production at the plant was scheduled to begin in June 1961.

**Beryllium.**—Beryllium metal, alloys, and compounds for nuclear and other applications were produced at Elmore by The Brush Beryllium Co. Research for new applications for the metal was continued by the company. A $6 million expansion program was well underway to increase vacuum-cast beryllium billet capacity from 12,500 pounds per month to about 25,000 pounds. The company also started constructing a $3 million plant at Cleveland to finish, fabricate, and machine beryllium metal. In May, 100 tons of beryl ore from Bombay, India, was received at the Elmore plant, the first shipment of its kind to be sent through the Port of Toledo. Beryl also was used in manufacturing ceramic products at the Lisbon plant of Delta Star Electric Division, H. K. Porter Co.

**Ferroalloys.**—Ohio continued as the leading producer of ferroalloys and supplied 29 percent of the U.S. production. Output totaled 619,000 tons—16 percent higher than in 1959. However, 1960 shipments increased only 1 percent in tonnage to 554,000 tons; value decreased 13 percent to $122.3 million. The decline in value was due to lower unit values for ferromanganese, silicomanganese, silvery pig iron, ferrosilicon, ferrochromium, and chromium briquets. As in 1959, these ferroalloys, represented 97 percent of the tonnage and 91 percent of the value of all ferroalloys shipped from plants in Ohio. Of these listed ferroalloys, only ferrosilicon and ferromanganese shipments increased.

**TABLE 9.—Ferroalloy producers in 1960**

| Company | Location | Type of furnace | Ferroalloys produced [1] |
|---|---|---|---|
| Interlake Iron Corp. | Beverly | Electric | SiMn, FeSi, FeCr. |
| Do. | Jackson | Blast and electric | Silvery pig iron, FeSi. |
| Jackson Iron & Steel Co. | do. | Blast | Silvery pig iron. |
| Ohio Ferro-Alloys Corp. | Brilliant | Electric | FeSi, FeCr. |
| Do. | Philo | do. | FeMn, SiMn, FeSi, other miscellaneous ferroalloys. |
| Do. | Powhatan Point | do. | FeSi, other miscellaneous ferroalloys, and Si. |
| Union Carbide Metals Co. | Marietta | do. | FeMn, SiMn, FeSi, FeCr, Spiegeleisen, other miscellaneous ferroalloys. |
| Do. | Ashtabula | do. | FeMn, SiMn, FeSi, FeCr. |
| Vanadium Corp. of America | Vancoram | do. | FeCr, FeSi. |
| Do. | Cambridge | do. | FeMn, FeTi, FeV, FeB, FeCb, other miscellaneous ferroalloys. |

[1] Symbols used: FeMn, ferromanganese; SiMn, silicomanganese; FeSi, ferrosilicon; FeCr, ferrochromium; FeTi, ferrotitanium; FeB, ferroboron; FeCb, ferrocolumbium; FeV, ferrovanadium; Si, silicon.

**Iron and Steel.**—Pig iron production increased 2 percent over 1959 and totaled 11.8 million tons. However, total shipments and value decreased 3 percent; stocks at furnaces on December 31, were nearly double those at yearend 1959. Basic, Bessemer, malleable, foundry, low-phosphorous, direct-casting, and other pig iron was produced at 19 plants (48 stacks). Basic and Bessemer pig iron predominated and totaled 9.1 and 1.9 million tons, respectively. Domestic iron ore shipped to plants increased 57 percent; foreign iron ore shipments increased 7 percent. Consumption of foreign ore in blast furnaces increased 16 percent; consumption of domestic ore decreased 11 percent. Other materials consumed in blast furnaces were 4.7 million tons of domestic sinter, 2.9 million tons of pellets, 773,000 tons of mill cinder and roll scale, 36,000 tons of flue dust, 758,000 tons of home and purchased scrap, 125,000 tons of slag scrap, 668,000 tons of open-hearth and Bessemer slag, 9.1 million tons of coke, and 3.2 million tons of limestone and dolomite. Scrap and slag production at blast furnaces totaled 176,000 tons and 4.9 million tons, respectively. Recovered materials included 862,000 tons of flue dust.

Construction of a two-furnace basic oxygen shop continued at the Cleveland Works of Jones & Laughlin Steel Corp. The furnaces will be capable of producing steel at the rate of 200 tons an hour. Completion of the shop was expected in July 1961. Also a $10 million oxygen plant was being constructed by Air Products, Inc., to supply 500 tons of pure oxygen per day to the Cleveland plant. In August, the No. 1 blast furnace of Wheeling Steel Corp. (Steubenville Works) was taken out of service for a $3 million rebuilding and capacity-increasing project. The company also took out of service a battery of 51 coke ovens for rebuilding at a cost of $4.5 million.

**Lead and Zinc Pigments.**—Black lead oxide pigments were produced at the Cleveland (Cuyahoga County) plant of Willard Storage Battery Co. E. I. duPont de Nemours & Co., Inc., manufactured zinc pigments (chlorides) at Cleveland. Zinc oxide was manufactured at Columbus (Franklin County) by American Zinc Oxide Co.

**Titanium.**—Titanium sponge was produced by sodium reduction of titanium tetrachloride at Ashtabula by Reactive Metals, Inc. (formerly Mallory-Sharon Metals Corp), and Union Carbide Metals Co., Division of Union Carbide Corp. Republic Steel Corp., Massilon and Canton, and Reactive Metals, Inc., Niles, melted titanium. Titanium Metals Corp. of America, Toronto, and Reactive Metals, Inc., Niles, rolled and fabricated titanium metal.

**Zirconium.**—Reactive Metals, Inc., produced hafnium-free zirconium sponge at Ashtabula and zirconium ingot in Niles. The Union Carbide Metals Co. (Ashtabula) and Vanadium Corp. of America (Cambridge) continued to produce zirconium ferroalloys. The Chas. Taylor Sons Co., Cincinnati, Ohio, produced zircon and zirconia refractories.

## REVIEW BY COUNTIES

Fulton County continued as the only county from which no mineral production was reported. Although increasing in 37 of the 87 mineral-producing counties, value declined in the other counties (mainly

Digitized by Google

coal-producing) resulting in a decrease in the State value of mineral production in 1960. Harrison, Belmont, Greene, and Lake Counties, in decreasing order of value, continued as the leading mineral-producing areas. In addition, eight other counties reported mineral production exceeding $10 million. Sand and gravel was produced by Government-and-contractor operations, mainly for the State of Ohio Highway Department, in 14 counties. Details of petroleum and natural-gas operations in producing counties were not available and were excluded from the county review section.

Adams.—Davon, Inc., mined, crushed, and screened limestone at its Plum Run quarry near Peebles. The prepared stone, used for agstone, cement, coal-mine dusting, and railroad ballast, was delivered by truck and railroad. Adams County road crews mined limestone for road construction and maintenance.

TABLE 10.—Value of mineral production in Ohio, by counties [1 2]

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Adams | $495,609 | $589,817 | Stone. |
| Allen | 862,538 | 767,802 | Do. |
| Ashland | (3) | (3) | Sand and gravel, clay. |
| Ashtabula | (3) | (3) | Lime, sand and gravel. |
| Athens | 2,544,012 | 2,160,416 | Coal, stone, clay, sand and gravel. |
| Auglaize | (3) | (3) | Sand and gravel, stone, clay. |
| Belmont | 27,650,404 | (3) | Coal, stone. |
| Brown | 96,890 | 42,243 | Stone, sand and gravel. |
| Butler | 2,951,839 | 3,311,573 | Sand and gravel. |
| Carroll | 1,973,515 | 1,907,670 | Coal, clay, sand and gravel, stone. |
| Champaign | 310,108 | 336,943 | Sand and gravel. |
| Clark | (3) | (3) | Sand and gravel, lime, stone. |
| Clermont | 908,575 | 720,555 | Sand and gravel. |
| Clinton | 1,091,162 | 666,439 | Stone, sand and gravel. |
| Columbiana | (3) | 7,754,903 | Coal, clay, sand and gravel, stone. |
| Coshocton | 7,868,583 | 8,703,319 | Coal, stone, sand and gravel. |
| Crawford | (3) | (3) | Stone, sand and gravel. |
| Cuyahoga | 1,204,653 | 1,298,182 | Sand and gravel, clay. |
| Darke | (3) | (3) | Sand and gravel, clay, stone. |
| Defiance | (3) | (3) | Sand and gravel. |
| Delaware | 1,828,307 | 1,463,252 | Stone, lime, clay, sand and gravel. |
| Erie | 6,406,165 | 4,609,124 | Stone, cement, sand and gravel, clay. |
| Fairfield | 456,015 | 345,932 | Sand and gravel. |
| Fayette | 887,841 | 914,242 | Stone, gem stones. |
| Franklin | 9,215,449 | 8,339,263 | Sand and gravel, stone, lime, clay. |
| Gallia | (3) | 3,498,991 | Coal, sand and gravel, stone, clay. |
| Geauga | (3) | (3) | Sand and gravel, stone. |
| Greene | (3) | (3) | Cement, sand and gravel, stone, clay. |
| Guernsey | 1,337,057 | 1,077,929 | Coal, stone. |
| Hamilton | 4,935,010 | 5,814,598 | Sand and gravel, stone. |
| Hancock | (3) | (3) | Stone, clay, gem stones. |
| Hardin | (3) | (3) | Stone. |
| Harrison | 33,218,717 | 31,743,348 | Coal, stone, clay. |
| Henry | (3) | (3) | Sand and gravel, clay. |
| Highland | (3) | (3) | Stone, sand and gravel, clay. |
| Hocking | 502,206 | 468,464 | Coal, clay, sand and gravel. |
| Holmes | 1,122,095 | 1,086,580 | Stone, clay, coal, sand and gravel. |
| Huron | 70,700 | (3) | Sand and gravel, peat, clay. |
| Jackson | (3) | 2,567,699 | Coal, clay, sand and gravel, stone. |
| Jefferson | 14,833,932 | 13,960,503 | Do. |
| Knox | (3) | (3) | Sand and gravel, stone. |
| Lake | (3) | (3) | Salt, cement, lime, sand and gravel, clay. |
| Lawrence | 10,302,141 | 10,564,390 | Cement, coal, clay, sand and gravel, stone. |
| Licking | 630,780 | 662,391 | Sand and gravel, gem stones. |
| Logan | (3) | 310,917 | Stone, sand and gravel. |
| Lorain | (3) | (3) | Stone, sand and gravel, abrasives. |
| Lucas | (3) | (3) | Cement, stone, sand and gravel, clay. |
| Madison | (3) | (3) | Sand and gravel, stone, clay. |
| Mahoning | (3) | (3) | Coal, stone, clay, sand and gravel, peat. |
| Marion | (3) | (3) | Stone, sand and gravel, clay. |
| Medina | (3) | (3) | Sand and gravel, clay. |
| Meigs | (3) | (3) | Sand and gravel, coal, salt. |
| Mercer | (3) | (3) | Stone. |
| Miami | (3) | (3) | Stone, sand and gravel, peat. |
| Monroe | (3) | (3) | Sand and gravel, stone. |

| Seneca | (3) | (3) | Lime, stone, clay. |
| Shelby | (3) | 426,504 | Sand and gravel, stone. |
| Stark | 11,857,316 | 10,767,157 | Cement, coal, clay, sand and gravel, stone, peat. |
| Summit | 12,292,033 | (3) | Salt, lime, cement, sand and gravel, clay, stone, peat, gem stones. |
| Trumbull | 225,257 | 246,840 | Sand and gravel. |
| Tuscarawas | 14,050,236 | 13,056,405 | Coal, clay, sand and gravel, stone. |
| Union | (3) | (3) | Stone, sand and gravel. |
| Van Wert | (3) | (3) | Stone, clay. |
| Vinton | (3) | 1,226,809 | Coal, clay, stone. |
| Warren | 315,611 | 689,971 | Sand and gravel. |
| Washington | (3) | (3) | Coal, sand and gravel, abrasives. |
| Wayne | (3) | (3) | Salt, sand and gravel, coal, clay. |
| Williams | (3) | (3) | Sand and gravel, clay. |
| Wood | (3) | (3) | Stone, clay, gem stones. |
| Wyandot | (3) | (3) | Stone, lime, sand and gravel, peat, clay. |
| Undistributed [4] | [5] 189,740,822 | 213,060,441 | |
| Total | 397,326,000 | 389,828,000 | |

[1] Fulton County not listed as no production was reported.
[2] Natural gas and petroleum not listed by counties as data are not available; included with "Undistributed."
[3] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[4] Includes natural gas and petroleum, some gem stones and sand and gravel (1960) that cannot be assigned to specific counties and value indicated by footnote 3.
[5] Revised figure.

**Allen.**—Suevers' Stone Co., Delphos; Bluffton Stone Co., Bluffton, and Western Ohio Stone Co. and National Lime & Stone Co., both near Lima, produced limestone for roadstone, concrete aggregate, railroad ballast, and agstone. Bluffton Stone Co. installed an automatic feeder to improve operating efficiency.

**Ashland.**—Sand and gravel was recovered near Ashland, Loudonville, and Polk. Most of the output was processed gravel used for road maintenance and repair. The E. Bigelow Co. mined shale near New London for manufacturing heavy clay products.

**Ashtabula.**—Sand and gravel used in building and highway construction was recovered near Ashtubula, Conneaut, Kingsville, and Richmond. Processed molding sand was produced at Conneaut.

**Athens.**—Output of coal decreased; 14 mines (12 underground and 2 strip) were active, compared with 16 mines in 1959. Gem Coal Co. cleaned coal by wet washing at its No. 255 plant. Diamond Stone Quarries, Inc., and Shamrock Quarries, Inc., both near Albany, continued to quarry limestone for concrete aggregate and roadstone. Ball & Ball mined limestone for concrete aggregate, roadstone, and agstone at a quarry near Amesville. Plastic fire clay was mined near

Digitized by Google

Nelsonville and shipped to plants in Hocking County for manufacturing building brick and other heavy clay products. Athens Building Material Co. (Athens) and Slater Sand & Gravel (The Plains) produced sand and gravel for building and paving purposes.

Auglaize.—Sand and gravel used chiefly for structural and paving purposes was produced by Wapak Sand & Gravel Co., Western Ohio Stone Co., and Quality Sand & Gravel & Ready Mix Co., all near Wapakoneta. Bank run gravel for paving was produced near Jackson Center. Limestone was mined and prepared for use as concrete aggregate, roadstone, railroad ballast, and agstone by National Lime & Stone Co. at its Buckland quarry. Sandkuhl Tile Co. mined clay near Spencerville for manufacturing heavy clay products.

Belmont.—Belmont County continued as the second ranking coal-producing area with an output of 6 million tons. Seventy percent of the production came from 16 underground mines; the remainder came from 22 strip and 8 auger mines. Seven cleaning plants processed 3.8 million tons of coal. In addition, 2.7 million tons were crushed, and 365,000 tons were treated with calcium chloride or oil. George and C. H. McCort (Malaga) and Somerton Crushing Co. (Somerton) continued to mine limestone for use as concrete aggregate, roadstone, and agstone.

Brown.—The Brown County Highway Department mined and prepared limestone for road construction and maintenance. Howard S. Watson (Georgetown) produced bank-run gravel.

Butler.—Butler County continued to rank fourth in sand and gravel production. Commercial output from 11 sand and gravel plants totaled 2.6 million tons, compared with 2.5 million tons in 1959. Output by Government-and-contractor operations dropped from 497,000 tons in 1959 to 107,000 tons.

Carroll.—Coal production totaled 493,000 tons, 16 percent higher than in 1959. Sixteen mines (9 strip, 4 underground, and 3 auger) were active, compared with 18 mines in 1959. Plastic fire clay and shale were mined from four pits near Magnolia. Mineral City Sand Co. produced molding and other sand at Mineral City. The Ames crushed stone plant (Cadiz) of the Hanna Coal Co., Division of Consolidation Coal Co., remained idle, but a small quantity of stone was shipped from stockpiles.

Champaign.—American Aggregates Corp. produced paving sand and gravel and railroad ballast gravel at Urbana. Sand and gravel also was recovered by Miller Excavating Service (Urbana) and Walter Dorsey (Springhill).

Clark.—Sand and gravel, chiefly processed material for construction and paving, was recovered at 9 operations. Output was centered near Springfield, New Carlisle, and Enon. Moores Lime Co. mined limestone at Durbin for use as blast-furnace flux, aggregate, agstone, and raw material for manufacturing lime and dead-burned dolomite. The four coal-fired shaft kilns produced dead-burned dolomite for refractory uses and both quicklime and hydrated lime for construction, agriculture, and a variety of chemical and industrial applications. The output was shipped to 24 States and exported to Canada and India.

Clermont.—Ohio Gravel Co. processed sand and gravel at its Miamiville plant.

Digitized by Google

**Clinton.**—Melvin Stone Co. quarried limestone near Melvin. The prepared stone was sold for aggregate, open-hearth flux, agstone, and riprap. Delivery was made by waterway and railroad. Melvin Stone Co. produced sand and gravel for building and highway construction at Melvin. Other sand and gravel producers were Clinton Gravel Co. (Clarksville) and Dick Curtis Gravel Pit (Wilmington).

**Columbiana.**—Coal production totaled 1.4 million tons, compared with 1.6 million tons in 1959. Fifty-one mines (36 strip, 8 auger, and 7 underground) were active compared with 42 mines in 1959. Columbiana County, with eight active pits in the eastern part of the county continued to rank second in value of clays. Fire clay and miscellaneous clay were recovered. Sand and gravel was recovered from three operations near Leetonia and one near Salem. Sandstone was mined and crushed for use as roadstone by Sandy Beaver Stone Co., Hanoverton.

**Coshocton.**—Coal output increased 5 percent and totaled 1.8 million tons. Nineteen mines were active; the same number as in 1959. Seven companies operated crushing plants. Blocks of sandstone were produced at four quarries by Brier Hill Stone Co., Glenmont. The blocks were sawed for architectural applications and for use as firestone in steel mills. Sandstone blocks also were produced by Variegated Quarries Division, Nicholl Stone Company; sawing was done at the company-owned fabricating plant in Holmes County. Sand and gravel output totaled 483,000 tons, a slight increase over that of 1959. Output consisted chiefly of processed material used for paving.

**Crawford.**—Limestone produced at the Spore quarry by National Lime & Stone Co., Bucyrus, was crushed and prepared for use as aggregate, metallurgical stone, agstone, and railroad ballast. About half was shipped by truck and half by railroad. Crawford County Highway Department also produced limestone for road building and maintenance. Sand and gravel for building, paving, and fill purposes was produced by Galion Gravel Co. (Galion).

**Cuyahoga.**—Commercial sand and gravel production totaled 791,000 tons, a 23-percent increase over 1959. Output by Government-and-contractor operations dropped from 150,000 tons to 46,000 tons. Commercial production was mostly processed material and came from nine operations. Miscellaneous clay and shale, produced at seven operations, was used mainly for manufacturing building brick and lightweight aggregate. Crude perlite that was shipped from Colorado, Nevada, and New Mexico was expanded at the Cleveland plant of Cleveland Gypsum Co. Output was used as plaster and concrete aggregate and for soil conditioning. Cuyahoga Lime Co. completed its $1.5 million lime plant and planned to begin operating it early in 1961.

**Darke.**—Seven sand and gravel operations were active during the year. American Aggregates Corp. (Fort Jefferson) was the leading producer. Output was used mostly for highway construction. Darke County Tile Co. (Greenville) and R. E. Clark (Versailles) mined clay for manufacturing heavy clay products. Calcareous marl mined and prepared by Woodrow Gary near New Madison was sold for agricultural purposes.

Digitized by Google

**Defiance.**—Sand and gravel was produced by Ohio Materials, Inc. (Hicksville), and Northwest Materials, Inc. (Defiance).

**Delaware.**—Marble Cliff Quarries Co. (Powell), The Owens Stone Co. (Ostrander), and Penry Stone Co. (Radnor) produced limestone for concrete aggregate, roadstone, agstone, and riprap. Scioto Lime & Stone Co., Delaware, mined limestone for a company-owned lime plant and crushed stone for sale as concrete aggregate, roadstone, and railroad ballast. Both quicklime and hydrated lime, produced in a coal-fired rotary kiln, were sold, principally for metallurgical use in open-hearth furnaces and for the treatment of sewage and water. Some hydrated lime was sold for agricultural purposes and construction. The lime was consumed mostly in Ohio, but shipments were made to West Virginia and Indiana.

Delaware Clay Co. (Westerville) and The Galena Shale Tile & Brick Co. (Galena) mined shale for manufacturing building brick. Sand and gravel was produced by Government-and-contractor operations for the State of Ohio Highway Department.

**Erie.**—Cement manufacturing at the Bay Bridge plant of Medusa Portland Cement Co. was discontinued September 30 because of the depletion of the calcareous marl deposit, which had served as a source of raw material since the plant was built in 1892. In addition, the plant had become obsolete. New loading and unloading equipment was installed to provide facilities for using the cement silos for bulk warehousing of cement manufactured at other Medusa plants. Portland and masonry cements were manufactured during the first 9 months of the year from calcareous marl and shale that was mined by the company and limestone that was purchased. Output was consumed in Ohio, Michigan, and Indiana.

Sandusky Crushed Stone Co., Inc. (Parkertown), Wagner Quarries Co. (Sandusky), and Castalia Quarries Co. (Castalia) produced limestone used principally for concrete aggregate, roadstone, and railroad ballast. The stone also was used for agstone, stone sand, riprap, filter beds, fill, and cement manufacture. Foundry sand was produced by Ohio Foundry Sand Co. (Shinrock) and Keener Sand & Clay Co. (Huron).

**Fairfield.**—Output of sand and gravel, used mainly for highway and building construction, decreased 25 percent from that of 1959. Most of the production came from operations near Lancaster and Reynoldsburg.

**Fayette.**—Limestone, produced from quarries near Washington Court House by Sugar Creek Stone Co., Fayette Limestone, Inc., and Blue Rock, Inc., was used for building and highway construction, agstone, railroad ballast, and riprap. Specimens of pyrite and sphalerite were recovered from the Blue Rock quarry.

**Franklin.**—Franklin County was replaced by Hamilton County as the leading sand and gravel producer. Commercial output decreased 18 percent and totaled 3.7 million tons. Twelve operations, mainly near Columbus, were active. Limestone mined by Marble Cliff Quarries Co. (Columbus) was used for concrete aggregate, roadstone, riprap, agstone, railroad ballast, blast-furnace flux, and lime manufacture. The company manufactured quicklime and hydrated lime principally for chemical and other industrial uses, but part of the

Digitized by Google

output was sold for mason's lime and agricultural use. Most of the lime was consumed in Ohio. The Columbus Clay Manufacturing Co. and The Claycraft Co., both near Blacklick, mined shale for manufacturing heavy clay products.

**Gallia.**—Coal production totaled 868,000 tons, a slight increase over 1959. The number of active mines (16 underground, 8 strip, and 5 auger) increased from 26 to 29. Construction sand and gravel and blast sand were produced near Gallipolis. Molding sand was recovered near Kerrs. James Merry Stone Co. (Bidwell) quarried limestone for concrete aggregate, roadstone, and riprap. Jess Brammer mined shale near Waterloo for manufacturing floor and wall tile.

**Geauga.**—Construction and industrial sand, and ground sand, were produced at Thompson by R. W. Sidley, Inc. Other construction sand was produced near Aurora, Newbury, Novelty, and Parkman. Quartzite was produced near Thompson by Harbison-Walker Refractories Co. for use in making refractory brick.

**Greene.**—Greene County continued to rank first in cement production. Producers were Southwestern Portland Cement Co. and Universal Atlas Cement Division of United States Steel Corp., both near Fairborn. Both companies mined limestone and clay, and Universal also mined sand as raw materials for cement. Types I–II (general use) and Type III (high-early-strength) portland cement and masonry cement were made by both companies; Southwestern also made waterproof portland cement. Shipments were principally to destinations in Ohio, Indiana, and Kentucky. A bag filter system was installed at the Universal Atlas Cement Co. plant to eliminate the discharge of dust through the stacks. Greene County commercial sand and gravel output totaled 1.1 million tons, 20 percent less than in 1959. Government-and-contractor production increased and totaled 42,000 tons. Commercial production came from 11 operations.

**Guernsey.**—Coal output decreased slightly from 1959 and totaled 242,000 tons. Eleven mines (7 strip and 4 underground) were active, the same number as in 1959. A & N Mining, Inc., cleaned coal by jigs at its Montgomery cleaning plant. John Gress Co. mined and crushed dolomite for roadstone at its New Concord quarry.

**Hamilton.**—Hamilton County was the leading sand and gravel producer. Commercial output increased 9 percent and totaled 3.8 million tons; production by Government-and-contractor operations increased 57 percent. Twelve commercial producers were active. Ohio Gravel Co. mined and crushed dolomitic limestone for agstone at its Newtown and Camp Dennison quarries. Southwestern Portland Cement Co. purchased a tract of land near Addyston for a distribution plant.

**Hancock.**—Pifer Stone Co. produced limestone from a quarry near Williamstown, and two limestone quarries near Findlay were operated by The Tarbox-McCall Stone Co. and National Lime & Stone Co. Stone was sold for concrete aggregate, roadstone, railroad ballast, and agstone. Miscellaneous clay was mined at Findlay by Hancock Brick & Tile Co. Calcite specimens were recovered near Van Buren by an amateur collector.

**Hardin.**—Dolomitic limestone was mined by The Hardin Quarry Co. (Dunkirk) and Herzog Lime & Stone Co. (Forest) for concrete

Digitized by Google

aggregate, roadstone, blast-furnace and open-hearth flux, agstone, and railroad ballast.

**Harrison.**—Harrison County continued to lead the State's 25 coal-producing counties. Output totaled 7.4 million tons, 3 percent less than in 1959. Sixty-four percent of the output came from nine strip mines; the remainder came from six underground and four auger mines. Most of the coal was cleaned at the Georgetown plant of Hanna Coal Co. Division, Consolidation Coal Co., and the Nelms plant of Youghiogheny & Ohio Coal Co. In addition, a substantial quantity of coal was crushed and treated for dust preventative and antifreezing. Hanna Coal Co. Division, Consolidation Coal Co., Cadiz, continued to quarry dolomitic limestone for concrete aggregate, roadstone, and agstone. Bowerston Shale Co. (Bowerston) mined shale for manufacturing farm draintile.

**Henry.**—Sand and gravel was produced by Turkey Foot Sand and Gravel and Napoleon Sand & Gravel Co., both near Napoleon. August Honeck & Son (Malinta) and Napoleon Brick & Tile Works (Napoleon) mined clay for manufacturing draintile.

**Highland.**—Limestone was mined for construction and agricultural uses by Highland Stone Division, Davon, Inc. (Hillsboro), Ohio Asphaltic Limestone Co., Inc. (New Vienna), and Marshall Quarry (Marshall). Sand and gravel was recovered from pits near Greenfield and Hillsboro. Miscellaneous clay for manufacturing draintile and building brick was mined by Mowrystown Brick & Tile Co. (Mowrystown).

**Hocking.**—Coal output totaled 63,000 tons and came from six underground, five strip, and two auger mines. Plastic fire clay and miscellaneous shale used entirely for manufacturing brick were mined by General Hocking Brick Co. (Logan). Natco Corp. manufactured brick and heavy clay products at its Haydenville plant. Building sand and gravel was produced near Logan by Donahey Bros. The Enterprise plant of F. H. Brewer Co. was idle.

**Holmes.**—Briar Hill Stone Co. quarried sandstone for architectural use at three localities near Glenmont and one near Killbuck. Variegated Quarries Division, The Nicholl Stone Co. produced sandstone blocks at its Richland Township quarry and operated a plant at which it sawed the material as well as sandstone blocks produced at Gobblers Knob in Coshocton County. The output was used for architectural stone. Holmes Clay Division of The Holmes Limestone Co., Berlin, mined and crushed dolomitic limestone for agstone. Clay was recovered near Berlin and Baltic. Output consisted mainly of plastic fire clay used for manufacturing building brick and refractories and as rotary-drilling mud. Production of coal decreased from 95,000 tons in 1959 to 83,000 tons. One underground and five strip mines were active. Construction sand and gravel was recovered from two pits near Millersburg and one pit near Berlin.

**Huron.**—Mainly paving sand and gravel was produced at the Willard plant of Huron Sand & Gravel Co. Humus peat was recovered from bogs near Willard by Mel-lo Peat Co. Salisbury Pottery, Inc., mined clay for manufacturing pottery near Monroeville.

**Jackson.**—Coal output from 11 strip and 6 underground mines totaled 314,000 tons, 19 percent greater than in 1959. Waterloo Coal

Digitized by Google

Co. cleaned coal by wet washing at its Waterloo plant. Fire clay used chiefly for refractory purposes was recovered at four operations near Oak Hill. Pennsylvania Glass Sand Corp. produced industrial sands for a wide variety of uses near Jackson. Other sand and gravel also was produced near Jackson. Waterloo Coal Co., Oak Hill, mined and crushed limestone for building and highway construction.

**Jefferson.**—Output of coal was virtually the same as in 1959; the number of active mines remained at 50. Jefferson County continued to rank third in coal output. Seventy percent of the coal was strip-mined, 24 percent was mined underground, and 6 percent came from auger mines. Coal was cleaned at the Piney Fork plant of Hanna Coal Co. Division, Consolidation Coal Co. and the Jennie plant of North American Coal Corp. Coal produced by Yougiogheny & Ohio Coal Co. was shipped to the Dorothy cleaning plant (company-owned) in Belmont County. Fire clay and miscellaneous clay and shale were recovered principally near Irondale and Toronto. Output from seven operations was used mainly for firebrick and block and for manufacturing vitrified sewer pipe. Duquesne Sand Co. operated a sand and gravel dredge on the Ohio River near Brilliant. Freeport Quarries, Inc., Stuebenville, produced sandstone rubble at its quarry near Hammondsville for use in a dam at Stratton.

**Knox.**—Sand and gravel production totaled 750,000 tons, a 23-percent decrease from 1959. Seven producers were active and recovered mainly construction material. Blast and molding sand was produced near Howard. Briar Hill Stone Co. quarried sandstone near New Castle, Cavallo, and Brinkhaven. The output was sawed and dressed for architectural stone and for use as firestone in steel mills.

**Lake.**—Standard Portland Cement Division, Diamond Alkali Co., mined miscellaneous clay and purchased limestone and gypsum for use in making cement at its Painesville plant. Types I–II, general use, and Type III, high-early-strength portland cement, and masonry cement were produced in the four-kiln plant. Output was consumed in Ohio and Pennsylvania. Diamond Alkali Co. also operated a lime plant at Painesville where quicklime made in coke-fired shaft kilns and salt brine from nearby wells were used in manufacturing chlorine and alkalis. Morton Salt Co. completed its first full year of production at its Fairport underground salt mine near Painesville. Sand and gravel output from 11 operations increased sharply. Most of the sand and gravel was used for paving and fill.

**Lawrence.**—Marquette Cement Manufacturing Co. mined limestone and shale near Bear Run to supply its cement plant at Superior. Cement rock (shaley limestone) and sandstone were mined by Alpha Portland Cement Co. for making cement at its Ironton plant. Both companies used the dry process to make regular and air-entrained portland cement and masonry cement. Output of both companies was consumed in Ohio, West Virginia, Kentucky, and Virginia. The Alpha Portland Cement Co. Ironton mine was awarded a Certificate of Achievement in Safety by the Federal Bureau of Mines. Mine employees worked 160,528 man-hours in 1960 without a lost-time injury. Limestone was mined and crushed for roadstone by O. K. Limestone Co. at a quarry near Pedro. Lawrence County Highway Department mined and crushed limestone for road construction and

615629—61——51

Digitized by Google

repair. Over 449,000 tons of coal was recovered from four strip mines. Output of clay (mostly fire clay) was reported from 10 operations principally near Ironton, Blackfork, and Pedro. Sand and gravel was produced at Chesapeake by Wilson Sand & Gravel Co.

**Licking.**—Output of sand and gravel increased 6 percent to 648,000 tons. Thirteen sand and gravel operations were active, mainly near Newark and Granville. Amateur mineral collectors reported recovering 200 pounds of jasper and 25 pounds of Ohio flint near Flint Ridge.

**Logan.**—Northwood Stone & Asphalt Co. (Belle Center) and C. E. Duff & Son, Inc. (Huntsville), quarried limestone chiefly for concrete aggregate and roadstone. Part of the production was used for asphalt filler, agstone, and riprap. The East Liberty quarry of National Lime & Stone Co. was idle, but shipments were made from stock. Sand and gravel was recovered at five operations and used chiefly for construction.

**Lorain.**—Lorain County ranked second in value of sandstone production, most of which was sawed for architectural and refractory applications. Cleveland Quarries Co., Amherst, and The Nicholl Stone Co., Kipton, quarried and sawed sandstone into blocks for use as wall stone, ashlar, and furnace lining. The latter company also produced grindstones. Stone & Equipment, Inc., Amherst, mined and crushed sandstone for concrete aggregate, roadstone, filler, and riprap. Construction sand and gravel was recovered near Amherst and Lorain. Crude gypsum was calcined for finished building materials at the newly completed Lorain plant of National Gypsum Co.

**Lucas.**—Medusa Portland Cement Co. mined limestone, sand, and miscellaneous clay for use in making cement at its plant near Toledo. Types I–II, general use, portland cement were manufactured and shipped to consumers in Ohio, Michigan, Indiana, and Wisconsin. Maumee Stone Co. (Maumee), Toledo Stone & Glass Sand Co. (Sylvania), and the France Stone Co. (Waterville) mined and crushed limestone principally for use as concrete aggregate and roadstone. Small quantities were sold for agstone, railroad ballast, and riprap. The Toledo House of Correction near Whitehouse produced a small quantity of rough blocks, rubble, and riprap from its limestone quarry. Construction sand and gravel was produced near Toledo.

**Madison.**—Construction sand and gravel was produced by The West Jefferson Sand & Gravel Co. (West Jefferson) and McMullen Sand & Gravel Co. (Mt. Sterling). Madison Stone Co., Inc., Galloway, produced dolomitic limestone for concrete aggregate and roadstone. A small quantity of limestone was sold for agstone and riprap. Miscellaneous clay for manufacturing building brick and draintile was produced.

**Mahoning.**—Coal output totaled 907,000 tons, a slight increase over that of 1959. Sixteen strip mines were active, compared with 17 in 1959. Carbon Limestone Co. mined and crushed limestone at a quarry near Lowellville for open-hearth flux and other metallurgical uses, concrete aggregate, roadstone, and agstone. Stone also was sold for coal-mine dusting, additive in livestock feed, paint filler, and poultry grit. Output of clays produced near Beloit, Canfield, and Youngstown, was used in refractories and for manufacturing building brick. Construction sand and gravel was produced by Gurlea Sand & Gravel

Digitized by Google

Co. at Salem. Reed-sedge and humus peat were recovered from bogs near Damascus and Beloit, respectively.

**Marion.**—National Lime & Stone Co. and J. M. Hamilton & Sons Co., both of Marion, and Tri-County Stone Co., LaRue, quarried limestone for concrete aggregate, roadstone, agstone, and railroad ballast. Sand and gravel used chiefly for building was produced near Prospect. Clays were produced by Marion Brick Corp. (Iberia) and LaRue Tile Co. (LaRue).

**Medina.**—Sand and gravel was produced near Lodi, Medina, Seville, and Wadsworth. Wadsworth Brick & Tile Co. (Wadsworth) mined fire clay and shale for manufacturing brick.

**Meigs.**—Tri-State Materials, Corp. (Pomeroy), Richards & Son, Inc. (Apple Grove), and Goeglein Gravel Co. (Middleport) produced construction sand and gravel. Twelve coal mines (seven underground, three strip, and two auger) were active. Output totaled 197,000 tons, less than half of the 1959 output. Evaporated salt was produced in open pans at the Pomeroy operation of Excelsior Salt Works, Inc.

**Mercer.**—The John W. Karch Stone Co. (Selina), and Rockford Stone Co. (Rockford) mined limestone principally for use as concrete aggregate and roadstone; small quantities were sold for agstone and riprap.

**Miami.**—Armco Steel Corp. produced limestone at its Piqua quarry. The stone was used principally for metallurgical flux and building and highway construction; smaller quantities were used for agstone, filler in rubber and putty, riprap, additive in livestock feed, and various other uses. Sand and gravel output totaled 564,000 tons, 6 percent higher than in 1959. Production was reported near Covington, Ludlow Falls, Piqua, Troy, and Vandalia. Humus peat was produced by Skinner's Soil Conditioners (New Carlisle).

**Monroe.**—Blaney Sand & Gravel Co., Inc. (Clarington), and Witten Gravel Pit (Woodsfield) produced sand and gravel used exclusively for paving purposes. Christman Quarry Co., Woodsfield, produced limestone for concrete aggregate and roadstone.

**Montgomery.**—Commercial output of sand and gravel decreased 9 percent and totaled 2.9 million tons; however, Montgomery County continued as the third largest sand and gravel producer. Twenty-six operations, mainly near Dayton, were active. Ninety-one percent of the output was processed material, and nearly all was shipped by truck. Limestone was quarried principally for concrete aggregate and roadstone by Carey Brothers Stone Co. (Dayton), Laura Gravel & Stone Co. (Phillipsburg), and Limestone-Dayton Division of American Aggregates Corp. (Dayton). Laura Gravel & Stone Co. sold part of its production for riprap, blast-furnace flux, and agstone. The City of Dayton Water Department recovered lime in a rotary kiln from waste sludge and the recarbonation of water in a purification and softening process. Surplus lime was sold to other municipalities.

**Morgan.**—Output of coal decreased 5 percent and came principally from two strip mines. One underground mine, also operated. Most of the output was cleaned at the Roberts and Schaefer plant of

Digitized by Google

Central Ohio Coal Co. Construction sand and gravel was produced by Stockport Sand & Gravel Co. (Stockport).

**Morrow.**—Chesterville Sand & Gravel Co. (Chesterville) produced construction sand and gravel.

**Muskingum.**—Sidwell Bros. (Zanesville) and Chesterhill Stone Co. (East Fultonham) produced limestone for concrete aggregate, roadstone, agstone, and riprap. Chesterhill Stone Co. began constructing an entirely new plant at the same location. Columbia Cement Corp. used limestone mined underground and shale recovered from an open pit for manufacturing cement at its East Fultonham plant. The entire cement output was shipped to consumers in Ohio and West Virginia. Coal production was 591,000 tons, 30 percent more than in 1959. Eight underground, six strip, and three auger mines were active. Sand and gravel was produced by Zanesville Gravel Co. and Muskingum River Gravel Co. Miscellaneous clay was mined near Dresden and Frazeysburg. Clay for stoneware was mined near East Fultonham and Roseville.

**Noble.**—Coal production increased 23 percent and totaled 1.8 million tons. Nine strip and three auger mines were active. Central Ohio Co. operated its Cumberland cleaning plant. James Merry Stone Co. (Caldwell) and Herman Zerger, Jr. (Woodsfield) mined limestone principally for concrete aggregate and roadstone. Shale for manufacturing face brick was produced near Ava by Ava Brick Corp.

**Ottawa.**—Limestone, mostly for concrete aggregate, roadstone, blast-furnace flux, sinter stone, and a small quantity for agstone, was produced by Chemstone Corp. Division of Minerals & Chemicals Philipp Corp. at its Marblehead quarry. Stone for construction came from Chemstone's newly developed bed of aggregate-quality limestone underlying the metallurgical limestone. United States Gypsum Co., Genoa, produced limestone for making lime at its nearby plant and for sale as concrete aggregate and roadstone. Most of the lime was sold hydrated for construction, agriculture, refractory, chemical, and other uses. Basic, Inc., Clay Center, mined dolomite for making dead-burned dolomite and lime and for sale as concrete aggregate and roadstone. The Basic plant used a coal-fired shaft and rotary kilns. Output was consumed principally for refractory uses. Celotex Corp. (Port Clinton) and United States Gypsum Co. (Gypsum) mined crude gypsum for calcining at nearby plants. Mineral specimens of celestite were collected near Clay Center.

**Paulding.**—Peninsular Portland Cement Division, General Portland Cement Co., mined limestone and shale near Paulding and purchased sand and gypsum for use in manufacturing portland cement at its nearby plant. Peninsular used the wet process to produce general use and high-early-strength portland cement and masonry cements. Output was consumed in Indiana, Ohio, and Michigan. Some of the limestone mined at the Peninsular Portland Division quarry was shipped to the company's plant in Michigan, and some was sold to France Co. (Paulding) for processing and sale for concrete aggregate, roadstone, railroad ballast, and agstone. Auglaize Stone Co., Oakwood, mined limestone for concrete, roadstone, agstone, and blast-furnace flux. Haviland Clay Works Co. (Haviland), and Baugh-

Digitized by Google

man Tile Co., and Dangler Drain Tile Co., both near Paulding, mined clay for manufacturing draintile.

**Perry.**—Coal production totaled 1.6 million tons, 26 percent below the 1959 output. Most of the production came from 12 strip mines; 8 underground and 2 auger mines also were active. Peabody Coal Co. (formerly Sunnyhill Coal Co.) operated the Sunnyhill No. 8 and Sunnyhill No. 9 cleaning plants. Sidwell Bros. operated its McNally Norton plant. Central Silica Co. (Glenford) mined sand for foundry, glass, and ceramic uses. Keener Sand & Clay Co. produced foundry sand near New Lexington. Clay (65 percent miscellaneous clay and 35 percent fire clay) was produced at 10 operations. Output was used mainly for building brick, vitrified sewer pipe, glaze structural tile, roofing tile, other heavy clay products, and lightweight aggregate. Production was centered near Gore, Junction City, New Lexington, Saltillo, Somerset, and Shawnee. Maxville Stone Co., Logan, and Beiter Stone Co., Rushville, quarried limestone principally for use in building and highway construction; small quantities were sold for railroad ballast and agstone.

**Pickaway.**—Construction sand and gravel and railroad ballast gravel were produced at Circleville by The Sturm & Dillard Co.

**Pike.**—Ralph Rogers & Co. of Ohio, Inc., Latham, produced concrete aggregate, roadstone, and agstone from dolomitic limestone. Cambria Clay Products Co., Jackson, mined sandstone for silica brick at the Big Rock quarry. The Beaver standstone quarry of Harbison-Walker Refractories Co. was idle. Construction sand and gravel was produced at Sargents by The Standard Slag Co. Pyro Refractories Division, A. P. Green Firebrick Co. (formerly Durex Refractories Co.), produced sand and gravel for refractories, and molding and glass sand. Construction gravel also was produced at Lucasville and Waverly.

**Portage.**—Sand and gravel output increased from 1.8 million tons in 1959 to 2.1 million tons. Most of the output was processed material and came from 25 operations; Ravenna and Mantua were the principal centers. Industrial sand for a wide variety of uses was produced at Aurora, Garrettsville, and Brady Lake. Kaiser Refractories & Chemical Division, Kaiser Chemical & Aluminum Corp.; Harbison-Walker Refractories Co.; and General Refractories Co. (Nelson Ledge) mined quartzite for silica brick. Limestone for highway construction was produced at the Deerfield quarry of City Asphalt & Paving Co. Peterson Coal Co. was the only coal operator (strip mine) active during the year. Output was processed at the company Atwater cleaning plant. United States Concrete Pipe Co. mined shale near Palmyra. Green Oaks Peat Moss Co. and Portage Peat, both near Ravenna, produced peat for sale in bulk.

**Preble.**—Limestone was mined by Marble Cliff Quarries Co. to supply its Lewisburg lime plant and for agstone, concrete aggregate, roadstone, and blast-furnace flux. Both quicklime and hydrated lime were produced principally for chemical and other industrial uses. White Gravel Co. (Camden), Steiners Sand & Gravel Co., and Blue Bank Gravel Co., both near West Alexandria, produced construction sand and gravel.

Digitized by Google

**Putnam.**—Limestone used principally for aggregate was produced by Ottawa Stone Co. (Blanchard Township), National Lime & Stone Co. (Columbus Grove), and The Putnam Stone Co. (Ottawa). Miscellaneous clay used exclusively for draintile was produced by Etter Tile & Coal Co. (Dupont), Glandorf Tile Co. (Glandorf), Miller Bros. Clay Works, Inc. (Ottoville), and Leipsic Clay Products Co. (Leipsic).

**Richland.**—Four operators produced construction sand and gravel; two near Bellville, and one each near Killbuck and Lexington. Shale for manufacturing brick was produced by Ohio Brick & Supply Co. and Richland Shale Brick Co., both near Mansfield. The county led in output of peat; producers were Reynolds Farms, Inc. (Ganges), and Swank Peat Moss Sales (Shiloh).

**Ross.**—Sand and gravel for building and highway construction was produced at two plants near Chillicothe, and one each near Bainbridge and Richmondale. Limestone was mined for construction and agstone by the Paint Valley Sand & Gravel Co. near Bainbridge. Southern Silica, Inc. (Richmondale), quarried sandstone for foundry use, glass manufacture, and furnace lining.

**Sandusky.**—Although totals were lower than in 1959, Sandusky County continued to lead in production and value of limestone. Sandusky County also was first in lime production (including dead-burned dolomite) with output of 904,000 tons valued at $14.9 million. Limestone was produced at nine pits, three each near Gibsonburg and Woodville, and one each near Bellevue, Fremont, and Millersville. Of the 3.1 million tons of limestone mined, 59 percent was used in making lime, 19 percent for concrete aggregate and roadstone, 10 percent for metallurgical flux, and 12 percent for all other uses including agstone, glassmaking, and filler. More than half the lime was dead-burned dolomite used as a refractory by the steel industry. The rest was used in construction, agriculture, chemical, and other industrial applications. Haulage from the National Gypsum Co. Gibsonburg quarry to the lime plant was converted from a combination system, using locomotive and truck, to through haulage by diesel truck. Lime was shipped to all States except Alaska, Arizona, California, Hawaii, Idaho, Nevada, Oregon, Utah, Washington, and Wyoming. Building sand was dredged by the Home Sand & Coal Co. near Fremont.

**Scioto.**—Scioto County led in value of sandstone produced. Sandstone was quarried and sawed for furnace brick and architectural purposes by Waller Bros. Stone Co. and The Taylor Stone Co., both of McDermott. General Refractories Co. mined and crushed sandstone at the Deever quarry near Portsmouth for use as ganister in silica brick. Fire clay was produced at mines near Minford, Portsmouth, and South Webster. Bank-run sand and gravel was produced near Lucasville.

**Seneca.**—Tonnage and value of limestone was higher than in 1959, and Seneca County continued to rank second in limestone production. Basic, Inc., made dead-burned dolomite in nine coal-fired rotary kilns at its Maple Grove plant from dolomite mined at its nearby quarry. Dolomite also was sold for concrete aggregate, roadstone, blast-furnace, open-hearth, other metallurgical uses, and agstone. The France Co. (Bloomville) mined limestone for construction, blast-

Digitized by Google

furnace flux, railroad ballast, and agstone. Northern Ohio Stone Co. (Flat Rock) and Webster Stone Co. (Bloomville) produced rubble and irregular-shaped stone as well as washed limestone for construction and agstone. St. Stephen Tile Co. (St. Stephen) and J. A. Miller Tile Co. (Bascom) produced clay for manufacturing draintile.

**Shelby.**—Construction sand and gravel was produced by Sidney Sand & Gravel Co. (Sidney), Spring Creek Gravel Co. (Fort Loramie), and The Ernst Gravel Co. (Houston). Miami River Quarries, Inc. (Sidney), produced crushed and broken limestone for construction.

**Stark.**—Limestone and shale were mined by Diamond Portland Cement Co., Division of The Flintkote Co., for making cement at its Middle Branch plant. Types I–II (general use) and Type III (high-early-strength) portland cements and masonry cement were produced for consumption mainly in Ohio; small quantities were shipped to Pennsylvania and West Virginia. East Ohio Limestone Co. (Hartville), Elmco Limestone & Coal Co. (Canton), and Alliance Stone Co. (Alliance) quarried limestone principally for construction. Coal production increased from 602,000 tons in 1959 to 695,000 tons. Eighteen (seventeen strip and one auger) mines were active during the year. Stark County continued as one of the State's leading clay-producers. Most of the output was fire clay used for refractories and heavy clay products. Seventeen operations were active during the year. Stark County was one of the leading sand and gravel-producing counties, with output exceeding 1.3 million tons. Nineteen operations were active mainly near Canton, Massillon, Navarre, and Uniontown. Some industrial sand was produced at Canal Fulton. Lab Nursery & Peat Moss, Lantz Peat Moss, Inc., and Sanders Peat Moss Co., all near Canton, produced peat for sale in bulk.

**Summit.**—Diamond Crystal Salt Co. produced evaporated salt and brine from wells at Akron. Evaporated salt was produced in both open and vacuum pans; some was marketed as pressed blocks. Columbia-Southern Chemical Corp., a subsidiary of Pittsburgh Plate Glass Co. (Barberton), used brine pumped from salt wells in manufacturing soda ash and chlorine and to make evaporated salt. The company also produced limestone from its underground mine principally for manufacturing cement and lime at its nearby plants. General use and high-early-strength portland cements were produced in a single rotary kiln by the wet process and consumed mostly in Ohio. Lime, produced in coal and coke-fired shaft kilns, was used by the company in manufacturing chemical products. Columbia-Southern also mined and crushed sandstone in Norton Township for manufacturing glass and for use as concrete aggregate. Sand and gravel output totaled 977,000 tons, 6 percent higher than in 1959. Twelve operations were active, producing mostly construction material. Clay was recovered from three pits, two near Mogadore, and one near Greentown. H. W. Codding & Sons Co. (Copley) mined and packaged reed-sedge peat. An amateur mineral collector reported collecting 300 pounds of celenite crystals near Barberton. Crude perlite shipped from Colorado was expanded at the Akron plant of J. P. Loomis Concrete Supply Co.

Digitized by Google

**Trumbull.**—Construction sand and gravel was produced by Kinsman Sand & Gravel Co. (Kinsman) and Harry Miller Excavating Co., Inc. (Warren).

**Tuscarawas.**—Coal production decreased 4 percent and totaled 2.4 million tons in 1960. Output came from 53 mines (31 strip, 18 underground, and 4 auger). Coal was cleaned by diaphragm jigs and air tables at the Midvale mine of Columbia-Southern Chemical Corp. The county continued to lead in output and value of clay. Seventy-eight percent of the fire clay produced was used for heavy clay products, refractories, and wall tile. Miscellaneous clay was used mainly for manufacturing heavy clay products. Of the 26 active clay mines, 21 were open pit, 4 were undergound, and 1 was a combination open pit and underground mine. Eight sand and gravel operations were active during the year, producing mostly construction material. Industrial sands were produced at plants near Dundee and Gnadenhutten. Limestone for concrete aggregate and roadstone was produced near Dover by Kimball Limestone Co. and near Strasburg by Limestone Aggregates, Inc. Bonum Lime Co. mined limestone at Sugar Creek for agstone. Yoder Stone Co. (Dundee) quarried sandstone in rough blocks for architectural uses.

**Union.**—L. G. Rockhold & Sons (York Center) and Union Limestone, Inc. (Ostrander), quarried limestone for construction and agstone. Marysville Concrete & Materials, Inc. (Marysville), produced mainly paving sand and gravel.

**Van Wert.**—Limestone, used principally for concrete aggregate and roadstone was produced by the Union Quarries Co. (Scott), Ridge Township Stone Quarry (Van Wert), and Delphos Quarries Co. (Delphos).

**Vinton.**—Coal production decreased from 270,000 tons in 1959 to 235,000 tons in 1960. Fourteen mines (seven underground, six strip, and one auger mines) were active. Benedict, Inc., continued operating its Econocoal cleaning plant. The McArthur Brick Co. mined plastic fire clay and shale for building brick near McArthur. The Zaleski clay pit and plant of Hope Fire Clay Co. was idle. McArthur Stone & Coal Co., McArthur, mined and crushed limestone for concrete aggregate, roadstone, and agstone.

**Warren.**—Sand and gravel output totaled 637,000 tons, more than double that of 1959. Construction materials chiefly were recovered from eight operations, mainly near Franklin, Loveland, Morrow, Lebanon, and Waynesville.

**Washington.**—Output of coal decreased 12 percent and totaled 262,000 tons. Most of the output came from two strip mines; three auger mines also were active. Construction sand and gravel was recovered near Little Hocking, Marietta, New Matamoras, and Waterford. The Hall Grindstone Co. (Constitution) produced abrasive stone (grindstone). All operations of the Constitution Stone Co. (Constitution) were terminated. During the year the plant and equipment were scrapped. Plant No. 4 of Chesterhill Stone Co. near Waterford was idle.

**Wayne.**—Morton Salt Co. produced evaporated salt at Rittman by vacuum and open pans; some was marketed as pressed blocks. Sand and gravel was produced near Doylestown, Marshallville, Rittman,

Digitized by Google

and Wooster. Most of the output was processed material used for building and paving material. Output of coal from two strip mines decreased. Clay was produced by Medal Brick & Tile Co. (Wooster) and Orrville Tile Co. (Orrville).

**Williams.**—Sand and gravel was recovered near Blakeslee, Edgerton, Edon, and Pioneer. Stryker Drain Tile Co. mined clay near Stryker.

**Wood.**—Limestone was produced at five quarries in Milton Township, North Baltimore, West Millgrove, Luckey, and Bowling Green principally for use as concrete aggregate and roadstone. Quantities also were used for agstone and riprap. Perrysburg Brick & Tile Co. (Perrysburg) mined miscellaneous clay for manufacturing building tile and draintile. Calcite crystals and celestite were recovered near Custar by amateur mineral collectors.

**Wyandot.**—Limestone for aggregate, metallurgical flux, lime, railroad ballast, agstone, and other uses was mined and prepared at the Carey plant of National Lime & Stone Co. The company produced quicklime, principally for glass, in its coal fired-shaft kilns and shipped the output to 21 States and Canada. Small quantities of lime were used for construction, agriculture, and chemical and industrial applications. Limestone also was produced by J. L. Foucht Quarry near Upper Sandusky for concrete aggregate, roadstone, and agstone. Sand and gravel was recovered from pits mainly near Upper Sandusky. The Humus Co. (Carey) mined humus peat for sale in packages and bulk. Shale for manufacturing building brick was produced at the Upper Sandusky operation of The Claycraft Co.

# The Mineral Industry of Oklahoma

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Oklahoma Geological Survey.**

By Robert B. McDougal,[1] Peter Grandone,[1] and William E. Ham [2]

FOURTEEN minerals and 5 mineral fuels produced in 76 of 77 counties in 1960 were valued at $779.1 million, $13.7 million more than in 1959. Nationally, Oklahoma ranked fourth as a producer of crude petroleum and third as a producer of natural gas and natural gas liquids. Cement, coal, gypsum, sand and gravel, and stone were produced in large quantities. Output of lead and zinc, which had been lagging in recent years, increased appreciably.

Value of the mineral fuels—petroleum, natural gas, natural gas liquids, coal, and helium—represented 95 percent of the total value of minerals produced. Only 5 percent of the total value was furnished by nonmetals and metals. Petroleum and natural gas were produced individually or together in 68 of 77 counties, nonmetals in 70 counties, and metals (lead and zinc) in Ottawa County only. Oil and natural gas were produced in a broad belt extending from the northeastern to the southwestern and western parts of the State; helium was recovered in Cimarron County. Nonmetals were mined in widely distributed parts of the northeast, north-central, and central regions, and in the southern part in the Arbuckle and Wichita Mountain areas.

**Employment and Injuries.**—Mineral industries in Oklahoma employed 45,100 persons in 1960, a 5-percent decline from 1959. Under the Oklahoma Employment Security Act, which covers establishments that employ four or more persons, the mineral industries paid $256.4 million in wages to 43,500 persons in 1960.

**Consumption and Markets.**—A significant part of the mineral output was processed by Oklahoma industries into semifinished and finished products for intrastate use or interstate shipments. These industries included oil refineries; natural gasoline and cycle plants which stripped condensable liquids from natural gas; a helium extraction plant; zinc smelters that reduced zinc concentrate mined partly in Oklahoma; brick, tile, pottery, glass, and cement plants that used clays, shales, silica sands, and limestone mined in Oklahoma; and producers of building materials made of Oklahoma gypsum. Large quantities of natural gas and petroleum were transmitted by pipelines

[1] Commodity-industry analyst, Bureau of Mines, Bartlesville, Okla.
[2] Geologist, Oklahoma Geol. Survey, Norman, Okla.

Digitized by Google

to industrial areas of the Eastern and North Central States. Ammonia was produced from natural gas, carbon black from petroleum distillate, and high-energy fuel from petroleum hydrocarbons reacted with sodium and boric acid.

**TABLE 1.—Mineral production in Oklahoma [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays [2] thousand short tons | 966 | $970 | 734 | $739 |
| Coal do | 1,525 | 10,272 | 1,342 | 9,113 |
| Helium thousand cubic feet | 98,749 | 1,619 | 289,069 | 4,691 |
| Lead (recoverable content of ores, etc.) short tons | 601 | 138 | 936 | 219 |
| Natural gas million cubic feet | 811,508 | 81,151 | 824,266 | 98,088 |
| Natural gas liquids: | | | | |
| Natural gasoline and cycle products thousand gallons | 448,353 | 29,443 | 531,995 | 33,074 |
| LP gases do | 675,869 | 27,070 | 762,258 | 32,409 |
| Petroleum (crude) thousand 42-gallon barrels | 198,090 | 578,423 | [3] 192,288 | [3] 561,481 |
| Salt thousand short tons | (4) | (4) | 3 | 16 |
| Sand and gravel do | 6,002 | 5,927 | 6,424 | 7,468 |
| Stone do | 12,683 | 14,980 | [5] 14,054 | [5] 16,098 |
| Zinc (recoverable content of ores, etc.) short tons | 1,049 | 241 | 2,332 | 602 |

Demand for Oklahoma crude petroleum continued to decline and at yearend the total produced was about 3.4 million barrels less than in 1959. Under State regulatory control, the output maintained a close balance with demand and stocks.

Continued low prices kept lead and zinc mines closed throughout 1960. However, miners in the Tri-State District received some encouragement in December when both American Zinc, Lead & Smelting Co. and The Eagle-Picher Co. announced plans to reopen their custom

Digitized by Google

mills early in 1961. The Eagle-Picher Co. treated only slimes in its Bird Dog mill in 1960.

Total construction (residential, nonresidential, and public works) increased 5 percent over 1959 as a result of a favorable showing in construction activity in the fourth quarter of 1960. Public works construction volume was 6 percent below 1959 despite increases attributed to the new State office building, the pipeline from the Atoka Reservoir, and a small increase in highway construction. Demands for sand and stone increased, whereas those for cement and gypsum decreased. The demand for lime, used primarily as a chemical by the Pryor industries and by municipal water-treating plants, declined for the third consecutive year.

**Trends and Developments.**—Recoverable petroleum reserves continued to decline though the outlook remained promising. Gas reserves continued to increase. Another successful oil- and gas-discovery year was recorded as a result of widespread drilling; 213 of 700 exploratory wells proved productive. Kingfisher County was the most prolific with 21 new discoveries; Beaver County was next with 15, and Carter, Cleveland, McClain, and Osage Counties had 10 each. The Anadarko basin in western Oklahoma was the site of much drilling activity for oil and gas. The new gas reserve of the Arkoma basin in southeastern Oklahoma was further developed by the completion of seven exploratory and six field wells.

The Sunray Mid-Continent Oil Co. new gas-products plant in the Criner area of McClain County underwent a $750,000 expansion to increase its throughput capacity from 5 million to nearly 30 million cubic feet of gas per day. This plant was placed onstream in 1959.

In April, D–X Sunray Oil Co. began a $1.6 million, two-phase modernization program at its Duncan refinery. The first phase consisted of a new steam generator and modification of the catalytic cracking unit; the second phase improved the efficiency of the gas recovery unit. Propane-proplyene and butane-butylene hydrocarbons were produced by the unit. The company announced plans to erect a new 85,000-barrel-per-day crude oil distillation unit at its Tulsa refinery, scheduled to go onstream in 1962, and designed to reduce costs and increase efficiency. It will replace five old crude oil units with a combined capacity of 75,000 barrels per day. A $1 million petrochemical plant to produce 610 barrels of benzene and up to 1,100 barrels of toluene daily was placed in operation at the company Tulsa refinery during 1960—its first entry into the petrochemical field.

Mid-Continent Pipeline Co. completed a 100-mile crude oil gathering pipeline in northwest Oklahoma early in the year. About 100 oil leases in Alfalfa and Grant Counties were served by the line.

Mid-America Pipeline Co. completed its LP gas pipeline from Hobbs, N. Mex., through the Oklahoma Panhandle, to the Conway storage facility near McPherson, Kans., as part of a system extending into Minnesota and Wisconsin. The entire system was controlled from Tulsa.

At Ponca City, Continental Oil Co. began operating a $1 million petrochemical plant to produce over 20 million gallons of cyclohexane annually. The company also announced plans for a $2.2 mil-

Digitized by Google

lion expansion of its Ponca City research and development facilities to be completed by early 1962.

Two wells of British American Oil Producing Co. in southern Oklahoma were reported to hold world records for the deepest, successful, hydraulic-fracturing treatment. In the Knox-Bromide field of Grady County the company's No. 1 Baker was treated in the Second and Third Bromide sands at a depth of 15,758 feet. In the Stephens County sector of the Knox-Bromide field, the company's No. 1 Brickel was treated in the same formation at a depth of 15,824 feet.

Dewey Portland Cement Co., division of American-Marietta Corp., continued construction of its $12 million plant near Tulsa. At Pryor, Oklahoma Cement Co. put its $8 million plant onstream and made its first shipment in July—about 14 months after start of construction. The company had purchased the assets of the defunct Ozark Portland Cement Co., which in 1956 was erecting a plant at Locust Grove. (See Minerals Yearbook, 1956, Volume III, p. 912.)

At Muskogee, an addition to the plant of Corning Glass Works raised the plant capacity about 50 percent.

The U.S. Army Corps of Engineers, Tulsa District, had three multimillion dollar public works projects in progress—the Eufaula dam on the South Canadian River between Haskell and McIntosh Counties, the Oologah dam on the Verdigris River in Rogers County, and the Keystone dam on the Arkansas River in Tulsa County.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

Oklahoma continued as an important producer of natural gas and crude petroleum and furnished a major supply of refined petroleum products in 1960. A substantial quantity of low-ash bituminous coal was produced.

**Coal.**—Output of coal declined 11 percent, partly because of the closing of the Lone Star Coal Co. Pittsburg County facilities in August. Twenty-two operators mined coal in nine counties. Haskell, Rogers, and Sequoyah Counties each reported output exceeding $1 million in value. Of the 1.3 million short tons produced, 13 operators supplied 82 percent from 15 strip mines, and 10 operators supplied the remainder from 11 underground mines.

**Helium.**—The new helium plant operated by the Federal Bureau of Mines at Keyes extracted 293.6 million cubic feet of helium from natural gas. Shipments totaled 289.1 million cubic feet valued at $4,690,833.

**Natural Gas.**—Oklahoma ranked third in marketed output of natural gas. Production was reported from 65 counties, of which Texas, Garvin, Beaver, Harper, and Grady Counties led, in that order. Searching for more reserves, the industry completed 434 gas wells of 4,802 wells of all types drilled, according to The Oil and Gas Journal. Exploratory drilling alone resulted in 65 gas discoveries from 700 exploratory tests. Interest in the Anadarko and Arkoma basins continued to run high throughout the year. In the Anadarko basin

Digitized by Google

(northwest area), Kingfisher County was the Nation's busiest single drilling locality. Nearly 80 locations were being drilled in the oil and gas boom area where the success ratio of test wells was in the 90-percent range. Prolific, multizone completions highlighted the rapid development of Mississippian and Pennsylvanian reservoirs. The southeast Oklahoma Arkoma basin was emerging as a big new source of natural gas, and 1960 exploration set the stage for important developments in 1961. Opening of a new gas pool was reported early in 1960 in Dewey County; in Grady County, a new producing zone for the Southeast Harness pool was indicated.

**TABLE 3.—Coal production**

(Thousand short tons and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 2,133 | $12,744 | 1958 | 1,629 | $10,858 |
| 1956 | 2,007 | 12,341 | 1959 | 1,525 | 10,272 |
| 1957 | 2,195 | 14,165 | 1960 | 1,342 | 9,113 |

**TABLE 4.—Marketed production of natural gas [1]**

| Year | Million cubic feet | Value (thousands) | Year | Million cubic feet | Value (thousands) |
|---|---|---|---|---|---|
| 1951–55 (average) | 584,815 | $37,704 | 1958 | 696,504 | $70,347 |
| 1956 | 678,603 | 54,288 | 1959 | 811,508 | 81,151 |
| 1957 | 719,794 | 59,743 | 1960 | 824,266 | 98,088 |

[1] Comprises gas either sold or consumed by producers, including losses in transmission, amounts added to storage, and increases in gas pipelines.

The natural gas industry had six gas-storage fields in six Oklahoma counties as reported by The Oil and Gas Journal. The underground storage facilities had a total capacity of 99.9 billion cubic feet of working-gas volume (above minimum working pressure) and 83.5 billion cubic feet of cushion-gas volume (below minimum working pressure). The available storage capacity permitted continuous production and conservation of casing-head gas from oil wells during low demand periods for gas.

**TABLE 5.—Estimated proved recoverable reserves of crude oil, natural gas liquids, and natural gas**

| Product | Proved reserves, Dec. 31, 1959 | Changes in proved reserves, due to extensions and new discoveries in 1960 | Proved reserves, Dec. 31, 1960 (production was deducted) | Changes from 1959, percent |
|---|---|---|---|---|
| Crude oil ..... thousand barrels | 1,864,749 | 115,405 | 1,790,500 | −4 |
| Natural gas liquids [1] ..... do | 367,569 | −773 | 338,313 | −8 |
| Natural gas ..... million cubic feet | 16,651,292 | 1,640,802 | 17,311,402 | +4 |

Digitized by Google

**Natural Gas Liquids.**—Output of natural gas liquids, recovered by 68 natural gasoline plants and 4 cycling plants, reached a new record of 1,294 million gallons and represented an increase of 15 percent above the 1959 figure. Of the 68 natural gas processing plants reported in 1960, 2 were sold (1 was being dismantled), 3 were shut down, and 3 plants were dismantled. The increased output, mostly in LP gases (propane and butane), was due to increased processing of commercial gas from the productive gasfields in the Panhandle area and separation of more LP gases from plant liquids to meet the rising demand. Natural gasoline and cycle products supplied 41 percent of the quantity and 51 percent of the value; LP gases furnished the balance. Use of LP gases for domestic heating fuels and for production of petrochemicals, particularly polyethylene, continued to grow.

Underground storage capacity for LP gases at four sites totaled 333,000 barrels. The sites comprised two salt layers in Beaver and Beckham Counties, abandoned oil wells in Pontotoc County, and a shale mine shaft in Seminole County. A fifth site, in limestone, was under construction near Ponca City, Kay County, for Continental Oil Co. This facility, when completed in April 1961, will increase the total storage capacity 300,000 barrels.

**TABLE 6.—Natural gas liquids production**

(Thousand gallons and thousand dollars)

| Year | Natural gasoline and cycle products | | LP gases | | Total | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 443,978 | $27,625 | 419,144 | $13,843 | 863,122 | $41,468 |
| 1956 | 489,963 | 26,543 | 579,101 | 23,427 | 1,069,064 | 49,970 |
| 1957 | 460,644 | 25,329 | 587,140 | 21,824 | 1,047,784 | 47,153 |
| 1958 | 440,798 | 26,029 | 657,114 | 25,822 | 1,097,912 | 51,851 |
| 1959 | 448,353 | 29,443 | 675,869 | 27,070 | 1,124,222 | 56,513 |
| 1960 | 531,995 | 33,074 | 762,258 | 32,409 | 1,294,253 | 65,483 |

**Petroleum.**—Oklahoma remained the fourth largest petroleum producing State. The Oklahoma Corporation Commission, under the Interstate Oil Compact, placed the allowable output for January at 540,000 barrels per day, which was based upon a 20-barrel daily rate per well. In February, the allowable was increased to about 560,000 barrels per day—an average-basic-per-well rate of 22 barrels daily. Then, in March, the allowable was cut to about 532,000 barrels, to maintain a balance between output and demand and to reduce the growing inventory of Oklahoma crude oil. Thereafter, a steady decline occurred until July when an estimated allowable of 488,000 barrels per day was set. This average basic well rate of 12 barrels daily on allocated pools—lowest in Oklahoma history—remained in effect until October when the allowable was raised to 506,000 barrels per day, based upon basic well rate of 15 barrels daily. The November rate was unchanged from October. In December the crude allowable was raised to 515,000 barrels per day for a basic well rate of 17 barrels per day.

Petroleum from 83,594 wells was reported from 64 counties, of which Osage, Stephens, Carter, Garvin, and Creek Counties led as producers

Digitized by Google

in order named. Of the State output, 47 percent was from nonallocated fields, which included secondary-recovery projects and stripper fields.

**TABLE 7.—Crude petroleum production**

| August | 15,841 | 17,198 | 17,459 | 1959 | 198,090 | 197,085 | |

[1] Preliminary figures.

The Interstate Oil Compact Commission reported that on January 1, 1960, Oklahoma had 68,836 stripper wells which produced over 91 million barrels of oil in 1959. Oil reserves of these totaled 1,242 billion barrels, or 69 percent of the overall proved oil reserve in Oklahoma as of January 1.

The average price per barrel of Oklahoma crude petroleum at the wellhead was $2.92, unchanged from 1959.

Again, Oklahoma ranked third in test-well drilling with 700 test wells (148 oil productive and 65 gas productive) compared with 827 in 1959. Test-well drilling totaled 3,592,838 feet—each well averaged 5,133 feet, compared with 4,953 feet in 1959. The 4,102 field-development wells drilled totaled 13,838,691 feet, or an average of 3,374 feet per well compared with an average of 3,574 feet in 1959.

Although major interest in drilling was directed to field wells, several counties continued to attract attention for exploratory drilling. In the south-central section, Cleveland and McClain Counties, 58 exploratory tests yielded 20 oil wells; in the northeastern section, Osage and Kay Counties, 85 exploratory tests yielded 13 oil wells and 3 gas wells; in the central section, Lincoln and Kingfisher Counties, 58 exploratory tests yielded 22 oil wells and 8 gas wells; and west of the Arbuckle Mountains, Stephens County, 31 exploratory tests yielded 6 oil wells and 2 gas wells.

Oklahoma had 15 refineries with a total daily capacity of 401,680 barrels of crude oil and 151,375 barrels of cracked gasoline. In 1960 the refineries processed 68 percent of the State production. Crude oil runs to stills, compared with total receipts, intrastate receipts, and yearend stocks at Oklahoma refineries, in thousand barrels, were as follows:

Digitized by Google

| Year | Runs to stills | Total receipts | Intrastate receipts | Stocks Dec. 31 |
|---|---|---|---|---|
| 1959 | 134,577 | 134,799 | 93,747 | 2,7[illegible] |
| 1960 | 131,042 | 130,820 | 93,073 | 2,[illegible] |

## NONMETALS

Nonmetals output was valued at $39.4 million, a new record and exceeding the previous record high established in 1959 by $2.3 million. The gain was attributed entirely to increases in production of stone and sand and gravel.

Asphalt (Native).—Output of native rock asphalt for road surfacing, reported from Murray County, dropped 87 percent below the 1959 production.

Cement.—Cement production decreased 20 percent from 1959. Shipments of cement into the State decreased 13 percent. Plants at Ada, Pontotoc County; Dewey, Washington County; and Pryor, Mayes County were active during the year. The newest cement producer, Oklahoma Cement Co., made the first shipment from its $8 million plant at Pryor in July, about 14 months after construction started. The limestone reserve at the plant site was sufficient to supply the plant for over 200 years at the 1960 rate of production. The Pryor plant had a reported annual capacity of 1.25 million barrels. Construction continued throughout 1960 on the new Dewey Portland Cement Co. $12 million plant east of Tulsa.

**TABLE 11.—Destination of shipments of portland cement to Oklahoma from mills**

| Year | Oklahoma (thousand barrels) | Change, percent | |
|---|---|---|---|
| | | In Oklahoma | In United States |
| 1951-55 (average) | 4,349 | | |
| 1956 | 4,814 | +1 | +6 |
| 1957 | 4,886 | +1 | −6 |
| 1958 | 5,131 | +5 | +6 |
| 1959 | 5,374 | +5 | +9 |
| 1960 | 4,669 | −13 | −7 |

Clays.—Clay was produced primarily for manufacturing brick and tile and, to a lesser extent, for portland cement and lightweight expanded-clay products. Brick and tile were made in Creek, Custer, Garfield, Greer, Lincoln, Oklahoma, Pittsburg, Pontotoc, Seminole, and Tulsa Counties; lightweight aggregate was made in Oklahoma and Rogers Counties. Pottery was manufactured in Creek County. Bentonite, produced in Dewey County, was used for filtering and as an absorbent.

Gem Stones.—A small quantity of gem stones, essentially crystalline specimens of quartz, barite, calcite, and marcasite, from Cleveland, Ottawa, Pontotoc, and McCurtain Counties, was collected by individuals.

**TABLE 12.—Clays sold or used by producers[1]**

(Thousand short tons and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 565 | $757 | 1958 | 576 | $579 |
| 1956 | 705 | 701 | 1959 | 966 | 970 |
| 1957 | 641 | 642 | 1960 | 734 | 739 |

[1] Excludes bentonite.

**Gypsum.**—Output of gypsum was 13 percent below that of 1959 because of decreased construction. Most of the crude gypsum was produced in Blaine County, where United States Gypsum Co. operated quarries and a plant at Southard to manufacture wallboard and plaster products. Gypsum also was produced in Caddo and Washita Counties.

**Lime.**—Lime, produced by St. Clair Lime Co. in Sequoyah County, declined 21 percent from 1959. It was used mostly by chemical plants at Pryor and by municipal water plants.

**Pumice.**—An increase in the output of pumice from Beaver County was noted. Principal use was for abrasive-type cleaners.

**Salt.**—Salt was produced in 1960 in Woods County from surface incrustations on the Big Salt Plain of the Cimarron River, and in Harmon County, by solar evaporation of brine from springs. Stock food and recharging of water softeners were the major uses. Minor uses included herbicides and salinity control of oil-well drilling fluid.

**Sand and Gravel.**—Sand and gravel was produced in 55 counties; Johnston, Tulsa, Pontotoc, Oklahoma, Kay, Pushmataha, and Murray Counties supplied over half the total value.

**TABLE 13.—Sand and gravel sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Commercial | | Government-and-contractor | | Total sand and gravel | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 2,876 | $2,868 | 1,860 | $841 | 4,736 | $3,709 |
| 1956 | 3,417 | 3,886 | 2,530 | 957 | 5,947 | 4,843 |
| 1957 | 3,297 | 3,608 | 1,663 | 899 | 4,960 | 4,507 |
| 1958 | 4,245 | 4,417 | 2,987 | 1,442 | 7,232 | 5,859 |
| 1959 | 4,376 | 4,988 | 1,626 | 939 | 6,002 | 5,927 |
| 1960 | 4,823 | 6,544 | 1,601 | 924 | 6,424 | 7,468 |

Most of the sand and gravel produced was used as concrete aggregate. Next in importance in terms of tonnage and value, was high-purity glass sand produced at two plants in Johnston and Pontotoc Counties, in the Arbuckle Mountain district. A small quantity of high-purity sand was used as foundry sand, in making sodium silicate, and in pottery and tile.

**Stone.**—Tulsa, Comanche, Murray, and Ottawa Counties supplied over half the 14.1 million tons of stone produced in 36 counties. Twenty producers at 30 quarries and the State highway department reported output of crushed limestone. The material was used prin-

Digitized by Google

cipally for cement, concrete aggregate, and road construction. Smaller quantities were used for agricultural limestone and the manufacture of glass.

*Chat.*—Chat, tabulated with miscellaneous stone, is the coarse tailing from milling lead and zinc ores. The material is mainly chert (microcrystalline silica) with small quantities of limestone, sphalerite, galena, marcasite, and pyrite. Railroad ballast, concrete aggregate, and road surfacing consumed most of the chat sold during the year. Operators in Ottawa County reported 18 percent more tonnage than in 1959.

**TABLE 14.—Stone sold or used by producers, by kinds**

(Thousand short tons and thousand dollars)

[1] Crushed granite included with "Other stone."
[2] Dimension limestone included with "Other stone."
[3] Excludes crushed granite.

*Granite.*—The dimension-granite industry was centered in the Wichita Mountains in the southwest part of the State, where four producers operated five quarries in Greer and Kiowa Counties.

Production came from Precambrian granites, which are predominantly pink and red. Dimension granite was used mostly for monumental stone and to some extent for exterior trim. Most of the stone was finished in plants in the Wichita Mountains, although some was shipped as rough rock to other States.

*Limestone and Dolomite.*—Limestone and dolomite were quarried in 26 counties; the greatest output came from Tulsa, Comanche, and Murray Counties.

Chemical-grade limestone quarried at Marble City, Sequoyah County, was used for limemaking, for use as a flux in glass manufacturing, and in fertilizers and mineral food. Nearly 2,400 short tons of dimension limestone was quarried for building stone in Pontotoc, Johnston, Caddo, and Jackson Counties. Limestone for portland cement was quarried in Washington, Pontotoc, and Mayes Counties.

Dolomite was produced in Johnston County for use as flux in glassmaking and for soil conditioning.

*Sandstone.*—Dimension sandstone was quarried in Pushmataha and Okmulgee Counties for use as building and veneer stone. The stone was cut in slabs 1½ to 6 inches thick from shallow, open-face quarries.

Digitized by Google

**Tripoli.**—Output of tripoli in eastern Ottawa County increased 12 percent over that of 1959. The crude material was shipped to Seneca, Mo., processed by the American Tripoli Division of the Carborundum Co., and sold primarily for buffing compounds and in minor quantities for foundry use.

**Vermiculite.**—Zonolite Co. exfoliated vermiculite in Oklahoma County from ores mined in Montana and South Carolina. The product was used mainly in concrete and plaster.

## METALS

Output of metals increased over 1959, halting the decline in lead and zinc production.

**Lead.**—Most mines in Ottawa County remained closed throughout 1960 due to a depressed market; however, the 936 short tons of recoverable lead mined in the county was 56 percent more than in 1959.

The price of lead, New York, at the beginning of the year was 12 cents per pound; it remained unchanged until December 13, when it fell to 11 cents.

**Zinc.**—Output of recoverable zinc in Ottawa County was 2,332 short tons, more than double that of 1959. Percentage of metal recovery from the ore was considerably higher as mining was more selective. Again, most mines remained closed. At the beginning of the year, the price of zinc metal was 12.5 cents per pound, East St. Louis, but effective January 8 the price increased to 13 cents. It remained unchanged until December 13, then dropped to 12.5 cents and, on December 19 to 12 cents per pound for the balance of the year.

[1] Based on Oklahoma ore (dirt) and old tailing treated at mills during calendar year indicated.
[2] In calculating metal content of the ores from assays, allowance made for smelting losses of both lead and zinc. In comparing values of concentrate (ore) and metal, it should be borne in mind that value given for concentrate is that actually received by producer, whereas value of lead and zinc is calculated from average price for all grades.

**Custom Mills and Smelters.**—Three horizontal-retort zinc plants were operated throughout 1960: American Metal Climax, Inc., at Blackwell, Kay County; National Zinc Co. at Bartlesville, Washington County; and The Eagle-Picher Co. at Henryetta, Okmulgee County. Ores and concentrates of domestic and foreign origin were treated at these smelters. Federated Metals Division of the American Smelting and Refining Co. operated a secondary zinc plant in Sand Springs, Tulsa County.

American Zinc, Lead & Smelting Co. announced plans to recondition and reopen by March 1961 its Barbara J. mill near Cardin. The mill has been closed for 3 years because of depressed zinc prices. Soon thereafter, The Eagle-Picher Co. announced plans to reopen its Central Mill north of Commerce sometime in March 1961; the mill had been closed since mid-1958.

National Zinc Co. recovered sulfuric acid as a byproduct from imported zinc ores processed at its plant in Bartlesville, Washington County.

### TRI-STATE DISTRICT

Depressed lead-zinc markets, which led to a general shutdown in mid-1958 of all major mining operations in the Tri-State District, continued in 1960. However, the quantites of lead and zinc concentrates recovered were up 93 percent and 119 percent, respectively, over the 1959 figures. Oklahoma produced 54 percent of the district's lead concentrate and 53 percent of its zinc concentrate, and Kansas produced 46 percent of the district's lead concentrate and 47 percent of the zinc concentrate. No output was reported from southwest Missouri in 1960.

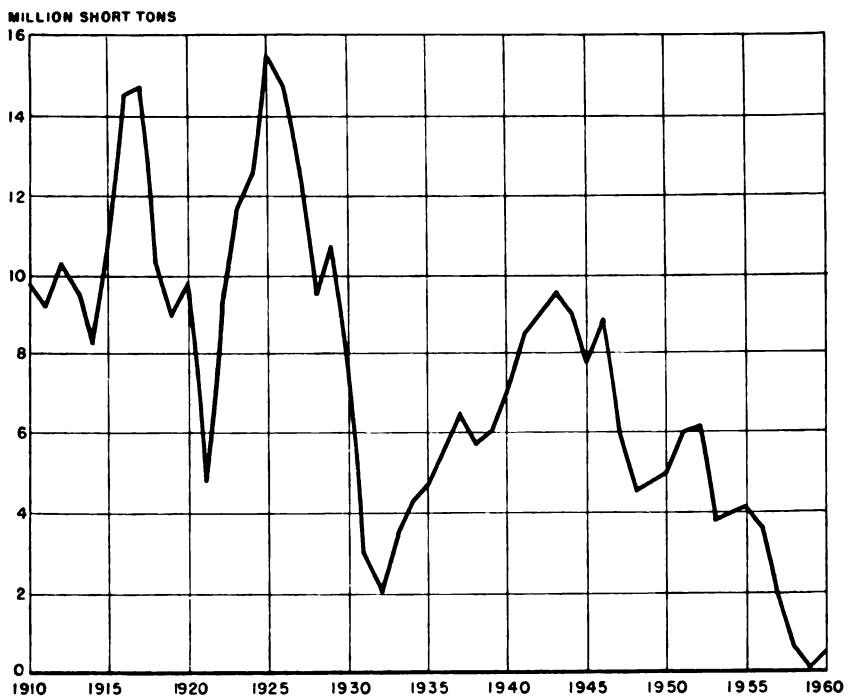

FIGURE 1.—Quantity of crude ore (rock) milled in the Tri-State District, 1910–60.

Digitized by Google

Three smelting companies maintained ore buyers in the Tri-State District. All production was purchased f.o.b. mill by the brokers; no metal concentrates were stockpiled at the mines. Deliveries of mined ore were so small that the mills were operated only part time.

## REVIEW BY COUNTIES

Output of metals, nonmetals, and mineral fuels was reported from 76 of 77 counties.

**Alfalfa.**—Petroleum and natural gas were produced. Construction sand and gravel was produced by Earl Kirkpatrick, and paving sand was produced by the State highway department.

Oklahoma had 15 refineries with a total daily capacity of 401,680 barrels of crude oil and 151,375 barrels of cracked gasoline. In 1960 the refineries processed 68 percent of the State production. Crude oil runs to stills, compared with total receipts, intrastate receipts, and yearend stocks at Oklahoma refineries, in thousand barrels, were as follows:

Digitized by Google

| Year | Runs to stills | Total receipts | Intrastate receipts | Stocks Dec. 31 |
|---|---|---|---|---|
| 1959 | 134,577 | 134,799 | 93,747 | 2,786 |
| 1960 | 131,042 | 130,820 | 93,073 | 2,522 |

## NONMETALS

Nonmetals output was valued at $39.4 million, a new record and exceeding the previous record high established in 1959 by $2.3 million. The gain was attributed entirely to increases in production of stone and sand and gravel.

**Asphalt (Native).**—Output of native rock asphalt for road surfacing, reported from Murray County, dropped 87 percent below the 1959 production.

**Cement.**—Cement production decreased 20 percent from 1959. Shipments of cement into the State decreased 13 percent. Plants at Ada, Pontotoc County; Dewey, Washington County; and Pryor, Mayes County were active during the year. The newest cement producer, Oklahoma Cement Co., made the first shipment from its $8 million plant at Pryor in July, about 14 months after construction started. The limestone reserve at the plant site was sufficient to supply the plant for over 200 years at the 1960 rate of production. The Pryor plant had a reported annual capacity of 1.25 million barrels. Construction continued throughout 1960 on the new Dewey Portland Cement Co. $12 million plant east of Tulsa.

**TABLE 11.—Destination of shipments of portland cement to Oklahoma from mills**

| Year | Oklahoma (thousand barrels) | Change, percent | |
|---|---|---|---|
| | | In Oklahoma | In United States |
| 1951–55 (average) | 4,349 | | |
| 1956 | 4,814 | +1 | +6 |
| 1957 | 4,886 | +1 | −6 |
| 1958 | 5,131 | +5 | +6 |
| 1959 | 5,374 | +5 | +9 |
| 1960 | 4,669 | −13 | −7 |

**Clays.**—Clay was produced primarily for manufacturing brick and tile and, to a lesser extent, for portland cement and lightweight expanded-clay products. Brick and tile were made in Creek, Custer, Garfield, Greer, Lincoln, Oklahoma, Pittsburg, Pontotoc, Seminole, and Tulsa Counties; lightweight aggregate was made in Oklahoma and Rogers Counties. Pottery was manufactured in Creek County. Bentonite, produced in Dewey County, was used for filtering and as an absorbent.

**Gem Stones.**—A small quantity of gem stones, essentially crystalline specimens of quartz, barite, calcite, and marcasite, from Cleveland, Ottawa, Pontotoc, and McCurtain Counties, was collected by individuals.

Digitized by Google

**TABLE 12.—Clays sold or used by producers[1]**

(Thousand short tons and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 565 | $757 | 1958 | 576 | $579 |
| 1956 | 705 | 701 | 1959 | 966 | 970 |
| 1957 | 641 | 642 | 1960 | 734 | 739 |

[1] Excludes bentonite.

**Gypsum.**—Output of gypsum was 13 percent below that of 1959 because of decreased construction. Most of the crude gypsum was produced in Blaine County, where United States Gypsum Co. operated quarries and a plant at Southard to manufacture wallboard and plaster products. Gypsum also was produced in Caddo and Washita Counties.

**Lime.**—Lime, produced by St. Clair Lime Co. in Sequoyah County, declined 21 percent from 1959. It was used mostly by chemical plants at Pryor and by municipal water plants.

**Pumice.**—An increase in the output of pumice from Beaver County was noted. Principal use was for abrasive-type cleaners.

**Salt.**—Salt was produced in 1960 in Woods County from surface incrustations on the Big Salt Plain of the Cimarron River, and in Harmon County, by solar evaporation of brine from springs. Stock food and recharging of water softeners were the major uses. Minor uses included herbicides and salinity control of oil-well drilling fluid.

**Sand and Gravel.**—Sand and gravel was produced in 55 counties; Johnston, Tulsa, Pontotoc, Oklahoma, Kay, Pushmataha, and Murray Counties supplied over half the total value.

**TABLE 13.—Sand and gravel sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Commercial | | Government-and-contractor | | Total sand and gravel | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 2,876 | $2,868 | 1,860 | $841 | 4,736 | $3,709 |
| 1956 | 3,417 | 3,886 | 2,530 | 957 | 5,947 | 4,843 |
| 1957 | 3,297 | 3,608 | 1,663 | 899 | 4,960 | 4,507 |
| 1958 | 4,245 | 4,417 | 2,987 | 1,442 | 7,232 | 5,859 |
| 1959 | 4,376 | 4,988 | 1,626 | 939 | 6,002 | 5,927 |
| 1960 | 4,823 | 6,544 | 1,601 | 924 | 6,424 | 7,468 |

Most of the sand and gravel produced was used as concrete aggregate. Next in importance in terms of tonnage and value, was high-purity glass sand produced at two plants in Johnston and Pontotoc Counties, in the Arbuckle Mountain district. A small quantity of high-purity sand was used as foundry sand, in making sodium silicate, and in pottery and tile.

**Stone.**—Tulsa, Comanche, Murray, and Ottawa Counties supplied over half the 14.1 million tons of stone produced in 36 counties. Twenty producers at 30 quarries and the State highway department reported output of crushed limestone. The material was used prin-

Digitized by Google

cipally for cement, concrete aggregate, and road construction. Smaller quantities were used for agricultural limestone and the manufacture of glass.

*Chat.*—Chat, tabulated with miscellaneous stone, is the coarse tailing from milling lead and zinc ores. The material is mainly chert (microcrystalline silica) with small quantities of limestone, sphalerite, galena, marcasite, and pyrite. Railroad ballast, concrete aggregate, and road surfacing consumed most of the chat sold during the year. Operators in Ottawa County reported 18 percent more tonnage than in 1959.

**TABLE 14.—Stone sold or used by producers, by kinds**

(Thousand short tons and thousand dollars)

| Year | Granite | | Limestone | | Sandstone | | Other stone | | Total | |
|---|---|---|---|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value | Quantity | Value | Quantity | Value |
| 1956 | [1] 5 | [1] $523 | [2] 8,626 | [1] $10,603 | 153 | $227 | 1,763 | $1,061 | 10,547 | $12,417 |
| 1957 | [1] 5 | [1] 557 | [2] 10,238 | [1] 12,041 | 306 | 373 | 1,467 | 1,093 | 12,016 | 14,064 |
| 1958 | 31 | 569 | 9,383 | 10,833 | 275 | 264 | 1,105 | 566 | 10,794 | 12,232 |
| 1959 | [1] 5 | 720 | 11,242 | 13,455 | 222 | 241 | 1,214 | 564 | 12,683 | 14,980 |
| 1960 | [2] 5 | 620 | 11,995 | 13,852 | 784 | 870 | 1,270 | 756 | [3] 14,054 | [3] 16,098 |

[1] Crushed granite included with "Other stone."
[2] Dimension limestone included with "Other stone."
[3] Excludes crushed granite.

*Granite.*—The dimension-granite industry was centered in the Wichita Mountains in the southwest part of the State, where four producers operated five quarries in Greer and Kiowa Counties.

Production came from Precambrian granites, which are predominantly pink and red. Dimension granite was used mostly for monumental stone and to some extent for exterior trim. Most of the stone was finished in plants in the Wichita Mountains, although some was shipped as rough rock to other States.

*Limestone and Dolomite.*—Limestone and dolomite were quarried in 26 counties; the greatest output came from Tulsa, Comanche, and Murray Counties.

Chemical-grade limestone quarried at Marble City, Sequoyah County, was used for limemaking, for use as a flux in glass manufacturing, and in fertilizers and mineral food. Nearly 2,400 short tons of dimension limestone was quarried for building stone in Pontotoc, Johnston, Caddo, and Jackson Counties. Limestone for portland cement was quarried in Washington, Pontotoc, and Mayes Counties.

Dolomite was produced in Johnston County for use as flux in glassmaking and for soil conditioning.

*Sandstone.*—Dimension sandstone was quarried in Pushmataha and Okmulgee Counties for use as building and veneer stone. The stone was cut in slabs 1½ to 6 inches thick from shallow, open-face quarries.

Digitized by Google

**Tripoli.**—Output of tripoli in eastern Ottawa County increased 12 percent over that of 1959. The crude material was shipped to Seneca, Mo., processed by the American Tripoli Division of the Carborundum Co., and sold primarily for buffing compounds and in minor quantities for foundry use.

**Vermiculite.**—Zonolite Co. exfoliated vermiculite in Oklahoma County from ores mined in Montana and South Carolina. The product was used mainly in concrete and plaster.

## METALS

Output of metals increased over 1959, halting the decline in lead and zinc production.

**Lead.**—Most mines in Ottawa County remained closed throughout 1960 due to a depressed market; however, the 936 short tons of recoverable lead mined in the county was 56 percent more than in 1959.

The price of lead, New York, at the beginning of the year was 12 cents per pound; it remained unchanged until December 13, when it fell to 11 cents.

**Zinc.**—Output of recoverable zinc in Ottawa County was 2,332 short tons, more than double that of 1959. Percentage of metal recovery from the ore was considerably higher as mining was more selective. Again, most mines remained closed. At the beginning of the year, the price of zinc metal was 12.5 cents per pound, East St. Louis, but effective January 8 the price increased to 13 cents. It remained unchanged until December 13, then dropped to 12.5 cents and, on December 19 to 12 cents per pound for the balance of the year.

**TABLE 15.—Mine production of lead and zinc, in terms of concentrate and recoverable metals[1]**

| Year | Lead concentrate (galena) | | Zinc concentrate (sphalerite) | | Recoverable metal content[2] | | | |
|---|---|---|---|---|---|---|---|---|

| 1960 | 1,687 | 155 | 4,715 | 344 | 936 | 219 | 2,332 | 602 |
| Total, 1891–1960 | 1,675,398 | 162,834 | 9,738,365 | 482,610 | 1,284,688 | 194,411 | 5,134,496 | 772,582 |

[1] Based on Oklahoma ore (dirt) and old tailing treated at mills during calendar year indicated.

[2] In calculating metal content of the ores from assays, allowance made for smelting losses of both lead and zinc. In comparing values of concentrate (ore) and metal, it should be borne in mind that value given for concentrate is that actually received by producer, whereas value of lead and zinc is calculated from average price for all grades.

| July | 66 | 241 | Total | 936 | 2,332 |

**Custom Mills and Smelters.**—Three horizontal-retort zinc plants were operated throughout 1960: American Metal Climax, Inc., at Blackwell, Kay County; National Zinc Co. at Bartlesville, Washington County; and The Eagle-Picher Co. at Henryetta, Okmulgee County. Ores and concentrates of domestic and foreign origin were treated at these smelters. Federated Metals Division of the American Smelting and Refining Co. operated a secondary zinc plant in Sand Springs, Tulsa County.

American Zinc, Lead & Smelting Co. announced plans to recondition and reopen by March 1961 its Barbara J. mill near Cardin. The mill has been closed for 3 years because of depressed zinc prices. Soon thereafter, The Eagle-Picher Co. announced plans to reopen its Central Mill north of Commerce sometime in March 1961; the mill had been closed since mid-1958.

National Zinc Co. recovered sulfuric acid as a byproduct from imported zinc ores processed at its plant in Bartlesville, Washington County.

### TRI-STATE DISTRICT

Depressed lead-zinc markets, which led to a general shutdown in mid-1958 of all major mining operations in the Tri-State District, continued in 1960. However, the quantites of lead and zinc concentrates recovered were up 93 percent and 119 percent, respectively, over the 1959 figures. Oklahoma produced 54 percent of the district's lead concentrate and 53 percent of its zinc concentrate, and Kansas produced 46 percent of the district's lead concentrate and 47 percent of the zinc concentrate. No output was reported from southwest Missouri in 1960.

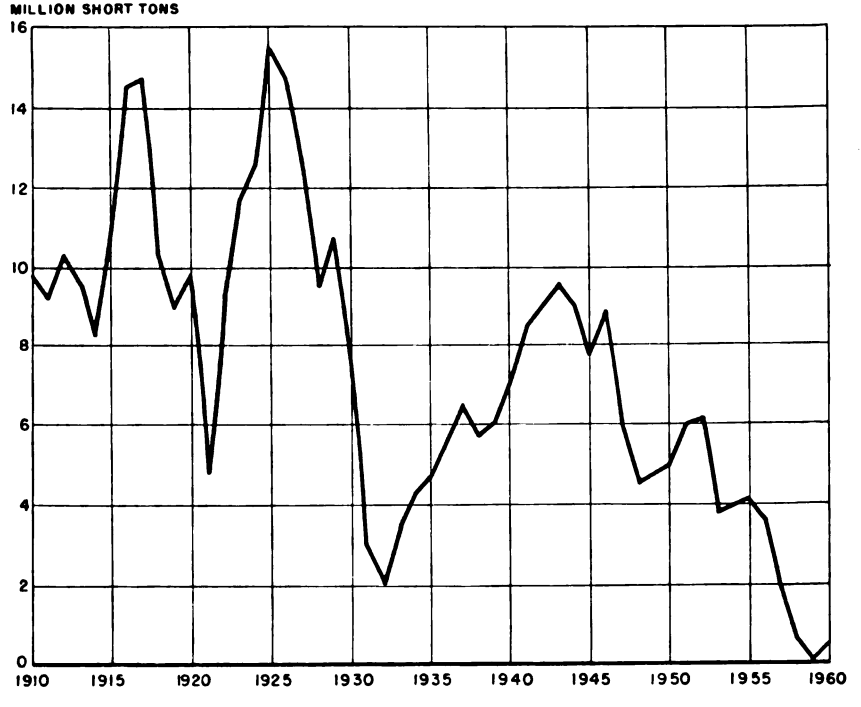

FIGURE 1.—Quantity of crude ore (rock) milled in the Tri-State District, 1910–60.

Digitized by Google

Three smelting companies maintained ore buyers in the Tri-State District. All production was purchased f.o.b. mill by the brokers: no metal concentrates were stockpiled at the mines. Deliveries of mined ore were so small that the mills were operated only part time.

## REVIEW BY COUNTIES

Output of metals, nonmetals, and mineral fuels was reported from 76 of 77 counties.

**Alfalfa.**—Petroleum and natural gas were produced. Construction sand and gravel was produced by Earl Kirkpatrick, and paving sand was produced by the State highway department.

Digitized by Google

**Atoka.**—Limestone was mined and crushed at the Southwest Stone Co. quarry near Stringtown for use as railroad ballast, road base, and aggregate in concrete. Sand and gravel was produced by the State highway department. A small quantity of petroleum was produced.

**TABLE 21.—Value of minerals produced in Oklahoma, by counties [1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Adair | $7,508 | $39,285 | Petroleum, stone. |

| Wooodward | 35,182 | 474,747 | Natural gas, petroleum, sand and gravel. |
| Undistributed | 6,647,982 | 9,721,476 | |
| Total | [3] 765,439,000 | 779,116,000 | |

[1] Delaware county is not listed because no production was reported.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Revised figure.

**Beaver.**—Natural gas, petroleum, and natural gas liquids were produced. The Mocane gas area was the largest in the county. LaRue-Axtell Pumice Co. mined volcanic ash near Gate. The State highway department produced sand and gravel.

**Beckham.**—Petroleum, natural gas liquids, and natural gas were produced, mostly from the Elk City field. Shell Oil Co. operated its Elk City cycling plant throughout 1960. Sand and gravel was produced by the State highway department.

**Blaine.**—Gypsum was produced northeast of Watonga by Universal Atlas Cement Co. and west of Okeene by Walton Gypsum Co. United States Gypsum Co. quarried and crushed gypsum and operated a large calcining, wall board, and plaster plant at Southard. Minor quantities of natural gas and petroleum were produced.

**Bryan.**—Petroleum and natural gas were produced from the Aylesworth, S.E. field. Limestone was quarried and crushed for highways. Sand and gravel for construction was produced from pits near Colbert, and elsewhere for paving by the State highway department.

**Caddo.**—Petroleum and natural gas were produced. Cement, the largest field, produced 3.8 million barrels of oil. At Cyril, the 10,000-barrel-a-day refinery of Anderson-Prichard Oil Corp. operated throughout the year. Dimension limestone, crushed limestone, and crushed sandstone were produced. Gypsum for portland cement and agricultural uses was produced near Lindsay by Harrison Gypsum Co. Construction sand and gravel was produced by two operators; paving sand was produced by the State highway department.

**Carter.**—Carter County ranked fourth in value of minerals and mineral fuels produced. Petroleum and natural gas came from numerous

Digitized by Google

fields, of which Fox-Graham, Healdton, Hewitt, and Sho-Vel-Tum were the largest. Natural gas liquids were recovered by five plants. The 12,000-barrel-a-day refinery of Ben Franklin Refining Co. at Ardmore operated during the year. Sand and gravel was produced for building and paving by one operator and for paving by the State highway department.

**Cimarron.**—Petroleum and natural gas were produced from several fields in the Keyes area. The Federal Bureau of Mines recovered helium from natural gas at its Keyes helium extraction plant, which began operating in 1959. Keyes gas for processing was supplied to the plant by Colorado Interstate Gas Co.

**Cleveland.**—Petroleum and natural gas were produced. Natural gas liquids were recovered by plants of Continental Oil Co. and Sunray Mid-Continent Petroleum Corp. Sand and gravel was produced by the State highway department.

**Coal.**—Petroleum and natural gas valued at about $1.6 million were produced. Crushed limestone was produced near Bromide by Dolese Co. and paving sand and gravel by the State highway department.

**Comanche.**—Crushed limestone was produced by Dolese Co. from its Richard Spur quarry north of Lawton. Paving sand was produced by the State highway department. Petroleum and natural gas were produced from a group of small fields (comprising three districts) and the Fort Sill Reservation field.

**Cotton.**—Petroleum and natural gas were produced from a group of fields in the Walters and Cache Creek districts and from several other fields. Sand and gravel was produced by the State highway department.

**Craig.**—Coal was strip mined at three pits by two operators. Minor amounts of petroleum and natural gas were produced.

**Creek.**—Petroleum and natural gas were produced from numerous fields; of these, the prolific Cushing and Glenn Pool fields furnished over 5.7 million barrels of petroleum during the year. Natural gas liquids were recovered by four plants, one of which, the Pure Oil Co. Glenn Pool plant at Sapulpa, was shut down on November 1. The Boswell-Frates Co. plant in the Edna field was dismantled. At Sapulpa, clay for manufacturing brick and tile was produced by Sapulpa Brick & Tile Co. and for pottery by Frankoma Pottery Co.

**Custer.**—Clay for brick and tile manufacturing was produced by Acme Brick Co. Stone, sand and gravel, natural gas liquids, natural gas, and petroleum were produced.

**Garfield.**—Petroleum and natural gas were produced. Natural gas liquids were recovered by Sinclair Oil & Gas Co. at Covington. The Sterling Oil Co. natural gas liquids plant in the Spring Valley field was dismantled. The 32,000-barrel-a-day Enid refinery of Champlin Refining Co. operated throughout the year. Enid Brick & Tile Manufacturing Co. continued production of clay for brick manufacturing.

**Garvin.**—Garvin County retained first position in total value of minerals and mineral fuels produced and ranked fourth in petroleum production. Petroleum and natural gas were produced from numerous fields which furnished 17 million barrels of petroleum. Natural gas liquids were recovered by six plants. The 17,500-barrel-a-day refinery of Kerr-McGee Oil Industries, Inc., at Wynnewood operated

Digitized by Google

throughout the year. Construction sand was mined by one operator from deposits east of Pauls Valley; paving sand and gravel and crushed sandstone were produced for highways by various producers and the State highway department.

**Grady.**—Petroleum and natural gas were produced. Natural gas liquids were recovered by two gasoline plants and two cycling plants. Warren Petroleum Corp. dismantled its Marlow field natural gasoline plant. Sand and gravel for construction and paving was obtained from pits near Tuttle by Dolese Co.

**Greer.**—Petroleum and natural gas were produced from the Lake Creek district. Granite was quarried by Century Granite Co. near the town of Granite. Sand and gravel was produced by three operators. Mangum Brick & Tile Co. mined clay south of Mangum.

**Harper.**—Natural gas and petroleum were produced. Gas from the big Laverne gasfield was processed at the Sun Oil Co. gasoline plant to recover natural gas liquids.

**Haskell.**—Haskell County ranked first in value of coal produced. Coal was mined underground by McAlpine and Dock Coal Co. and strip mined by five other producers. Natural gas was produced from Quinton and Kinta districts, where drilling interest continued. A minor quantity of sand and gravel was produced by the State highway department. The U.S. Army Corps of Engineers, Tulsa District, was constructing the Eufaula dam on the South Canadian River between Haskell and McIntosh Counties.

**Hughes.**—Petroleum and natural gas were produced from numerous fields. The Grimes Gasoline Co. closed its Wetumka natural gas liquids plant during the year. Paving gravel was produced for highways.

**Jackson.**—Small amounts of petroleum and natural gas were produced from fields southeast of Altus. Crushed granite was produced by H. D. Youngman Co. at Hedrick for the Altus Air Base. Dimension limestone was quarried by Masters Stone Co. Building sand was produced by one operator.

**Jefferson.**—Petroleum and natural gas were produced. Sandstone was quarried and crushed by various producers. Sand for road construction was produced by the State highway department.

**Johnston.**—Pennsylvania Glass Sand Corp. of Oklahoma produced sand for glass and ground silica from pits north of Mill Creek. Construction sand from a pit east of Tishomingo and paving gravel were used for highways. Ada Stone Co. mined dimension limestone for building near Pontotoc and Rock Products Co. crushed dolomite for flux in glassmaking.

**Kay.**—Petroleum and natural gas were produced from numerous fields; natural gas liquids were recovered by plants of Cities Service Oil Co. and Underlich Development Co. Petroleum refineries of Cities Service Oil Co. and Continental Oil Co. at Ponca City operated throughout the year. The petrochemical units of the Continental Oil Co. refinery continued to produce benzene, toluene, and propylene hydrocarbons and carbon black. An underground LP gas-storage site in limestone was being mined near Ponca City for Continental Oil Co. Capacity of the facility will be 300,000 barrels when completed in April 1961. Crushed limestone was produced by Cookson

Digitized by Google

Stone Co. from its quarry and plant northeast of Ponca City. Sand was produced for construction and paving by two operators and by the State highway department. Blackwell Zinc Co., Inc., a division of American Metal Climax, Inc., operated a zinc smelter throughout the year.

**Kingfisher.**—Petroleum, natural gas, and natural gasoline were produced. Natural gas liquids were recovered by the Trindle plant of Sohio Petroleum Co. Construction and paving sand were produced near Dover by Dolese Co. and paving sand by the State highway department.

**Kiowa.**—Dimension granite was quarried near Snyder by three operators and near Hobart by Century Granite Co. Construction sand and gravel and crushed limestone for highways were produced by two operators. Petroleum and natural gas were produced.

**LeFlore.**—Coal was mined by eight operators, one at an open pit and the others at underground mines. The county ranked sixth in coal output. Sand and gravel and crushed sandstone were produced for highway surfacing. Natural gas was produced, mainly from three fields.

**Lincoln.**—Petroleum and natural gas were produced from numerous fields. Natural gas liquids were recovered by five plants. The Allied Materials Corp. 3,500-barrel-a-day refinery at Stroud operated throughout the year. Sand was produced for highways. Stroud Clay Products Co. produced clay for building brick.

**Logan.**—Petroleum and natural gas were produced from numerous fields and natural gas liquids were recovered by plant No. 3 of Eason Oil Co. Construction sand was produced by one operator.

**Love.**—Petroleum and natural gas were produced. Sand and gravel was produced by the Gulf, Colorado and Santa Fe Railway Co.

**Major.**—Petroleum and natural gas were produced, mostly from the Ringwood field. Natural gas liquids were recovered by Warren Petroleum Co. at Ringwood. Construction sand was produced by one operator.

**Marshall.**—Petroleum and natural gas were produced from several fields; the most important was the Cumberland field which yielded 1.2 million barrels of oil. Natural gas liquids were recovered by plants of Warren Petroleum Corp. and Service Gas Products Co. Near Madill, sulfur from sour gas was recovered by Central Chemical Co. Crushed limestone and sand and gravel were produced for highways.

**Mayes.**—Limestone and clay were produced for cement manufacture by Oklahoma Cement Co. at its new $8 million plant southeast of Pryor. Crushed limestone was quarried for roadstone, concrete aggregate, and agriculture. A small amount of petroleum was produced.

**McClain.**—Petroleum and natural gas were produced from numerous small fields and natural gasoline was recovered at the Criner plant of Sunray Mid-Continent Oil Co. Sand and gravel for highway paving was produced.

**McIntosh.**—Coal was strip mined by Magic City Coal Co. Small amounts of petroleum and natural gas were produced, mostly from the Coalton and Stidham fields. Sand was produced for highways. The U.S. Army Corps of Engineers, Tulsa District, was constructing

Digitized by Google

the Eufaula dam on the South Canadian River between Haskell and McIntosh Counties.

**Murray.**—Asphaltic limestone and sandstone were produced near Dougherty by United States Asphalt Corp. Limestone was mined and crushed at the Rayford and Big Canyon quarries of Dolese Co.; elsewhere by other producers. Structural and paving sand and gravel were produced by Makin Sand & Gravel Co. and sand and gravel for highways by the State highway department. Petroleum and natural gas were produced from two fields.

**Muskogee.**—Petroleum and a small quantity of natural gas were produced. Sand and gravel was dredged from the Arkansas River by two producers and the State highway department. At Muskogee, Fansteel Metallurgical Corp. operated its columbium-tantalum plant. Callery Chemical Co. continued to make high-energy fuels at its Muskogee plant. The Corning Glass Works announced that it would construct an addition to its Muskogee plant to increase its glassmaking capacity 50 percent.

**Noble.**—Petroleum and natural gas were produced from numerous fields; natural gas liquids were recovered by the Lucien unit of Gasoline Plant Management Co. Sandstone was quarried and crushed by several producers.

**Nowata.**—Petroleum and natural gas were produced from six fields. Crushed limestone was produced by Peerless Rock Co. Coal was strip mined by Markley Coal Co. and Patch Coal Co.

**Okfuskee.**—Petroleum and natural gas were produced from numerous fields. The productive Olympic field furnished about 1 million barrels of crude oil. Natural gas liquids were recovered by two plants of Grimes & Grimes and by the Laffoon plant of Kerr-McGee Oil Industries, Inc. Sand and gravel was produced by the State highway department.

**Oklahoma.**—Petroleum and natural gas were produced from numerous fields; Oklahoma City field yielded 2.8 million barrels of oil. Natural gas liquids were recovered by Patton & Swab, Inc.; Champlin Oil & Refining Co.; Phillips Petroleum Co. (two plants); and Cities Service Oil Co. The Oklahoma City plant of Monarch Refineries, Inc., was inactive during the year. Structural and paving sand was produced by four operators, and paving sand was produced by the State highway department. Clay for manufacturing brick and tile was obtained from pits in the west part of Oklahoma City by Acme Brick Co. and United Brick & Tile Co. Near Choctaw, clay for lightweight aggregate was produced by Oklahoma Lightweight Aggregate Corp.

**Okmulgee.**—Petroleum and natural gas were produced from numerous fields. The Phillips Petroleum Co. refinery at Okmulgee was in operation. Coal was mined underground near Henryetta by Ben Hur Coal Co. and Consolidated Coal Co. Sandstone was quarried near Henryetta by the Ada Stone Co. Paving sand was produced for highways.

**Osage.**—Osage, with many fields yielding oil and gas, was the leading oil-producing county. The Burbank field, under an extensive waterflooding program, produced 15.7 million barrels of oil and remained one of the most prolific fields. Natural gas liquids were recovered by

615629—61——53

Digitized by Google

Phillips Petroleum Co. in two plants. Crushed limestone was produced by Burbank Rock Co., Blake Stone Co., and Cookson Stone Co.

**Ottawa.**—All of the Oklahoma lead and zinc output and a major part of the Tri-State district output was supplied from mines in Ottawa County. Because of depressed metal markets, all major mining operations remained idle during the year. At Miami, the Rare Metals plant of The Eagle-Picher Co. operated during the year. Chat was supplied by five producers. Tripoli was quarried in east central Ottawa County by American Tripoli Division and processed in its plant at Seneca, Mo. Mineral specimens of sphalerite and galena were collected and sold as gem stones.

**Pawnee.**—Petroleum and natural gas were produced from numerous fields; natural gas liquids were recovered by Frame Natural Gasoline Co. Construction and paving sand and gravel were produced by two operators. Limestone was quarried and crushed by several producers.

**Payne.**—Petroleum and natural gas were produced from numerous fields; Yale-Quay, with a production of 1.3 million barrels of oil, was the largest in the county. Gas Products Corp. recovered natural gas liquids at the Norfolk field plant, formerly owned by Boswell-Frates Co. The refineries of Kerr-McGee Oil Industries, Inc., and Midland Cooperatives, Inc., at Cushing operated throughout the year. Crushed limestone was produced by Cookson Stone Co. at the Cushing quarry and sand was mined by the Payne County highway department.

**Pittsburg.**—Pittsburg County ranked fourth in value of coal produced. The underground coal mine of Lone Star Steel Co. closed in August. Natural gas was produced from three fields near Quinton. Sand was produced for highway construction. Clay for manufacturing brick and tile was produced by the Oklahoma State Penitentiary west of McAlester.

**Pontotoc.**—Petroleum and natural gas were produced from many fields, and natural gas liquids were recovered by plants of Humble Oil & Refining Co. and Kerr-McGee Oil Industries, Inc. However, the Fitts field plant of Kerr-McGee was closed on July 31. Building limestone was quarried near Fittstown by Townsend Quarry. Shale, clay, and limestone were quarried near Lawrence by Ideal Cement Co. for use in its Ada plant. Mid-Continent Glass Sand Co. produced glass sand and molding sand. Paving sand and gravel was produced by Dolese Co. and the State highway department. Ideal Cement Co. operated its new Ada plant throughout the year and retained its old plant on standby status.

**Pottawatomie.**—Petroleum and natural gas were produced from numerous fields. St. Louis field was the largest producer. Natural gas liquids were recovered by the St. Louis plant of Sinclair Oil & Gas Co. The Warren Petroleum Corp. plant in the Maud field, sold to Sinclair Oil & Gas Co., was being dismantled. Paving gravel was produced by the State highway department; construction sand was mined by one producer.

**Rogers.**—Rogers County ranked second in coal production. Coal was strip mined by McNabb Coal Co. and Sinclair Coal Co. Shale was produced by Chandler Materials Co. as raw material for its

Digitized by Google

lightweight aggregate plant. Petroleum and natural gas were produced from three fields. The Chelsea district produced most of the oil. The U.S. Army Corps of Engineers, Tulsa District, was constructing the Oologah Dam on the Verdigris River. The Public Service Co. of Oklahoma was building its Oologah hydroelectric power plant.

**Seminole.**—Petroleum and natural gas were produced from numerous fields; Seminole City field was the most prolific. Natural gas liquids were recovered at the plants of Redco Corp., Sinclair Oil & Gas Co., and Phillips Petroleum Co. Clay for manufacturing brick and tile was obtained west of Wewoka by Wewoka Brick & Tile Co. Sand and gravel was produced for highways.

**Sequoyah.**—The total value of coal, mined from open pits by Sallisaw Stripping Co., was third highest in the State. Limestone was mined and crushed north of Marble City at the St. Clair Lime Co. quarry; part of the limestone was burned at Sallisaw in the company kilns; and the remainder was used for glassmaking, soil conditioning, and highway construction and maintenance. Other operators produced limestone for riprap. Natural gas was produced from a small field. Sand and gravel was produced by one operator and the State highway department.

**Stephens.**—Stephens County ranked second in petroleum production and produced considerable natural gas. Natural gas liquids were recovered by four plants. The D–X Sunray refinery at Duncan was being modernized at a cost of $1.6 million. Crushed sandstone and paving gravel were produced for highways.

**Texas.**—Natural gas, from the vast Hugoton gasfield, and petroleum were produced during the year. Natural gas liquids were recovered near Guymon by Cities Service Oil Co. and Hugoton Plains Gas & Oil Co., and elsewhere by Dorchester Corp. and Excelsior Corp. Construction sand and gravel was produced by three operators.

**Tillman.**—Petroleum and a small quantity of natural gas were produced. The Granfield refinery of Bell Oil & Gas Co. operated throughout the year. Construction sand was produced by two operators. Century Granite Co. operated a granite-finishing plant at Frederick.

**Tulsa.**—Petroleum and natural gas were produced. Brick and tile were manufactured by Acme Brick Co. and United Brick & Tile Co. in Tulsa, and by United Brick & Tile Co. in Collinsville. East of Tulsa, near Garnett, crushed limestone was produced by Anchor Stone Co., Chandler Materials Co., and Standard Industries, Inc. (two quarries). Also east of Tulsa, Dewey Portland Cement Co. continued constructing its $12 million plant; initial capacity will be 1.25 million barrels of cement yearly. Construction and paving sand were produced by nine operators. At west Tulsa, refineries of The Texas Co. and of D–X Sunray operated throughout the year. D–X Sunray was installing an 85,000-barrel-a-day crude oil distillation unit and a $1 million petrochemical unit to produce benzene and toluene. The U.S. Army Corps of Engineers, Tulsa District, was constructing the Keystone dam on the Arkansas River.

**Washington.**—Petroleum and natural gas were produced from five districts. Dewey Portland Cement Co. quarried limestone and clay

Digitized by Google

near Dewey for manufacturing portland cement. Crushed limestone was produced east of Bartlesville by M. E. Stewart & Sons. The Bartlesville smelter of National Zinc Co. operated throughout the year; sulfuric acid, as a byproduct from imported zinc ores, was produced in addition to zinc.

**Washita.**—Petroleum and natural gas were produced from several small fields and from part of the prolific Elk City field. Sand and gravel was produced for highways. Agricultural gypsum was quarried near Colony by Agricultural Gypsum Co.

**Woods.**—Natural gas and petroleum were produced from several small fields. Construction sand was produced near Waynoka by Waynoka Sand & Gravel Co. Ezra Blackmon recovered salt by solar evaporation from water basins adjacent to the Cimarron River, west of Freedom.

**Woodward.**—Natural gas and petroleum were produced. Sand and gravel was produced by Klines Sand Pit and by the State highway department.

Digitized by Google

# The Mineral Industry of Oregon

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Oregon Department of Geology and Mineral Industries.**

By Frank B. Fulkerson,[1] William N. Hale,[1] and Norman S. Petersen [1]

MINERAL output in Oregon advanced to a record high in 1960, mainly because of increased values for stone and cement. Production value of sand and gravel, nickel ore, clays, and lime also gained. Output of uranium and mercury decreased markedly. The State value of production, which had recorded increases annually for 5 consecutive years, was 9 percent greater than in 1959. Unit values generally were steady, and the increase was due to the greater tonnages produced. Sand and gravel, stone, cement, and nickel ore continued to supply most of the State value.

An index of the physical volume of production rose 10 percent from 1959 to 1960. The index, which was obtained by averaging the relative changes in the volume of production for all commodities, weighted by their 1960 values, was 110 in 1960 (1959=100).

A favorable development in the primary aluminum industry was the announcement that a new plant would be built in Oregon or Washington by Harvey Aluminum, Inc. The same company expanded the capacity of The Dalles aluminum plant during 1960.

**TABLE 1.—Mineral production in Oregon [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays.....thousand short tons | 294 | $308 | 318 | $370 |
| Copper (recoverable content of ores, etc.)...short tons | ---------- | ---------- | 6 | 4 |
| Gold (recoverable content of ores, etc.)....troy ounces | 686 | 24 | 835 | 29 |
| Mercury.....76-pound flasks | 1,224 | 278 | 513 | 108 |
| Nickel (content of ore and concentrate).....short tons | 12,374 | (2) | 13,115 | 5,246 |
| Sand and gravel.....thousand short tons | 18,087 | 15,506 | 17,673 | 16,170 |
| Silver (recoverable content of ores, etc.)...troy ounces | 242 | (2) | 284 | (2) |
| Stone.....thousand short tons | 13,341 | 16,126 | 16,864 | 19,620 |
| Value of items that cannot be disclosed: Asbestos, carbon dioxide, cement, diatomite, gem stones, iron ore (pigment material) 1959, lime, pumice, uranium, and values indicated by footnote 2 | ---------- | [4] 18,607 | ---------- | 14,124 |
| Total [5] | ---------- | [4] 49,843 | ---------- | 54,419 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Figure withheld to avoid disclosing individual company confidential data.
[3] Less than $500.
[4] Revised figure.
[5] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.

[1] Commodity-industry analyst, Bureau of Mines, Albany, Oreg.

Digitized by Google

New distribution facilities were completed by Calaveras Cement Co. at Springfield and by Ideal Cement Co. at Eugene.

**Consumption, Trade and Markets.**—The bulk of the mineral output was for local consumption. Oregon business conditions improved slightly in 1960. These improvements occurred despite a continued depression in the production of lumber and wood products, the main manufacturing industry. Personal income and factory payrolls gained, and monthly average unemployment, although fairly high, was less than in the preceding year. Construction gained due to greater activity in nonresidential building and stepped-up work on the highways, which more than offset lower residential construction. Building permits in the principal cities, contracts awarded, and monthly average employment all increased 3 percent. Average weekly hours of construction workers would have been higher than in 1959 except for inclement weather in 2 months which curtailed work.

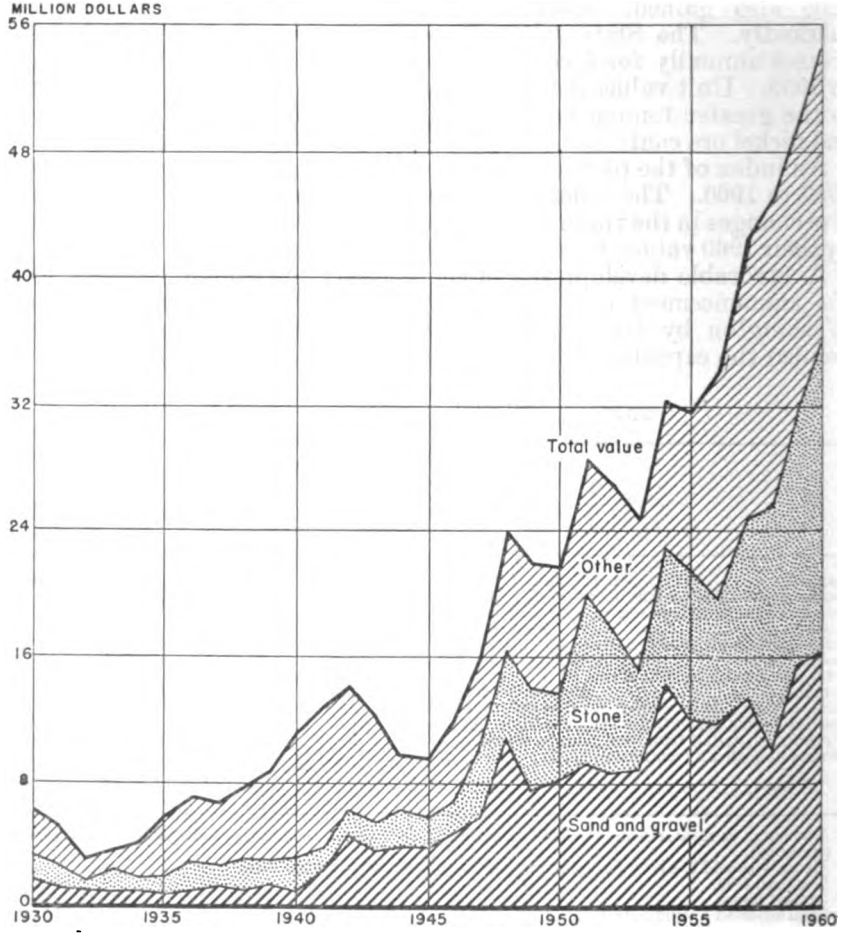

FIGURE 1.—Value of sand and gravel, stone, and total value of mineral production in Oregon, 1930–60.

**Employment and Injuries.**—Employment in the mineral industries was higher by 4 percent than in 1959 due to more workers in concrete, gypsum, and plaster products manufacturing, and in steelmaking. Employment in mining, at iron and steel foundries, and in nonferrous metals smelting and refining was slightly less than in 1959. From 1955 to 1960, employment in primary metals gained at an average rate of 7 percent annually, making these industries one of the fastest growing manufacturing sectors in Oregon. Table 4 gives data on injuries in mining industries.

**TABLE 3.—Employment and payrolls in mineral-industry establishments subject to Oregon unemployment-compensation law, by industries**

| Industry | 1959 | | 1960 | |
|---|---|---|---|---|

[1] Includes cement- and lime-processing plants.
[2] Preliminary figures.

**Government Programs.**—Two contracts involving mercury were active under the program of the Office of Minerals Exploration (OME), U.S. Department of the Interior. These contracts covered work at the Nisbet mine (A. O. Bartell, Clackamas County) and the Big Muddy prospect (Oregon Cinnabar Mines, Inc., Jefferson County). The amounts were $14,920 and $47,910, respectively, with Government participation of 50 percent.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Asbestos.**—A small quantity of chrysotile asbestos (shorts) was shipped by Oregon Asbestos Co., Mount Vernon, Grant County, to a California market.

**Cement.**—Production and shipments of cement were 18 and 15 percent greater, respectively, than in 1959. As in previous years, output was from three plants—one each in Baker, Clackamas, and Jackson Counties. Shipments were made chiefly within the State; out-of-State shipments were mainly to Idaho and Washington, with smaller quantities to northern California and Alaska. Trucks continued to be the principal method of transport; however, water and rail movement increased. The ratio of bulk to container (bag) shipments from producing plants was greater than in 1959.

Combined production from nine cement plants in Oregon and Washington was 8,244,300 barrels (376 pounds each) of finished portland cement; the same plants shipped 8,319,400 barrels of cement. The average value of portland cement shipped by producers in Oregon and Washington was $3.52 per barrel, f.o.b. plant, compared with $3.50 in 1959.

Calaveras Cement Co. placed in operation a 2,350-barrel-capacity bulk-cement transfer plant at Springfield. The plant was to be supplied by rail shipments from Calaveras plants in California. Ideal

Digitized by Google

Cement Co. constructed a 2,000-barrel-capacity distribution terminal at Eugene. The terminal, which was equipped to receive bulk or packaged cement by rail or truck, was to be supplied from the Ideal plant at Gold Hill.

**Clays and Shale.**—Clays sold or used by producers in Oregon advanced 8 percent over 1959 because of increased production of clay for cement. Miscellaneous clay production used in making heavy clay products, principally building brick and agricultural draintile, was 15 percent less than in 1959. Miscellaneous clay was produced in Benton, Clackamas, Klamath, Malheur, Marion, Multnomah, Polk, Tillamook, Union, Washington, and Yamhill Counties. Clay and shale used at cement plants were produced in Baker and Jackson Counties.

Production of shale for processing to expanded aggregate declined. The raw shale was expanded at plants of Smithwick Concrete Products Co. and Northwest Aggregate, Inc., in Washington County. Output was marketed mainly for use as a lightweight-concrete aggregate; the expanded product also was used as pozzolan additive to concrete used in constructing the John Day Dam.

Central Oregon Bentonite Co. increased production and shipments of bentonite from the Silver Wells operation southeast of Prineville, Crook County. The ground bentonite was used mainly as a binder for pelletized livestock feed and for sealing earth-lined irrigation canals and reservoirs. Smaller quantities were used in oil-well drilling muds and for insecticide dusts.

**Diatomite.**—Production and shipments of prepared diatomite were 6 percent lower than in 1959. Output was from the quarry and preparation plant of Great Lakes Carbon Corp., Mining & Mineral Products Division, near Terrebonne, Deschutes County. The prepared product was marketed chiefly for filter, filler, and insulation uses.

A. M. Matlock continued to explore diatomite deposits in the Silver Lake area of Lake County. A small tonnage of crude ore was produced and stockpiled.

**Lime.**—Output of lime at the Baker plant of Chemical Lime Co. was slightly greater than in 1959. Electroprocess, metallurgical, and paper plants in the Pacific Northwest continued as the principal markets for the quicklime and hydrated lime produced.

Pacific Carbide & Alloys Co. quarried limestone from the Black Marble quarry near Enterprise, Wallowa County, to supply the company limekilns at Portland, Multnomah County. Quicklime production was utilized by the firm to manufacture calcium carbide.

**Perlite.**—Output of expanded perlite by Supreme Perlite Co., Portland, Multnomah County, was 9 percent lower than in 1959. Nevada mines supplied the crude perlite processed at the plant. The expanded product was marketed chiefly as a building plaster aggregate; smaller quantities were sold for soil conditioning and for concrete aggregate use.

**Pumice and Volcanic Cinder.**—The quantity of pumice and pumiceous materials (volcanic cinder and scoria) sold or used by producers in Oregon was 4 percent lower than in 1959. Production was from three operations in Deschutes County.

Digitized by Google

The quantity of pumice sold or used remained substantially the same as in the previous year; however, volcanic cinder and scoria output declined moderately. Pumiceous materials produced were used mainly as lightweight-concrete aggregate. Smaller tonnages of cinder were used for surfacing roads and as roofing rock, and a small quantity of pumice was utilized for insulation purposes.

**Sand and Gravel.**—Total output of sand and gravel was 17.7 million tons—a decline of 2 percent from the record high of 18.1 million tons produced in 1959. The principal cause of the decline was curtailed requirements for sand and gravel by the U.S. Forest Service and the U.S. Army Corps of Engineers. The quantity of sand and gravel used at State highway department projects remained substantially the same (2.9 million tons) as the year before. Sand and gravel output by commercial producers was 7.4 million tons, compared with 7.2 million tons in 1959. Noncommercial (Government-and-contractor) production was 10.3 million tons—a decline of 6 percent from the 10.9 million tons produced in 1959. Production was reported from 33 of the 36 counties. Output exceeding 1 million tons was reported from Clackamas, Lane, Multnomah, and Gilliam Counties.

**TABLE 5.—Sand and gravel sold or used by producers, by classes of operations and uses**

(Thousand short tons and thousand dollars)

| Class of operation and use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Commercial operations: | | | | |
| Building | 2,360 | $2,829 | 2,313 | $2,706 |
| Concrete and roadstone | 4,369 | 4,657 | 3,852 | 4,513 |
| Other [1] | 484 | 401 | 1,237 | 865 |
| Total | 7,213 | 7,887 | 7,402 | 8,083 |
| Government-and-contractor operations: | | | | |
| Building | 5,284 | 2,031 | 3,734 | 2,783 |
| Concrete and roadstone | 5,589 | 5,588 | 4,582 | 4,757 |
| Other [1] | | | 1,954 | 747 |
| Total | 10,874 | 7,619 | 10,271 | 8,087 |
| All operations: | | | | |
| Building | 7,644 | 4,861 | 6,047 | 5,289 |
| Concrete and roadstone | 9,958 | 10,245 | 8,434 | 9,270 |
| Other [1] | 484 | 401 | 3,191 | 1,612 |
| Grand total [2] | 18,087 | 15,506 | 17,673 | 16,170 |

[1] Includes special sands, railroad ballast, and sand and gravel used for miscellaneous purposes.
[2] Owing to rounding, the individual items may not add to totals shown.

**Stone.**—Output of stone for all purposes reached a record of 16.9 million tons, an increase of 26 percent over 1959. The rise resulted from increased quantities of crushed stone used at State and Federal road projects. Stone output by commercial concerns was 4.2 million tons, and noncommercial (Government-and-contractor) production was 12.7 million tons, compared with 4.8 and 8.5 million tons, respectively, in 1959. In tonnage, basalt continued to be the principal stone quarried. Output was used for roadstone, ballast, and riprap.

The quantity of limestone quarried was 1.2 million tons, an in-

Digitized by Google

crease of 10 percent. Greater production of limestone for cement manufacture accounted for the increase. Producers reported that the largest tonnage was used by the cement industry, followed by the lime, sugar, paper, calcium carbide, and metallurgical industries, and agriculture. Limestone for industrial uses was quarried in Baker, Josephine, Polk, and Wallowa Counties.

Bristol Silica Co. continued to produce industrial silica (quartz) near Rogue River, Jackson County. Crushed silica was marketed for manufacturing silicon carbide, ferrosilicon, and refractories, and for other industrial purposes. The processing plant had to be relocated during the year because of highway construction. A new crushing and screening facility was built adjacent to rail and truck transportation routes west of Gold Hill. Sampling and evaluating of the Rannells silica deposit on Quartz Mountain northeast of Roseburg, Douglas County, continued and the deposit was the subject of an article.[2]

**TABLE 6.—Stone sold or used by producers, by uses**

(Thousand short tons and thousand dollars)

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Building (dimension stone) | (1) | (1) | 4 | $37 |
| Concrete, roadstone, and screening | 9,018 | $11,860 | 12,062 | 14,266 |
| Riprap | 2,855 | 2,161 | 2,879 | 2,886 |
| Railroad ballast | (1) | (1) | 309 | 328 |
| Other [2] | 1,468 | 2,105 | 1,610 | 2,104 |
| Total [3] | 13,341 | 16,126 | 16,864 | 19,620 |

[1] Included with "Other" to avoid disclosing individual company confidential data.
[2] Used at sugar refineries, in manufacturing paper and cement, at metallurgical and chemical plants and for other unspecified purposes; and items indicated by footnote 1.
[3] Owing to rounding, individual items may not add to total shown.

Rough building-stone production increased sharply as new quarries were brought into production. Dimension stone was quarried in Baker, Deschutes, Lake, Marion, and Multnomah Counties.

Stone was produced from operations in all 36 counties, and output exceeded 1 million tons in Baker, Jackson, and Lane Counties.

**Talc and Soapstone.**—Soapstone mined in northwestern Washington was ground at Portland plants of Stauffer Chemical Co. and Miller Products Co. Output of ground soapstone, which was used as a carrier in insecticides and fungicides, declined sharply from 1959.

**Vermiculite (Exfoliated).**—Production and shipments of exfoliated vermiculite were moderately higher than in 1959. Vermiculite from Montana and the Union of South Africa was utilized at Portland plants of Vermiculite Northwest, Inc., and Supreme Perlite Co., respectively. The exfoliated product was marketed as a loose-fill insulation, as a lightweight aggregate for plaster and concrete, and as a soil conditioner.

## METALS

**Aluminum.**—In April, Harvey Aluminum, Inc., announced that it would expand the annual capacity of its primary aluminum plant at The Dalles from 60,000 to 75,000 tons. Fabricating and billet-casting facilities also were planned at The Dalles, along with additions to the company mill at Torrance, Calif. The Harvey concern planned to construct another plant in Oregon or Washington with an annual capacity of 75,000 tons of primary aluminum, increasing primary annual capacity of the company in the Pacific Northwest to 150,000 tons. In July, the Harvey company entered into an agreement with Bonneville Power Administration for a peak load delivery of 75,000 kilowatts of firm power and 80,000 kilowatts of secondary power, to begin by January 1963.

**Chromium.**—No chromium ore or concentrate was produced in 1960; chromite mines and mills were closed in mid-1958 upon completion of the Federal chromite stockpiling program. Southwest Oregon beach sand containing chromite was the subject of a report.[3]

**Copper.**—Concentrate from the Standard mine, Grant County, the source of small quantities of copper in recent years, was shipped to the Tacoma (Wash.) smelter; production also was recorded at the Copper Eagle and other mines in Josephine County late in the year.

**TABLE 7.—Mine production of gold, silver, copper, lead, and zinc, in terms of recoverable metals[1]**

| Year | Mines producing | | Material sold or treated[2] (short tons) | Gold (lode and placer) | | Silver (lode and placer) | |
|---|---|---|---|---|---|---|---|
| | Lode | Placer | | Troy ounces | Value (thousands) | Troy ounces | Value (thousands) |
| 1951-55 (average) | 15 | 23 | 2,078 | 6,030 | $211 | 9,133 | $8 |

Digitized by Google

A geologic report on copper-cobalt deposits was placed on open file for public inspection at the Spokane (Wash.) office of the Federal Geological Survey.[4]

**Gold.**—Gold output increased 149 ounces over the 1959 record low. Placer mines in Josephine County supplied 63 percent of the 835 ounces (lode and placer) produced. In Grant County, lode gold was recovered principally from the Buffalo (gold ore) and Standard (copper ore) mines; over 65 percent of the State lode output was mined in this county.

Some gold mines were developed in the Cracker Creek district, Baker County. Emerald Empire Mining Co., Corvallis, leased the Champion, Musick, and Helena group claims (Bohemia district) from Lane Minerals, Inc. Work was done at these properties and at mines in the Blue River district late in 1960. Lane Minerals, Inc., Cottage Grove, was developing mines near Fairview Peak (Central Bohemia district), Lane County, where access to the Bohemia district was improved by county and Federal road projects.

**Mercury.**—Mercury production was 513 flasks, a decline of 58 percent from 1959. The Bretz mine (Arentz Mining Venture), Malheur County, and the Bonanza mine (Bonanza Mine & Oil Corp.), Douglas

**TABLE 8.—Gold production at placer mines**

| Year | Mechanical and hydraulic methods | | | Small-scale hand methods [1] | | | Total | | |

Digitized by Google

County, yielded 63 and 36 percent, respectively, of the total output; mines in Crook and Jackson Counties accounted for the remainder. Of the 11,631 tons of ore processed, 72 percent was beneficiated by flotation before furnacing. The Bonanza mine, one of the major Oregon producers in past years, was abandoned on October 1.

**Nickel.**—Nickel silicate ore, totaling 874,318 tons and averaging 1.5 percent nickel, was hauled by tramway and diesel trucks from the Nickel Mountain open-pit mine (Hanna Mining Co.) to the smelter (Hanna Nickel Smelting Co.) near Riddle. The latter company, using the d'Ugine process to recover nickel from the ore, produced 22,229,000 pounds of nickel contained in 48,728,000 pounds of ferronickel. Commercial marketing of ferronickel was one of numerous projects being considered to keep the Hanna nickel plant operating after completion of the Federal stockpiling program in 1962.

The Hanna nickel operation was the subject of three reports in 1960.[5]

**Silver.**—Silver was recovered as a byproduct of lode and placer gold operations; output increased 42 ounces over the 1959 record low of 242 ounces.

Seventy-one percent of the placer silver production was reported from Josephine County, and over 70 percent of the lode silver output was from Grant County, where the Buffalo mine accounted for 54 percent of the State lode total.

**Steel.**—In Portland, Oregon Steel Mills, Inc., the only producer of rolled-steel products in Oregon, reduced prices April 1 in an effort to offset increased competition from foreign producers of merchant bars and structural items.

**Uranium.**—Production of uranium ore was recorded late in 1960 from the Lucky Lass claims, Lake County, and the Rocky Ridge claims, Crook County. The White King mine, Lake County, leased by Lakeview Mining Co., did not produce in 1960. The company returned the property to the owners, and later it was leased to Vance Thornburg, Grand Junction, Colo. Uranium ores from Alaska and Nevada, in addition to the Lucky Lass and Rocky Ridge ore, were processed at the Lakeview Mining Co. mill at Lakeview. The company contracted with the Atomic Energy Commission to process uranium ores until November 1963.

**Other Metals.**—Wah Chang Corp. installed rolling-mill equipment to shape ingot to rod, sheet, plate, and other forms at its refractory metals plant at Albany. The company produced zirconium, columbium, tantalum, and hafnium metals from ores and concentrates, and employment rose to a high of more than 500 during the year. Oregon Metallurgical Corp., also at Albany, received a $430,000 Government contract to produce high-purity vanadium for atomic energy applications. Other metals processed by the company were zirconium, titanium, tungsten, and molybdenum. Employment fluctuated during the year and reached 325 at peak production.

## MINERAL FUELS

**Carbon Dioxide.**—Natural carbon dioxide recovered from mineral waters pumped at wells of the Gas-Ice Corp., Ashland, Jackson County, was reduced sharply from 1959. Carbon dioxide was processed to dry ice at the company's Ashland plant.

**Coal.**—Pacific Power & Light Co. mined and shipped a 60-ton sample of coal from the Eden Ridge field in Coos County to the Colorado School of Mines for testing. The testing was part of an extensive evaluation program begun by the company in 1956 to determine the feasibility of basing a steam-electric generation plant on the coal reserves of the Eden Ridge field.

**Natural Gas.**—Additional supplies of natural gas were made available to consumers in the State through construction of a 120-mile pipeline from Camas, Wash., to Eugene, Lane County. The pipeline, constructed for El Paso Natural Gas Co., made available natural gas to the Eugene area for the first time. Approval of the Canadian Government, the Federal Power Commission, and the Public Utilities Commissions of California, Oregon, and Washington was obtained for construction of a 36-inch, 1,404-mile pipeline from Alberta (Canada) fields to markets in northern and central California. The pipeline, which was to traverse eastern and central Oregon, would bring natural gas to Bend, Klamath Falls, Medford, and Rogue River Valley points. The project was scheduled for completion in 1961.

**Petroleum.**[6]—The Oregon Department of Geology and Mineral Industries issued seven new drilling permits in 1960—five in Polk County and two in Lake County—compared with three permits issued in 1959. A total of 22,802 feet was drilled in 1960, compared with 5,192 feet the previous year.

Humble Oil & Refining Co. in southern Lake County drilled to a depth of 12,093 feet before abandoning the well. This was the second-deepest hole drilled in Oregon in search for oil and gas; the deepest was a 12,880-foot dry well by Sinclair Oil & Gas Co. (1955) in Lane County. At yearend, the Humble company was drilling a second well, the "Leavitt No. 1," in southern Lake County 4 miles south of Lakeview.

## REVIEW BY COUNTIES

**Baker.**—Increased production of cement, lime, sand and gravel, stone, and clay advanced the value of mineral production in the county over that of the previous year. The Oregon Portland Cement Co. plant at Lime continued, in terms of value, to be the principal mineral-industry activity. Portland cement output increased substantially over 1959 when dam construction in the region was curtailed because of a nationwide steel strike. Limestone for the plant was supplied from the nearby Limerock quarry, and shale was obtained from the company Gales Creek quarry. Chemical Lime Co. continued production of quicklime and hydrated lime at a plant north of Baker. Limestone for the plant was obtained from the company Marble Creek quarry northwest of Baker.

[6] Oilwell drilling data were obtained from The Ore.-Bin, a monthly publication of Oregon Department of Geology and Mineral Industries.

**TABLE 10.—Value of mineral production in Oregon, by counties**

(Thousand dollars)

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Baker | (1) | (1) | Cement, stone, lime, sand and gravel, clays, gold, silver. |
| Benton | $471 | $384 | Sand and gravel, stone, clays. |
| Clackamas | (1) | (1) | Cement, sand and gravel, stone, clays. |
| Clatsop | 141 | 1,205 | Stone, sand and gravel. |
| Columbia | 252 | 389 | Do. |
| Coos | 292 | 868 | Stone, sand and gravel, gold. |
| Crook | 252 | 340 | Stone, sand and gravel, clays, mercury, uranium. |
| Curry | 251 | 699 | Stone, sand and gravel. |
| Deschutes | 1,210 | 1,461 | Diatomite, sand and gravel, pumice, stone. |
| Douglas | 6,576 | 7,011 | Nickel, sand and gravel, stone, mercury, gold, silver. |
| Gilliam | 75 | 878 | Sand and gravel, stone. |
| Grant | 96 | 42 | Stone, gold, asbestos, copper, silver. |
| Harney | 112 | 68 | Stone, sand and gravel. |
| Hood River | 197 | 151 | Do. |
| Jackson | 4,185 | 3,347 | Cement, stone, sand and gravel, clays, carbon dioxide, gold, mercury, silver. |
| Jefferson | 87 | 430 | Stone, sand and gravel. |
| Josephine | 763 | 231 | Stone, sand and gravel, gold, copper, silver. |
| Klamath | 240 | 226 | Stone, sand and gravel, clays. |
| Lake | (1) | 320 | Stone, sand and gravel, uranium. |
| Lane | 5,427 | 7,844 | Sand and gravel, stone, gold, silver. |
| Lincoln | 439 | 363 | Stone, sand and gravel. |
| Linn | 2,563 | 457 | Do. |
| Malheur | 1,008 | 457 | Stone, sand and gravel, mercury, gold. |
| Marion | 382 | 846 | Sand and gravel, stone, clays. |
| Morrow | 188 | 282 | Stone. |
| Multnomah | 3,411 | 4,008 | Sand and gravel, stone, lime, clays. |
| Polk | 475 | 428 | Stone, sand and gravel, clays. |
| Sherman | 345 | 587 | Stone, sand and gravel. |
| Tillamook | 175 | 255 | Stone, sand and gravel, clays. |
| Umatilla | 1,059 | 1,171 | Stone, sand and gravel. |
| Union | 663 | 380 | Stone, sand and gravel, clays. |
| Wallowa | 138 | 270 | Stone. |
| Wasco | 815 | 426 | Stone, sand and gravel. |
| Washington | 777 | 1,016 | Stone, clays, sand and gravel. |
| Wheeler | 188 | 98 | Stone, sand and gravel. |
| Yamhill | 198 | 92 | Sand and gravel, clays, stone. |
| Undistributed [2] | 17,399 | 18,642 | |
| Total [3] | [4] 49,843 | 54,419 | |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[2] Includes value of mineral production that cannot be assigned to specific counties and values indicated by footnote 1.
[3] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.
[4] Revised figure.

Limestone for industrial and agricultural uses was quarried near Durkee by Oregon Portland Cement Co.

Crushed roadstone output (chiefly basalt) increased substantially over the previous year owing to greater requirements by the State highway department.

In July, fire destroyed the plant and stone-processing equipment of Northwestern Granite Co., near Haines. The company was a producer of monumental stone.

Some of the old workings at the E & E, Columbia, Ibex, and North Pole gold mines near Bourne, along with gold properties of Cracker Creek Mining Co., Cracker Creek district, were operated in early 1960. Bourne Mines, Inc., revamped a 120-ton ball mill at the E & E mine to mill gold ore from some of these properties.

Clackamas.—In terms of value, the county again ranked first in the State for mineral production. Oregon Portland Cement Co. continued cement production at Oswego at about the 1959 rate. Sand and gravel output was 4 percent lower than in 1959, and crushed

Digitized by Google

stone production also declined. Three firms mined clay for making heavy clay products; production was 4 percent lower than in 1959.

The OME approved a loan to explore a mercury deposit (the Nisbet mine, A. O. Bartell) in Clackamas County; government participation was 50 percent of $14,920.

**Coos.**—A pilot plant capable of concentrating 50 tons of ore a day was under construction by Bolivar Copper Co. at a property 28 miles from Powers.

**Columbia.**—Stone and sand and gravel were produced. Stone production increased sharply over 1959, mainly because of greater demand for roadstone at State and county highway projects. The C. K. Williams & Co., Western Division, operation near Scappoose (crude iron oxide pigment) was inactive.

**Crook.**—Central Oregon Bentonite Co. continued production of bentonite from the Silver Wells operation southeast of Prineville. Ground bentonite shipments increased fourfold over 1959, the first year of operation. Stone and sand and gravel for road use also were produced in the county.

Werdenhoff Mining Co. began open-pit mining at a cinnabar deposit in the Lookout Mountain area near Prineville. A 40-ton Hershoff furnace, 48 condensers, a crusher, conveyor, and other facilities to extract mercury from the ore were installed at the property.

**Deschutes.**—Diatomite, pumice, sand and gravel, and stone were produced by mineral industries. Diatomite was quarried, processed, and shipped by Great Lakes Carbon Corp. from an operation near Terrebonne. Three producers supplied the State production of pumice and cinder in 1960.

**Douglas.**—Machinery and equipment were being salvaged from the Bonanza mine (Bonanza Oil & Mine Corp.) near Sutherlin, following its closure in October. The company was considering sending the rotary furnace and related equipment to a quicksilver operation in Ecuador.

Additional mining benches were developed on the north and east side of the open-pit nickel mine (Hanna Mining Co.) at Riddle. Attention was given also to the relocation of main haulage roads for future operations.

A tramway used by Hanna Mining Co. to transport nickel ore from the mine to the smelter was damaged in an accident and shut down for several weeks; during that time ore was delivered to the smelter by large diesel trucks.

**Grant.**—A lower adit was driven at the Buffalo mine in the Granite district. The level was 250 feet below previous workings and was driven to tap an ore body that had yielded shipping- and milling-grade ore for many years.

**Jackson.**—The Gold Hill cement plant of Ideal Cement Co. continued to be the principal mineral-industry activity. Production of cement was slightly less than in 1959. Limestone used at the plant was obtained at a quarry in Josephine County, and shale was supplied from the company Gold Hill quarry.

Bristol Silica Co. continued quarrying and crushing silica (quartz) for industrial uses; the firm also quarried and crushed granite for

615629—61——54

Digitized by Google

poultry grit. Gas-Ice Corp. recovered natural carbon dioxide from ground waters pumped at wells near Ashland. The quantity of carbon dioxide recovered declined sharply from 1959. Crushed stone and sand and gravel output remained substantially the same as in the previous year.

**Jefferson.**—Oregon Cinnabar Mines, Inc., was granted an OME loan for exploration at the Big Muddy prospect; Government participation was 50 percent of $47,910.

**Josephine.**—Sharply reduced requirements for road materials by the State highway department and the U.S. Forest Service caused a drop in value of mineral production. The Marble Mountain quarry was operated by Ideal Cement Co. to supply limestone requirements of the company cement plant at Gold Hill, Jackson County. Moderately lower production of limestone for this use also contributed to the decline.

Harry Commers of Grants Pass shipped two carloads of copper ore to the Tacoma smelter in October; the ore was mined at the Copper Eagle (Brass Ledge) mine in the Galice district.

The War Eagle quicksilver mine was being examined by David Chase of Medford. A 10-ton Gould-type rotary furnace and other equipment were moved from the nearby Bonita mine to the War Eagle property where small amounts of ore were tested. The possibility of beneficiating a mercury-bearing coal on War Eagle property was considered.

**Lake.**—In July, Humble Oil & Refining Co. began drilling its 250,000-acre lease block in southern Lake County. A test hole northwest of Lakeview, the Thomas Creek No. 1, was drilled to a depth of 12,093 feet before the well was abandoned. At yearend, the company was drilling a second test well 4 miles south of Lakeview.

**Lane.**—The county ranked first in production of sand and gravel (6.3 million tons) and stone (3.1 million tons). Most of the output was utilized by the U.S. Army Corps of Engineers at dam-construction projects. Sand and gravel produced by commercial firms was 1.7 million tons, compared with less than 1 million tons in 1959. Output of stone by commercial concerns during the year dropped to 835,000 tons, a decline of 31 percent from the 1.2 million tons produced in 1959.

**Linn.**—Two electron-beam melting furnaces and four rolling mills were installed by Wah Chang Corp. in 1960. Strip, slab, sheet, foil, and rod were made at the new rolling mill where metal ingots shipped from various customers throughout the United States, and the ingots produced at Wah Chang, were processed. Facilities of Wah Chang Corp. included separation, refining, melting, and fabrication plants for the four refractory metals—zirconium, hafnium, columbium, and tantalum. The company marketed sponge, ingot, and fabricated products of these metals.

Oregon Metallurgical Corp., in addition to preparing ingots and castings of titanium, molybdenum, tungsten, vanadium, and zirconium, experimented with casting spent uranium for use as a counterweight in supersonic aircraft. The company installed additional furnaces and auxiliary equipment for melting refractory metals.

**Multnomah.**—Chemical and metallurgical plants in Portland pro-

Digitized by Google

duced calcium carbide, ferrosilicon, ferromanganese, silicomanganese, caustic soda, chlorine, and rolled and cast steel products.

Oregon Steel Mills, Inc., Portland, reduced extras and lowered the price of merchant bar (10- to 20-ton orders) and structural steel (over 10-ton orders) by $15 a ton. The other two steel producers in the Pacific Northwest (Bethlehem Steel Corp., Pacific Coast Division, and Northwest Steel Rolling Mills, Inc., Seattle, Wash.) lowered prices in areas where they competed with the Portland firm. Oregon Steel Mills, Inc., operated three electric furnaces with an annual steel capacity of 150,000 ingot tons.

Portland was the port of entry for foreign base-metal ores and concentrates transshipped to smelters in Idaho and Montana. During a 7½-month labor dispute at The Bunker Hill Co. operations, Kellogg, Idaho, a shortage of storage space at the smelter required stockpiling more than 20,000 tons of lead and zinc ores and concentrates at Portland dock terminals.

Aluminum oxide from Japan was received at Portland for reduction to aluminum at the Harvey Aluminum, Inc., plant at The Dalles.

Sand and gravel, stone, clay, and lime were the mineral commodities produced. Output of sand and gravel rose to 3.3 million tons, an increase of 9 percent over 1959. Increased requirements for this commodity by county, State, and Federal agencies was the principal reason for the greater production. Columbia Brick Works manufactured building brick from clay mined at the company pit southeast of Gresham. Limestone quarried in Wallowa County was processed to quicklime by Pacific Carbide & Alloys Co. of Portland. The quicklime was utilized by the firm to manufacture calcium carbide.

Perlite, vermiculite, and soapstone were shipped from out-of-State mines to processing plants in the county. Perlite mined in Nevada was expanded by Supreme Perlite Co., Portland. Vermiculite was exfoliated at Portland plants of Vermiculite Northwest, Inc., and Supreme Perlite Co. Soapstone mined in Washington was ground by Stauffer Chemical Co. and Miller Products Co. for use in manufacturing insecticide dusts.

**Polk.**—Limestone was quarried near Dallas by Oregon Portland Cement Co. for use at the company Oswego cement plant. Output of limestone was lower than in the previous year. Clay mined near Monmouth was used to make draintile by Monmouth Brick & Tile Co. Sand and gravel and crushed roadstone also were produced.

**Washington.**—Shale quarried near Banks and Vernonia was expanded at plants of Northwest Aggregate, Inc., and Smithwick Concrete Products Co., respectively. Scholls Tile Co. continued clay production at about the 1959 rate from a pit near Scholls. Output was utilized at the company plant to manufacture agricultural draintile.

Metals, Inc., a new industry established in Beaverton, planned to recover silver, gold, and platinum from industrial wastes. Silver was to be recovered primarily from photographic film and developing solutions collected from hospitals, clinics, and industrial plants in the Pacific Northwest. Gold and platinum were to be reclaimed on a small scale from discarded jewelry.

# The Mineral Industry of Pennsylvania

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Pennsylvania Bureau of Topographic and Geologic Survey.**

By Robert D. Thomson,[1] Mary E. Otte,[2] and Robert E. Ela[3]

PENNSYLVANIA'S mineral output in 1960 was adversely affected by decreased markets. The index of general business activity in Pennsylvania varied from 205 in February (1947–49=100) to 180 in December, the latter being 3 points below the annual index for 1959. The index of industrial activity also declined from 125 in February to 106 in December. Output of several mineral products declined as construction activity decreased. This slowdown in the

**TABLE 1.—Mineral production in Pennsylvania[1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Cement: | | | | |
| Portland thousand 376-pound barrels | 41,270 | $143,054 | 36,374 | $124,122 |
| Masonry do | 2,086 | 7,864 | 1,946 | 7,641 |

State as well as in the Nation was one of the principal factors affecting mineral production in 1960. All major mineral industries except bituminous coal, natural gas, petroleum, and iron ore declined in value of output. Value of mineral production (fuels, metals, and nonmetals) totaled $824 million, a 4-percent decrease.

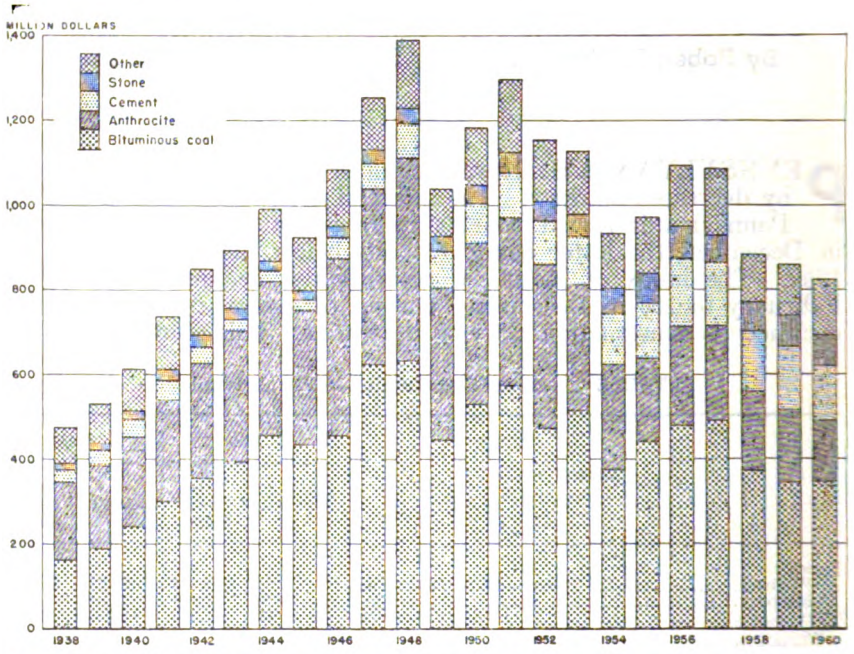

FIGURE 1.—Value of bituminous coal, anthracite, cement, and stone, and total value of mineral production in Pennsylvania, 1938–60.

**Employment and Injuries.**—Employment in selected mineral industries as shown in table 2 was about 11 percent less than in 1959. Injury experience was much better. A total of 66 fatalities was reported, compared with 89 for 1959, and 2,974 nonfatal lost-time injuries were reported, compared with 3,464 for 1959. The cement industry (including captive-mining operations) had the lowest frequency rate, reporting no fatalities and 20 nonfatal lost-time injuries for a total of 9.8 million man-hours.

The safety record of the bituminous coal industry was better than in 1959; the number of fatalities decreased from 36 to 28 and the number of nonfatal lost-time injuries decreased from 1,208 to 1,150. The number of fatalities per million man-hours was 0.60 compared with 0.69 in 1959. Per million short tons, the frequency rate was 0.43 compared with 0.55 in 1959. The number of nonfatal injuries per million man-hours was 24.77, compared with 23.17 in 1959. Of the fatalities, 25 occurred underground and 3 at strip operations. Roof, rib, and face falls accounted for 12 of the underground fatalities. Of the remaining 13 fatalities at underground mines, 2 were caused by falls of roof from equipment knocking out support; 3, from

[3] Excludes quarries or pits producing limestone from captive operations used in manufacturing cement or lime.

haulage; 2, from electricity; 5, from machinery; and 1, from mine fires. One of the strip mine fatalities was caused by machinery and the other two resulted from miscellaneous causes.

The anthracite industry in 1960 reported 35 fatalities compared with 47 in 1959. The number of nonfatal lost-time injuries decreased from 1,723 to 1,401. The number of injuries per million man-hours of exposure was 1.43 for fatalities and 57.30 for nonfatalities, compared with 1.60 and 58.66, respectively, for 1959. The number of fatalities per million short tons was 1.85; the number of nonfatalities was 73.98. Of the 35 fatalities 28 occurred underground, 3 at surface operations of underground mines, and 4 at stripping operations. Falls of roof, face, and rib caused 18 (64 percent) of the underground fatalities. Of the remaining 17 fatalities, underground haulage and transportation accounted for 4; bump, 1; rush of materials, 2; fall of persons, 2; and explosives, 1. Causes of the seven fatalities that occurred on the surface were: Squeezed between railroad cars, 1; run over by auto truck, 1; suffocated under rush of culm, 1; transportation at strip mines, 2; rolling rock from high wall, 1; and electrocution at strip mine, 1.

Huber Colliery of Glen Alden Corp. in Luzerne County was the trophy winner of the National Safety Competition for anthracite mines in 1960. The mine was operated for 763,202 man-hours, at an injury-severity rate of 1,741.348. Winners of a Certificate of Achievement in Safety for anthracite mines included Good Springs mine, Penag Coal Co.; Sugar Notch Colliery, Glen Alden Corp.; Tremont mine, Herb and Reed Coal Co.; and Woodward Colliery, Glen Alden Corp. The Maple Creek mine in Washington County was operated by United States Steel Corp. without a lost-time injury and received a Certificate of Achievement in Safety for the bituminous coal group. The Hillsville quarry operated by Michigan Limestone Division, United States Steel Corp. and the Bessemer quarry operated by The Bessemer Limestone and Cement Co. were among the five top contenders for the trophy of the quarry group. Both mines, in Lawrence County, operated in 1960 without lost-time injuries.

**Legislation and Government Programs.**—In June, the U.S. Supreme Court ruled that depletion allowances for the cement industry could not be computed on the basis of the finished product. Almost simultaneously, Congress passed a law which established kiln feed as a cut-off point for computing percentage depletion for 1960 and subsequent years. Cement companies were given the option to settle open years on the basis of kiln feed or take a chance on final outcome of further litigation. Most cement companies choose the kiln-feed method.

The Pennsylvania State Superior Court reversed a decision of the Public Utility Commission by approving the transfer of cement in bulk and bags by truck from cement plants in eastern Pennsylvania to customers within the State. Previously, trucks could not deliver cement to consumers having rail sidings.

Control facilities provided under the joint Federal-Pennsylvania anthracite mine-water control program at the end of 1960 totaled 11 pumping projects and 13 surface-drainage improvements. The 11 pumping projects required 29 large-capacity deep-well pumps with an average capacity of 143,000 gallons per minute. The 13 surface-drainage improvements consisted of backfilling abandoned strip mines, constructing steel and concrete flumes, and reestablishing surface-drainage over mined areas.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

**Anthracite.**—The downward trend in anthracite output continued, with production totaling 18.8 million short tons, a reduction of 9 percent from 1959. The index of anthracite production (1947–49=100) ranged from a high of 42 in March to a low of 35. The low was 3 points less than that reported in 1959 and 7 points below that of 1958.

Thirty-eight percent of the anthracite was mined from strip pits compared with 34 percent in 1959, and 41 percent was mined from underground mines, compared with 46 percent in 1959. Output from culm banks and dredging remained approximately the same.

Fifty-three percent of the coal produced underground was mechanically loaded; however, 14 percent less coal was mechanically loaded than in 1959—4 million tons in 1960 compared with 4.7 million tons in 1959. A total of 3.7 million tons was hand-loaded compared with 4.7 million tons in 1959. In all, 114 scraper loaders (72 less than in 1959), 45 mobile loaders (1 less than in 1959), and 754 conveyors and pit-car loaders (115 less than in 1959) were used to mechanically load coal mined underground.

Slightly more anthracite was mined from strip pits than in 1959. The 1960 output was 7.1 million tons. A total of 170 power shovels and 222 draglines was used in stripping Pennsylvania anthracite and in recovering culm banks, compared with 168 and 233, respectively, in 1959.

Production from culm banks totaled 3.3 million tons compared with 3.4 million tons in 1959. Operations were active in the Lehigh, Schuylkill, and Wyoming regions and in Sullivan County; the largest output came from the Schuylkill region (1.6 million tons).

Digitized by Google

Anthracite was produced by dredging the Lehigh, Schuylkill, and Susquehanna Rivers. Production by dredges totaled 712,000 tons, 5,000 tons less than in 1959. Of the total production, 22,700 tons was recovered from the Lehigh River, 23,600 from the Schuylkill River, and 665,800 from the Susquehanna River.

Apparent consumption continued to decrease. A total of 13.8 million tons was shipped outside the producing regions; 5 million tons was sold to local trade; and the remainder was used as colliery fuel. Average value per ton of anthracite was $7.91 for shipments outside the producing regions, $7.60 for local sales, and $5.96 for colliery fuel, compared with $8.53, $7.80, and $5.97, respectively, in 1959.

The average number of men working daily totaled 19,051—4,243 less than in 1959. Of the total, 9,041 were employed at underground mines; 3,470, at strip pits; 585, at culm banks; 3,145, at preparation plants; 2,682, at other surface operations; and 128, at dredging operations. The average number of days active was 176, compared with 173 in 1959. Output per man per day for all types of operations was 5.60 compared with 5.12 in 1959. Output at all operations, excluding dredges, was 5.43, and at dredging operations, 26.40.

Schuylkill County continued to be the principal center for producing anthracite—6.9 million tons in 1960. Luzerne County ranked second with production of 5.7 million tons, followed by Northumberland and Lackawanna Counties. Production also was reported from Carbon, Columbia, Dauphin, Lancaster, Lebanon, Northampton, Snyder, Sullivan, Susquehanna, and Wayne Counties.

**Bituminous Coal.**—Output from the Pennsylvania bituminous coalfields increased slightly over 1959, despite a 1-percent decrease in production from underground mines. The number of mines in operation decreased 101 in 1960, totaling 1,282 mines producing 1,000 tons or more. The number of active underground mines totaled 680, a decrease of 76 compared with 1959. Strip mines decreased 36 mines to a total of 553; auger mines increased 11, to a total of 49 mines.

Approximately 67 percent of the bituminous coal output came from underground mines, 1 percent or 572,000 tons less than in 1959. Of the total underground production, 43.2 million tons was cut by machines, including that mined by continuous miners; the remainder was cut by hand or shot from the solid. In all, 1,032 cutting machines and 337 continuous miners were used. Locomotives (2,046), animals (439), mother conveyors (338), shuttle cars (1,013), and rope hoists (623) were used for underground haulage. Pennsylvania underground production continued to be highly mechanized; 98 percent of the underground output was mechanically cut, using 1,032 cutting machines, and 94 percent was mechanically loaded by 1,097 machines. Mobile loaders were the principal moving device, loading 10.8 million tons into shuttle cars, 1.9 million tons into mining cars, and 484,000 tons onto conveyors. Handheld and post-mounted drills totaled 805 and drilled 10.2 million tons of coal; 118 mobile drills were used to drill 5.4 million tons of coal.

Output from strip mines increased 3 percent or approximately 569,000 short tons. Bituminous coal was stripped and loaded using electrical, diesel-electric, diesel, and gasoline power shovels and draglines. Of the 936 power shovels in use (38 less than in 1959), 864 had a

Digitized by Google

capacity of less than 3 cubic yards; 68, 3 to 5 cubic yards; 1, 6 to 12 cubic yards; and 3, more than 12 cubic yards. A total of 362 draglines was used (23 less than in 1959); 148 had a capacity of less than 3 cubic yards; 128, 3 to 5 cubic yards; 76, 6 to 12 cubic yards; and 10, more than 12 cubic yards. Twenty carryall scrapers (one less than in 1959) were used; four had a capacity of 3 cubic yards; one, 3 to 5 cubic yards; nine, 6 to 12 cubic yards; and six, over 12 cubic yards. In addition, 809 bulldozers (68 less than in 1959), 145 horizontal power drills, and 146 vertical power drills were used.

The number of auger mines increased from 38 to 49 in 1960, resulting in a 20-percent increase in tonnage.

Bituminous coal produced from underground mines was shipped chiefly by rail (38.4 million short tons) and by truck (3.9 million short tons). The value per ton of coal produced underground averaged $6.07 ($0.06 greater than in 1959). Underground coal sold on the open market averaged $5.34 per ton. Truck shipments of strip coal to consumers totaled 8.1 million tons, and shipments by rail or water totaled 12.7 million tons. The value per ton of strip-mine coal averaged $3.68 ($0.05 lower than in 1959). Strip-mine coal sold on the open market was valued at $3.68 per ton, ($0.02 less than in 1959). Of the auger mine production, 55 percent was shipped by truck and 44 percent by rail or water. The value of auger-mine coal sold on the open market averaged $3.22 per ton, $0.03 greater than in 1959.

**TABLE 3.—Bituminous coal production, by types of mining and counties in 1960**

(Exclusive of mines producing less than 1,000 tons annually)

| County | Underground | | Strip | | Auger | |
|---|---|---|---|---|---|---|
| | Number of mines | Short tons | Number of mines | Short tons | Number of mines | Short tons |

Digitized by Google

Eighty-four preparation plants were active, compared with 85 in 1959. A total of 39.6 million tons of coal was cleaned, of which 35.5 million came from underground mines and 4.1 million from strip mines. Of the mine production mechanically cleaned, 34.5 million tons was wetwashed (6.9 million tons by jigs and 27.6 million tons by other methods), and 5.1 million tons was cleaned by pneumatic methods.

At mines having crushing facilities, 31.4 million tons was crushed; this represented 67 percent of the tonnage produced at these mines. Of the total production at these mines, 6.6 million tons was treated—820,000 tons with calcium chloride, 4.4 million tons with oil, 351,000 tons with both calcium chloride and oil, and 991,000 tons with other materials.

Strip mines were active in all 28 counties, underground mines in 24 counties, and auger mines in 14 counties. Greene County replaced Washington County as the leading producer from underground mines; other leading counties in decreasing order were Washington, Cambria, Allegheny, Indiana, Westmoreland, Fayette, Armstrong, and Clearfield. Clearfield County continued as the leading producing county from strip mines, followed by Clarion, Butler, Armstrong, and Somerset. Armstrong County continued to lead in output from auger mines, followed by Clearfield and Indiana Counties.

**Coke and Coal Chemicals.**—Pennsylvania continued as the leading producing State for beehive and oven coke. Production from oven-coke operations increased 3 percent, principally because of a 6-percent increase in the use of this type of coke in blast furnaces. Production of beehive coke decreased 4 percent mainly because of a 17-percent decline in the use of beehive coke in blast furnaces and a 57-percent decrease in use by foundries.

Fourteen plants, operating 3,792 slot-type ovens (341 less than in 1959), carbonized 20.4 million short tons of coal to produce 14.1 million tons of oven coke. Yield of coke from coal was 69.27 percent, slightly greater than in 1959. The average value of oven coke at the ovens was $17.14 per ton, compared with $16.56 in 1959. Of the oven-coke produced, 96 percent was used in blast furnaces and 1 percent each for foundries and other industrial uses. The remainder was used by producing companies for sundry purposes and for industrial heating.

Thirty-three plants, two less than in 1959, operated 6,208 beehive coke ovens (128 ovens more than in 1959) to produce 684,250 tons of beehive coke. Yield of coke from coal increased from 62.52 to 62.86 percent. The average value of beehive coke at the ovens was $14.18, 42 cents less than that reported in 1959. The beehive coke was used in blast furnaces (73 percent), by foundries, for residential heating, and for sundry industrial uses (26 percent).

Coal produced in Kentucky, Pennsylvania, Virginia, and West Virginia was used at oven-coke plants in Pennsylvania. Of the total, 58 percent came from mines in Pennsylvania and 36 percent from mines in West Virginia. Seventy-seven percent of the coal used at oven-coke plants was high volatile, 8 percent medium volatile, and 15 percent low volatile.

Digitized by Google

A total of 214 billion cubic feet of coke-oven gas was produced; 40 percent was used in heating ovens, 59 percent was surplus used or sold, and 1 percent was wasted. Thirteen plants produced coke-oven ammonia, totaling 200,873 short tons of sulfate equivalent. A total of 198 million gallons of coke-oven tar was produced; 137 million gallons was used by producers for refining or topping; 17 million gallons for fuel; and 309,000 gallons, for sundry uses; and 48 million gallons was sold for refining into tar products. Crude light oil, totaling 64 million gallons, was produced at 14 oven-coke plants. Oven-coke plants also produced benzene (36 million gallons), toluene (9 million gallons), xylene (2.7 million gallons), and solvent naphtha (1.9 million gallons).

**Peat.**—Pennsylvania ranked fourth among the 21 peat-producing States. Tonnage and value of production increased 14 and 24 percent, respectively, compared with 1959. Producers of humus and reed-sedge were active in Erie, Lawrence, Luzerne, and Wayne Counties. Luzerne was the leading county.

**Petroleum and Natural Gas.**—Output of crude petroleum increased 2 percent in quantity and 10 percent in value. Pennsylvania ranked 20th in the production of petroleum. The average value of crude petroleum at yearend was $4.80 from the Northern or Bradford district, $4.52 from the Middle or Venango district, and $4.25 from the Southwestern district.

Pennsylvania ranked 11th out of the 28 gas-producing States. Output increased 15 percent in quantity and 25 percent in value, compared with 1959.

Exploration resulted in the discovery of one new gasfield, eight new gas pools, and one deeper gas pool.[4] Also several gas-producing areas were extended and a new producing depth record was established for the State. The new producing depth record was established by the Robert I. Snyder No. 1 well in Somerset County when gas was found at 8,574 feet. The outstanding discoveries were the DuBois and Helvetia pools in Clearfield County in the Punxsutawney-Driftwood field and the Baldwin pool of Westmoreland County in the Johnstown field. The greatest density of deep drilling occurred in Clearfield County where 46 gas wells were drilled. As in 1959, Armstrong County had the greatest number of shallow-sand completions outside the secondary-recovery area with the drilling of 54 new gas wells. After drilling a dry hole to the Gatesburgh formation (Upper Cambrian) in each of its two offshore blocks in Lake Erie, the New York State Natural Gas Corp. surrendered its acreage.

Well completions totaled 860 or 212 more than in 1959. Of these, 840 were field wells and 20 wildcat wells. Of the 840 field wells, 256 were oil; 264, gas; 76, dry holes; and 244, service wells. Of the wildcat wells, 5 were gas wells and 15, dry holes. Total footage for completed wells was 2,416,950—an average of 2,810 feet. Footage for completed field wells was 2,297,806 and for wildcat wells, 119,144. Ninety-three percent of the wells were drilled with cable tools and the remainder, by rotary.

Source: Pennsylvania Bureau of Statistics, Department of Internal Affairs.

The proved recoverable crude-oil reserve in Pennsylvania was estimated at 107.6 million barrels on December 31—5.9 million barrels less than was reported at yearend 1959. The proved recoverable reserve of natural gas was 1,192,480 million cubic feet on December 31, 140,000 million more than on December 31, 1959. Of the natural-gas reserve, 714,941 million cubic feet was nonassociated reserve, 22,940 million was dissolved, and 454,599 million was stored in underground reservoirs.

**Natural Gas Liquids.**—Natural gas liquids produced in Pennsylvania totaled 2,979,000 gallons, valued at $223,000. Output consisted of liquefied petroleum gas and ethane (manufactured at natural-gasoline plants), totaling 1,580,000 gallons, and natural-gasoline and cycle products, totaling 1,399,000 gallons. Average value for liquefied petroleum gases was $0.087 per gallon and for natural-gasoline and cycle products $0.061. Reserves of natural gas liquids on December 31 were estimated at 2.1 million barrels—1.6 million barrels less than at the end of 1959.

## NONMETALS

**Cement.**—Production of cement decreased 9 percent. Output of portland cement decreased 10 percent, that of masonry cement declined 2 percent; shipments of portland and masonry cements decreased 12 percent and 7 percent, respectively.

Kilns operated at approximately 66 percent of capacity and produced 37 million barrels of portland cement. Of the 24 active plants, 64 percent of capacity was dry process and 34 percent, wet process. The industry consumed 919 million kilowatts of electrical energy, about 55 million kilowatts less than in 1959. Seventy-two percent of the electrical energy was purchased from public utility companies, compared with 68 percent in 1959. Stocks of portland cement increased slightly during the year, totaling 5.8 million tons at yearend.

Digitized by Google

The principal raw materials used for manufacturing portland cement were cement rock and lime. Totals of 7.3 million short tons of cement rock and 3.1 million of limestone were used. In addition, the following tonnages of raw material were used: Gypsum, 316,135; sand, 184,020; clay, 178,104; and iron materials, 63,310. Slag, slate, carbon black, air-entraining compounds, and grinding aids also were used.

Portland cement was shipped to consumers in Pennsylvania, 40 other States, the District of Columbia, and to foreign countries. Thirty-five percent of the shipments went to Pennsylvania; 22 percent to New Jersey; 20 percent to New York; 6 percent to Ohio; 5 percent to Connecticut; 3 percent to Maryland; 2 percent each to Massachusetts and West Virginia; and 1 percent to Virginia.

Distribution of portland cement shipments by use was as follows: 21 million tons to ready-mixed concrete companies, 7.2 million tons to concrete product manufacturers, 5.4 million tons to building material dealers, 248,000 to miscellaneous consumers, 267,000 to other contractors, and 48,000 to Federal, State, and local government agencies.

Masonry cement was shipped to 24 States and the District of Columbia. Forty percent was consumed in Pennsylvania, 18 percent in New Jersey, 15 percent in New York, and 11 percent in Ohio.

**TABLE 5.—Portland cement shipments, by counties**

| County | Number of plants in 1960 | 1959 | | 1960 | |
|---|---|---|---|---|---|
| | | Barrels | Value | Barrels | Value |

Clays.—Pennsylvania ranked second in output of clay, yielding 7 percent of the U.S. tonnage and over 10 percent of the total value. The State also ranked second in fire clay production, fifth in kaolin production, and seventh in the tonnage of miscellaneous clay produced.

Production of fire clay, the most important clay produced in 1960, increased 3 percent over 1959, representing 52 percent of the State clay tonnage and 70 percent of total value. Fire clay was used principally in manufacturing refractory firebrick and block, and heavy clay products; smaller quantities were used in producing other refractories and architectural terra cotta. Thirty-seven percent of the fire clay sold and used was mined underground.

Miscellaneous clay production was 4 percent higher than in 1959. Most of the clay was used in producing heavy clay products; but smaller quantities were used in manufacturing lightweight aggregate, portland cement, art pottery, refractories, and linoleum and oilcloth filler. All of the miscellaneous clay came from open pits.

Digitized by Google

Output of koalin had declined for 10 years, and 1960 production was well below the 75,415 short tons produced in 1951.

Kaolin used to produce firebrick and block and for manufacturing portland cement was produced in Cumberland and Blair Counties.

**TABLE 6.—Clays sold or used by producers, by kinds and uses**

(Short tons)

| Use | Fire clay | | Miscellaneous clay | | Kaolin | |

| Washington | 29,190 | 45,236 | Miscellaneous clay. |
| Undistributed [1] | 1,312,354 | 5,134,158 | |
| Total [2] | 3,557,428 | 16,536 350 | |

[1] Includes Berks, Blair, Bucks, Butler, Centre, Clinton, Cumberland, Dauphin, Elk, Huntingdon, Indiana, Jefferson, Lancaster, McKean, Monroe, Northumberland, Schuylkill, Snyder, and York Counties.
[2] Incomplete total; excludes kaolin produced in Blair and Cumberland Counties.

**Gem Stones.**—The value of gem stones, including mineral specimens, was higher than in 1959. Eastern Pennsylvania continued to be the most popular source of gem materials. Gem stones were reported to be found in Adams, Chester, Berks, Lancaster, Lehigh, Montgomery, and Northampton Counties. Chester County was the leading county for mineralogical interest, followed by Montgomery County. Most

Digitized by Google

of the mineral specimens were collected by members of Pennsylvania and out-of-State mineral and lapidary clubs.

**Graphite.**—Crystalline graphite was recovered from schist in Chester County; production increased in 1960. The processed material was marketed as crucible flake and fine flake for use in manufacturing crucibles and foundry facings. Manufactured (artificial) graphite powder and products were produced at a plant in St. Marys. The graphite powder was sold to steel manufacturers, foundries, and chemical producers.

**Iron Oxide Pigments.**—Sulfur mud continued to be the only crude iron oxide pigment produced in Pennsylvania; output continued to decrease both in tonnage and value. Production came from Cambria and Elk Counties, mostly from Cambria County.

Pennsylvania continued to be the leading State in producing finished natural and manufactured iron oxide pigments. Output decreased 9 percent in tonnage and 10 percent in value owing chiefly to lower output of natural red iron oxide, manufactured red iron oxide, Venetian red, pyrite sinter, and magnetite. Principal natural iron oxide pigments, based on value, were brown iron oxide, burnt umber, red iron oxide, and burnt sienna. Leading manufactured iron oxide pigments were red, yellow, and black. The finished natural and manufactured iron oxide pigments were produced at one plant in Carbon County and two plants in Northampton County.

**Lime.**—Production of quicklime and hydrated lime decreased 11 percent as all major uses decreased, compared with 1959. Shipments of chemical and industrial lime were down 12 percent; building lime, down 3 percent; agricultural lime, down 13 percent; and refractory lime, down 14 percent. Of the total lime sold or used, 75 percent was quicklime compared with 78 percent in 1959.

In 1960, 21 companies, 1 more than in 1959, operated 24 plants in 17 counties. Centre County continued as the leading producer with 45 percent of the State's lime production. Centre, York, Lebanon, Chester, Montgomery, and Butler Counties, in decreasing order, each produced over $1 million. Most of the lime output in Pennsylvania was consumed within the State (62 percent), but large quantities were shipped to Maryland (9 percent), New Jersey (7 percent), Ohio (6 percent), New York (6 percent), Delaware (3 percent), and Maine (2 percent).

**TABLE 8.—Lime sold or used by producers, by uses**

| Year | Agricultural | | Building | | Chemical and industrial | | Refractory | | Total | |
|---|---|---|---|---|---|---|---|---|---|---|
| | Short tons | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) |
| 1951–55 (average) | 125,070 | $1,466 | 120,665 | $1,644 | 854,965 | $9,896 | 143,403 | $1,984 | 1,245,003 | $14,990 |

[2] Includes Bedford, Blair (1960), Butler, Chester, Lancaster, Montgomery, and York Counties, and counties indicated by footnote 1.

**Magnesium Compounds.**—Decreased demand for magnesium compounds, chiefly as magnesium oxide for insulation and for use in manufacturing rubber, contributed to the decline in output of magnesium compounds from Pennsylvania plants. Magnesium carbonate, produced at Plymouth Meeting from raw dolomite, was used in producing precipitated magnesium oxide.

**Mica.**—Output of scrap mica increased owing to a greater demand for ground mica by the paint and rubber industries. The mica was mined and processed near Glenville.

Block and film mica was fabricated by Sylvania Electric Products, Inc., at its Titusville plant. Mica splittings were consumed by General Electric Co., Erie, and Westinghouse Electric Co., Pittsburgh, to produce built-up mica.

**Mullite, Synthetic.**—Synthetic mullite, essentially $3Al_2O_3 \cdot 2SiO_2$, was produced by Remmey Division of A. P. Green Firebrick Co. at a plant in Philadelphia. Production increased compared with 1959.

**Perlite (Expanded).**—Perlite mined in western States was expanded at plants in Allegheny, Delaware, Lehigh, Montgomery, and York Counties. Sales of expanded perlite totaled 17,434 tons, valued at $1,092,161, and less was marketed than in 1959, mainly because of decreased demand in building plaster and loose fill installation. The expanded perlite also was used as a concrete aggregate, soil conditioner, filler, and as a filter aid.

**Pyrite.**—A much greater tonnage of pyrite was produced than in 1959. Pyrite concentrate, obtained as a byproduct of iron ore mining in eastern Pennsylvania, was processed to recover pyrite and cobalt.

**Sand and Gravel.**—Sand and gravel production totaled 13,011,176 tons valued at $21,204,193 and was 9 percent below 1959 in both tonnage and value. More than 86 percent of the commercial output was used as building and paving sand and gravel and totaled 11,227,586 tons; 55 percent was consumed as building material and 31 percent as paving material. Industrial sand produced in 16 counties

Digitized by Google

represented 18 percent of the total sand produced. The largest concentration of industrial sand was in the south-central part of Pennsylvania, chiefly in Huntingdon and Mifflin Counties. Less than 2 percent of the total sand and gravel produced reached consumers as unprepared material.

The number of operations extracting sand and gravel totaled 110, of which 32 in 24 counties produced over 100,000 tons. Production from these 32 plants totaled 10,321,029 tons valued at $17,093,452, representing 80 and 81 percent, respectively, of the State total. Pennsylvania ranked 18th in tonnage of sand and gravel produced and furnished 2 percent of the U.S. total.

Commercial production of sand and gravel was reported from 45 of the 67 counties. Clinton County was the only county reporting Government-and-contractor operations during the year. Despite a substantial decrease in both tonnage and value, Bucks County continued as the leading producer. Of the total commercial sand and gravel tonnage, 65 percent was transported by truck; 9 percent, by railroad; and the remainder, by waterway and other means.

[1] Included with "Undistributed" to avoid disclosing individual company confidential data.
[2] Includes Beaver, Berks, Bucks, Columbia, Dauphin, Elk, Forest, Fulton, Huntingdon, Lackawanna (1960), Lawrence, Lycoming, McKean, Mifflin, Montgomery, Montour (1960), Warren, and Wyoming Counties, unspecified counties (1960), and counties indicated by footnote 1.

**Slag (Iron-Blast Furnace).**—Output of blast furnace slag increased from 7,240,000 in 1959 to 7,804,000 short tons. However, the value of output decreased $196,000, totaling $11,651,000. Pennsylvania continued to be the leading producer of blast-furnace slag with 27 percent of the U.S. tonnage. Of the slag processed in Pennsylvania, 76 percent was screened air-cooled slag used chiefly as an aggregate in portland cement concrete construction, bituminous construction of various types, highway and airport construction, and railroad ballast.

**Stone.**—Production of stone (including slate and oystershell) decreased in both tonnage and value (4 percent each). The decline was due mainly to a lower demand for dimension building stone and crushed and broken stone for railroad ballast, concrete aggregate, and refractory material. The demand for curbing and flagstone, riprap, flux, and agricultural stone, increased.

Stone (comprised of basalt, granite, miscellaneous stone, sandstone, limestone, slate, and oystershell) was produced in 50 of the 67 counties. New operations were reported in Cambia, Lackawanna, Philadelphia, and Washington Counties. Northampton County was the leading stone-producing county. Counties producing over $3 million, in decreasing order were: Northampton, Montgomery, Lawrence,

Digitized by Google

York, Adams, Chester, Centre, Berks, and Lancaster. In addition, Bucks, Dauphin, Delaware, Lebanon, and Lehigh Counties each produced over $2 million worth of stone, and Blair, Butler, Huntingdon, Mifflin, and Westmoreland Counties produced over $1 million, each.

Output of limestone, the leading stone produced, decreased 3 percent in both tonnage and value, chiefly because of a drop in demand for crushed and broken stone as a raw material for producing lime and cement, asphalt filler, stone sand, and dimension building stone. Increases were reported in the use of limestone as flux 11 percent, railroad ballast doubled, riprap 20 percent, and agricultural stone 7 percent. Crushed limestone was produced in 37 counties—2 more than in 1959; new operations were reported in Washington and Westmoreland Counties. Northampton County continued to lead in output of crushed limestone, with 5 million tons compared with 5.8 million tons in 1959 followed in decreasing order by counties producing over 2 million tons—Montgomery, Lawrence, York, Lancaster, Lehigh, and Berks. Dimension limestone production continued in Bucks County. No production of dimension stone was reported for Lancaster County.

Output of basalt (diabase), the stone that ranked second in Pennsylvania, decreased 22 percent in tonnage and 28 percent in value, mainly because of a 16-percent decrease in the demand for its use as concrete aggregate and a 40-percent decline in its use as railroad ballast. Less basalt also was used as building stone and for miscellaneous purposes. More basalt was used than in 1959 for riprap and dimension stone. Use of basalt for curbing and flagging stone was reported as a new use in 1960. Crushed basalt was reported in seven counties, one less than in 1959. No production was reported from Westmoreland County. Delaware was the leading county followed by Chester, Berks, Bucks, and Montgomery Counties. Dimension basalt was produced in Bucks, Chester, and Montgomery Counties; Montgomery County was the leading area.

Sandstone ranked third as stone in Pennsylvania tonnage-wise, and led in value. It was marketed as both dimension and crushed stone. Output was greater than in 1959, increasing 21 percent in tonnage and 13 percent in value. Crushed sandstone production increased 23 percent over that in 1959; more was used as concrete aggregate and for miscellaneous uses; and less was used for riprap, railroad ballast, and as refractory material. Production of dimension sandstone, based on value, decreased slightly. Greater quantities of dimension stone were used as rough architectural stone, rubble, and curbing and flagging; less was used as rough and dressed construction building stone and sawed or dressed building stone. Crushed sandstone was produced in 20 counties and dimension sandstone, in 11 counties. New operations were reported in Adams, Berks, Cambria, Chester, and Lackawanna Counties. Westmoreland was the leading county for crushed sandstone based on tonnage, and Carbon County led, based on value. Other leading counties were Adams, Blair, Huntingdon, Luzerne, Montgomery, Schuylkill, Susquehanna, and Wayne. No production of dimension stone was reported from Mercer County. Noncommercial production of crushed stone was reported in Wayne County.

Digitized by Google

Granite was prepared and marketed both as dimension stone and as crushed stone. Production of dimension granite was less than in 1959 because of a lower demand for building stone. New production of granite as crushed stone was reported in Montgomery County. Granite also was crushed by the Pennsylvania Highway Department in Philadelphia.

The tonnage of miscellaneous stone as dimension stone and as crushed stone increased. Output of dimension stone increased 6 percent, owing mainly to a greater demand for rough and dressed construction stone, although less was used for rubble and curbing and flagging. Production of crushed miscellaneous stone increased because of a greater demand in concrete aggregate. Crushed miscellaneous stone production continued in Bucks and Montgomery Counties. Dimension miscellaneous stone was produced in Delaware, Lycoming, Montgomery, Potter, and Westmoreland Counties; most of the output came from Delaware County.

Oystershell was again collected in Berks County and processed for agricultural use.

Output of slate was slightly less than in 1959. However, Pennsylvania continued to lead in slate production. Sales of dimension slate decreased 5 percent below 1959. Use of slate for roofing, blackboards and bulletin boards, billiard tabletops, and flagging declined, but structural and sanitary, school slates, and miscellaneous uses increased. The demand for slate granules and flour was slightly greater than in 1959. Dimension slate was produced by 1 company in Lehigh County and 11 companies in Northampton County. The dimension slate came mostly from Northampton County. Crushed slate was marketed from Lycoming, Northampton, and York Counties. York County led in production. The three producers in Northampton County and one producer in Lycoming County also produced dimension slate.

Output of natural and artificially colored roofing granules decreased in both tonnage and value compared with 1959, owing mainly to a decreased demand for natural granules. Of the total production,

**TABLE 12.—Stone sold or used by producers, by uses**

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Dimension stone: | | | | |
| Building stone | 176,989 | $1,344,896 | 153,304 | $1,142,813 |
| Curbing and flagging | 12,118 | 289,281 | 12,493 | 306,897 |
| Other uses | 50,134 | 3,320,679 | 48,834 | 3,165,132 |
| Total | 239,241 | 4,954,856 | 214,631 | 4,614,842 |

artificially colored granules represented 76 percent, compared with 74 percent in 1959 and 87 percent in 1958. Plants were active in Adams, Beaver, and York Counties.

[1] Figure withheld to avoid disclosing individual company confidential data.
[2] Includes Allegheny, Armstrong, Bedford, Clarion, Clinton, Delaware, Fulton, Lycoming, Monteur, Perry, Potter, Susquehanna, Washington (1960), and York Counties, and counties indicated by footnote 1.

**Sulfur.**—Byproduct sulfur continued to be recovered in the liquid purification of oil refinery gases obtained from domestic and foreign sources. Production was less than that reported in 1959. The Sinclair Refining Co., Marcus Hook refinery and the Gulf Oil Corp., Philadelphia refinery, used the Claus process to recover sulfur.

The Atlantic Refining Co. (Philadelphia) recovered hydrogen sulfide by the Girdler process and burned it to sulfur dioxide for use in making sulfuric acid at the local plant. Sulfur also was recovered at the Sun Oil Co., Marcus Hook refinery, using a two-stage catalytic oxidation of hydrogen sulfide.

Output of byproduct sulfuric acid (100 percent $H_2SO_4$) at zinc smelters and zinc roasters totaled 323,519 short tons, valued at $4,990,000. New Castle Chemical Co., which for 50 years furnished sulfuric acid mainly for the Youngstown, Ohio, steel industry, ceased business in 1960.

**Talc.**—Output of pyrophyllite (sericite-schist) and soapstone decreased, mainly because of a lower demand for these materials as a filler in asphaltic compounds, insecticides, and joint cement. The sericite-schist was processed at Aspers, and the soapstone was trans-

Digitized by Google

ported to a plant near Marriottsville, Carroll County, Md., for processing.

**Tripoli.**—Lower demand for buffing compounds and filler material contributed to decreased production of tripoli (rottenstone). The crude material was ground at two plants in Lycoming County.

**Vermiculite (Exfoliated).**—Crude vermiculite from other States and foreign countries was exfoliated at plants in Lawrence and Bucks Counties. The exfoliated vermiculite was used in building plaster, lightweight concrete, loose-fill installation, and other applications.

## METALS

**Cadmium.**—Primary metallic cadmium was produced from flue dust recovered at the St. Joseph Lead Co., Josephtown plant and the New Jersey Zinc Co., Palmerton smelter.

**Cobalt.**—Production of cobalt as a byproduct of iron ore mined in Pennsylvania increased over that produced in 1959.

**Copper.**—Production of copper from ores produced in Pennsylvania increased over that of 1959. The copper was recovered in concentrate produced at the Lebanon concentrator. The concentrate was shipped to a smelter at Laurel Hill, N.Y.

**Ferroalloys.**—Production and shipments of ferroalloys were greater than in 1959, increasing 38 percent and 11 percent, respectively. Shipments totaled 476,865 short tons valued at $116,212,148 and consisted chiefly of ferromanganese, spiegeleisen, ferromolybdenum, and ferrocolumbium. In addition, smaller quantities of ferrotungsten, ferroboron, nickel-columbium, aluminum-vanadium, nickel-tungsten, molybdenum-aluminum, and ferrovanadium were shipped.

**Gold and Silver.**—Output of gold and silver increased over 1959. These metals were recovered from a copper concentrate produced at the Lebanon concentrator.

**Iron Ore.**—Iron ore production increased over 1959. Magnetite ore from the Cornwall and Grace underground mines was shipped to the Lebanon and Morgantown concentrators, respectively, for processing. Concentrate from the Lebanon concentrator and a small quantity of concentrate fines from the Morgantown concentrator were processed in the agglomerating plant at the Lebanon concentrator. Shipments from the Lebanon plant consisted of concentrate and agglomerates (sinter and pellets), for use in producing pig iron and steel. Shipments from the Morgantown concentrator consisted principally of concentrate for direct use in producing pig iron and steel. In order to treat the ore mined from the Cornwall mine more efficiently, construction work was started on a new concentrating and agglomerating plant in Cornwall. The new facilities will replace the existing treatment plant at Lebanon.

**Iron and Steel Scrap.**—Ferrous scrap was collected and prepared chiefly in Coatesville, Conshohocken, Glassport, Harrisburg, Philadelphia, Pittsburgh, and Sharpsburg. Plants reporting monthly averaged 62, which represented only a small part of the industry. Stocks on hand at the yards for dealers, brokers, and automobile wreckers totaled 191,000 short tons on December 31. The leading varieties of scrap processed and shipped were No. 1 heavy melting steel,

Digitized by Google

No. 2 and all other bundles, cast-iron scrap and other borings, and No. 1 and electric furnace bundles. A total of 13,501,711 short tons of ferrous scrap was reported as consumed by companies in Pennsylvania. Stocks of ferrous scrap held by all consumers at yearend were 1,899,850 short tons.

**TABLE 14.—Pig iron and ferrous scrap consumption by type of furnace**

(Short tons)

| Type of furnace and raw material | 1959 | 1960 | Type of furnace and raw material | 1959 | 1960 |
|---|---|---|---|---|---|
| Open-hearth furnaces: | | | Air furnaces: | | |
| Pig iron | 13,301,590 | 13,807,676 | Pig iron | 47,064 | 47,307 |
| Scrap | 9,960,128 | 9,543,920 | Scrap | 148,385 | 153,956 |
| Total | 23,261,718 | 23,351,596 | Total | 195,449 | 201,263 |
| Bessemer converters: [1] | | | Blast furnaces: | | |
| Pig iron | 752,653 | 1,009,202 | Scrap | 1,027,609 | 1,124,042 |
| Scrap | 275,731 | 339,546 | Total | 1,027,609 | 1,124,042 |
| Total | 1,028,384 | 1,348,748 | Miscellaneous uses: | | |
| Electric steel furnaces: [2] | | | Pig iron (direct casting) | 1,116,514 | 1,197,319 |
| Pig iron | 27,047 | 24,729 | Scrap [3] | 86,648 | 70,419 |
| Scrap | 1,774,097 | 1,723,268 | Total | 1,203,162 | 1,267,738 |
| Total | 1,801,144 | 1,747,997 | Total: | | |
| Cupola furnaces: | | | Pig iron | 15,499,188 | 16,295,129 |
| Pig iron | 244,320 | 208,896 | Scrap | 13,866,340 | 13,501,711 |
| Scrap | 593,742 | 546,560 | Total | 29,355,528 | 29,796,840 |
| Total | 838,062 | 755,456 | | | |

[1] Includes scrap and pig iron consumed in the basic oxygen converter.
[2] Includes small quantity used in crucible furnaces.
[3] Includes ferroalloy, reforging, and rerolling.

**Lead and Zinc Pigment.**—Red lead and litharge were manufactured by National Lead Co., in Philadelphia, and black oxide was produced by Electric Storage Battery Co., in Philadelphia, and Price Battery Corp., in Hamburg. Zinc oxide for pigment purposes was manufactured by New Jersey Zinc Co., Palmerton; St. Joseph Lead Co., Josephtown; Superior Zinc Corp., Bristol; and Rohm and Haas Co., Bristol. In addition, New Jersey Zinc Co. produced leaded zinc oxide.

**Molybdenum.**—Molybdenite concentrate was converted to molybdic oxide by Climax Molybdenum Co. at its Langeloth plant, Washington County, and by Molybdenum Corporation of America at its Washington plant, Washington County. Both firms produced ferromolybdenum and other molybdenum products at these plants. The molybdenite concentrate consumed by Climax Molybdenum Co. was from the firm's operation in Climax, Colo., and that consumed by Molybdenum Corporation of America was obtained mainly from the Utah Copper Division of Kennecott Copper Corp. Molybdenum Corporation of America produced ammonium molybdate and other molybdenum compounds at its York plant, York County.

**Pig Iron.**—Contrary to expectations for a near-record year, the demand for steel products was reduced owing to reduction of inventories and gradual reduction for steel in important areas such as construc-

Digitized by Google

tion, heavy machinery, and containers. Despite this, pig iron production totaled 16.5 million short tons, a 9-percent increase over 1959. The pig iron was produced at 21 plants having 73 stacks. Basic, Bessemer, foundry, low-phosphorous, malleable, and direct-casting types of pig iron were produced.

More basic and Bessemer pig iron were produced than other classes; basic represented 87 percent of the total or 14.5 million short tons. Shipments of pig iron totaled 16.2 million tons valued at $973,815,000. In blast furnaces, raw material consumption totaled 7.4 million tons of domestic iron ore, 5.5 million tons of foreign iron ore, 4.2 million tons of limestone and dolomite, 846,000 tons of mill cinder and roll scale, 17,000 tons of flue dust, 1.3 million tons of open-hearth Bessemer slag, 12.3 million tons of coke, 153,000 tons of pig iron and 922,000 tons of home and purchased scrap, 180,000 tons of slag scrap, 9.6 million tons of sinter, 953,000 tons of pellets, and 329,000 tons of foreign agglomerates. In addition, manganiferous ore, coke breeze, anthracite, self-fluxing agglomerates, briquets, and other miscellaneous materials were consumed in making pig iron. A total of 3.7 million tons of domestic iron ore, 290,000 tons of mill cinder and roll scale, 1.4 million tons of flue dust, and quantities of foreign iron ore, manganiferous ore, limestone and dolomite, coke breeze, and anthracite were consumed in agglomerating plants in Pennsylvania to produce sinter and self-fluxing agglomerates.

Smelters.—The Palmerton and Josephtown smelters were active; however, production at Palmerton was adversely affected by a strike. The Palmerton plant of New Jersey Zinc Co. processed concentrate from company operations at Friedensville, Pa.; Austinville, Va.; Jefferson City, and Treadway, Tenn.; Canyon City, Colo.; and other domestic and foreign sources. Zinc was the primary product of the smelter. From May 19 to July 13, improvements at this plant involved converting the vertical retort furnaces, refineries, and metal oxide furnaces to natural gas fuel from fuel formerly made from coal. Savings in operating costs were reported to be substantial. The Josephtown plant of St. Joseph Lead Co. processed zinc concentrate received from the company's Edwards and Balmat, N.Y., and Indian Creek, and Leadwood, Mo., operations, as well as material from other States and foreign countries. The Josephtown smelter operated 48 hours per week during the entire year. The zinc content of the metal produced at the smelter was 146,732 tons for the year, compared with 128,670 tons for 1959. Scrap zinc materials made up a large part of the smelter feed in 1960. To handle this, a new secondary materials plant was built and became fully operative in July.

Zinc.—Production of zinc concentrate was adversely affected by a strike which closed the Friedensville mine from August 5 to November 26. Production declined 18 percent in tonnage during the year. The ore produced at the Friedensville mine was concentrated at a nearby plant, and the concentrate was shipped to the Palmerton smelter for processing. Mine drainage was still a major problem. Rerouting of water made ore available from the 600-foot level, and limited production was done below the water table from the 600- and 800-foot levels. The 700- and 800-foot levels were developed further to facilitate drainage and haulage.

Digitized by Google

## REVIEW BY COUNTIES

**Adams.**—Total stone output increased 23 percent over 1959. Bethlehem Limestone Co., subsidiary of Bethlehem Steel Co., quarried and crushed limestone at a quarry and plant west of Hanover, chiefly for blast furnace flux, road material, and stone sand. Liberty Stone & Supply Co., Inc. (Fairfield), quarried and crushed limestone for concrete aggregate and roadstone. The Funkhouser Mills Division of the Ruberoid Co. crushed basalt from the Charmian quarry east of Charmian in Adams County; and quartzite was crushed from a quarry nearby for use as roofing granules, tennis court surfacing, and stone dust as an asphaltic filler. Teeter Stone, Inc., subsidiary of H. T. Campbell Sons' Corp., quarried traprock in Gettysburg for use as concrete aggregate and roadstone.

Liberty Stone Co. produced soapstone at a pit near Fairfield and transferred the crude material to its Marriottsville, Md., plant for processing. Summit Industries, Inc., recovered sericite-schist at the Heller No. 3 mine, 3 miles west of Bendersville. The crude material was trucked to the company plant at Aspers to be crushed, screened, and ground, chiefly for use as a filler in asphaltic compounds and joint cement. The crude material at this mine was depleted during the year, and mining was started in Cumberland County.

Production of miscellaneous clay was almost the same as in 1959. Clay recovered from open pits by Alwine Brick Co. (New Oxford) and Gettysburg Drain Tile Works (Gettysburg) was used to manufacture building brick and draintile.

**Allegheny.**—Bituminous coal was produced from underground and strip mines; underground tonnage comprised 89 percent of the output. Twenty-five underground mines were active—four less than in 1959. A total of 86 cutting machines cut 4.6 million tons of coal, and about the same quantity of coal was mechanically loaded. Of the mechanically cleaned coal, 99 percent was washed, with jigs representing 28 percent. Twenty-two strip mines, five less than in 1959, produced coal, using 32 power shovels and 7 draglines. The capacity of most draglines and shovels was less than 3 cubic yards.

Shipments of cement again declined. Green Bag Cement Co. (formerly Pittsburgh Coke & Chemical Co.) manufactured mostly portland-pozzolan cement and some masonry cement by the wet process. It operated three 175-by-10-foot rotary kilns at its plant at Neville Island. Universal Atlas Cement, Division of U. S. Steel Corp., produced general-use and moderate-heat portland cement and mortar cement by the dry process at the company plant at Universal. Shipments were mostly intrastate and to West Virginia and Ohio.

Output of miscellaneous clay declined for the third consecutive year and was only 3 percent above the previous low of 1956. Milliken Brick Co., Inc., mined clay from an open pit near Wilkinsburg and continued as the largest of seven clay producers in the county. Miscellaneous clay was mined from other pits near Bridgeville, Creighton, McKeesport, Pitcairn, and Pittsburgh. Rebuilding and remodeling kept the Allegheny Brick Co. inactive, but the company plans to resume operations in 1961.

**TABLE 15.—Value of mineral production in Pennsylvania [1] [2] [3]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Adams | (4) | (4) | Stone, sericite-schist, clays, soapstone. |
| Allegheny | $43,462,995 | (4) | Coal, cement, clays, sand and gravel, stone. |
| Armstrong | (4) | (4) | Coal, sand and gravel, clays, lime, stone. |
| Beaver | (4) | (4) | Clays, coal, sand and gravel. |
| Bedford | (4) | (4) | Stone, coal, lime, sand and gravel. |
| Berks | 13,690,800 | $13,229,516 | Cement, iron ore, stone, clays, sand and gravel. |
| Blair | 2,218,760 | (4) | Stone, coal, clays, sand and gravel, lime. |
| Bradford | 87,881 | (4) | Sand and gravel, coal. |
| Bucks | (4) | (4) | Sand and gravel, stone, clays. |
| Butler | 14,803,739 | 14,099,030 | Coal, cement, lime, stone, sand and gravel, clays. |
| Cambria | 42,242,812 | 40,686,920 | Coal, clays, stone, sand and gravel, iron ore (pigment material). |
| Cameron | 171,706 | 292,965 | Coal. |
| Carbon | (4) | (4) | Coal, stone, sand and gravel. |
| Centre | (4) | (4) | Lime, coal, stone, clays. |
| Chester | (4) | (4) | Stone, lime, clays, graphite, gem stone. |
| Clarion | (4) | (4) | Coal, stone, clays. |
| Clearfield | 26,836,053 | 27,526,100 | Coal, clays. |
| Clinton | 2,708,633 | 2,343,929 | Coal, stone, clays. |
| Columbia | (4) | (4) | Coal, sand and gravel, clays. |
| Crawford | 179,678 | 164,174 | Sand and gravel. |
| Cumberland | (4) | (4) | Stone, sand and gravel, sericite-schist, clays. |
| Dauphin | 3,317,375 | 3,918,994 | Stone, coal, clays, sand and gravel, lime. |
| Delaware | 2,608,524 | (4) | Stone. |
| Elk | 1,370,674 | 1,243,645 | Coal, sand and gravel, clays, iron ore (pigment material). |
| Erie | (4) | (4) | Sand and gravel, peat. |
| Fayette | (4) | (4) | Coal, clays, stone, sand and gravel. |
| Forest | (4) | (4) | Sand and gravel. |
| Franklin | (4) | (4) | Stone, sand and gravel, lime. |
| Fulton | (4) | (4) | Do. |
| Greene | 61,165,085 | 63,349,280 | Coal, clays. |
| Huntingdon | 4,931,074 | 4,834,112 | Sand and gravel, stone, coal, clays. |
| Indiana | (4) | (4) | Coal, clays. |
| Jefferson | (4) | (4) | Coal, clays, sand and gravel. |
| Juniata | (4) | (4) | Stone, lime. |
| Lackawanna | 19,614,830 | (4) | Coal, sand and gravel, stone. |
| Lancaster | (4) | (4) | Stone, coal, sand and gravel, clays, lime, gem stone. |
| Lawrence | (4) | (4) | Cement, stone, coal, clays, sand and gravel, peat. |
| Lebanon | 16,449,766 | 16,272,894 | Iron ore, lime, copper, stone, cobalt, pyrite, gold, coal, silver. |
| Lehigh | (4) | (4) | Cement, zinc, stone, gem stone. |
| Luzerne | (4) | (4) | Coal, sand and gravel, stone, peat, clays. |
| Lycoming | 1,806,045 | 1,489,284 | Stone, sand and gravel, coal, tripoli. |
| McKean | 436,981 | 439,400 | Clays, coal, sand and gravel. |
| Mercer | 2,585,092 | 3,156,941 | Coal, sand and gravel, stone. |
| Mifflin | (4) | (4) | Sand and gravel, stone, lime. |
| Monroe | (4) | (4) | Stone, clays, sand and gravel. |
| Montgomery | 13,964,287 | 14,071,756 | Stone, cement, lime, clays, sand and gravel, gem stone. |
| Montour | (4) | (4) | Stone, sand and gravel. |
| Northampton | (4) | (4) | Cement, stone, sand and gravel, coal, gem stone. |
| Northumberland | (4) | (4) | Coal, clays, stone, sand and gravel, lime. |
| Perry | (4) | (4) | Stone. |
| Philadelphia | 485,638 | (4) | Sand and gravel, stone. |
| Potter | (4) | (4) | Stone. |
| Schuylkill | 65,530,404 | 54,881,224 | Coal, stone, sand and gravel, clays. |
| Snyder | 548,014 | 614,357 | Clays, coal, stone, sand and gravel, lime. |
| Somerset | (4) | (4) | Coal, clays, stone, sand and gravel. |
| Sullivan | 81,311 | 97,845 | Coal. |
| Susquehanna | (4) | (4) | Stone, coal. |
| Tioga | 1,217,688 | (4) | Coal, stone. |
| Union | 464,487 | 461,463 | Stone. |
| Venango | 2,616,378 | (4) | Coal, sand and gravel. |
| Warren | (4) | (4) | Sand and gravel. |
| Washington | 64,510,269 | (4) | Coal, stone, clays. |
| Wayne | (4) | (4) | Stone, peat, coal, sand and gravel. |
| Westmoreland | 19,643,023 | 19,823,493 | Coal, stone. |
| Wyoming | (4) | (4) | Sand and gravel, stone. |
| York | 15,875,371 | 13,814,831 | Cement, stone, lime, sand and gravel, clays, mica. |
| Undistributed | [5] 416,524,816 | 527,680,429 | |
| Total | [5] 862,150,000 | 824,493,000 | |

[1] Pike County is not listed because no production was reported.
[2] Excludes value of production for LP gases, natural gasoline, petroleum, natural gas, and some gem stone and sand and gravel unspecified by counties; included with "Undistributed".
[3] Excludes value of clays and stone used in manufacturing lime and cement.
[4] Included with "Undistributed" to avoid disclosing individual company confidential data.
[5] Revised figure.

Digitized by Google

The only industrial sand produced in southwestern Pennsylvania came from plants near Acmetonia and Pittsburgh. Output of construction sand and gravel and industrial sand totaled 121,113 tons and marked the second consecutive year that a substantial increase had been reported over the preceding year.

Malli Mines, Jefferson Borough, produced dimension sandstone for use as flagging and as irregular-shaped building stone. Nick Gioia quarried dimension sandstone in Elizabeth Township for use as rubble.

Panacalite Perlite Co. (Pittsburgh) and Perlite Manufacturing Co. (Carnegie) expanded perlite obtained from Nevada and New Mexico. The material was sold or used mainly in building plaster and loose-fill insulation.

**Armstrong.**—Fifty-four bituminous coal underground mines, 39 strip mines, and 10 auger mines were active. This represented an increase of three strip mines and one auger mine, and a decrease of four underground mines. Slightly more coal was produced from strip mines than from underground mines. Fifty-six power shovels and 20 draglines were operated; 51 of the power shovels had less than 3-yard capacity; 10 draglines had 3-yard capacity; and 6 had between 3- and 5-yard capacity. Of underground production, 86 percent was mechanically loaded, and 35 percent was mechanically cleaned. Pneumatic and other washing methods were used for cleaning the coal.

Armstrong County remained the largest sand and gravel producing county in western Pennsylvania and continued to rank second in the State in total quantity and value. The output from four plants was used mainly as building and paving material. Shipments to consumers were made by truck, waterway, and railroad.

Combined output of clay from six underground mines—one each at Adrian, Freeport, New Bethlehem, and Templeton, and two at Kittanning—and two open pits—one each at Craigsville and Worthington—totaled 217,000 tons. The fire clay was used to manufacture firebrick and block, building brick, and vitrified sewer pipe. Haws Refractories Co. did not operate its Bridgeburg underground mine during the year.

Three lime companies (all near Kittanning) produced hydrated lime for agricultural purposes. Limestone, quarried and crushed at two operations near Kittanning, was used solely for manufacturing lime.

**Beaver.**—Despite a 21-percent decrease Beaver County continued to rank second as a clay-producing county. Four underground mines yielded 90,000 tons of fire clay, which was used chiefly in manufacturing building brick. Fire clay from open pits was used for firebrick and block, clay crucibles, foundries and steelworks, building brick, and vitrified sewer pipe. Miscellaneous clay produced from an open pit near New Brighton was used to manufacture heavy clay products. Friedl-Elverson Pottery Co. discontinued mining and purchased material from an outside source. McQuiston Coal Co. completed mining operations near Darlington and began to backfill its property.

Ninety-eight percent of the bituminous coal production came from strip mines. The remainder was obtained from underground mines. Twenty-four power shovels, 13 draglines, and 17 bulldozers were used at the stripping operations. At underground mines, three cutting

Digitized by Google

machines and two loading machines were used; 59 percent of the production was mechanically loaded. None of the coal was mechanically cleaned.

Iron City Sand & Gravel Corp. dredged sand and gravel from newly acquired property in Beaver County and established the area as the third largest in the State. Other producers were Lee Block Co. near Industry, and Shippingport Sand & Gravel Co. near Shippingport.

**Bedford.**—Two companies produced and crushed limestone near Everett and Hyndman for use as concrete aggregate, roadstone, agricultural stone, asphalt filler, dust for coal mines, and lime manufacture. Leap Ganister Rock Co. produced ganister rock at its Leap No. 1 quarry near Madley. The stone was crushed and sized at a local plant for use as furnace or converter linings. Martin Quarries produced and crushed sandstone at a quarry near Bechtelsville.

Sixty-three percent of the bituminous coal production came from underground mines. Of the underground production, 40 percent was mechanically loaded, and none was mechanically cleaned. At the strip mines, three power shovels, two draglines, four bulldozers, and two horizontal power drills were used.

New Enterprise Lime & Stone Co. produced and sold hydrated agricultural lime at its Ashcom plant near Everett. J. Mason Kerr (Hyndman) operated a one-pot kiln and sold quicklime for agricultural purposes.

Building sand was processed by Feight Bros. and transported by truck to consumers.

**Berks.**—General-use and moderate-heat and high-early-strength portland and masonry cements were produced by the dry process at the No. 1 five-kiln plant of Allentown Portland Cement Co. (Evansville). Output was shipped mostly in bulk by railroad to ready-mixed concrete companies. Shipments were largely intrastate, but significant quantities also were shipped to New York, New Jersey, and Connecticut.

Bethlehem Cornwall Corp., subsidiary of Bethlehem Steel Co., continued to produce crude iron ore at its Grace underground mine near Morgantown by block caving, open stope, and shrinkage stoping. The crude ore was processed at the local company concentrator by flotation and magnetic concentration.

Tonnage and value of stone decreased 12 percent and 13 percent, respectively. Four companies continued operating six limestone quarries—two near Evansville, and one each near South Temple, Sinking Spring, Kutztown, and Oley. Output was sold or used mostly as concrete aggregate, roadstone, and in manufacturing of cement. Eighty-six percent of the stone produced was shipped by truck. Basalt, crushed or broken for use as railroad ballast and road material, was recovered from the Clingan quarry near Birdsboro by The John T. Dyer Quarry Co. Two new operators, Pottstown Trap Rock Quarries, Inc., Douglasville, and Bradford Hills Quarry, Inc., Morgantown, quarried diabase solely for use as roadstone. Reading Poultry Food Co., Reading, crushed oystershell for use as poultry grit and mineral food.

Digitized by Google

Miscellaneous clay and shale taken from open pits by the Reading Shale Division and Shoemakersville Division of Glen-Gery Shale Brick Corp. was used to manufacture building brick.

Prepared sand and gravel by two producers, one near Sinking Spring, and the other near Temple, was hauled to consumers by truck.

Blair.—Production and value of stone was slightly less than in 1959. Six companies continued operating seven quarries near Roaring Springs, Canoe Creek, Hollidaysburg three, Altoona, and Claysburg. Output was used chiefly as concrete aggregate and roadstone, and for agricultural purposes. The leading producer was New Enterprise Stone & Lime Co. Quartzite was quarried and crushed for use in making silica brick by General Refractories Co., Frankstown, and J. L. Hartman, Sproul. General Refractories Co. discontinued operations at its Claysburg quarry. Basalt Traprock Co. produced and crushed quartzite at its quarry and stationary plant near Williamsburg, chiefly for railroad ballast and road material.

Coal production came mostly from strip operations.

Blair County was one of two counties producing kaolin. Kaolin mined at the Grannas No. 1 mine near Williamsburg was used to manufacture refractories. Miscellaneous clay and plastic fire clay were also produced in limited quantities.

Building sand was recovered from two pits in the southern part of the county near Hollidaysburg. Material mined near Frankstown was processed and used as building gravel.

Chimney Rocks Lime & Stone Co. (Hollidaysburg) produced hydrated lime for agricultural use.

Bradford.—Two plants near Towanda were able to supply the increased demands for building and paving sand and gravel.

Bituminous coal also was produced.

Bucks.—Output of sand and gravel (all processed) declined sharply from that of 1959; however, the county continued to lead in tonnage and value of output. Shipments of construction sand and gravel, for use chiefly as building and paving material were made by waterway, truck, and railroad. The following leading producers each produced more than 100,000 tons: Amico Sand & Gravel Co. (Morrisville), B & M Sand & Gravel, Inc. (Upper Black Eddy), and Warner Co. (Philadelphia).

Crushed limestone was produced by four companies operating quarries near Buckingham, Eureka, Rushland, and New Hope, solely for use as concrete aggregate and roadstone. Edward Karpinski (Langhorne) produced dimension limestone for use in rough construction work. Dimension diabase for use as rough and dressed construction stone and crushed or broken diabase as road material was quarried by Edison Quarry (Edison). Coopersburg Granite Co., east of Coopersburg in Bucks County, quarried dimension stone for dressed architectural and monumental stones, and rubble. Four operators near Quakertown, Weisel, Telford, and Ottsville quarried and crushed diabase solely for concrete aggregate and roadstone.

Samuel M. Yoder Estate operated the Blooming Glen quarry and crushing plant, producing redstone and bluestone, and George Wiley operated Wiley's quarry (bluestone) near Point Pleasant. Both companies quarried and crushed sandstone for use as concrete aggre-

Digitized by Google

gate and roadstone. Better Materials Corp., Penns Park, produced crushed and broken miscellaneous stone (argillite) and sold or used the stone as concrete aggregate and roadstone.

Quakertown Brick & Tile Co., Inc., mined miscellaneous clay for building brick from an open pit near Quakertown.

**Butler.**—Bituminous coal was produced from 24 underground mines, 37 strip mines, and 5 auger mines, representing 1 additional strip mine, 2 auger mines, and 4 less underground mines than in 1959. Thirty-eight cutting machines and 16 loading machines were used in the underground mines; 58 percent of the production was mechanically loaded. Fifty-nine power shovels, 33 draglines, 1 carryall, and 53 bulldozers were used at the strip mines. Only 26 percent of the coal was mechanically cleaned, all by jigs.

General-use and moderate-heat and high-early-strength portland cement and some mortar cement were manufactured by the wet process by Penn-Dixie Cement Corp. at its No. 9 plant, West Winfield. Two 250 feet by 10 feet 6 inches rotary kilns were fed crushed captive limestone. Cement was shipped intrastate, mostly by truck in bulk to ready-mixed concrete companies. Small quantities were shipped to New York, West Virginia, and Ohio.

Quicklime and hydrated lime were produced by Mercer Lime & Stone Co. at its plant one-half mile west of Branchton, and marketed for chemical and industrial uses. Some hydrated lime was sold for agricultural purposes.

Output of limestone was slightly less than in 1959, although four companies continued to produce from quarries near West Winfield, Harrisville, and Branchton. The stone was crushed for use as concrete aggregate, roadstone, cement manufacture, and agricultural purposes.

Highway Sand & Gravel Co., Inc., produced building sand and gravel for local and general sales. H. W. Cooper produced sand and gravel and processed sand for fill and gravel for miscellaneous uses.

Miscellaneous clay output was used in manufacturing cement and building brick. Having ceased mining at the beginning of the year, McCrady Refractories, Inc., used clay from its stockpile and clay purchased from outside sources. Glenn R. Boosel, after mining a small quantity of flint fire clay, discontinued operations June 1. Pittsburgh & Erie Coal Co. was liquidated during 1960.

**Cambria.**—Eighty-six underground mines, 23 strip mines, and 4 auger mines were worked for bituminous coal. This was six less underground mines, four less strip mines, and three more auger mines than were worked in 1959. Ninety-two percent of the production came from underground mines, 7 percent from strip mines, and the remainder from the auger mines. One hundred and forty-two cutting machines and 182 loading machines were used in the underground operations; 96 percent of the underground production was mechanically loaded. Forty-eight power shovels, 14 draglines, 30 bulldozers, 7 horizontal power drills, and 6 vertical power drills were used at the strip mines. Approximately 73 percent of the coal production was mechanically cleaned, about 60 percent by pneumatic methods.

The Hiram Swank's Sons, Inc., Swank No. 24 mine remained the only active underground clay mine in the county at the end of the

Digitized by Google

year; however, lack of orders caused periods of limited production throughout the year. Patton Clay Manufacturing Co. discontinued operating its No. 1 underground mine September 1, and leased the property to Joseph Shero. Triangle Clay Products Co. became the leading clay producer in the county. Miscellaneous clay produced by Triangle Clay Products Co. at its open pit near Johnstown was used in manufacturing building brick. North Cambria Fuel Co. produced plastic fire clay for manufacturing vitrified sewer pipe.

Nicosia Stone Quarry, Johnstown, produced crushed sandstone for making silica brick and for road material. Parry Sand & Gravel Co. near Johnstown supplied sand and gravel for home construction. Lanzendorfer Minerals Co. produced iron oxide pigments of the sulfur mud variety from its No. 31 mine near Nanty Glo. The material was sold for use in making paint pigments.

**Cameron.**—The entire production of bituminous coal came from one strip mine. Three power shovels, one dragline, and three bulldozers were used at this mine.

**Carbon.**—Anthracite from underground mines, strip pits, and culm banks totaled 661,165 short tons. Seventy-five percent of the output was shipped outside the producing region; the remainder was sold locally. The principal producers of anthracite were Pollock Trucking Co., Sullivan Trail Coal Co., and Coaldale Mining Co.

Valuewise, Carbon County led in producing sandstone; output increased slightly over that of 1959. Quartzite used in making silica brick was produced at the Little Gap quarry and crushed at the Palmerton plant of North American Refractories. Crushed and broken sandstone used mainly for road material was quarried at the Red Rock quarry near Nesquehoning by James and Paul Fauzio.

Alliance Sand Co., producing only sand for use as building and paving material and for manufacturing cement, ranked 16th in the State for total sand and gravel production. Two other companies produced sand and gravel for construction material.

**Centre.**—Despite decreases of 16 percent in quantity and 15 percent in value, Centre County remained the leading lime-producing area. Three producers operated rotary limekilns near Bellefonte. Quicklime and hydrated lime were marketed chiefly for chemical and industrial uses; smaller quantities were sold for agricultural and building uses.

Two auger mines, 11 underground mines, and 17 strip mines produced bituminous coal. Strip mines produced 92 percent of the county output; 34 power shovels, 13 draglines, and 28 bulldozers were used. At the underground operations, four cutting machines, three loading machines were used; 32 percent of underground production was loaded mechanically. None of the coal was mechanically cleaned.

Both tonnage and value of limestone (the only stone produced in the county) declined 11 percent. Chief uses of the limestone were for concrete aggregate, roadstone, lime manufacture, open-hearth flux, glassmaking, and dust for coal mines. Six companies produced crushed and broken stone, principally from quarries near Bellefonte, Pleasant Gap, and State College.

Fire clay produced by Harbison-Walker Refractories Co. was used in manufacturing firebrick and block.

Digitized by Google

Chester.—Total output of stone was slightly less than in 1959. Bradford Hills Quarry, Inc., crushed limestone at a quarry and plant near Downingtown for use as road material. Some of the stone was sold to local government agencies for road construction. The Cedar Hollow plant at Devault, operated by Warner Co., Bellefonte Division, yielded crushed limestone for use as road material, blast-furnace flux at chemical plants, agricultural purposes, and in manufacturing refractories and lime. Quicklime and hydrated lime chiefly for sewage and trade-waste treatment, paper manufacture, and agricultural use were produced at the Cedar Hollow plant. The company's Johnson quarry and plant near Paoli yielded limestone solely for use as concrete aggregate and roadstone. Valley Forge Stone Co. (Malvern) produced crushed limestone for use as road material. Limestone was sold to local government agencies as roadstone.

V. DiFrancesca, Devault, quarried and crushed diabase for use as road material. Keystone Trappe Rock Co., Glenmoore, produced crushed and broken diabase for road material and railroad ballast. In addition to crushed and broken diabase for use as riprap, French Creek Granite, Saint Peters, produced dimension dressed architectural stone, ornamental stone for monuments and mausoleums, and curbing. Some of the dimension stone was used on the exterior of the Federal Office Building in Richmond, Va.

John Fecondo & Sons, Albert Rotunno, and Abram T. Minor, all near Avondale, quarried dimension sandstone (bluestone) as irregular-shaped construction stone, rubble, and flagging. Dimension sandstone for use as irregular-shaped construction stone and rubble was quarried by Bacton Hill Quarry, Malvern. The stone from the Bacton Hill quarry was used on the exterior of the Allstate Insurance Building (King of Prussia, Montgomery County) and Kaufmann's Department Store (Monroeville, Allegheny County).

Quicklime and hydrated lime chiefly for sewage and trade-waste treatment, paper manufacture, and agricultural use were produced at the Cedar Hollow plant of Warner Co. Hydrated lime also was sold for building lime.

Graphite Corp. of America produced crystalline flake graphite near Chester Springs for use in crucibles and foundry facings.

McAvoy Vitrified Brick Co. used miscellaneous clay and shale produced from an open pit at Phoenixville to manufacture building brick.

Clarion.—Clarion County again ranked second in strip mining bituminous coal, with 13 percent of the State's strip-mine tonnage. Seventy-four power shovels, 32 draglines, and 46 bulldozers were used at the 35 (4 more than in 1959) active strip mines. Smaller quantities were produced by 10 underground mines and 1 auger mine. Forty-three percent of the coal was mechanically cleaned, 58 percent by jigs, and 42 percent by other wet methods.

Allegheny Mineral Corp. crushed limestone for concrete aggregate, roadstone, and agricultural purposes at a quarry and plant east of Parker.

Flint fire clay produced from four underground operations was used exclusively for refractories. Plastic fire clay was mined from two open pits for use in manufacturing heavy clay products.

615629—61——56

Digitized by Google

Harbison-Walker Refractories Co. abandoned its Lucinda underground clay mine.

Clearfield.—Clearfield County led in production of bituminous coal from strip mines. One hundred and six active strip mines, the same number as in 1959, yielded 5 million tons. Two hundred and fifteen power shovels, 81 draglines, 4 carryalls, 178 bulldozers, 36 horizontal power drills, and 40 vertical power drills were used at strip operations. Production from 82 underground mines, 6 less than in 1959, totaled 1.1 million tons. Of the coal mined underground, 1 million tons was cut by 112 cutting machines, and 710,000 tons was mechanically loaded. A total of 489,000 tons of coal was wetwashed, and 584,000 tons was cleaned, using pneumatic methods.

Clearfield continued as the principal clay-producing area in the State; the total output of 542,000 short tons was 13 percent above 1959 but 6 percent below the high of 577,000 short tons established in 1957. Clay-mining, by 12 companies, was all from open pits. Eight companies produced under contract or marketed their entire production of plastic and flint fire clays for manufacturing refractory firebrick and block. Miscellaneous clay produced by Robinson Clay Products, Inc., and Williams Grove Clay Co. was used in manufacturing heavy clay products. Hiram Swank's Sons, Inc., conducted exploration and development work at its Swank No. 27 underground mine. This work was limited to tunneling and crosscutting. Due to economic conditions, the company ceased underground mining operations December 16.

Clinton.—Bituminous coal was mined from four underground mines and five strip mines, one less strip mine than in 1959. Strip mines used 12 power shovels and 7 draglines to produce 469,000 tons of coal. Only one cutting machine was used underground, and none of the production was mechanically loaded. Only 36 percent of the county production was mechanically cleaned.

Crushed and sized limestone for use as concrete aggregate, roadstone, and railroad ballast was produced by Lycoming Silica Sand Co. (Salona). Some roadstone was sold to the Pennsylvania Department of Highways.

Union Mining Co., Inc., purchased the Kelsey Mining Co. on January 1. Diaspore-type fire clay, produced by the new owners, was marketed for use in manfacturing high-alumina brick. Miscellaneous clay mined under contract for Mill Hall Clay Products Co., Inc., was used in manufacturing heavy clay products.

Columbia.—Anthracite was mined from strip mines, underground mines, and culm banks. Leading producers were Jeddo-Highland Coal Co., Raven Run Coal Co., and Reading Anthracite Co.

Bloomsburg Sand & Gravel Co. produced building sand and gravel from a pit and processing plant near Bloomsburg.

The Alliance Clay Product Co. mined miscellaneous clay for manufacturing building brick on property near Mifflinville, leased from Lloyd E. Eister.

Crawford.—Sand and gravel production was 27 percent below the high of 142,000 tons produced in 1959. State and local governments and other consumers nearby used the output of four plants for ready-

Digitized by Google

mixed concrete, bituminous and antiskid material, road base and road repairs, highway drainage, and as building material.

Cumberland.—Crushed limestone for use as road material was produced by Valley Quarries, Inc. (Shippensburg), and Hempt Bros., Inc. (Camp Hill). Locust Point Stone Quarries (Mechanicsburg) produced roadstone and agricultural limestone.

The sand and gravel industry, consisting of three plants recorded its best year since 1955. Sand and gravel production totaled 175,000 tons and represented a 2-percent increase over 1959.

Summit Industries, Inc., recovered sericite schist from the Herman mine near Goodyear. The crude material was transported to the company mill at Aspers (Adams County) for processing.

Cumberland County was the leading of two kaolin-producing counties. Kaolin mined from an open pit near Mount Holly Springs by Philadelphia Clay Co. was used almost entirely in making white cement. Increased demands for kaolin, which began early in 1960, did not continue throughout the year, and production declined slightly below the 1959 level. The Penn Products Corp. sold a small quantity of stoneware clay for manufacturing floor and wall tile.

Dauphin.—Four companies reported crushing limestone at plants near Steelton, High Spire, Camp Hill, and northwest of Palmyra. Chief uses of the stone were for concrete aggregate, roadstone, blast-furnace flux, and stone sand. Taylor Lime & Stone Co. (Elizabethville) quarried and crushed stone for road material. The Pennsylvania Department of Highways purchased some stone for road construction.

Less than 20 percent of the anthracite mined from underground mines, strip pits, and culm banks was consumed by local trade.

Output of miscellaneous clay and shale was 5 percent below 1959. Bethlehem Limestone Co. recovered miscellaneous clay from an open pit near Steelton, and sold it for use in making foundry refractories and protective coating for pipes. Glen-Gery Shale Brick Corp. used shale from its open pits near Harrisburg and Royalton in manufacturing building brick.

Material processed by Highspire Sand & Gravel Co., Ltd., and Pennsylvania Supply Co. was used exclusively as paving sand and gravel.

H. E. Millard Lime & Stone Co. burned hydrated lime for agricultural use at its Swatara plant near Hershey.

Delaware.—In Delaware County, granite gneiss production decreased 29 percent in tonnage and 18 percent in value. V. DiFrancesca & Sons, Freeborn quarry (Havertown), Llanerch quarry and crusher (Llanerch), and General Crushed Stone Co., Glen Mills quarry, crushed granite gneiss for use as concrete aggregate and roadstone. In addition granite gneiss for railroad ballast was recovered at the Glen Mills quarry. Media Quarry Co. (Media) quarried dimension sandstone for rubble and rough construction. Dimension granite was recovered at two quarries, near Lima and Swarthmore, for use as dressed and irregular-shaped construction stone. Three quarries in the central part of the county near Media, Springfield, and Marple Township yielded dimension miscellaneous stone (mica schist) used as rough and dressed structural stone and rubble.

Digitized by Google

Perlite Products Inc. (Primos), expanded perlite from crude material obtained from Colorado. The material was sold or used chiefly as building plaster and as a mix with asphalt for insulating material.

Fenix & Scisson, Inc., completed a liquid propane underground storage cavern for Sun Oil Co. The 400,000-barrel capacity cavern was blasted out of granite underlying the Sun Oil Marcus Hook Refinery. The company has two additional nearby caverns, each with a capacity of 250,000 barrels, for butane storage.

Elk.—Bituminous coal was produced at 16 underground mines (19 in 1959), 10 strip mines (7 in 1959), and an undisclosed number of auger mines. Slightly more coal was produced underground than from strip mines. Of the coal mined underground, 85 percent was cut by machine, and 82 percent was mechanically loaded. Only a small percent of the county production was mechanically cleaned; wet-washing methods were used.

Paving gravel and building sand and gravel were processed by Stone Haven Mix (Johnsonburg) and C. A. Hoffman Gravel Co. (Ridgway), respectively.

Plastic fire clay was produced by St. Marys Sewer Pipe Co. for making vitrified sewer pipe.

From the Brandy Camp mine (Brandy Camp) William DeSalve recovered sulfur mud, which was sold for manufacturing paint pigments.

Speer Carbon Co. (Saint Marys) manufactured graphite (artificial) for use by steel manufacturers and chemical companies.

Erie.—Erie County was one of three industrial sand-producing counties in northwestern Pennsylvania. The industry, consisting of four plants, used rail and truck transportation to supply consumers with building and paving sand and gravel, miscellaneous gravel, and molding sand.

Corry Peat Products Co. recovered reed-sedge and humus peat from a bog in the southeastern part of the county near Corry.

Fayette.—Bituminous coal was produced at 37 underground mines (41 in 1959), 30 strip mines (31 in 1959), and 1 auger mine. Thirty cutting machines and 36 loading machines were used underground; 94 percent of the output was cut by machines, and 66 percent was loaded mechanically. Three draglines, 27 power shovels, and 26 bulldozers were used at the strip mines. Fifty-eight percent of the total production from all mines was mechanically cleaned, using both wet-wash and pneumatic methods.

Combined output of clay from five open-pit mines continued upward and was only 6 percent below the high of 159,000 tons set in 1957. Miscellaneous clay and fire clay were produced by Layton Fire Clay Co. for use in making refractory firebrick and block, building brick, and other heavy clay products. Fire clay produced by Harbison-Walker Refractories Co., Kaiser Refractories & Chemical Division, Robert N. Matthews, and John Hustosky was used chiefly for manufacturing refractory firebrick and block.

Fry Coal & Stone Co., Division of American-Marietta Co., operated the Lake Lynn quarry (formerly owned by Vesco Corp.) and produced crushed, ground, and sized limestone for use as concrete aggregate,

Digitized by Google

roadstone, dust for coal mines, and for agricultural purposes. Crushed and ground ganister rock for making silica brick was produced at the Childs operation near Layton by General Refractories Co. Connellsville Bluestone Co., Connellsville, produced crushed and broken sandstone (bluestone) as road material and sold some of the stone to the Pennsylvania Department of Highways and various townships for road construction. Dimension sandstone (bluestone) for rough construction also was quarried near Connellsville.

McClain Sand Co., Inc., used truck, railroad, and waterways to transport its finished product to customers.

Small quantities of sand and gravel were sold to the U.S. Army Corps of Engineers and the Pennsylvania Department of Highways.

General Chemical Division of Allied Chemical Corp. produced cinder at its Newell plant for use in refractories and cement.

**Forest.**—Tionesta Sand & Gravel, Inc. (Tionesta), processed sand and gravel for construction uses. J. & J. Sand & Gravel Co. (Rimersburg), operating only 2 months, processed bank run material, mined from a pit near Clarington.

**Franklin.**—Production of stone totaled 608,000 short tons, a 15-percent decrease from 1959. Crushed limestone for use as concrete aggregate, roadstone, railroad ballast, for agricultural purposes, and for making lime, was reported by six companies operating seven quarries. Quarries were active near Mercersburg, Zullinger, Dry Run, Chambersburg, Williamson, and Shippensburg.

Building sand was the only sand product processed.

Frank L. Heinbaugh (Mercersburg) produced quicklime in its 3-shaft-kiln plant, and sold it for agricultural use. Bituminous coal was used as fuel.

**Fulton.**—H. B. Mellot Estate, Inc., produced limestone at the Morton quarry (Big Cove Tannery) and the Charlton quarry (Warfordsburg). The stone was crushed at local plants chiefly for use as concrete aggregate and roadstone, and a quantity was used for agricultural purposes. John P. Martz & Son crushed limestone for making lime at its Martz Draw Kiln near Hustontown. The lime was marketed for agricultural use.

Sand, produced by H. B. Mellot Estate, Inc. (Warfordsburg), was marketed chiefly as paving sand for highways.

**Greene.**—Greene was the leading county in output of bituminous coal from underground mines; production totaled 10 million tons. Nineteen underground mines were active, the same number as in 1959. All but a small fraction of the underground production was cut by machine and loaded mechanically. One strip mine was active. Seventy-three percent of the county production was mechanically cleaned, using jigs and other wet methods.

Greene County Clay Products Co. mined miscellaneous clay from an open-pit operation near Waynesburg. The clay was used to manufacture building brick.

**Huntingdon.**—Huntingdon County ranked third in value of sand and gravel and continued as the leading industrial sand-producing county in the State. Industrial sands produced at the Pennsylvania Glass Sand Corp., Keystone Works were used as glass, molding, and engine sand, and for other industrial uses. In addition, the company pro-

Digitized by Google

duced ground sand for use in making enamel, foundry molds, glass, pottery, and abrasives.

New Enterprise Stone & Lime Co. recovered limestone from the McConnelstown quarry for use as concrete aggregate and roadstone. Its Orbisinia quarry was not operated during the year. Warner Co., Bellefonte Division (Union Furnace) quarried and crushed limestone as concrete aggregate, roadstone, railroad ballast, and riprap. Harbison-Walker Refractories Co. (Mount Union) and North American Refractories Co. (Three Springs) quarried and crushed quartzite for making silica brick at local plants.

Bituminous coal was produced at four underground mines (nine in 1959) and four strip mines (five in 1959). Only 46 percent of the underground tonnage was cut by machine, and none was mechanically loaded. Eight power shovels and three draglines were used at the four strip pits. None of the output from the underground mines or the strip mines was mechanically cleaned.

Two companies produced fire clay for making refractories. That produced by Alexandria Fire Clay Co. was sold on the open market; output of Harbison-Walker Refractories Co. was captive.

**Indiana.**—Production of bituminous coal from 74 underground mines, 28 strip mines, and 4 auger mines totaled 5 million tons. Indiana County ranked fifth in output of coal from underground mines. One hundred and two cutting machines and 124 loading machines were used. Virtually the entire underground production was mechanically cut and loaded. At the 28 strip mines, 50 power shovels, 17 draglines, and 50 bulldozers were used. Seventy-two percent of the total output was mechanically cleaned, using jigs, other wet methods, and pneumatic methods.

In addition to the fire clay mined at its No. 6 underground mine, Hiram Swank's Sons, Inc., purchased fire clay produced at the L. H. Foehrenbach strip-mining operation near Clymer. The product from these mines was used to produce sleeves, nozzles, stoppers, and other refractory materials.

**Jefferson.**—Bituminous coal was produced from 29 underground mines (30 in 1959), 30 strip mines (29 in 1959), and 5 auger mines (4 in 1959). At the underground mines, 40 cutting machines and 18 loading machines were used; 47 percent of the coal was mechanically loaded. Only 7 percent of the county output was mechanically cleaned. Only jigs were used to clean the coal.

Flint and plastic fire clays were produced. Flint fire clay, mined underground by Henry O'Neill & Co., was used in manufacturing firebrick and block. Plastic fire clay, mined from two open pits near Brockway and from an underground mine near Summersville, was used to manufacture vitrified sewer pipe, building brick, and tile.

Gravel for building, paving, and railroad ballast was produced at the Brockway Sand & Gravel Co. plant near Brockway.

**Juniata.**—Limestone used for concrete aggregate and roadstone was quarried near Mifflintown by W. N. Quigley. Local and nearby government agencies purchased stone for road construction. Fulkroad Lime Quarry (McAllisterville) used its limestone output solely for producing lime for agricultural use, using anthracite as fuel. Kaiser

Digitized by Google

Aluminum & Chemical Corp. recovered quartzite and crushed it for making silica brick at the Van Dyke plant near Thompsontown.

**Lackawanna.**—Production of anthracite declined from 2.1 million tons in 1959 to 1.8 million tons. Despite the decline the county ranked fourth in tonnage and third in value. Operators producing over 100,000 tons were Hudson Coal Co. and Moffat Coal Co., Inc.

Contractors Sand & Gravel, Inc., supplied the Pennsylvania Department of Highways and contractors with building and paving materials. Keystone Pavement & Construction Co., Inc., used part of its output as a prime contractor and sold building and paving sand and gravel to the Pennsylvania Department of Highways and local consumers.

Crushed and broken sandstone was quarried for road material at the West Mountain quarry near Scranton by Stabler Construction Co.

**Lancaster.**—Production of dimension limestone ceased in the county. The tonnage and value of crushed and broken limestone decreased 9 percent and 13 percent, respectively; output totaled 2,293,000 short tons.

Thirteen companies operated 15 quarries and plants (each 1 less than in 1959) near Bainbridge, Morgantown, E. Petersburg, Ephrata, Gap, Lititz, Landisville, Rheems, Denver, Blue Ball, Quarryville, and Talmage. Leading producers were D. M. Stoltzfus & Son, Inc., Bradford Hills Quarry, Inc., and Ivan M. Martin, Inc. L. F. Zook & Sons (Bareville) discontinued operations during the year. Most of the crushed stone was sold or used for concrete aggregate and roadstone; smaller quantities were used for agricultural purposes, stone sand, asphalt fill, and lime manufacture. Much of the stone was sold to the Pennsylvania Department of Highways, local and nearby Government agencies, and the Maryland and Delaware State Highway Departments for road construction.

Anthracite was recovered by dredging.

A. T. Harris Sand Co. processed and sold industrial sand for use as fire or furnace material. Hempt Bros. (Elizabethtown) and Milton Grove Sand, Inc. (Milton Grove), continued to be the main sources of construction sands.

Output of both fire clay and miscellaneous clay continued to decline. Lack of orders forced the Whitaker Clay Co. to curtail mining during the second half of 1960. The Glen-Gery Shale Brick Corp., Ephrata Division, shut down its operation for approximately 3 months after a fire of undetermined origin swept through the plant May 15. Several of the nine kilns, drying rooms, a two-story processing building, and a conveyor bridge spanning the Reading Railroad track were damaged. Although much of the plant was destroyed, rebuilding was started immediately. Lancaster Brick Co. strip-mined clay for manufacturing building brick.

Hydrated lime for agricultural use was produced near Elverson by Amos K. Stoltzfus. Dead-burned dolomite for use as a refractory material was produced by J. E. Baker Co. at its rotary-kiln plant near Bainbridge.

**Lawrence.**—Shipments of portland and masonry cements decreased slightly in tonnage and value. Crushed captive cement rock was used to manufacture cement at the Bessemer plant of Bessemer Limestone

Digitized by Google

& Cement Co. Mostly Types I–II, air-entrained and non-air-entrained, and some Type III, non-air-entrained, portland cement was produced by the wet process. Some mortar cement also was produced. Three 235- by 10-foot rotary kilns and one 450- by 12-foot kiln were operated. Medusa Portland Cement Co. (Wampum) also manufactured mostly general-use and moderate-heat and high-early-strength portland cements and some masonry cement by the dry process. Two 390- by 12-foot rotary kilns were operated. A new regrinding and packing facility was completed at the Wampum plant. Major shipments from the Bessemer and Wampum plants were made by truck to ready-mixed concrete companies and concrete product manufacturers in Pennsylvania and Ohio.

Output of limestone was 2,913,000 tons, a slight increase over 1959; although value decreased slightly, the county ranked third in stone production. Five companies produced crushed limestone and cement rock, chiefly for blast-furnace flux, cement, concrete aggregate, roadstone, and dust for coal mines. The stone was quarried near Wampum, Hillsville, Bessemer, West Pittsburgh, and Mahoning Township. Mooney Bros. Supply Co. (West Pittsburgh) was a new limestone producer. Most of the county stone production was transported to consumers by rail.

Bituminous coal was mined from underground, strip, and auger mines. Thirty power shovels, 18 draglines and 25 bulldozers were used at the strip mines. Coal mined underground was mechanically loaded and mechanically cut; however, none of the production from the underground, strip, or auger mines was mechanically cleaned.

Lawrence County ranked fourth in clay output. Production of both fire clay and miscellaneous clay continued at a high rate and totaled 317,000 short tons, a 17-percent increase over 1959. Plastic fire clay, which was produced near Enon Valley by The Negley Fire Clay Co. and Natco Corp., was used in making refractories and heavy clay products. Metropolitan Brick, Inc., and Fenati Brick Co., Inc., produced both fire clay and miscellaneous clay for manufacturing building brick. Fenati Brick Co., Inc., curtailed operations for approximately 3 months following a fire in the machine room. The Bessemer Limestone & Cement Co. produced miscellaneous clay for use in manufacturing portland and other hydraulic cements; Keystone Loam & Clay Co. sold miscellaneous clay in bulk for use in foundries and steelworks.

Mooney Bros. Supply Co. produced sand and gravel for its own use. Superior Sand & Supply Co. and Mahoning Valley Sand Co. processed sand and gravel as building and paving materials.

D. M. Boyd produced humus peat from bogs near New Wilmington. Moore's Humus & Nursery recovered reed-sedge peat at a bog near Leesburg and sold the material in bulk.

**Lebanon.**—Bethlehem Cornwall Corp., subsidiary of Bethlehem Steel Corp., at the Cornwall underground mine 5 miles south of Lebanon, mined crude iron ore by block-caving and open-stope methods. The crude ore was processed at the Lebanon concentrator by flotation, magnetic concentration, and agglomeration, yielding iron ore, gold, silver, copper, cobalt, and pyrite.

Digitized by Google

Lebanon County ranked second in production and third in value of lime. H. E. Millard Lime & Stone Co. operated four rotary kilns and one continuous hydrator to produce quicklime and hydrated lime at its Annville plant. The quicklime and hydrated lime were sold chiefly for building, metallurgical, papermaking, and water purification uses; some quicklime was sold for agricultural purposes.

Limestone was crushed and sold or used chiefly for blast-furnace flux, manufacturing cement and lime, concrete aggregate, and roadstone. Total output was 1,670,000 short tons. Quarries were operated near Annville, Lebanon, and Cornwall.

Anthracite was recovered solely by dredging.

Lehigh.—Shipments from four cement manufacturers, declined slightly. Mostly captive cement rock was crushed and used for manufacturing general-use and moderate-heat, high-early-strength portland, and some mortar cements. Plants were operated near Coplay, Egypt, Fogelsville, and Cementon. Major shipments were by railroad, mostly in bulk to ready-mixed concrete companies, intrastate and to New Jersey, New York, and Ohio. Lehigh Portland Cement Co. installed an electrostatic precipitator at is Fogelsville plant at a cost of about $2 million. Giant Portland Cement Co. also installed dust-collecting equipment. A change in regulations permitted truck shipments, and cement companies were building truck-loading stations, storage silos for direct bulk loading into trucks, and other truck facilities.

Production and value of cement rock and limestone increased slightly; output totaled 2,234,000 short tons. The increase in production was attributed to a larger demand for limestone as road material. The Whitehall Cement Manufacturing Co. (Cementon), Giant Portland Cement Co. (Egypt), Lehigh Portland Cement Co. (Fogelsville), and Coplay Cement Manufacturing Co. (Coplay) produced and crushed cement rock or limestone at local plants solely for manufacturing cement. Lehigh Stone Co. (Ormrod) and Roy J. Kern (Guthsville), a new operator in the county, both operated stationary plants to produce crushed or broken limestone solely as concrete aggregate and roadstone. Some of the stone was sold to local Government agencies for road material. Penn Big Bed Slate Co. produced and processed slate at its No. 2 quarry near Slatedale, chiefly for structural and sanitary uses, blackboards and bulletin boards, and roofing slate.

Crude perlite mined in Colorado was expanded at the Pennsylvania Perlite Corp. Allentown plant and marketed for use as building plaster aggregate.

New Jersey Zinc Co. (Friedensville) mined crude zinc ore at its Friedensville underground mine by the room and pillar method. Zinc concentrate was shipped by truck to the company smelter at Palmerton. Operation of the mine was curtailed by a labor strike from August 5 to November 25.

Luzerne.—Luzerne County continued to rank second in production of anthracite. More than 70 percent of the anthracite produced from undeground mines, strip mines, and culm banks was shipped to consumers outside the producing region. Glen Alden Corp., Hudson

Digitized by Google

Coal Co., Jeddo-Highland Coal Co., Number One Contracting Co., and Susquehanna Collieries Co. were the leading producers.

Luzerne County ranked second as a sand and gravel producing county in northeastern Pennsylvania.

Sand and gravel sold principally for use as building or paving material totaled 429,000 tons and was processed at seven plants.

Four sandstone producers operated quarries at Kingston, Dupont, Sweet Valley, and White Haven. The output was crushed and sold or used solely as road material.

Blue Ridge Soil Pep Co., Inc., recovered humus peat from a bog near White Haven. Pennsylvania Peat Moss, Inc., produced moss, reed-sedge, and humus peat from bogs near White Haven.

Clay mined near Hazleton was used in manufacturing buff brick by Hazleton Brick Co.

Lycoming.—Lycoming Silica Sand Co. produced limestone from the Lime Bluff quarry (Muncy) and the Pine Creek quarry (Jersey Shore). The stone was crushed and sized at local plants chiefly for use as road material. In addition, limestone from the Pine Creek quarry was crushed and sold for agricultural purposes. A new pneumatic mill was installed at the Pine Creek plant. Susquehanna Quarry Co. operated a quarry and portable plant near Jersey Shore to produce limestone for road material. Both companies sold stone to nearby Government agencies for road construction. The Keystone Filler & Manufacturing Co. Muncy plant crushed and ground slate for use as flour. Callahan & Haines Stone Co. (Slate Run) produced dimension miscellaneous stone for flagging and rubble.

Lycoming Silica Sand Co. (Montoursville) produced building and paving sand and gravel, molding and engine sand, sand for use in preparing anthracite, and gravel for railroad ballast. J. A. Eck & Sons, Inc., produced building and paving material in Montoursville.

Bituminous coal was produced from three underground mines and three strip mines (one more strip mine than was active in 1959). The entire production from the underground mines was produced by hand methods. At the strip mines, three power shovels and two draglines were used. None of the coal produced was mechanically cleaned.

Tripoli (rottenstone) was quarried by Penn Paint & Filler Co. at the Sheddy quarry (Muncy) and by Keystone Filler & Manufacturing Co. at the Ramsey quarry (Antes Fort). The crude material was crushed, dried, and ground for use as an abrasive and filler.

McKean.—Plastic and burley fire clays produced by Kness Brothers (Mount Jewett) were marketed for use in manufacturing foundry refractories. Kaul Clay Products Co. used plastic fire clay from its Kaul stripping operation near Clermont to manufacture hot tops for steel mills. Hanley Co. recovered clay from an open pit at Lewis Run for use at a local plant in making building brick and marketed a small quantity for the production of floor and wall tile.

Bituminous coal was produced from strip mines. Six power shovels, one dragline, and six bulldozers were used at the strip mines. None of the coal produced was mechanically cleaned.

C. L. McGavern, Jr., produced and shipped molding sand from a plant near Eldred.

Digitized by Google

**Mercer.**—Three underground and six strip mines were active; 97 percent of the bituminous coal came from the strip mines. Five cutting machines and one loading machine were used underground; all the output was cut by machine, and 26 percent was loaded mechanically. None of the coal was mechanically cleaned.

Sand and gravel output totaled 315,000 tons in 1960. Sand and gravel processed as building and paving material and for miscellaneous uses was transported to local markets by truck.

White Rock Silica Sand Co. (Greenville) quarried and crushed sandstone principally for use as furnace or converter linings, road material, and in foundries. The Rock Kastle quarry (north of Volant) was not operated during the year.

**Mifflin.**—The Pennsylvania Glass Sand Corp. McVeytown plant processed sand for industrial uses. In addition to molding and engine sand, Miller Silica Sand Co., Burnham, and George E. Miller Coal Co. and James R. Klines Sons, both near Lewistown, processed construction material.

Bethlehem Limestone Co. operated the Naginey quarry near Milroy and crushed limestone chiefly for use as blast-furnace flux, concrete aggregate, roadstone, and stone sand. Ehrenzeller Lime Co. (McVeytown) and Honey Creek Lime Co. (Reedsville) quarried and crushed limestone for manufacturing lime. Quartzite, for use in manufacturing silica brick, was quarried near Hawstone by Haws Refractories Co.

Honey Creek Lime Co (Reedsville) operated a 10-pot kiln and a continuous hydrator to produce hydrated lime for agricultural purposes. Ehrenzeller Lime Co. burned and sold quicklime as agricultural lime at its 7-draw-kiln plant near McVeytown.

**Monroe.**—Hamilton Stone Co. (Bossardsville) quarried and crushed limestone for use as concrete aggregate, roadstone, and asphalt fill.

Universal Atlas Cement Division of U.S. Steel Corp. produced white clay near Kunkletown for use at its cement plant.

Output of sand and gravel declined in 1960. Sand, the major product, was used chiefly in cement and ready-mixed concrete.

**Montgomery.**—Production of stone in Montgomery County exceeded 4 million tons, a 9-percent increase over 1959, and the county continued to rank second in stone production. Two operators, near Conshohocken and Norristown, produced crushed and broken limestone for use as concrete aggregate and roadstone. Two quarries, near Plymouth Meeting and Bridgeport, yielded limestone principally for blast-furnace flux, concrete aggregate, roadstone, agricultural purposes, and manufacturing lime. Limestone quarried and crushed at a quarry near West Conshohocken was used for manufacturing cement. Fifty-three percent of the limestone was transported by truck and the remainder by rail and unspecified means.

Basalt, recovered from quarries near Perkiomenville and Saratoga, was crushed and broken for use as road material. Montgomery Stone Co., Inc., Montgomeryville, produced dimension basalt as dressed structural stone and crushed basalt for road material. Dimension sandstone for use as rough architectural blocks and refractory linings in steel-producing furnaces was quarried near Glenside by Fire Stone Products Co. Irregular-shaped rough construction dimension sandstone was quarried by Wm. Bambi & Sons, Inc. (Norristown). Vec-

Digitized by Google

chione Bros. (Glenside) produced dimension sandstone as irregular-shaped rough construction stone and rubble. Irvin B. Gill (E. Norriton Township) produced crushed and broken sandstone for road material.

Mignatti Construction Co., Inc. (Bethayres), produced crushed granite for use as concrete aggregate and roadstone and a small quantity of dimension stone for use as rubble. Marcolina Bros., Inc., operated the Hill Crest quarry near Laverock to produce dimension granite, which was used for building retaining walls. A. Manero & Sons (Glenside) produced miscellaneous dimension stone (mica schist) for use as rough and dressed construction stone. Spring House Quarry (Spring House) and M. & M. Stone Co. (Harleysville) quarried miscellaneous stone (argillite) solely for road material.

Allentown Portland Cement Co. continued to operate its West Conshohocken No. 2 plant, using captive cement rock and limestone to manufacture Types I–II general-use and moderate-heat, air-entrained and non-air-entrained portland cements and some masonry cement. Three rotary kilns were operated. The material was shipped by rail, mostly in bulk, chiefly to ready-mixed concrete companies.

Lime production increased 5 percent in quantity, but decreased 2 percent in value. G. & W. H. Corson, Inc., produced mostly hydrated lime for building and chemical and industrial uses, agricultural lime, and some dead-burned dolomite for refractory use. Six shaft kilns and three continuous hydrators were operated to produce the material.

Production of fire clay and miscellaneous clay totaled 87,000 tons, compared with 66,000 tons in 1959. Miscellaneous clay produced by the Keller-Whilldin Pottery Co. (North Wales), Norristown Brick Co. (Norristown), and Philadelphia Brick Co. (Trappe) was used at local plants to produce art pottery, flowerpots, building brick, and other heavy clay products. Robinson Clay Products Co. produced both plastic fire clay and shale at Pottstown to make vitrified sewer pipe at a local plant. Robinson Clay added six new 40-foot kilns for increased production of wedge lock-joint clay pipe.

The William Bambi & Sons, Inc., plant in Norristown, produced building sand and gravel.

Perlite mined in California and Nevada was expanded by The Philip Carey Manufacturing Co. (Plymouth Meeting) and Refractory & Insulation Corp. (Port Kennedy).

**Montour.**—Crushed and sized limestone was produced at a quarry and plant east of Milton by Lycoming Silica Sand Co. for use as road material and for agricultural purposes. Limestone, for use as concrete aggregate and roadstone, was quarried near Danville by Mausdale Quarry Co. Both companies sold road material to the Pennsylvania Department of Highways and to local municipalities and townships.

Construction sand and gravel was produced at the Thomas Sand & Gravel Co. Danville plant.

**Northampton.**—Northampton County continued as the leading cement-producing area, although the quantity and value of shipments decreased 15 percent and 17 percent, respectively. Ten companies operated 12 plants and manufactured cement from captive limestone

Digitized by Google

and cement rock, and from purchased materials. General-use, moderate-heat and high-early-strength portland cements and masonry cement were produced. Most of the cement was shipped by rail in bulk, mainly to ready-mixed concrete companies and manufacturers of concrete products. Plant operations were near Martins Creek, Northampton, Bethlehem, Bath, Sandts Eddy, Nazareth, and Stockertown. Keystone Portland Cement Co. (Bath) increased its storage capacity to 115,000 barrels by installing six new silos. A change in regulations permitted truck shipments and many of the cement companies built truck loading docks and storage facilities for finished cement.

Although tonnage declined 15 percent and value decreased 20 percent, Northampton County continued to lead in stone production. Twelve firms produced limestone and cement rock from 13 quarries: 4 near Nazareth, 2 near Bethlehem, 2 near Northampton, and 1 each near Bath, Sandts Eddy, Martins Creek, and Stockertown. The stone was used mostly at company plants for manufacturing cement, and as concrete aggregate, and roadstone. Smaller quantities were sold or used as stone sand, railroad ballast, and for agricultural purposes.

Northampton County was again the principal source of slate; production increased 8 percent in quantity and decreased 5 percent in value compared with 1959. Slate was recovered from 11 mines; 6 near Pen Argyle, 2 near Bangor, and 1 each near East Bangor, Bath, and Wind Gap. The processed slate was used chiefly for structural and sanitary ware, blackboards, standard roofing, and flagging.

Output of sand and gravel reached a new high as producers processed and shipped over 425,000 tons of material. Production was expected to go higher in 1961 when a new plant built by Saucon Sand Co., Inc., near Hellertown is completed. The plant was designed to meet specifications for fine aggregate for highways.

Anthracite was recovered by dredging.

**Northumberland.**—Anthracite production totaled 2,355,000 tons and was 13 percent of the State production. Fifty-six percent of the quantity produced was shipped outside the producing area, 44 percent was sold locally, and a very small quantity was consumed as colliery fuel. Leading producers were Reading Anthracite Co., Sayre Contracting Co., and Susquehanna Collieries Co.

Demand for shale was 14 percent greater than in 1959. Shale produced by Watsontown Brick Co. and Glen-Gery Shale Brick Corp., Watsontown Division, was used exclusively for manufacturing building brick. Watsontown Minerals Products Co. used shale from stock as a linoleum filler.

Limestone quarried near Herndon and Sunbury was crushed for use as road material, for agricultural purposes, and lime manufacture. Some of the roadstone was sold to local Government agencies.

M. E. Wallace Co. transported its entire output of molding sand by railroad. Trucks were used to transport building sand and sand for fill from Wilson's Sand Plant near Montandon.

Clyde Starook (Northumberland) burned quicklime for agricultural purposes in a pot kiln, using anthracite as fuel. The lime was sold to local consumers.

Digitized by Google

Perry.—Bradford Hills Quarry, Inc. (Newport), quarried and crushed limestone at its local plant for use as road material. Some of the stone was sold to local Government agencies and the Pennsylvania Department of Highways for road construction.

Philadelphia.—Dredging along the Delaware River by The Liberty Corp. (Philadelphia) yielded sand and gravel for use as building material.

Crushed noncommercial granite for riprap was produced by crews of the Philadelphia County Bureau of Highways.

Potter.—Dimension sandstone as curbing stone, irregular-shaped rough construction stone, and rough architectural blocks was recovered from two quarries near Austin. Carroll M. Winseck (Roulette) quarried dimension miscellaneous stone for use as flagging, and rough and dressed construction stone.

Schuylkill.—Schuylkill County continued as the leading anthracite-producing county. Anthracite production totaled 6,936,001 tons, compared with the 7,930,166 tons in 1959. Underground mines, strip pits, and culm banks were operated during the year. The five leading producers were Honeybrook Mines, Inc., Newkirk Mining Co., Mammoth Coal Co., Gilberton Coal Co., and Reading Anthracite Co.

Huss Contracting Co. (Andreas) and Pennsylvania Aggregates, Inc. (Summit Station) quarried and crushed limestone for use as road material. Stone was transported to consumers by truck. Quartzite, quarried and crushed for use in manufacturing silica brick, was produced at the Andreas quarry (Andreas) by Harbison-Walker Refractories Co.

Refractory Sand Co., Inc., transported its output of fire and furnace sand and sand for paving by railroad and trucks.

Various producers supplied Lehigh Materials Co. with shale for use in its lightweight aggregate plants. Auburn Brick Co. used its entire output of miscellaneous clay to manufacture building brick.

Snyder.—Output of shale increased slightly over that of 1959. Glen-Gery Shale Brick Corp., Beavertown Division, and Paxton Brick Co. used shale mined from open pits near Beavertown and Paxtonville, respectively.

Anthracite was produced by dredging.

National Limestone Quarry, Middleburg, quarried and sold crushed limestone for road material and agricultural purposes. Carton L. Comfort, Mount Pleasant Mills, quarried and crushed limestone solely for use in manufacturing lime. Quicklime, sold for agricultural purposes was burned at the company's local 6-pot kiln plant.

Central Builders Supply Co. processed and sold building sand and gravel from its stationary plant near Selinsgrove.

Somerset.—Somerset County again had the greatest number (101) of underground bituminous coal mines (2 less than in 1959). Underground production totaled 910,000 short tons; 84 percent was mechanically cut, and 51 percent was mechanically loaded, using 129 cutting machines and 82 loading machines. Approximately 16 percent of the output was mechanically cleaned, using wetwashing and pneumatic methods. Seventy-three power shovels and 31 draglines were used to produce 1.2 million tons of strip coal at the 43 active strip mines. One auger mine also was active in 1960, one less than in 1959.

Digitized by Google

Production of fire clay totaled 96,000 tons and was 18 percent higher than in 1959. Manufacturers used fire clay produced from two underground mines and three open-pit operations, mainly for refractories such as sleeves, nozzles, stoppers, and firebrick and block.

Keystone Lime Co. (Springs) quarried and crushed limestone locally for use as concrete aggregate and roadstone and for agricultural purposes. Somerset Limestone Co., Inc. (Bakersville), quarried and crushed limestone solely as road material.

Two plants near Boswell produced sand for general purposes. A third producer, near Springs, produced building sand and gravel for use in concrete products.

**Sullivan.**—Anthracite, the only mineral produced in the county, was mined underground and from strip pits. Output of anthracite increased substantially over that of 1959; however, the average value per ton declined from $8.69 in 1959 to $8.37 in 1960.

**Susquehanna.**—Dimension sandstone (bluestone) was quarried and sold or used mostly as flagging; smaller quantities were used for irregular-shaped rough construction stone and rubble. Seven quarries were operated near Springville, Kingsley, New Milford, Lakeside, Harford, and Brooklyn Township. Near Clifford crushed and broken sandstone for road material was recovered from the Bennett's quarry by Keelor Supply Co., Inc.

A small quantity of anthracite was produced.

**Tioga.**—Three underground mines and six strip mines produced bituminous coal. Sixteen power shovels and nine draglines were used at the strip mines.

Lyle R. Robinson (Elk Township) quarried dimension sandstone chiefly as flagging, and a small quantity for rubble.

**Union.**—Crushed limestone used mainly for concrete aggregate and roadstone was quarried near Mifflinburg and Winfield. Some roadstone was sold under contract to the Pennsylvania Department of Highways and to nearby townships and boroughs.

**Venango.**—Bituminous coal production from 11 strip mines (2 less than in 1959) totaled 588,000 short tons. Four draglines and 13 power shovels were used at the strip mines. Sixty-seven percent of the coal mined was mechanically cleaned, using jigs.

The Industrial Silica Division of the Pennsylvania Glass Sand Corp. produced molding sand and fire and furnace sand at its Venango works. Mrs. Ralph Vincent of Cambridge Springs, using portable equipment, processed bank-run gravel for sale to townships, boroughs, and builders. Oil City Sand & Gravel Co. dredged material near Oil City and processed it for sale as building and paving sand and gravel.

**Warren.**—Sand and gravel dredged by General Concrete Products Corp. was processed for use as building and paving material. Nelson & Ellberg produced construction sand and gravel at its plant near Warren.

**Washington.**—Washington County led in value of mineral output in the State; coal was the major commodity produced. Washington County led in both total and underground production of bituminous coal. Twenty-one underground mines produced 9.9 million short tons of coal. Virtually all the coal mined underground was mechanically cut and mechanically loaded. Twenty-two strip mines, one more than

Digitized by Google

in 1959, produced 991,000 short tons of coal. Ten draglines, 37 power shovels, and 48 bulldozers were used at the strip mines. Most of the coal mined and coal shipped in from Greene and other counties was mechanically cleaned. Maple Creek mine of U.S. Steel Corp. was reported to be the first underground mine to use alternating current in the State to power continuous mining equipment.

Limestone for concrete aggregate and roadstone was quarried near Washington by Westmoreland Clay Products Co.

Combined output of miscellaneous clay by Westmoreland Clay Products Co. (Washington) and Monongahela Clay Products, Inc. (Monongahela), was 29,000 tons, 28 percent less than in 1959. The entire quantity was used in manufacturing building brick. Donley Brick Co. produced red shale from its open pit near Washington. The Haas Refractories Co. completed major alterations required to convert its Canonsburg plant (formerly known as the W. S. George Pottery Co.) from producing pottery to manufacturing pouring-pit refractories.

**Wayne.**—Paul Thompkins Estate, W. R. Strong, and Walter C. Blum (Lookout) reported output of dimension sandstone chiefly for flagging. Wayne Concrete & Sand Works, Inc. (Lake Ariel), produced and sold crushed and broken sandstone solely for road material. Some noncommercial sandstone was produced for road material.

Wayne Peat Moss Co. recovered humus peat from bogs at the southern tip of the county near Gouldsboro.

Most of the anthracite produced was sold locally.

Willis R. Black supplied farmers in the area with building sand and gravel and gravel for fill.

**Westmoreland.**—Forty-eight underground bituminous coal mines, 20 strip mines, and 2 auger mines were active. Almost all the bituminous coal mined underground was cut and loaded mechanically. A total of 22 power shovels and 3 draglines were used at the strip mines to produce 252,000 tons of coal.

Penn Aggregates (Jeannette) produced crushed limestone solely for road material, and sold stone to the Pennsylvania Department of Highways for road construction. John C. Beaumont and Ray Brant-hoover (both near Belle Vernon) quarried dimension sandstone for rubble. Four producers operated quarries near Ligonier, Greensburg, and Baggaley to produce crushed and broken sandstone solely for road material. J. G. Robinson, Inc., produced and sold or used dimension sandstone for use as flagging. Dimension miscellaneous stone quarried at Lynn's Quarry, Belle Vernon, also was used as flagging.

**York.**—Medusa Portland Cement Co. remained the only cement producer in the county. Six rotary kilns were operated at the York plant to produce waterproof white and gray portland cements and mortar cement. The cement was shipped by rail, mostly in bulk, to ready-mixed concrete companies and manufacturers of concrete products. A new finish mill was completed in anticipation of enlarged production capacity.

Due to decreased tonnage and value (19 percent and 13 percent, respectively), York County dropped from third in 1959 to fourth in stone production. Limestone was quarried at 10 operations: 7

Digitized by Google

near York, and 1 each near Mount Wolf, Wrightsville, and Thomasville. The chief uses for the stone were as concrete aggregate, roadstone, lime and cement manufacture, and open-hearth and blast-furnace flux. Smaller quantities were sold or used for agricultural purposes and as railroad ballast. Slate was crushed and ground at the Delta plant of Funkhouser Mills, Division of The Ruberoid Co., and marketed as natural granules and flour. Some of the slate flour was exported.

York County ranked second in value of lime production, but tonnage and value decreased slightly compared with 1959. J. E. Baker produced dead-burned dolomite for refractory material at its York plant. Shipments were mostly to points in Pennsylvania, Maryland, Ohio, and Delaware, but some of the material was exported.

Combined output of three companies totaled 280,000 tons of sand and gravel. It was 33 percent below the high established in 1959.

Medusa Portland Cement Co. produced miscellaneous clay for its own use. Shale produced by the York Colonial Division, Glen-Gery Shale Brick Corp., was used to manufacture building brick.

General Mining Associates (Glenville) was the only mica producer in the State. The fine mica (sericite) schist was processed by drying and air separation and was used for filler purposes.

Pennsylvania Perlite Co. (York) expanded perlite shipped from Colorado.

# The Mineral Industry of Puerto Rico, the Panama Canal Zone, the Virgin Islands, and Pacific Island Possessions

**The Puerto Rico section of this chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Mineralogy and Geology Section, Economic Development Administration, Commonwealth of Puerto Rico.**

By Clinton Knox,[1] Leovigildo Vázquez,[2] and R. Y. Ashizawa[3]

## PUERTO RICO

MINERAL production in Puerto Rico in 1960 was valued at $29.5 million, an increase of $9.8 million, or 50 percent, over 1959. A large part of the apparent gain was due to improved coverage of the mineral producers in Puerto Rico. Increases in cement, sand and gravel, and stone production offset decreases in clay, lime, and salt production. No metals or mineral fuels were produced.

Imports of mineral fuels, metals, and many other raw mineral materials used in oil refineries, steel mills, copper fabricating plants, and other plants manufacturing petrochemicals, fertilizers, ceramics, glass, cement, machinery, and hardware continued to increase in 1960, paralleling the rapidly expanding economy of the Commonwealth. About 65 percent of the total value of mineral imports was from the United States and 35 percent from foreign countries.

Exports from Puerto Rico in 1960 totaled $646 million compared with $503 million in 1959. Exports of minerals and products manufactured from minerals accounted for nearly 25 percent of the 1960 total or $161 million, of which 80 percent went to the United States and 20 percent to foreign destinations. Cement shipments to the United States and foreign countries declined in 1960, whereas Puerto Rican consumption increased.

The rate of increase in net income of mineral industries in Puerto Rico from 1955 to 1959[4] was projected through 1960 at approximately the following rates: Mining 18 percent; stone, clay, and glass products 13 percent; machinery and other metal fabrications 5 per-

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Total adjusted to eliminate duplicating value of clays and stone.

cent; construction 15 percent; and petroleum refinery products and chemicals 9 percent.

Exploration for petroleum continued along the north and south coasts on large concessions previously granted by the Puerto Rico Mining Commission. Prospecting and exploration for copper, iron, gold, and molybdenum continued in the Island's interior mountains.

During 1960, Kewanee Inter-American Oil Co. completed drilling of the first three exploratory wells on the south coast and one well on the north coast but no oil discoveries were announced. Total drilling in the four completed wells amounted to 22,978 feet on concessions which aggregated about 2,500 square miles.

Three of five mining companies, holding grants of metallic mineral prospecting concessions aggregating some 4,200 square miles, reported activities on their extensive programs of diamond core drilling, surface trenching, and geological, geophysical, and geochemical surveys. Exploration work on the other two grants, recessed through 1960, was to be resumed in 1961. A sixth mining company planned an exploration project on a concession of about 1,200 square miles acquired and prospected after mid-1960.

Cooperative work by the Puerto Rico Economic Development Administration (PREDA) and the Federal Geological Survey resulted in publication of results obtained by core drilling and geologic mapping at the Keystone iron mine near Juncos.[5] The Geological Survey, working under a cooperative agreement with PREDA, completed geologic mapping of 16 quadrangles and started mapping 5 more. During 1960, geologic maps and reports on the Comerío,[6] Cayey,[7] and Central Aguirre[8] quadrangles and a series of six short papers[9] concerning research on certain geologic features of Puerto Rico, were published.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Cement.**—Shipments from the plants of Ponce Cement Corp. in the Ponce District, and Puerto Rico Cement Corp. in the San Juan District, accounted for nearly 50 percent of the value of all Puerto Rico mineral production in 1960. The combined output of the plants, producing only portland cement by the wet process, averaged 90 percent of rated capacity. Of 5.4 million barrels, 57 percent was shipped in bulk and 43 percent in bags. Total shipments increased 1 percent over 1959, but total value decreased 15 percent. As a result of construction gains in Puerto Rico during 1960, consumption by the building trades, cement products manufacturers, ready-mix concrete plants, and governmental agencies increased about 10 percent over 1959. In addition to consuming 73 percent, or 4 million barrels, of the domestic production, Puerto Rico imported about 400,000 barrels. About 25 percent of the 1960 cement production was exported to Florida and 2 percent to foreign countries. Except for gypsum, imported from the nearby Dominican Republic, all cement raw materials were mined near the plants of the two manufacturers.

**Clays.**—Most of the clay production was used in manufacturing cement. A small amount of clay was used in studio potteries and much of the production from deposits near Carolina in San Juan District was used in manufacturing heavy clay products. The total clay used by the two cement manufacturers and the clay products plant was about 4 percent less than the 1959 output. Several million tons of clay used in swamp reclamation, new highways, and other projects was not reported.

The PREDA Mineralogy and Geology Section, Industrial Research Laboratories, published the results of research on clays suitable for making lightweight aggregate.[10] The Federal Geological Survey published a paper [11] on occurrences of bauxitic clay in north-central Puerto Rico giving results of exploratory work done in cooperation with PREDA.

**Lime.**—South Puerto Rico Sugar Co. operated its limestone quarry and kiln in the southern part of the Mayaguez District about 3

[10] Cadilla, José F., A clay for a lightweight aggregate: Mineralogy and Geology Section, Department of Industrial Research, Puerto Rico Economic Development Administration, Technical Report, June 30, 1960, 62 pp.

Digitized by Google

months to replenish its lime stocks for sugar refining and to supply the small market for chemical and sanitation needs of neighboring communities. Numerous sugar refineries and chemical, building, and other lime-consuming industries reportedly resorted to imports in 1960, owing to the increased cost of producing lime in Puerto Rico.

**Salt.**—Production of salt was negligible because of unseasonable rains during the late summer, when salt ordinarily is harvested. The three producers along the southern coast of the Mayaguez District obtained salt by solar evaporation of sea water in earthen pans. Late in 1960, Ponce Salt Industries Corp. developed facilities for producing about 60 tons of refined salt daily. The company planned to use the salt as raw material in a caustic soda and chlorine plant, beginning in 1961.

**Sand and Gravel.**—About 50 suppliers of sand and gravel in Puerto Rico were listed during a brief field survey in November 1960. Annual productive capacity of over 500,000 tons each was observed at some of the largest operations. As in previous years of increasing industrialization and construction in the Commonwealth, about 1 percent of the producers reported 1960 output. The production of the only large-scale operator that reported amounted to about 500,000 tons of sand and gravel, all sold as concrete aggregate. For a realistic figure, the 1960 sand and gravel production was estimated to total 9 million tons. The estimate is a composite of computations based in part on production reports and on consumption, employment, and other data obtained from private and governmental sources, and in part on field observations at representative operations and pertinent construction projects. Indexed to 1960 Puerto Rican cement consumption—about 4.4 million barrels after accounting for imports, domestic production, sales, exports, and stocks—at least 6.3 million tons of aggregate was used in concrete in the unprecedented 1960 building construction, highway, city, and airport paving projects, and emergency reconstruction programs in the wake of Hurricane Donna in September 1960. Sand and gravel comprised an estimated 80 percent, or 5 million tons of the concrete aggregate; the balance of about 1.3 million tons was crushed stone added to meet concrete specifications. The remaining 4 million tons of the production estimate was largely the excess sand from the numerous deposits worked along river valleys and from beaches. In addition to building plaster, the principal uses for sand were in fills; asphalt paving and road base; vertical drainages in swamp reclamation; slum clearance; airport expansion projects; grading access areas in the large Federal forest reservations, parks, and numerous U.S. Defense Department establishments in Puerto Rico; and for improving Commonwealth beaches and parks. Total sand and gravel production was estimated to have exceeded the 1959 output by about 10 percent. No sand and gravel was imported or exported.

Silica sand from deposits in the north central part of Puerto Rico was produced primarily for use in the nearby cement and glass plants, but unreported lesser amounts were consumed in potteries and foundries, and as an abrasive in commercial sand-blasting and marble-polishing operations. Puerto Rico Glass Corp. doubled its capacity by expanding silica sand washing, magnetite-separating,

Digitized by Google

and storage facilities late in 1960. Feldspar and other raw materials used in making glass were imported.

**Stone.**—Limestone, classified as marble in many of the deposits, was produced in all seven districts. Andesite, tuffaceous siltstone, and other volcanic stone was produced in Mayaguez, Aguadilla, Ponce, and San Juan Districts; granitic rock, in Humacao District. Except for small quantities of dimension limestone or marble, and some siltstone intermittently produced for building veneering, the stone output was about 83 percent crushed limestone and the rest granitic and miscellaneous stone. The two cement companies reported the largest production, totaling about 1.5 million tons of crushed limestone used in cement manufacture. South Puerto Rico Sugar Co. quarried and crushed limestone for lime making and one office of the Puerto Rico Land Authority reported production of agricultural limestone. Output of crushed limestone for concrete aggregate and road base was reported from quarries of the Arecibo and Humacao Districts of the Puerto Rico Department of Public Works. Other governmental agencies producing or using stone and about 80 commercial suppliers of stone were listed during a brief field survey in November 1960. Rated capacities at some of the stone quarries and crushing plants were observed to range up to 1,500 tons per day. Most of the smaller producers, however, operated only intermittently. The 1960 stone production was estimated to total 4.2 million tons. The total included 1.5 million tons of crushed limestone used for cement and an estimated 1.3 million tons of crushed limestone, granite, and miscellaneous stone for concrete aggregate. The additional 1.4 million tons was estimated in part on production reports and consumption, employment, and other data obtained from private and governmental sources, and in part on field observation at representative production operations and pertinent construction projects. A small output of dimension stone was used in buildings and in improving docks and harbors. The use of crushed stone was evidenced at new highway and airport expansion projects and in the emergency repair of hurricane damage. Based on estimates for both years, 1959 stone production was about 5 percent under 1960. Except for minor imports of monumental stone, Puerto Rico did not import or export stone.

**TABLE 3.—Stone sold or used by producers in Puerto Rico**

| Year | Dimension limestone | | Crushed limestone[1] | | Miscellaneous stone | | Total | |
|---|---|---|---|---|---|---|---|---|
| | Short tons | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) |
| 1956 | 75,168 | $143 | 2,001,285 | $2,413 | ---------- | ---------- | 2,076,453 | $2,556 |
| 1957 | 178,619 | 356 | 2,225,139 | 3,085 | 48,261 | $64 | 2,452,019 | 3,505 |
| 1958 | 148,146 | 281 | 1,777,656 | 2,352 | 60,000 | 135 | 1,985,802 | 2,768 |

## MINERAL FUELS

The oil refineries of Caribbean Refining Co. in Catano, San Juan District, and Commonwealth Oil Refining Co. in Guayanilla, Mayaguez District, continued to operate near capacity on imported crude oil. Their combined refining capacity was 94,500 barrels a day. Caribbean Refining Co. planned a $2.5 million plant expansion for early 1961. Large steam power plants of the Puerto Rico Water Resources Authority and petrochemical and other manufacturing industries near the refineries required many of the petroleum products.

The Penuelas (Mayaguez District) ethylene glycol plant of Union Carbide Caribe, Inc., processed raw ethylene from the nearby refinery of Commonwealth Oil Refining Co. Union Carbide Caribe, Inc., acquired 435 acres adjoining the Penuelas plant and began constructing a $30 million polyethylene plastic plant. Completion of the 700-million-pound-a-year plant was scheduled for mid-1962. Caribbean Alkali Corp., affiliate of Wyandotte Chemicals Corp., was constructing a $1 million electrolytic chlorine and caustic soda plant in Penuelas. Initial production was expected about mid-1961.

Early in 1960, Caribe Nitrogen, Inc., a unit of W. R. Grace & Co., acquired the large plant of Gonzales Chemical Industries, Inc., near Guanica Bay, Mayaguez District. Products of the plant were anhydrous ammonia, ammonium sulfate, and fertilizers.

In accordance with the plan to double the Commonwealth's previous 368,920 kilowatts of electrical power generating capacity by 1964, Puerto Rico Water Resources Authority put in operation two 82,500-kilowatt generating units of the new Palo Seco thermoelectric plant in the San Juan District. In Rincon, south of Ramey Air Force Base, Aguadilla District, the U.S. Atomic Energy Commission, jointly with the Puerto Rico Water Resources Authority, started construction of the first Latin American nuclear power plant. Completion of the $11 million plant was scheduled for late 1962. The plant will provide an additional 16,300 kilowatts of electrical generating capacity. The boiling water reactor will be fueled with uranium dioxide.[12]

## METALS

Siderurgica Industrial, Inc., Catano, San Juan District, Puerto Rico's only steel mill, continued to produce steel reinforcing bars from domestic and imported scrap. The company announced that plant expansion, scheduled for completion in late 1961, would increase production of steel reinforcing bars from 20,000 to 65,000 tons a year. New York and San Juan interests announced that a newly formed organization, The Danrich Steel Co., Inc., would complete construction of a $3 million steel mill in Bayamon, San Juan District, in September 1961. Domestic and imported scrap would be used for the anticipated yearly production of about 25,000 tons of steel reinforcing bars for the growing construction market.

**TABLE 4.—Value of mineral production in Puerto Rico by Districts**

| District | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Aguadilla | $172,992 | $1,090,308 | Stone, sand and gravel. |
| Arecibo | 22,751 | 803,509 | Do. |
| Guayama | 58,092 | 1,203,479 | Do. |
| Humacao | 547,670 | 643,580 | Sand and gravel, stone. |
| Mayaguez | 324,920 | 3,419,316 | Sand and gravel, stone, lime. |
| Ponce | 12,324,371 | 12,134,501 | Cement, sand and gravel, stone, clays. |
| San Juan | 6,169,795 | 9,910,510 | Do. |
| Various | 79,270 | 234,524 | Stone. |
| Total | 19,700,000 | 29,530,000 | |

## PANAMA CANAL ZONE[13]

A 10-percent decrease in basalt production in the Panama Canal Zone was more than offset by an increase of 50,000 tons in sand and gravel output. Approximately 6 million cubic yards of clay, shale, sandstone, basalt, and other rock in the channel and hillsides was bench-quarried for the Panama Canal Co. during enlargement of the Canal from 300 to 500 feet in width and from 45 to 50 feet in depth through the Gaillard cut.[14]

## VIRGIN ISLANDS[15]

Basalt in the Virgin Islands was quarried and crushed for concrete aggregate, roadstone, and other uses at a rate about equal to 1959. The U.S. Department of the Interior, in mid-1960, contracted for construction of a $2.5 million saline water conversion and electric turbogenerating plant in St. Thomas. The plant should be completed by mid-1961.

**TABLE 5.—Mineral production in the Panama Canal Zone and Virgin Islands[1]**

| Mineral | 1959 | | 1960 | |

## PACIFIC ISLAND POSSESSIONS [16]

### REVIEW BY ISLANDS

**American Samoa.**—Substantial quantities of basalt and coral limestone were quarried and crushed by crews of the Government of American Samoa in 1960. Although some of the material was used as riprap and as concrete aggregate for roads and buildings, a far greater tonnage was used as fill.

**Guam.**—A multimillion-dollar project for extending the runway, taxiways, and parking aprons at an airfield near Agana, as well as other construction activities including roads, storage facilities, and Capehart housing, required large quantities of base course, concrete aggregate, and riprap material in Guam during 1960. Government crews and contractors and commercial producers quarried coral limestone by drilling and blasting. They also used either rippers and bulldozers or mechanical shovels to work deposits of well indurated coral sand known locally as "Sugar Coral." A small tonnage of beach sand was used by crews of the Public Works Department, Government of Guam, for road maintenance and fill.

TABLE 9.—Mineral production in the Pacific Islands possessions

| Area and mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| American Samoa: Stone (crushed) | 177,977 | $219,091 | 523,161 | $260,798 |
| Canton: | | | | |
| Sand | 70 | 63 | ---- | ---- |
| Stone (crushed) | 434 | 585 | ---- | ---- |
| Total | ---- | 648 | ---- | ---- |
| Guam: | | | | |
| Sand | 28,372 | 19,860 | 965 | 965 |
| Stone (crushed) | 567,657 | 1,109,496 | 961,818 | 2,193,557 |
| Total | ---- | 1,129,356 | ---- | 2,194,522 |
| Johnston: | | | | |
| Sand | ---- | ---- | 1,300 | 3,800 |
| Stone (crushed) | ---- | ---- | 1,500 | 5,000 |
| Total | ---- | ---- | 2,800 | 8,800 |
| Wake: Stone (crushed) | 31,750 | 34,152 | 36,200 | 48,870 |

**Johnston.**—Crushed coral limestone and coral sand were used for concrete aggregate by a Government contractor during construction of the U.S. Coast Guard's LORAN (Long Range Navigation) Station at Johnston.

**Midway.**—Stockpiles of coral limestone quarried and processed in previous years were used for construction and maintenance purposes at Midway.

**Wake.**—More than 36,000 tons of coral limestone was quarried and processed by Government crews and contractors for building and road construction, and for paving the new aircraft taxiway and parking and fueling aprons at Wake.

**Other Pacific Island Possessions.**—No mineral production was reported for 1960 on the Islands of Canton, Enderbury, Jarvis, and Palmyra.

# The Mineral Industry of Rhode Island

By Joseph Krickich [1]

MINERAL production in Rhode Island set a new record in 1960. The value of $5.7 million, more than doubled the previous record set in 1959. The high level of mineral output resulted mainly from constructing breakwater facilities at Newport, where 1.4 million tons of granite riprap was used. A new quarry was developed exclusively to supply the material.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Graphite.**—Graphite Mines, Inc., discontinued production of natural amorphous graphite from a former meta-anthracite underground mine at Cranston. The deposit was not depleted, but the property was being converted to a housing development. Production was suspended in March 1959 after a roof-fall fatality in the mine.

**Sand and Gravel.**—Output of sand and gravel totaled 1.5 million tons, a 12-percent drop from 1959. Commercial output declined mainly because of less demand for paving material. Production by Government-and-contractor operations dropped from 124,000 tons in 1959 to 19,000 tons in 1960. Building sand and gravel supplied 45 percent of the State output. Paving material furnished 30 percent of the total output, compared with 45 percent in 1959. In ad-

**TABLE 1.—Value of mineral production in Rhode Island, by counties [1]**

(Thousand dollars)

| County | 1959 | 1960 | Minerals produced in 1960, in order of value |
|---|---|---|---|
| Kent | 1,180 | (2) | Sand and gravel. |
| Newport | 17 | 3,528 | Stone, sand and gravel. |
| Providence | 1,015 | 1,445 | Do. |
| Washington | 121 | (2) | Sand and gravel, stone. |
| Undistributed | | 754 | |
| Total | 2,333 | 5,727 | |

[1] No production reported from Bristol County.

Digitized by Google

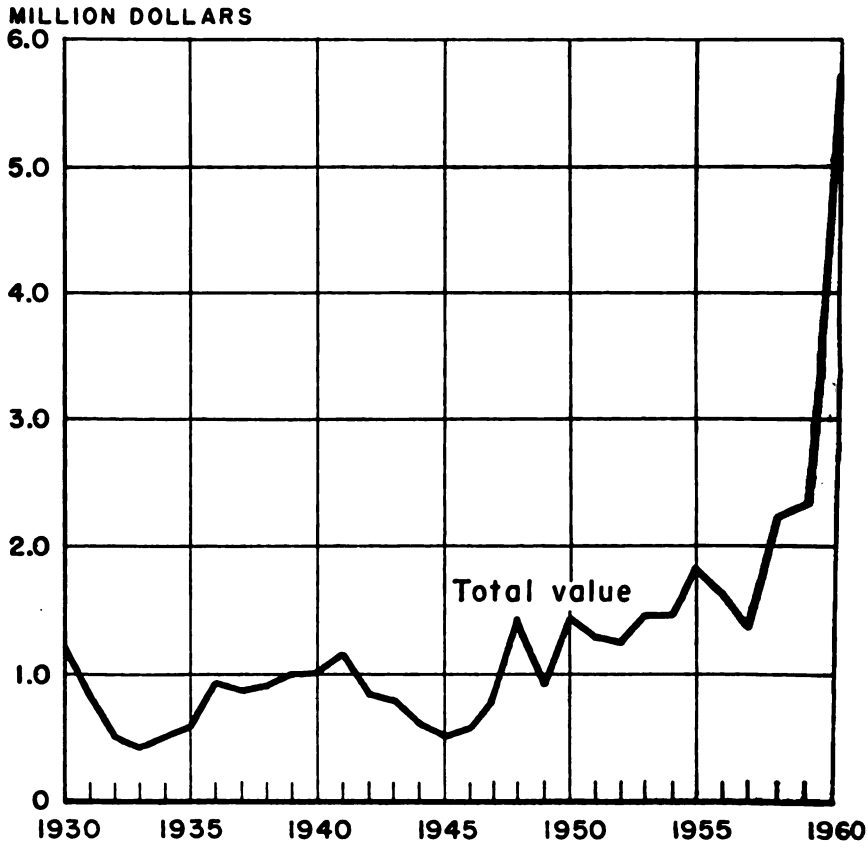

FIGURE 1.—Total value of mineral production in Rhode Island, 1930–60.

dition, quantities of sand as fill, molding sand, and sand and gravel for miscellaneous uses were produced. The average value per ton of commercial sand and gravel dropped from $0.93 in 1959 to $0.89 in 1960. Of the State's total output, 78 percent was processed material, compared with 70 percent in 1959. The number of commercial producers increased from 21 to 26; two had portable operations. An average of 145 production employees worked daily for a total of 237,000 man-hours. Five lost-time injuries were reported. The State's commercial plants in 1960 produced an average of 51 tons per man-shift compared with 59.8 tons the preceding year. Less than 1 percent of the commercial production was shipped by rail; the remainder was transported by truck.

**Stone.**—Over 1.8 million tons of stone valued at $4.4 million was produced in 1960—the highest production of stone on record. The sharp increase was due chiefly to development of a new granite quarry in Newport County for producing riprap used for constructing a breakwater on a Government project. In addition to granite, the quantity and value of limestone and miscellaneous stone produced also increased. Limestone used mainly as agstone was produced in

Digitized by Google

Providence County. Miscellaneous stone was quarried in Providence and Newport Counties and was used chiefly as concrete aggregate and roadstone. Production of crushed granite in Providence County was higher than in 1959. About the same quantity of dimension granite was produced in Washington County for construction and monumental purposes as in 1959. Dimension granite quarried in Massachusetts and other States was processed and fabricated at a yard in Providence County. A daily average of 83 production employees worked a total of 144,000 man-hours at the State's 6 stone quarries. No lost-time injuries were reported.

## METALS

Washburn Wire Co. produced basic steel at four open-hearth furnaces at Philipsdale. Pig iron, scrap iron and steel, ferroalloys, and other raw materials were obtained from other States for consumption at the plant, which had a rated annual capacity of 93,000 tons of steel ingots. Cold-rolled strip steel was produced at two plants at Pawtucket. Combined capacity of these plants was 32,000 tons. Ferrous scrap dealers were active chiefly in Providence, Newport, Westerly, and Pawtucket. Shipments of scrap from their yards consisted mainly of Nos. 1 and 2 heavy melting steel, bundles, and cast iron scrap other than borings. Pig iron, pig lead, solder, babbitts, and caulking leads were smelted and refined at a plant near Providence from nonferrous scrap. Numerous foundries throughout the State produced aluminum, brass, bronze, gray iron, malleable and other castings.

## REVIEW BY COUNTIES

Sand and gravel was produced under contract only in Providence County for the State of Rhode Island, Division of Roads and Bridges, Department of Public Works. Output was substantially below the previous year's level.

**Kent.**—Kent County again ranked second as a sand and gravel producing area despite inactivity of Government-and-contractor producers in the county. Although tonnage and value were below 1959 figures, the county continued to supply over one-third of the State sand and gravel production. Four commercial producers were active during the year. The output was used mostly for paving and building purposes. Molding sand was produced by Rhode Island Sand and Gravel Co., Inc., Warwick; and Whitehead Brothers Co., Washington. Other producers who operated stationary plants were Luigi Vallone, Inc., Warwick; and Barber Sand and Gravel, Coventry.

**Newport.**—Owing to the development of a new granite quarry by M. A. Gammino Construction Co. at Tiverton, the value of the county mineral output was a record high, even surpassing the previous State record for value of mineral output. The company produced 1.4 million tons of random and select riprap valued at $3.5 million for use at the U.S. Naval Base at Newport in constructing a breakwater. To facilitate transporting the stone, the company constructed a $400,000 loading dock, from which the stone was loaded onto a specially

Digitized by Google

designed scow which transported the material to the construction site. The company employed 35 men at the quarry.

Peckham Bros. Co., Inc., produced conglomerate stone and paving sand and gravel near Middletown. The stone was crushed for use as concrete aggregate and roadstone.

**Providence.**—Production of sand and gravel by commercial producers in the county decreased 17 percent compared with 1959; Government-and-contractor production declined 68 percent. Eighty-one percent of the commercial sand and gravel was washed, screened, or otherwise prepared; all of the Government-and-contractor material was processed. The sand and gravel was used mostly in highway building and maintenance and in construction of buildings. Principal producers were A. Cardi Construction Co., Inc., and Del Bonis Sand and Gravel Co., both of Cranston; L. Romano Construction Co., East Providence; Foster Sand and Gravel Co., Inc., Foster; Cormier Sand and Gravel, Inc., Lincoln; Courtois Sand and Gravel Co., Pawtucket; Joseph Santoro, and Valley Cement Block Co., both of Providence; Tasca Sand and Gravel Co., Smithfield; and Town Line Sand and Gravel, Slatersville.

M. A. Gammino Construction Co. continued development of its new quarry at Cranston. The company crushed stone and processed the material by wet-washing for use exclusively as concrete aggregate and roadstone. Low-magnesium limestone was quarried near Lincoln by Conklin Limestone Co., Inc. Output was used mainly for agricultural purposes; limited quantities were sold as blast-furnace flux, fertilizer filler, roofing gravel, and cast stone aggregate. Fanning and Doorley Construction Co., Inc., produced crushed and broken granite near Berkeley for riprap, concrete aggregate, and road material. Providence Granite Co. processed and fabricated building and architectural granite and granite for curbing at its yard in Providence. The company used granite quarried in Massachusetts by a subsidiary company as well as stone shipped from other States and foreign countries. Production of natural amorphous graphite at the Cranston mine of Graphite Mines, Inc., was discontinued and the mine was abandoned. The property was to be used for a housing development.

**Washington.**—Sand and gravel used mainly in road construction and maintenance and consisting primarily of processed material was produced by South County Sand and Gravel Co., Washington; Louis B. Schaeffer, Peace Dale; and J. Romanella and Sons, Westerly. Westerly Granite Corp., Bradford, quarried granite for rough construction work and monumental purposes. Oscar Larson quarried dimension granite for construction work at Hopkinton.

# The Mineral Industry of South Carolina

**This chapter has been prepared under a cooperative agreement for collecting mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the South Carolina Geological Survey.**

By Lawrence E. Shirley [1] and Laurence L. Smith [2]

RECORD PRODUCTION of crushed limestone, masonry cement, clays, feldspar, crushed sandstone (quartz), peat, and vermiculite highlighted the mineral industry of South Carolina in 1960. Total mineral output in the State decreased 2 percent and was $597,000 less than 1959. Leading commodities, in order of total value, were crushed granite, cement (masonry and portland), clays (kaolin and miscellaneous), sand and gravel, crushed limestone, and vermiculite; these six commodities accounted for 99 percent of the total value of mineral production in 1960.

South Carolina again ranked second in the Nation in output of kaolin, kyanite, and vermiculite. Leading companies mining and processing minerals were Carolina Giant Division of Giant Portland Cement Co. (portland and masonry cement, clays, and limestone); Campbell Limestone Co. (crushed granite and limestone); J. M. Huber Corp. (kaolin); Becker County Sand & Gravel Co. (sand and gravel); and Zonolite Co. (vermiculite).

**TABLE 1.—Mineral production in South Carolina [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays.....thousand short tons.. | 1,160 | $5,920 | 1,297 | $6,201 |

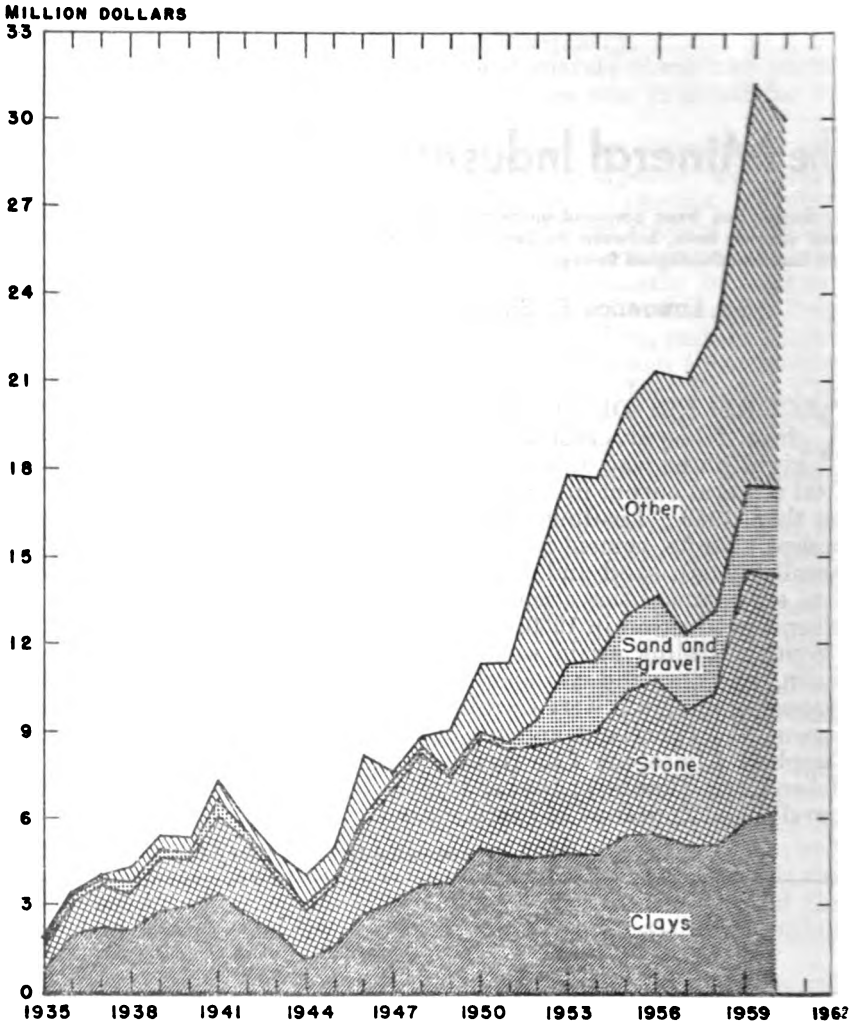

FIGURE 1.—Value of clays, stone, sand and gravel, and total value of minerals produced in South Carolina, 1935–60.

**Employment and Injuries.**—Reports submitted by producers in the mineral industries indicated that 2 percent less mines, mills, and quarries were active in 1960 than in 1959, and that employment decreased 7 percent. Employment decreased 12 percent in nonmetal mines; that in quarries and mills increased 5 percent. Employment in sand and gravel mines decreased 18 percent. Average active days worked were about the same as in 1959, and total man-hours worked in all mines, quarries, and mills decreased 7 percent.

The overall frequency rate for injuries per million man-hours decreased 8 percent. Nonfatal injuries decreased by 13 or 11 percent from 1959; in nonmetal mines, injuries decreased by 32, in quarries

Digitized by Google

TABLE 2.—Employment and injuries in the mineral industries

| Year and industry | Active operations | Men working daily | Average active days | Man-hours worked | Fatal injuries | Nonfatal injuries | Injuries per million man hours |
|---|---|---|---|---|---|---|---|
| 1959: | | | | | | | |
| Nonmetal mines | 41 | 1,173 | 263 | 2,470,039 | 1 | 66 | 27 |
| Quarries and mills | 20 | 762 | 266 | 1,621,090 | 1 | 41 | 26 |
| Sand and gravel mines | 41 | 278 | 260 | 579,541 | | 8 | 14 |
| Total | 102 | 2,213 | 264 | 4,670,670 | 2 | 115 | 25 |

| Sand and gravel mines | 42 | 228 | 246 | 448,675 | | 3 | 7 |
| Total | 100 | 2,069 | 263 | 4,361,385 | | 102 | 23 |

[1] Preliminary figures.

and mills injuries increased by 24, and in sand and gravel mines injuries decreased by 5. There were no fatal accidents reported for the year, as compared with two in 1959.

**Trends and Developments.**—Value of foreign trade through South Carolina's ports of Charleston, Georgetown, and Port Royal reached the highest level in history in 1960, totaling over $244 million. Total trading through State ports had risen phenomenally—by almost $200 million—since 1947, when imports and exports were valued at $49.5 million. The State's large port construction program was nearing completion; in October, the biggest single project of the program, a $10 million terminal at Charleston was dedicated. At Charleston, expansion was underway at State Piers 2 and 4, which were expected to be completed in 1961. The port of Charleston ranked 14th among the Nation's ports for the year.

The growth of the State was reflected in expenditures for major construction of new facilities by the power companies in the area. Carolina Power & Light Co. completed in May its newest generating plant, a 250,000-h.p. steam-electric unit near Hartsville. The initial unit, operating at full power, consumed 2,340 tons of coal daily; since startup in May, expenditures for coal alone totaled more than $2.5 million. The plant was designed for eventual expansion to over 1.5 million horsepower.

South Carolina Electric & Gas Co. announced a 3-year, $73 million expansion program that included construction of a $41 million steam-electric generating facility at Canadys Station, near Walterboro, Colleton County. Future expansion plans included purchase of four package-type gas-fired generating units for peaking and emergency purposes and the installation of a second 137,500-kw. unit at the Canadys Station plant.

Carolinas Virginia Nuclear Power Associates, Inc., composed of Carolina Power & Light Co., South Carolina Electric & Gas Co., Duke Power Co., and Virginia Electric & Power Co., began construction of the first nuclear-powered steam generating plant in the Southeast at Parr Shoals, S.C., in June. This was the first time that private companies had invested in a reactor that will use heavy water

Digitized by Google

for cooling and moderating. The generating station was designed to produce 17,000 kw. of electric power and will feature pressure tubes installed in a relatively low-pressure tank, in place of the usual heavy steel vessel, to house the reactor core and its structural supports. The plant was scheduled for completion by mid-1962 and was 10 percent complete by the end of 1960.

A program of highway construction costing approximately $45 million was conducted by the South Carolina State Highway Department during the year, resulting in the award of contracts for construction and improvement of 1,240 miles of roads and numerous bridges. An expanded program, expected to reach $53 million, was outlined for 1961.

Contracts awarded to low bidders during the year involved work on 35 miles of Interstate System routes, 110 miles of primary and urban roads, 499 miles of secondary roads that receive Federal aid, and 18 miles of miscellaneous projects. Highway maintenance cost $15 million in 1960 compared with $14 million for the previous year. Contracts were awarded during 1960 for construction of 35 miles on the Interstate Highway System and involved $13.5 million in Federal and State aid funds.

About 200 miles of the new expressways had been opened to traffic, including the Cherokee and Spartanburg County sections of Interstate Highway 85 and the segments of Interstate Highway 26 extending from State Highway 33 near Orangeburg to U.S. Highway 276 in Laurens County and from Interstate Highway 85 in Spartanburg County to a point near the North Carolina line. Enlargements and additions in the State highway department were necessary to keep apace of new developments. Increased activity in road construction was reflected by increased use of materials, especially sand and gravel.

Carolina Giant Division of Giant Portland Cement Co., Harleyville, began construction on a $4 million expansion program by adding a fourth kiln with an annual cement capacity of 1.1 million barrels, increasing plant capacity to 4 million barrels. Eastern Brick & Tile Co., Sumter, completed construction of its new brick and tile plant, which was equipped to produce 70,000 to 100,000 brick per day and which cost $1 million. Guignard Brick Co., Columbia, added a new tunnel kiln and dryer that doubled its daily production of brick. Owens-Corning Fiberglas Corp. completed a new glass fiber plant at Aiken, comprising 10 direct melt furnaces with a total production capacity of 70 million pounds per year. Richland Shale Products Co., Columbia, announced plans for a $1 million addition to its plant, which would double capacity. American Lava Co., a wholly owned subsidiary of Minnesota Mining & Manufacturing Co., announced that a new technical ceramics plant would be built at Laurens.

**Legislation and Government Programs.**—E. I. du Pont de Nemours & Co., Inc., operated the Savannah River plant for the Atomic Energy Commission (AEC) under the second extension of a contract originally undertaken in 1950 at the request of the Government. Since 1950, total expenditures administered by Du Pont for construction operation and improvements under contract had been in excess of $1.9 billion. At the end of 1960 the operating force was about 6,600 and the construction force engaged in modifying and improving the

Digitized by Google

plant was about 1,100. The primary objective of the operation was production of plutonium and other special nuclear materials for national defense, but Du Pont also was being called upon to increase research devoted to AEC's projects on the peaceful use of atomic energy.

Initial operation of the Heavy Water Components Test Reactor under construction at AEC's Savannah River plant near Aiken was scheduled for 1961. The reactor, whose construction was approximately 45 percent complete at the end of 1960, was designed to permit simultaneous test irradiation of up to 12 full-sized natural uranium fuel elements at temperatures, pressures, and power densities similar to those encountered in operating power reactors. The test reactor will yield operating information on a heavy-water modulated system under conditions similar to those for power production. It will irradiate fuel elements and test other heavy-water reactor components.

AEC awarded a contract to the operator of the Savannah River plant, Aiken, for reprocessing nuclear fuels from a Hanford, Wash., production reactor.

The fiscal year 1961 appropriation for the Civil Works Program of the U.S. Army Corps of Engineers was announced and included $21.4 million for new construction at the Hartwell reservoir on the border between South Carolina and Georgia. The Corps of Engineers later awarded a $1.2 million contract for highway and railroad relocation necessary to divert the Seneca River around the Clemson College campus. The diversion will require relocation of a section of State Highway 37 and the line of the Chicago & North Western Railway Co. at the Seneca River crossing, about 2 miles south of the Clemson campus.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Barite.**—Industrial Minerals, Inc., Cherokee County, the only barite producer in the State, increased output 2 percent in quantity and 3 percent in value over 1959. The crude barite was ground for use as rubber filler and shipped out of State. Operations in 1961 were expected to improve as the result of new grinding equipment installed near the end of 1960.

**Cement.**—By value, cement was the second leading commodity in the State. Masonry cement continued to establish record output, with increases made each year since production began in 1957. Portland cement decreased in output for the first year since production began in 1949. Both types of cement were manufactured by Carolina Giant Division of Giant Portland Cement Co. near Harleyville, Dorchester County. Masonry output increased 13 percent in quantity and 14 percent in value; portland cement decreased 16 percent in quantity and 14 percent in value, compared with 1959. Limestone and clay used in the manufacture of masonry and portland cements decreased 14 percent each in quantity. During the year Carolina Giant began an expansion program to increase plant capacity to 4 million barrels of cement annually. The construction program, estimated to cost $4 million, entailed the addition of a fourth kiln with an annual capacity

Digitized by Google

of 1.1 million barrels and additional storage and shipping facilities. A new sales office was established in Raleigh, N.C. The plant had been enlarged twice since it went into operation in 1948.

**TABLE 3.—Kaolin sold or used by producers, by uses**

| Use | 1959 | | | 1960 | | |
|---|---|---|---|---|---|---|
| | Short tons | Value | | Short tons | Value | |
| | | Total | Average per ton | | Total | Average per ton |
| Rubber | 229,442 | $2,829,645 | $12.33 | 220,846 | $2,868,888 | $12.99 |
| Insecticides and fungicides | 49,464 | 579,081 | 11.71 | 49,599 | 651,529 | 13.14 |
| Other refractories | (1) | (1) | (1) | 38,078 | 233,805 | 6.14 |
| Firebrick and block | (1) | (1) | (1) | 11,191 | 57,363 | 5.13 |
| Plaster and plaster products | 2,000 | 27,060 | 13.53 | 2,500 | 34,200 | 13.68 |
| Saggers, pins, stilts, and wads | 4,400 | 59,532 | 13.53 | | | |
| Other uses [2] | 160,780 | 1,796,779 | 11.18 | 124,406 | 1,656,556 | 13.32 |
| Total | 446,086 | 5,292,097 | 11.86 | 446,620 | 5,502,342 | 12.32 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other uses."
[2] Includes whiteware, art pottery, fire-clay mortar, paper filler, paper coating, linoleum and oilcloth, paint, fertilizers, other fillers, chemicals, exports, and other uses.

**Clays.**—By value, clay was the third leading commodity in the State. New high record outputs were established for kaolin and miscellaneous clay; South Carolina ranked second in the Nation in production of kaolin. Total clay output was 1.3 million tons, valued at $6.2 million. Kaolin production increased slightly over 1959 to 447,000 tons valued at $5.5 million, and miscellaneous clay increased 19 percent in quantity to 850,000 tons and 11 percent in value to $699,000. Kaolin, used for filler in rubber, insecticides and fungicides, and other fillers, and for refractories, pottery, and stoneware, was produced at 17 mines in Aiken and Richland Counties by 13 companies. Miscellaneous clay, used for cement and heavy clay products, including building brick, paving brick, draintile, sewer pipe, and kindred products was produced at 12 mines in Cherokee, Dorchester, Fairfield, Greenwood, Lexington, Marion, Marlboro, and Richland Counties by 12 companies. J. M. Huber Corp. (three mines), Dixie Clay Co., and National Kaolin Products Co., all of Aiken County, were the leading producers of kaolin, in that order, for the second consecutive year. The three leading producers of miscellaneous clay for the second consecutive year were Carolina Giant (Dorchester County), Columbia Brick & Tile Co. (Richland County), and Southern Brick Co. (Greenwood County).

Guignard Brick Co., Columbia, doubled its brick production with the installation of a new tunnel kiln and dryer, bringing plant production to 100,000 brick per day. The first brick was made at this plant by John Guignard in 1803.[3] Richland Shale Products, Columbia, had plans in the initial stages for a $1 million addition to its sewer pipe, draintile, and flue lining division, which will double production and enable production of larger pipe. In 1960, Richland Shale Products was producing 50,000 tons of 4-inch to 12-inch pipe annually. Since 1958, Columbia Brick & Tile Co., Columbia, had

[3] Brick and Clay Record, Complete Automation on Kiln at Guignard: Vol. 136, No. 6, June 1960, pp. 102–106.

Digitized by Google

duplicated its original plant at a cost of over $1 million and was equipped to produce in excess of 200,000 brick per day. A description of the new plant facilities was published.[4] Eastern Brick & Tile Co., Sumter, completed its plant at a cost of $1 million and was producing brick, although the plant was built basically to produce glazed structural tile. The plant was equipped to produce 70,000 to 100,000 brick per day. Southern Brick Co., Ninety Six, completed an extensive modernization program begun in 1956. Kiln and dryer units were installed in 1959, and a grinding room and clay storage shed were constructed in 1960. A description of the new facilities was published.[5]

Brief studies[6] were made during the year on the geology and mineral resources of clays as follows: Bentonitic clays of the Coastal Plain, preliminary appraisal of brick clay and bentonite in Jasper County, bentonitic clay in Orangeburg and Calhoun Counties, common clay in Charleston and Berkeley Counties, and kaolin in northwestern Sumter County. Articles on brick clays of Medway Plantation, Berkeley County, and on the use of a power auger to obtain information on clay as well as other resources were included.

The Federal Bureau of Mines at its Norris (Tenn.) Metallurgy Research Laboratory continued making tests and analyses on refractory and common clays from South Carolina as a part of its clay-testing program in the Southeastern States.

**Feldspar.**—Paco Products, Inc., produced feldspar for the second year from granite screenings mined by Campbell Limestone Co. at its Pacolet quarry; quantity and value increased substantially over 1959. The material was ground and shipped out of State for use by the glass industry.

**Kyanite.**—South Carolina ranked below Virginia, the only other kyanite-producing State. Output increased 11 percent in quantity and 8 percent in value over 1959. Commercialores, Inc., Henry Knob mine, York County, the only producer, mined, processed, and shipped the material to refractory producers; the company conducted extensive research to produce a better refractory material.

**Mica.**—Sheet mica was produced by four operators in two counties, and scrap mica by one operator in one county. Production of full-trimmed sheet mica, all from pegmatite deposits, declined 60 percent in quantity and 61 percent in value; the number of operators decreased from seven to four. Production and the number of operators had decreased for 3 successive years. Full-trim sheet mica was sold to the GSA Purchasing Depot, Spruce Pine, N.C., at an average of $11 per pound. Mineral Mining Corp., Kershaw, the only scrap mica producer in the State, recovered scrap mica from an opencut mica schist deposit in Lancaster County; output decreased 9 percent in quantity and 28 percent in value from 1959.

**Pyrites.**—Commercialores, Inc., York County, produced pyrites as a byproduct in the milling of kyanite and reported production for the

first year. Production of pyrites in South Carolina had not been recorded by the Bureau of Mines since 1918; cumulative production for the period 1915–18 totaled 14,268 short tons valued at $98,671.

**Sand and Gravel.**—By value, sand and gravel was the fourth leading commodity in the State. Production decreased in 1960 because of slack periods of construction and adverse weather conditions; output decreased 2 percent in quantity and 1 percent in value below 1959. Sand and gravel was produced at 42 mines by 27 companies in 26 counties. All operations were commercial except that of the State highway department. The highway department produced paving sand at 11 mines in 11 counties, a decrease of 2 mines from 1959; 38,000 tons of sand valued at $17,000 was produced, a decrease of 15 percent in quantity and 20 percent in value from 1959. Twenty companies produced building sand in 13 counties; 9 companies paving sand in 7 counties; and 3 companies fill sand in 3 counties. Glass, molding, blast, fire or furnace, engine, filtration, and other industrial sand was produced by 16 companies in 12 counties. Construction gravel was produced by eight companies in eight counties and consisted of gravel for building, paving, railroad ballast, and other purposes. Leading sand and gravel producers for the second consecutive year were Becker County Sand & Gravel Co. in Chesterfield, Marlboro, and Sumter Counties, and Columbia Silica Sand Co. and Capital Sand Co., both in Lexington County. J. F. Cleckley & Co. produced paving sand in Beaufort, Charleston, Edgefield, and Horry Counties. Seventy-one percent of the material was processed by washing and the remainder was unprocessed or mine-run material. Shipments of sand and gravel were 54 percent by truck and 46 percent by railroad.

Whitehead Bros. Co. of New York, N.Y., one of the leading producers of foundry and industrial sands with plants in New Jersey, New York, and New England, moved into the Southeast with a modern new operation near Lugoff, Horry County. Most of the output was foundry sand, and shipments were made throughout the Southeast. A detailed description of the operation was published.[7] Owens-Corning Glass Co., Aiken, completed and placed in operation a new glass fiber plant, the largest of its kind in the United States, with a capacity of 70 million pounds of glass fiber per year. The company also had an operation at Anderson. American Lava Corp., Chattanooga, Tenn., wholly owned subsidiary of Minnesota Mining & Manufacturing Co., announced plans to build a technical ceramics plant at Laurens, as part of the company's decentralization program.

**Stone.**—By value, stone production led all commodities in the State. Record highs were established in 1960 for output of crushed limestone and crushed sandstone (quartz), offsetting decreases in crushed and dimension granite. Total stone sales, including crushed limestone, crushed sandstone (quartz), crushed granite, and dimension granite, increased slightly over 1959. Crushed limestone, following a trend discernible in 1959, increased in tonnage and value. Crushed sandstone (quartz) increased 308 percent in quantity and 355 percent in value; the quartz was recovered from granite screenings at the Pacolet quarry of Campbell Limestone Co. by Paco Products Co., Pacolet. Crushed granite output decreased 4 percent in tonnage and 1 percent in value; dimension granite decreased 1 percent in tonnage and 6 percent in value.

Crushed granite was produced from 12 quarries in 8 counties by 6 companies, 1 quarry more than operated during 1959. The largest crushed granite producers, responsible for 82 percent of the total tonnage were: Campbell Limestone Co., Greenville, Pickens, and Spartanburg Counties; Palmetto Quarries Co., Fairfield, Greenwood, and Richland Counties; and Weston & Brooker Co., Lexington County. Eighty-six percent of the total was used for concrete, roadstone, and

[7] Pit and Quarry, Whitehead's South Carolina Plant Opens New Foundry Sand Market in Southeastern States: Vol. 53, No. 5, November 1960, pp. 96–99.

Digitized by Google

screenings. The granite was transported 72 percent by truck and 28 percent by railroad. Dimension granite was quarried by two companies in Fairfield County and one company in Kershaw County. The largest producer was Winnsboro Granite Co., Rion, who accounted for over 70 percent of the total output. All of the material was used as monumental stone.

**TABLE 6.—Crushed granite sold or used by producers, by uses**

| Use | 1959 | | | 1960 | | |
|---|---|---|---|---|---|---|
| | Short tons | Value | | Short tons | Value | |
| | | Total | Average per ton | | Total | Average per ton |
| Concrete and roadstone | 5,346,058 | $7,555,243 | $1.41 | 5,196,290 | $7,277,128 | $1.40 |

| Total | 6,232,929 | 8,269,875 | 1.33 | 5,994,404 | 8,178,158 | 1.36 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other."
[2] Includes stone sand, riprap, other uses, and uses indicated by footnote 1.

Crushed limestone was produced by two producers, one in Cherokee County and one in Dorchester County. Forty-eight percent was used for cement manufacture, fertilizer filler, and local foundry use; 42 percent was used for concrete, roadstone, and screenings; and the remainder was used as agricultural lime. The material was transported 93 percent by truck and 7 percent by railroad. Crushed sandstone (quartz), showing considerable increase in output, was used for the manufacture of glass and other uses.

Comolli Granite Co. of Elberton, Ga., announced the opening of a new quarry near Kershaw, Kershaw County. The stone was to be sold under the name "Carolina Diamond Gray" and used primarily for mausoleums and for buildings. Bird & Sons, Inc., Charleston Heights, processed stone screenings from material produced in Georgia. The materials plant was adjacent to a roofing mill, which it supplied, and had been in operation since 1955. The Bird organization, originally founded in 1795, with general offices in East Walpole, Mass., was a longtime producer of roofing materials.

Vermiculite.—By value, vermiculite was the fifth leading commodity in the State. Record highs were again established in 1960 for crude vermiculite tonnage and value; new highs had been recorded each year since 1944, attesting to the rapid growth of the commodity. For the second consecutive year, the State ranked second in the Nation in crude ore production. Total output increased 3 percent in quantity and 12 percent in value over 1959. Zonolite Co., Enoree, continued to be the principal producer, mining crude ore in Laurens and surrounding counties and processing the ore at its Kearney plant, near Enoree, Laurens County. A description [3] of Zonolite's South Carolina operations, including mining and milling, with a flowsheet of the

[3] North, Oliver S., Vermiculite Sparkles in Modern Industry: Rock Products, vol. 63, No. 10, October 1960, pp. 95–97.

Digitized by Google

Kearney mill near Enoree, was published during the year. Zonolite shipped the processed ore to its own exfoliating plant near Travelers Rest and to out-of-State exfoliating plants. Patterson Vermiculite Co. mined crude ore and processed the material at its own plant nearby. American Vermiculite Co., Roan Mountain, Tenn., mined crude ore in Laurens and Spartanburg Counties and processed the material at its own exfoliating plant in the Enoree area, Laurens County. Most of the material was used as plaster and concrete aggregate, insulation fill, fertilizer conditioner, and floral needs. Research in developing new uses was in progress during the year.

## METALS

**Ferroalloys.**—Virginia-Carolina Chemical Corp., Charleston County, operated an electric-arc-furnace plant, producing ferrophosphorous. Pittsburgh Metallurgical Co. Inc., Charleston County, operated an electric-arc-furnace near Charleston and produced ferromanganese, ferrosilicon, and ferrochromium.

**Gold and Silver.**—No gold and silver production had been reported to the Bureau of Mines in South Carolina since 1943. Nearly half of the total production of gold came from placer operations during the period 1829–80. The history of gold production in the State since 1880 was mainly the record of production of a single large gold mine, the Haile mine in Lancaster County. This mine operated during two periods, 1901–14 and 1933–42, and accounted for more than one-third of the total production of the State. Table 7 shows the production of gold and silver, 1829–1960.

Kershaw Mining Co., Kershaw, announced the reopening of the Lamar Gold mine, Kershaw County, in 1960, after a preliminary examination and sampling program.

**Zirconium.**—Orefraction Minerals, Inc., Georgetown County, continued operating its zircon processing plant near Andrews. The company used domestic ore from Florida and imported ores, and supplied granular and dry-milled zircon for the foundry, refractory, and ceramic and glass industries. During the year, Metal & Thermit Corp., New York, acquired the resources and facilities of Orefraction Minerals, Inc., thus expanding its activities in the minerals field. Metal & Thermit Corp. had diversified interests in chemicals, metals, alloys, minerals, and welding equipment and supplies, and owned or operated mining and ore processing facilities in Carteret, N.J., and Beaverdam, Va., and in Australia, and Mexico.

## MINERAL FUELS

**Peat.**—Peat production reached a record high in South Carolina in 1960; total value increased 76 percent over 1959. Humus peat, for use as a soil conditioner, was produced from a single operation in Colleton County.

**Petroleum.**—Delhi-Taylor Oil Corp., Dallas, Tex., opened a new petrochemical terminal at North Charleston. The new terminal had 2-million-gallon storage capacity and was to be supplied by seagoing tankers; the Delhi terminal is accessible by truck, rail, barge, and

Digitized by Google

ocean tanker. Delhi-Taylor operated in 42 States and had sizable oil exploration interests in Central America and Australia.

Off-Shore Explorations, Houston, Tex., announced that construction had begun on an electronic survey tower off Hilton Head Island to aid in oil exploration. It was one of three towers to be constructed to

guide survey ships gathering geological information off the coast; the other two towers were to be located near Townsend, Ga., and Jacksonville, Fla. The oil search will cover the entire coastal shelf, extending 40 to 50 miles offshore.

Transcontinental Pipe Line Co., Houston, Tex., and Dixie LPG Pipe Line Co. announced that they would build essentially parallel liquefied petroleum gaslines extending from Texas through Mississippi, Georgia, and South Carolina and into North Carolina. Transcontinental was planning a $63 million system, with a capacity of 60,000 barrels daily, and planned to use existing natural-gas pipeline right-of-way for its system; preliminary studies for the Dixie line called for a $35 million project with an initial capacity of 25,000 barrels daily. The planned new lines would be the first liquefied petroleum gaslines in the Southeast, which received its liquefied petroleum gas chiefly by truck and rail.

The Ethyl Corp. at Orangeburg completed an expansion program at its plant, producing methyl, ethyl, isobutyl aluminus, ethyl, and methyl aluminum halides.

## REVIEW BY COUNTIES

Mineral production was recorded in 31 of the 46 counties in the State, 3 counties more than in 1959. Dorchester, Aiken, and Spartanburg Counties furnished more than 50 percent of the total mineral production value. The leading 10 counties, in order of value, all had output exceeding $1 million and furnished 89 percent of the total

Digitized by Google

value of mineral production; they were Dorchester, Aiken, Spartanburg, Richland, Lexington, Laurens, Fairfield, Pickens, Cherokee, and Marlboro Counties. Fifteen counties reported no mineral production.

**Aiken.**—For the fifth consecutive year, Aiken County was the second most important mineral-producing county in the State. Twelve mines operated by seven companies produced a total of 404,000 tons of kaolin valued at $5,304,000, a decrease of 1 percent in tonnage and an increase of 4 percent in value. Aiken County, as in 1959, was again the largest kaolin-producing county. The three largest producers of kaolin, all in Aiken, were J. M. Huber (Barden, Ideal, and Paragon mines); Dixie Clay Co. (McNamee mine); and National Kaolin Products Co. (Aiken mine). Other active operations were Southeastern Clay Co. (Johnson, Rodgers, Gardner, and Toole mines); International Clay Corp. (Graniteville mine); United Clay Mines Corp. (No. 7 mine); and Bell Clay Co. (Batesburg mine). Sand and gravel output in the county increased 5 percent in tonnage and 8 percent in value over 1959. Perry Sand & Gravel Co. (Marine Minerals mine) produced both sand and gravel, and the State highway department mined paving sand for use on county roads.

**TABLE 10.—Value of mineral production in South Carolina, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1959 in order of value |
|---|---|---|---|
| Aiken | (2) | (2) | Kaolin, sand and gravel. |
| Anderson | $1,648 | $2,669 | Sand and gravel, mica. |
| Beaufort | | (2) | Sand and gravel. |
| Charleston | (2) | (2) | Do. |
| Cherokee | (2) | (2) | Limestone, barite, sand and gravel, miscellaneous clay. |
| Chester | 1,938 | 1,644 | Sand and gravel. |
| Chesterfield | (2) | (2) | Do. |
| Colleton | (2) | (2) | Peat. |
| Dorchester | (2) | (2) | Cement, limestone, miscellaneous clay, sand and gravel. |
| Edgefield | | (2) | Sand and gravel. |
| Fairfield | (2) | (2) | Granite, miscellaneous clay. |
| Florence | (2) | (2) | Sand and gravel. |
| Greenville | (2) | (2) | Granite, sand and gravel. |
| Greenwood | (2) | (2) | Granite, miscellaneous clay |
| Horry | (2) | (2) | Sand and gravel. |
| Jasper | (2) | (2) | Do. |
| Kershaw | 164,642 | (2) | Sand and gravel, granite. |
| Lancaster | (2) | (2) | Mica, miscellaneous clay, sand and gravel. |
| Laurens | (2) | (2) | Vermiculite, sand and gravel. |
| Lexington | (2) | (2) | Granite, sand and gravel, miscellaneous clay. |
| Marion | (2) | (2) | Miscellaneous clay, sand and gravel. |
| Marlboro | (2) | (2) | Sand and gravel, miscellaneous clay. |
| Newberry | 875,000 | 62,978 | Granite. |
| Oconee | 2,708 | 2,681 | Sand and gravel. |
| Orangeburg | | (2) | Do. |
| Pickens | (2) | (2) | Granite. |
| Richland | (2) | (2) | Granite, kaolin, miscellaneous clay, sand and gravel. |
| Spartanburg | (2) | 2,213,039 | Granite, quartz, feldspar, vermiculite, sand and gravel, mica. |
| Sumter | (2) | (2) | Sand and gravel. |
| Union | (2) | 250 | Do. |
| York | (2) | (2) | Kyanite, pyrites, sand and gravel. |
| Undistributed | [3] 29,552,064 | 27,720,420 | |
| Total | 30,598,000 | 30,001,000 | |

[1] The following counties are not listed because no production was reported: Abbeville, Allendale, Bamberg, Barnwell, Berkeley, Calhoun, Clarendon, Darlington, Dillon, Georgetown, Hampton, Lee, McCormick, Saluda, and Williamsburg.

[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."

[3] Revised figure.

Digitized by Google

**Anderson.**—J. E. Wilson (Emma mine), Frank Holland (Holland mine), and Ben B. Williams (Williams mine) sold sheet mica from pegmatite deposits. The State highway department mined paving sand for its own use; tonnage and value were the highest since 1954.

**Beaufort.**—J. F. Cleckley & Co. (Beaufort mine) opened a new mine in the county and produced paving sand; this company was the only mineral producer in the county.

**Charleston.**—J. F. Cleckley (Charleston mine) opened a new mine and produced paving sand; Edisto Sand & Gravel Co. (Edisto mine) produced building and paving sand, and Sandrying Co. (North Charleston mine) produced sand for use as fertilizer filler. Output more than doubled in quantity and increased 61 percent in value over 1959.

**Cherokee.**—Cherokee County ranked ninth in the State in value of mineral production and was eighth in 1959. Industrial Minerals, Inc. (Kings Creek mine) mined barite; tonnage and value increased slightly over 1959, establishing a record year for Industrial Minerals since taking over operation of the mine in 1949. The company installed a new 30-inch vibrating ballmill, increasing capacity to 2 tons per hour, after experimenting with a 15-inch mill; feed is ½-inch ground barite ore, and product size is 99 percent minus 325-mesh. Campbell Limestone Co. (Blacksburg quarry) crushed limestone for concrete aggregate, roadstone, and agricultural use; tonnage decreased 12 percent, and value decreased 8 percent below 1959. Bennett Brick & Tile Co. (Kings Mountain mine) produced miscellaneous clay for manufacturing building brick; output was 22,000 tons valued at $11,000. Bennett reported production for the first year. Jobe Sand Co. (Blacksburg mine) mined engine sand; tonnage increased 13 percent and value 47 percent over 1959. The State highway department mined paving sand for its own use.

**Chester.**—Paving sand was mined by the State highway department for use in the highway program; production decreased from 1959.

**Chesterfield.**—Becker County Sand & Gravel Co. (Cash mine) mined sand and gravel for construction purposes and continued to increase output; tonnage and value increased 32 and 35 percent, respectively, over 1959. The State highway department mined paving sand for use in its road program; output increased considerably over 1959.

**Colleton.**—Ti-Ti Peat Humus Co., Inc., Green Pond, produced peat for use as a soil conditioner; quantity and value increased considerably over 1959 and 1960 was a record year for the company. This was the only mineral production reported in the county and the only peat producer in the State.

**Dorchester.**—For the fifth consecutive year, Dorchester County led the State in total value of mineral production; total value decreased 4 percent from 1959, principally because of a decrease in portland cement output. Masonry cement output had a record year. Carolina Giant Division of Carolina Giant Cement Co. manufactured portland and masonry cements and produced clay and crushed limestone for use in cement. Masonry cement output, the highest in the company's history, increased 13 percent in quantity and 14 percent in value over 1959. Portland cement output decreased 16 percent in quantity and 14 percent in value. The company produced miscel-

Digitized by Google

laneous clay at its Harleyville mine; tonnage decreased 14 percent and value decreased 29 percent. Crushed limestone, previously classified as marl, was produced by Carolina Giant near Harleyville. The company began construction on a large expansion program announced in 1959. Volunteer Portland Cement Co., Agstone Division, mined agricultural limestone; output decreased from 1959. Salisbury Brick Corp. (Salisbury mine) mined 23,000 tons of miscellaneous clay valued at $13,254, a decrease from 1959. Murray Mines Division of Murray Mines Co., Summerville, produced 21,000 tons of building sand valued at $15,000.

**Edgefield.**—J. F. Cleckley & Co. (Edgefield mine, a new operation) reported production of paving sand for the first year. All of the material was transported by truck. This was the only mineral producer in the county.

**Fairfield.**—Fairfield County ranked seventh in the State in value of mineral production; the county had ranked fourth in 1959. Palmetto Quarries Co. (Blair quarry) and Rion Crushed Stone Co. (Rion quarry) crushed granite for concrete aggregate, roadstone, and screenings; the output of Palmetto Quarries decreased 20 percent in quantity and 15 percent in value from 1959. Comolli Granite Co. (Carolina Mahogany quarry) and Winnsboro Granite Co. (Winnsboro quarry) quarried dimension granite for the monument industry; output increased slightly. Richland Shale Products Co. (Richtex mine) mined miscellaneous clay and shale for use in its brick and tile plant; output decreased 17 percent in quantity and 18 percent in value.

**Florence.**—Coastal Sand Co. (Johnsonville mine) produced building, paving, and fill sand; output decreased slightly from 1959. Lanford Sand Co. (Florence mine), in its second year of operation, reported an increase in output of building sand.

**Greenville.**—Zupan Sand Co. (Greenville mine), W. M. Barber Sand Co. (Greenville mine), and Saluda Sand Co. (Garrison mine) produced building sand; total output of the three mines decreased 13 percent in quantity and 8 percent in value from 1959. Campbell Limestone Co. (Lakeside quarry) crushed granite for use in concrete, road material, railroad ballast, and stone sand; the company was the leading crushed granite producer in the State. The State highway department produced slightly more paving sand for use in its highway program than in 1959.

**Greenwood.**—Palmetto Quarries Co. (Stoney Point quarry) reported in 1959 as Greenwood quarry, crushed granite for use in concrete, roadstone, and screenings, and railroad ballast; tonnage and value increased 4 percent over 1959. Southern Brick Co. (Ninety-Six mine) produced 108,000 tons of miscellaneous clay valued at $81,000 for use in manufacturing building brick and tile. The company completed an extensive modernization program begun in 1956, by building a new 50- by 100-foot grinding room and an 80- by 280-foot shed providing storage for over 30 days' supply of clay. Southern used a mixture of one-third highly plastic alluvial clay and two-thirds friable and variable Precambrian shale as kiln feed. Angus Brick & Tile Co. (Ninety-Six mine) produced 22,000 tons of miscellaneous clay valued at $16,000 for use in manufacturing building brick; tonnage increased 6 percent, but value decreased.

Digitized by Google

**Horry.**—E. P. Pitts Sand Corp. (Pitts mine), listed as Locher Silica Corp. in 1959, produced glass sand for local consumption and out-of-State use; output increased slightly over 1959. J. F. Cleckley & Co. (Conway mine) produced paving sand; output decreased considerably from 1959.

**Jasper.**—Deerfield Sand & Mining Co. (Deerfield mine) produced paving sand; output decreased considerably from 1959. The sand was transported 84 percent by rail and 16 percent by truck. Deerfield Sand was the only mineral producer in the county.

**Kershaw.**—Whitehead Bros. Co. (Lugoff mine) produced molding sand for industrial uses in the Southeastern States; tonnage and value increased considerably. A description of the mining and processing of sand at the Lugoff operation was published.[9] Kershaw County Sand Co. (Camden mine) produced building sand; output decreased slightly from 1959. Kershaw Granite Co. (Kershaw quarry) quarried dimension granite for use by the monument industry; output decreased slightly from 1959.

**Lancaster.**—Mineral Mining Corp. (Kershaw Strip mine) recovered scrap mica from a mica schist deposit; the material was dry-ground and used in the manufacture of paint, plastics, pipeline enamel, and electrical insulation. Ashe Brick Co. (Van Wyck mine) mined 73,000 tons of miscellaneous clay valued at $64,000, an increase over 1959, for the manufacture of building brick in its own plant. The State highway department produced paving sand for use in the highway program.

**Laurens.**—Laurens County ranked sixth in the State in value of mineral production, moving up from the seventh ranking county in 1959. South Carolina ranked second in the Nation in vermiculite production. Most of the output was produced or processed in the Enoree Area of Laurens. Zonolite Co. (Enoree Area mines) mined and processed crude ore at its Kearney plant near Enoree. The processed crude ore was shipped to Zonolite's exfoliating plant at Travelers Rest and to exfoliating plants in surrounding States. The company published a description of its mining and milling operations in the Enoree Area.[10] Patterson Vermiculite Co. (Laurens County mine) mined crude vermiculite ore adjacent to its exfoliating plant. American Vermiculite Co., of Roan Mountain, Tenn., mined crude vermiculite ore and operated an exfoliating plant in the Enoree Area; material from an adjacent county was also exfoliated at this plant. McCrary Construction Co. (Joana mine) mined paving gravel for highway construction for the first year.

**Lexington.**—For the second consecutive year, Lexington County ranked fifth in the State in value of mineral production. Weston & Brooker Co. (Cayce quarry) crushed granite for use in concrete, roadstone, screenings, railroad ballast, and stone sand; tonnage and value decreased slightly from 1959. Guignard Brick Co. (Columbia mine) mined 94,000 tons of miscellaneous clay valued at $83,000; an increase of 35 percent in quantity and 33 percent in value over 1959. The company used the clay in manufacturing building brick at its own plant. Guignard installed a tunnel kiln and dryer, thus doubling

[9] Work cited in footnote 7.
[10] Work cited in footnote 8.

Digitized by Google

output to 100,000 brick per day. Columbia Silica & Sand Co. (Edmund mine) produced building, paving, blast, fire or furnace, engine, filtration, and fertilizer filler sand; output decreased from 1959. Capitol Sand Co. (Capitol mine) mined paving sand for road-base, surface, and bridges; output decreased from 1959. Foster Bros. Dixiana Sand Co. (Dixiana mine) mined building, blast, engine, filtration, and fertilizer filler sand; output decreased from 1959. Southeastern Sand Co. (Cayce mine) produced 46,000 tons of building sand and closed the operation in November. The State highway department mined paving sand for use in its highway program; 1,265 tons was mined compared with 18,500 tons in 1959.

**Marion.**—J. D. Murchison (Pee Dee mine) produced miscellaneous clay for use in manufacturing building brick; output decreased 16 percent in quantity and 18 percent in value. Sandy Bluff Sand Co. (Snipes mine) mined building sand; tonnage and value decreased considerably from 1959.

**Marlboro.**—Marlboro County, for the second consecutive year, was the first ranking county in sand and gravel and tenth in value of total mineral production. Becker County Sand & Gravel Co. (Marlboro mine), the leading producer of sand and gravel in the State, mined building sand; gravel for building, chemical, or metallurgical uses, and railroad ballast. Sand output increased 117 percent and gravel output decreased 7 percent from 1959. Lawrence Stone & Gravel Co. (Blenheim mine) mined building sand; output decreased from 1959. Palmetto Brick Co. (Irby mine) mined 50,000 tons of miscellaneous clay valued at $44,000 for use in manufacturing building brick at its own plant. Cheraw Brick Works (Cheraw mine) mined 54,000 tons of miscellaneous clay valued at $54,000, for use in manufacturing building brick at its own plant.

**Newberry.**—Clement Bros. (Pomaria quarry) of Hickory, N.C., crushed granite for use in the Interstate highway program; output was 50,000 tons valued at $63,000, a drastic drop from 1959. This quarry was opened to supply a nearby Interstate road contract; it was anticipated that when contract demands had been met, the quarry would be closed. Clement Bros. was the only company in the county reporting mineral production.

**Oconee.**—The State highway department produced 8,124 tons of paving sand valued at $2,681 for use in its highway program.

**Orangeburg.**—J. F. Cleckley & Co. (Orangeburg mine) reported production of paving sand for the first year from this county. All of the sand was transported by truck.

**Pickens.**—Pickens County ranked eighth in the State in value of mineral production and second in crushed granite output. Campbell Limestone Co. (Beverly quarry) largest crushed granite producer in the State, crushed granite for use in concrete, roadstone, screenings, and riprap; output increased 23 percent in quantity and 19 percent in value over 1959. Campbell was the only mineral producer in the county.

**Richland.**—Richland County ranked fourth in the State in value of mineral production, moving up from sixth in 1959. The county ranked second in refractory kaolin and miscellaneous clay production.

Digitized by Google

Refractory kaolin output increased 18 percent in quantity and 14 percent in value over 1959. Carolina Ceramics Co. (Pontiac mine), R. M. Stork Fire Brick Works (Stork mine), Eastern Brick & Tile Co. (601 mine), and Columbia Pipe Co. (Ridgewood mine) produced refractory kaolin for use in the manufacture of firebrick and block, mortar, and other refractories. Eastern Brick & Tile reported from the 601 mine for the first year. Columbia Brick & Tile Co. (Columbia mine) produced 149,000 tons of miscellaneous clay valued at $131,000; output increased 66 percent in quantity and 64 percent in value over 1959. Palmetto Quarries Co. (Columbia quarry) crushed granite for use in concrete, roadstone, screenings, railroad ballast, and stone sand; output increased 1 percent in quantity and 4 percent in value over 1959. Harrison Sand Corp. (Harrison mine) produced building, engine, and fertilizer filler sand; output increased over 1959. Strickland Sand Pit (Columbia mine) produced building and fill sand; output increased 33 percent in quantity and 67 percent in value over 1959.

**Spartanburg.**—For the fourth consecutive year, Spartanburg County ranked third in value of mineral production; the county led the State in crushed granite output for the second consecutive year. Campbell Limestone Co., the leading producer of crushed granite in the State, crushed granite at its Pacolet and Pelham quarries; the Fair Forest quarry, operated in 1959, was closed. Output of the two quarries decreased from 1959. Clement Bros. Construction Co. Inc. (Westview quarry), of Hickory, N.C., crushed granite for highway construction, reporting for the first year. Green Construction Co., Spartanburg, closed the Inman quarry, which operated during 1959, and opened the Woodruff quarry. The company reported substantial output from the new operation; the material was used to supply an Interstate highway contract in the area. Zonolite Co. operated an exfoliating plant at Travelers Rest, using vermiculite ore from the nearby Enoree Area. American Vermiculite Co. (Propst mine) of Roan Mountain, Tenn., mined crude vermiculite and transported the material by truck to its own exfoliating plant in the Enoree Area. Paco Products Co., in operation for its second year, produced quartz, crude feldspar, and ground feldspar from granite screenings produced at the Campbell Limestone Co. Pacolet quarry; the material was shipped out-of-State and used primarily by the glass industry. O. M. Gardner (Dove mine) produced a small amount of sheet mica. The State highway department mined 2,238 tons of paving sand, valued at $1,119 for use in its highway program.

**Sumter.**—Sumter County was the third largest sand and gravel producing county in the State, dropping from second in 1959. Becker County Sand & Gravel Co. (Camden mine), the largest sand and gravel producer in the State, was the only mineral producer in the county; output decreased 10 percent in quantity and 11 percent in value below 1959. The new brick and tile plant of Eastern Brick & Tile Co., near Sumter, was completed; the plant was equipped to produce 70,000 to 100,000 brick per day. The plant, representing a $1 million investment, was built, basically, to produce glazed structural tile, but was manufacturing building brick.

Digitized by Google

**Union.**—The State highway department mined paving sand for use in its highway program and was the only mineral producer in the county.

**York.**—Commercialores, Inc. (Henry Knob mine), the only producer of kyanite in the State, mined kyanite ore and produced kyanite concentrate for use in firebrick and tile; tonnage increased 11 percent and value 8 percent over 1959. The company, for the first year, also recovered pyrite as a byproduct from its milling of kyanite ore. The State highway department mined paving sand for use in its highway program; output decreased from 1959.

# The Mineral Industry of South Dakota

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the South Dakota State Geological Survey.**

By D. H. Mullen [1] and Allen F. Agnew [2]

MINERAL production in South Dakota in 1960 was valued at $46.8 million, a 4-percent decline from the record high of $48.5 million reached in 1959. The drop in total value resulted from lower production and value of some commodities, both metal and nonmetal, that represented major portions of the State's mineral output. Declines were noted in the value of gold, silver, uranium, clays, and sand and gravel, all of which were produced in substantial quantities. There were moderate to substantial gains in other commodities such as beryllium concentrate, cement, feldspar, gypsum, scrap mica, and stone, but these advances were not sufficient to offset the losses in those commodities that were produced in greater quantity.

The total value of the mineral fuels—coal (lignite) and petroleum—more than doubled over 1959. The value of the lignite declined, but represented only a small part of the State total.

Northern States Power Co. began building the Pathfinder nuclear powerplant near Sioux Falls early in the year, and by the end of December it was 42 percent complete. The 62,000-kw. reactor was designed to provide test and operating data on an integral boiling-superheating core with a superheater centrally located within the reactor core. The reactor was scheduled to go critical in June 1962.

Black Hills Power & Light Co. completed a 22,000-kw., $5.5 million, steam-electric generating plant at Rapid City. The plant was designed to burn ¼-inch coal in a cyclone furnace and discharge a liquid slag at 2,800° F.

**Employment and Injuries.**—Employment and injuries data in the mineral industry, excluding petroleum, collected by the Bureau of Mines on its annual canvass, are shown on table 2.

**Government Programs.**—Hand-cobbed mica and beryllium concentrate (beryl) were purchased by the Federal Government through the General Services Administration (GSA) purchase depot at Custer. Hand-cobbed mica was processed at the station by a contractor for GSA, and the recovered strategic sheet mica, as well as the beryllium concentrate purchased, was shipped to stockpiles of strategic and defense minerals.

[1] Excludes petroleum industry.
[2] Preliminary figures.
[3] Source: Federal Bureau of Mines data.
[4] Includes beryl.

The Office of Mineral Exploration (OME) approved one contract for the exploration of a deposit for beryl and columbium-tantalum in Custer County.

The Federal Bureau of Mines continued to investigate the recovery of beryllium from low-grade products obtained by beneficiating material from South Dakota pegmatite deposits. The investigations were primarily in the field of solvent extraction after leaching.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Cement.**—Portland and masonry cement shipments from the State-owned plant at Rapid City increased 6 percent in quantity and 11 percent in value over those of 1959. The average price of portland cement in 1960 was $3.14 a barrel compared with $3.01 in 1959; the price of masonry cement increased to $3.89 a barrel from $3.76.

**Clays.**—Production of bentonite was 48 percent below that of 1959 as known mineable deposits in the State approached exhaustion. Processing plants obtained crude material in greater amounts from deposits in Wyoming. The quantity of miscellaneous clay produced in Butte County for the manufacture of building brick, sewer tile, and heavy clay products and in Pennington County for the manufacture of cement and lightweight aggregates declined 11 percent below that of 1959.

**Feldspar.**—Feldspar production from 64 mines in Custer County and 8 in Pennington County was 48 percent greater than in 1959. Except for one operation, all feldspar was sold to International Minerals & Chemical Corp. (IMC) for grinding at its plant at Custer. The ground product was shipped to consumers throughout the United States, Canada, and Mexico for the manufacture of glass, pottery, enamel, porcelain, and other uses.

**Gem Stones.**—Gem stones and mineral specimens were collected in Custer, Fall River, Lawrence, and Pennington Counties. Most were sold to tourists as souvenirs. Better quality specimens of agate and onyx, and gem varieties of beryl and similar gem minerals were polished by processors.

Digitized by Google

**Gypsum.**—Gypsum for use as a retarder in portland cement was mined by the South Dakota State Cement Commission from deposits in Pennington County. Production was 16 percent above that of 1959.

**Lime.**—High-calcium limestone for manufacturing quicklime at a plant near Pringle was mined from deposits in Custer County. The entire output of lime was used within the State for metallurgical purposes.

**Lithium.**—Spodumene was produced at the Etta mine, and lepidolite and amblygonite were produced at The Bob Ingersoll mine, both near Keystone, and spodumene was produced at the Hunter-Louise mine on the county line between Custer and Pennington Counties. A portion of the amblygonite produced was shipped to Germany.

**Mica.**—Hand-cobbed mica produced from 28 mines in Custer County and 8 mines in Pennington County was 20 percent below that of 1959. Although the quantity mined in 1960 was less than in 1959, the quality and grade of recovered sheet mica was higher; consequently, the total value declined only 8 percent. The entire output was sold to GSA at Custer, where it was processed by a private contractor for the Government. Scrap mica was produced at two mines, one each in Custer and Pennington Counties. The quantity mined was 30 percent greater, and the value was double that of 1959. All scrap mica produced was sold to grinders in Illinois and Minnesota.

**TABLE 3.—Production of hand-cobbed mica and yield of sheet mica**

| Year | Hand-cobbed mica | Total block mica recovered | | Stained quality recovered | | Good-stained and better quality recovered | |
|---|---|---|---|---|---|---|---|
| | Pounds | Pounds | Percent of hand cobbed | Pounds | Percent of total block | Pounds | Percent of total block |
| 1956 | 210,802 | 12,238 | 5.64 | 7,429 | 60.63 | 253 | 2.07 |
| 1957 | 149,163 | 9,048 | 6.07 | 4,828 | 53.36 | 255 | 2.82 |
| 1958 | 257,198 | 16,681 | 6.49 | 9,552 | 57.26 | 471 | 2.82 |
| 1959 | 365,712 | 38,734 | 10.59 | 20,079 | 51.84 | 601 | 1.55 |
| 1960 | 286,043 | 30,887 | 10.80 | 18,662 | 60.42 | 461 | 1.49 |

**Sand and Gravel.**—The reported production of sand and gravel was 24 percent below that of 1959. State, county, and municipal governments engaged in road construction report production upon completion of construction contracts, and a decline in reported production does not necessarily indicate a decline in activity. Production was reported in 61 of the State's 67 counties; at 84 commercial operations in 35 counties; and at 101 Government-and-contractor operations in 56 counties.

Of the total sand and gravel output, 88 percent was used for paving and roadbuilding, most of which (66 percent) was produced by contractors for governmental agencies. The quantity of sand and gravel that was washed, sized, or otherwise prepared continued to increase; of the total produced in 1960, 75 percent was processed. The value per ton ranged from $0.439 for unwashed gravel produced by contractors to $1.012 per ton for washed material produced by commercial operators.

| Short tons | 1,274 | 1,631 | 1,011 | 177 | 220 |
| Value | $98,277 | $88,649 | $92,123 | $162,743 | $154,902 |

[1] Sold to the Government through GSA.

Construction of the National System of Interstate and Defense Highways and Federal-aid projects continued at a high rate. During 1960 the Bureau of Public Roads changed its method of reporting progress, and strictly comparable data for 1959 and 1960 were not available. A report[3] of progress on the program showed that between July 1, 1956, and the end of 1960, 59.3 miles of the Interstate System had been completed to full standards, and 56.5 miles had been completed to standards adequate for current traffic. This represented a total of 115.8 miles open to traffic. At the end of the year, 93.7 miles were under construction, and engineering studies and right-of-way acquisition had begun on 185.7 miles. The total designated mileage of the System in South Dakota was 677.6 miles, leaving 282.4 miles yet to be planned and constructed. Under the Federal-aid (ABC) program, 1,138 miles were completed in 1960, and at the end of the year 445.5 miles were under construction.

Production of sand and gravel in excess of 500,000 tons was recorded in six counties: Brown (1,092,400), Brookings (658,500), Minnehaha (613,800), Day (599,400), Clark (574,400), and Lincoln (516,700). Leading commercial producers included Mannerud Construction Co., Hallett Construction Co., See Nel Construction Co., and Concrete Materials Co.

**Stone.**—Dimension granite was produced at 11 quarries in Grant County for architectural and monumental use. Of the total output, 62 percent was finished at plants at Cold Spring, Delano, Saint Cloud, and Sauk Centre, Minn. Crushed limestone, of which 61 percent was used in road construction and as a concrete aggregate, was produced in four counties. A substantial quantity was mined in Pennington County for the manufacture of cement. Other uses of limestone included riprap, railroad ballast, the manufacture of quicklime, and

| Building | 309 | 349 | 132 | 128 |
| Paving | 11,550 | 6,460 | 9,595 | 6,350 |
| Total gravel | 11,949 | 6,809 | 9,727 | 6,488 |
| Total sand and gravel | 12,394 | 7,109 | 10,249 | 6,832 |
| All operations: | | | | |
| Sand | 1,388 | 1,228 | 1,393 | 1,355 |
| Gravel | 16,387 | 9,830 | 12,155 | 8,004 |
| Grand total | 17,775 | 11,058 | 13,548 | 9,359 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other."
[2] Less than 1,000 short tons

sugar refining. Crushed sandstone from quarries in Hanson and Minnehaha Counties was used for road construction, as a refractory stone, in foundries, for filters, for railroad ballast, and in the manufacture of ferrosilicon. Crushed miscellaneous stone, used entirely for road construction, was produced by commercial operators in 2 counties and by contractors in 47 counties. Total stone production in 1960 was 16 percent greater than in 1959.

## METALS

**Beryllium.**—Beryllium concentrate (beryl) production from 71 mines in Custer and Pennington Counties was 7 percent above that of 1959. The greater portion (71 percent) was from Pennington County. The major output was sold to the GSA purchase depot

Digitized by Google

at Custer for the national stockpile and the remainder to Gladys Wells of Custer for resale to consumers. Production from individual mines ranged from a few pounds to 35 tons.

**Copper.**—Copper ore was shipped from a dump at the Maloney Blue Lead mine in Pennington County. The ore also contained an ounce of gold and a small quantity of silver. This was the first recorded production of copper in the State since 1944 when copper was recovered from a lead concentrate produced from claims operated by the Belle Eldridge Gold Mines, Inc., in Lawrence County.

**Gold and Silver.**—Production of gold and silver declined 4 and 13 percent, respectively, below that of 1959. Virtually all production was from the Homestake mine at Lead in Lawrence County. Although more ore was mined and milled than in 1959, the grade was slightly lower.

**TABLE 6.—Mine production of gold, silver, copper, lead, and zinc, in terms of recoverable metals [1]**

| Year | Mines producing | | Material sold or treated [2] (thousand short tons) | Gold (lode and placer) | | Silver (lode and placer) | | Total value (thousands) |
|---|---|---|---|---|---|---|---|---|
| | Lode | Placer | | Troy ounces | Value (thousands) | Troy ounces (thousands) | Value (thousands) | |
| 1951–55 (average) | 4 | 1 | 1,447 | 509,386 | $17,829 | 143 | $130 | [3] $17,963 |
| 1956 | 2 | -- | 1,743 | 568,523 | 19,898 | 136 | 123 | 20,021 |
| 1957 | 2 | -- | 1,779 | 568,130 | 19,885 | 135 | 122 | 20,007 |
| 1958 | 3 | -- | 1,824 | 570,830 | 19,979 | 153 | 138 | 20,117 |
| 1959 | 2 | -- | 1,778 | 577,730 | 20,221 | 124 | 113 | 20,334 |
| 1960 | 2 | -- | 1,767 | 554,771 | 19,417 | 108 | 98 | [4] 19,515 |
| 1876–1960 | -- | -- | [5] | 28,250,907 | 770,379 | 11,518 | 8,557 | [6] 779,101 |

[1] Includes recoverable metal content of gravel washed (placer operations), ore milled, old tailings or slimes retreated, and ore or old tailings shipped directly to smelters during the calendar year indicated.
[2] Does not include gravel washed.
[3] Includes 14 short tons of lead valued at $3,956.
[4] Includes 1 ton of copper valued at $642.
[5] Data not available.
[6] Includes 107 short tons of copper valued at $37,108, 497 tons of lead valued at $71,752, and 265 tons of zinc valued at $56,406.

**Iron Ore.**—Iron ore was mined from the Iron Hill mine in Pennington County for use as an additive in the manufacture of cement.

**Uranium.**—Production of uranium ore was 10 percent below that of 1959; however, the number of operations increased from 36 to 48. The greatest production continued to be from Fall River County; Custer County ranked second. A small quantity of uranium ore was mined from the Fort Union formation in Harding County. The entire output was processed at the Edgemont plant operated by Mines Development, Inc. The average grade of the ore mined was 0.19 percent (3.8 pounds per ton) uranium oxide.

**Vanadium.**—During 1960 a vanadium-recovery circuit was added to the Edgemont uranium mill. The quantity of contained vanadium in the uranium ores from South Dakota and Wyoming was relatively small but was sufficient to warrant recovery. The unit began operating in November.

Digitized by Google

## MINERAL FUELS

**Coal (Lignite).**—Production of coal (lignite) was 9 percent below that of 1959. The entire output came from the Dewey County Coal Co. operation of a strip mine on the Hellcreek seam. Other mines, producing less than 1,000 tons during the year, were operated in Dewey, Corson, and Perkins Counties.

**Petroleum.**—Petroleum production was 281,000 barrels, an increase of 86 percent over 1959 all from the Buffalo field in Harding County. The State geologist reported that 19 wells in the Harding field were producing at the close of the year. Thirteen wells, eight exploratory and five development, were completed during the year; three were producers.

## REVIEW BY COUNTIES

**Butte.**—American Colloid Co. produced bentonite and operated its processing plant at Belle Fourche. The processed product was used in rotary drilling mud, in foundries and steel plants, for filters, and in other miscellaneous products. Eastern Clay Products Department, International Minerals & Chemical Corp. (IMC), operated a bentonite mill at Belle Fourche and processed crude material from deposits in Wyoming. Miscellaneous clay for the manufacture of building brick, draintile, and other clay products was produced by Black Hills Clay Products Co.

Crushed stone and sand and gravel for road construction and repairs were produced by contractors for the State department of highways and the Butte County Highway Department. The county ranked fifth in the value of mineral production.

**Custer.**—Beryllium concentrate (beryl), feldspar, and hand-cobbed and scrap mica from numerous pegmatite deposits represented 67 percent of the value of all minerals produced in the county. Beryl was recovered from 41 mines, feldspar from 64, and mica from 29. Major producers of beryl were Double R Mines at the Smith Dike, Bland Mining & Milling Co. at 5 mines, and J. D. Long at 12 mines.

IMC was the leading producer of feldspar and operated the Shamrock and White Elephant mines. Abingdon Potteries, Inc., produced feldspar at its mines and shipped the crude material to its grinding plant at Abingdon, Ill. All other feldspar produced was sold to IMC for grinding at its plant at Custer. Scrap mica was produced at the Old Mike mine. Hand-cobbed mica was sold to the GSA purchase depot at Custer. Major producers included York Minerals, at six mines; Merical Exploration Co., at the Red Fawn; Homestead Mining Co., at the GC Dike; and Marvin Kenoyer, at the Lillian Fraction.

High-calcium limestone was mined for manufacturing quicklime at a plant near Pringle. Crushed stone and sand and gravel were produced by contractors for the State department of highways for road construction. Gem stones and mineral specimens were produced and collected by Allen's Minerals and Mining, Scott's Rose Quartz Co., and others for sale to tourists as souvenirs. Uranium ore was produced at the Lucky Bud Nos. 1 and 2 mines by Bettenhausen & Wheeler, Susquehanna Western, Inc., and Triangle Enterprises, Inc., and processed at the uranium mill at Edgemont.

| Undistributed [4] | [3] 1,215,280 | 118,454 | |
| Total [5] | [3] 48,553,000 | 46,780,000 | |

[1] Value of petroleum is preliminary.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Revised figure.
[4] Includes production of lithium minerals, vanadium (1960), some sand and gravel and gem stones that cannot be assigned to specific counties and values indicated by footnote 2.
[5] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.

Digitized by Google

The Office of Mineral Exploration (OME) approved a contract with Lithium Corp. of America, Inc., for exploration of the Black Diamond pegmatite deposit for beryl and columbite-tantalite by drilling. Total amount of the contract was $26,640, with Government participation limited to 50 percent.

**Fall River.**—Three-fourths of all uranium ore produced in the State came from 43 operations in Fall River County. Major producers included Walter L. McKenna, at five operations; Black Hills Uranium Co., at nine; and Chord Uranium Co., at seven. The entire production was processed at the Mines Development, Inc., mill at Edgemont. Improvements were made at the mill, and a circuit was added to recover vanadium oxide contained in uranium ores from South Dakota and Wyoming. Seventy-five percent of the ore processed at the mill was from Wyoming deposits.

Crushed stone and sand and gravel were produced for road construction by contractors for the State department of highways. Building and paving sand and gravel was produced at five locations. Leading producers were Oral Sand Co., Rounds Construction Co., and Flyte Rock Products Co.

**Grant.**—Mahogany-brown and deep-red granites of Grant County were produced at 11 quarries near Milbank and Big Stone City by 7 companies. One-half of the stone quarried was finished at plants in Minnesota. The color and texture of the granite makes it particularly desirable for building facings, interior decoration, and monuments; the finished stone was widely marketed.

**Harding.**—Petroleum production, entirely from wells in the Buffalo field in Harding County, was 86 percent greater than in 1959. At yearend 19 wells from the Red River formation were producing. According to data from the State geologist, 13 wells (8 exploratory, 5 development) were completed during the year; 3 were producing. Drilling totaled 87,878 feet. Sand and gravel was produced by contractors for the State department of highways for road construction. Uranium ore was produced at the Lonesome Pete claims and shipped to the processing plant at Edgemont.

**Lawrence.**—Homestake Mining Co. operated the Homestake mine and 4,800-ton-per-day amalgamation-cyanidation plant at Lead and continued to be the Nation's leading gold producer. The quantity of ore mined and milled was nearly 1.77 million tons, the highest in 83 years of operation. However, the recoverable value of gold and silver in the ore was only $11.02 a ton, a decrease of $0.50 from 1959, and the total value of bullion recovered was 4 percent below that of the previous year. The percentage recovery was 97.21 percent, the same as in 1959. Productivity increased from 3.41 tons per man shift in 1959 to 3.58 tons in 1960. No new blocks were added to the ore reserve; however, 92 percent of the ore mined in 1960 was offset by production from specific blocks in excess of the amounts previously estimated, and further development above the 5,000 level removed the discount formerly applied to reserves that had not been sufficiently delineated. Development between the 5,000 and 6,200 levels continued. The ore-bearing structures revealed, although smaller and less continuous, were comparable in grade and mineralogy to the ore bodies above the 5,000 level. Reserves below the 5,000 level were not to be

Digitized by Google

estimated until continuity between widely spaced exposures and more definite data concerning the grade were determined, according to the company. On the basis of available information, it appeared that a reserve of at least 2.5 million tons below the 5,000 level eventually would be established. The program was continued to provide adequate ventilation and to control high rock temperatures below the 4,800 level. Stripping of the Oro Hondo shaft began and was expected to be completed by mid-1961. This would complete the ventilation program and permit extensive development of the deep block at a greater rate. Plans were developed to mine ore in the deep block concurrently with the ore above the 5,000 level. A program to mine and mill 800 tons per day from the deep levels was begun. It would require skip hoisting below the 4,850 level, the addition of another grinding unit, and other minor changes in the mill. This program was to increase daily milling capacity to 5,600 tons.

TABLE 8.—Homestake mine ore milled, receipts, and dividends[1]

| Year | Ore milled (thousand short tons) | Receipts for bullion product | | Dividends (thousands) |
|---|---|---|---|---|
| | | Total (thousands) | Per ton | |
| 1956 | 1,628 | $19,354 | $11.89 | $4,019 |
| 1957 | 1,660 | 19,479 | 11.74 | 4,019 |
| 1958 | 1,725 | 19,611 | 11.37 | 4,019 |
| 1959 | 1,746 | 20,120 | 11.52 | 4,019 |
| 1960 | 1,767 | 19,465 | 11.02 | 4,021 |

[1] From 1876 to 1960, inclusive, this mine yielded bullion and concentrates that brought a net return of of $698.0 million and paid $210.9 million in dividends.

Cole Construction Co. produced crushed limestone for road construction and railroad ballast, and for use in sugar refining. Crushed miscellaneous stone and sand and gravel were produced for road construction by contractors for the State department of highways, and the Lawrence County Highway Department produced sand and gravel for road repairs.

**Pennington.**—The county ranked second in the value of mineral production, and its mines, quarries, and mills produced a variety of minerals and mineral products. Beryllium concentrate (beryl) was produced at 30 mines. Major production was from the Peerless lode operated by Thomas M. Edson, Peerless Minerals, Inc., and Bland Mining & Milling Co.; the Hugo lode operated by Walter Hough; the Sackett Fraction lode operated by C. L. Myler; the White Cap operated by McCarty-Pullen Mines, Bland Mining & Milling Co., Northwest Defense Minerals, and C. O. Patterson; and the Ingersoll operated by Bland Mining & Milling Co. Northwest Defense Minerals installed new equipment in the Holy Terror mill at Keystone (previously operated as a cyanide mill for gold and silver ores and for the recovery of spodumene concentrate) for the recovery of beryl concentrate. Crude ore was to come from the dump at the White Cap pegmatite mine. The daily capacity of the mill was to be 100 tons, and the beryl was to be recovered by a flotation process developed at the Federal Bureau of Mines Research Laboratory at Rapid City.

Digitized by Google

Trial runs were made, but no production was reported. Hand-cobbed mica was recovered at eight mines and sold to GSA at Custer for processing. Principal producers were McCarty-Pullen Mines at the White Cap and R. W. Meiners at the Cobb. Scrap mica was produced at the Peerless lode by Thomas M. Edson. Crude feldspar was produced at eight mines and sold to IMC for grinding at its plant at Custer. Principal producers were Walter Hough at the Hugo and High Climb mines, McCarty-Pullen Mines at the White Cap, and Alfred V. Hazeltine at the Hesnard lode. The Etta mine near Keystone, operated by Maywood Chemical Co., was closed early in the year after being operated almost continuously since 1898. Unconfirmed reports indicated the mine had been sold to Clifford and Corde, operators of pegmatite mines in Custer and Pennington Counties. A shipment of copper ore was made from dump material at the Maloney Blue Lead mine. This was the first recorded production of copper in South Dakota since 1944.

Shipments of portland and masonry cements from the State-owned cement plant at Rapid City operated by the South Dakota State Cement Commission were 6 percent above those of 1959. The Commission produced the limestone, shale, gypsum, and sand used by the plant at deposits near Rapid City. Iron ore, also used at the plant as an additive, was produced by a contractor at the Iron Hill mine near Nemo. Bentonite clay was obtained from a bentonite processing mill at Belle Fourche. Cement clinker was used as a base in the manufacture of masonry cement. Shipments were made to consumers in South Dakota, North Dakota, Wyoming, Montana, Nebraska, Minnesota, Iowa, and Colorado. Miscellaneous clay, in addition to that used for cement, was produced from deposits near Rapid City for the manufacture of lightweight aggregate. Gem stones and mineral specimens were produced and collected by Scott's Rose Quartz Co., Allen's Minerals and Mining, and individuals, largely for sale to tourists as souvenirs. The better qualities of agate and gem varieties of beryl and similar minerals were polished.

Sand and gravel and crushed miscellaneous stone were produced by contractors for the State department of highways and for the Pennington County Highway Department for road construction and repairs. Building and paving sand and gravel was produced by four operators. Molding sand and oil sand (hydrafrac) was produced by the Black Hills Silica Sand Corp. Crushed limestone for riprap, road construction, concrete aggregate, and railroad ballast was produced by Hills Materials Co., L. G. Everist, Inc., Pete Lien & Sons, and The South Dakota Cement Plant. A general improvement program extending for 7 years was completed at the quarry and preparation plant of Pete Lien & Sons. The program consisted of a modern crushing, screening, and preparation plant in addition to replacement of the quarry equipment. The plant produced a complete range of sized- and blended-rock products for concrete aggregate, ready-mixed concrete, and base courses for highways and military construction. Because the production rate of 250 tons per hour was below design capacity, and shipments could be made at the rate of 500 tons per hour, plans were made to increase capacity of the plant to 500 tons per hour.

# The Mineral Industry of Tennessee

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Tennessee Division of Geology.**

By Avery H. Reed, Jr.,[1] William D. Hardeman [2] and Mildred E. Rivers [3]

RECORD production of crushed limestone, zinc, phosphate rock, copper, sand and gravel, and scrap mica highlighted the mineral industry of Tennessee in 1960. Tennessee led the Nation in production of ball clay, pyrite, and zinc; ranked second in output of phosphate rock and dimension marble; and third in the production of fuller's earth. The total value of mineral production increased 2 percent over 1959, the previous record year.

**TABLE 1.—Mineral production in Tennessee [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Cement: | | | | |
| Masonry thousand 376-pound barrels | 772 | $2,743 | 729 | $2,606 |
| Portland do | 8,381 | 26,191 | 7,517 | 24,688 |
| Clays thousand short tons | 1,146 | 4,952 | 1,270 | 4,537 |
| Coal do | 5,913 | 23,581 | 5,930 | 21,154 |
| Copper (recoverable content of ores, etc.) short tons | 11,490 | 7,055 | 12,723 | 8,168 |
| Gem stones | (2) | (2) | (2) | 1 |
| Gold (recoverable content of ores, etc.) troy ounces | 99 | 3 | 123 | 4 |
| Iron ore gross weight, long tons | 21,346 | 111 | (4) | (4) |
| Manganese ore (35 percent or more Mn) short tons, gross weight | 7,586 | 589 | 283 | 15 |
| Manganiferous ore (less than 35 percent Mn) short tons, gross weight | 56 | 1 | (4) | (4) |
| Natural gas million cubic feet | 52 | 9 | 63 | 11 |
| Petroleum (crude) thousand 42-gallon barrels | 6 | (4) | [5] 6 | (4) |
| Phosphate rock thousand long tons | 1,755 | 13,255 | 1,939 | 15,424 |
| Sand and gravel thousand short tons | 6,221 | 7,570 | 6,293 | 7,655 |
| Silver (recoverable content of ores, etc.) troy ounces | 59,739 | 54 | 64,560 | 58 |
| Stone thousand short tons | 18,767 | 29,094 | 20,074 | 29,942 |
| Zinc (recoverable content of ores, etc.) short tons | 89,932 | 20,684 | 91,394 | 23,580 |
| Value of items that cannot be disclosed: Barite, lime, scrap mica, pyrite, and values indicated by footnote 4 | | 7,392 | | 7,570 |
| Total Tennessee [6] | | 140,738 | | 143,439 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Weight not recorded.
[3] Less than $1,000.
[4] Figure withheld to avoid disclosing individual company confidential data.
[5] Preliminary figure.
[6] Total adjusted to eliminate duplicating the value of clays and stone.

Digitized by Google

Leading industries were copper and zinc mining, stone quarrying, cement manufacturing, coal mining, and phosphate rock mining and processing, which together furnished 88 percent of the total value of production. Leading companies were Tennessee Copper Co. (gold, silver, copper, pyrite, and zinc), American Zinc Co. of Tennessee (zinc and limestone), New Jersey Zinc Co. (zinc and limestone), Volunteer Portland Cement Co. (cement, limestone, and clay), and Penn-Dixie Cement Corp. (cement, limestone, and clay).

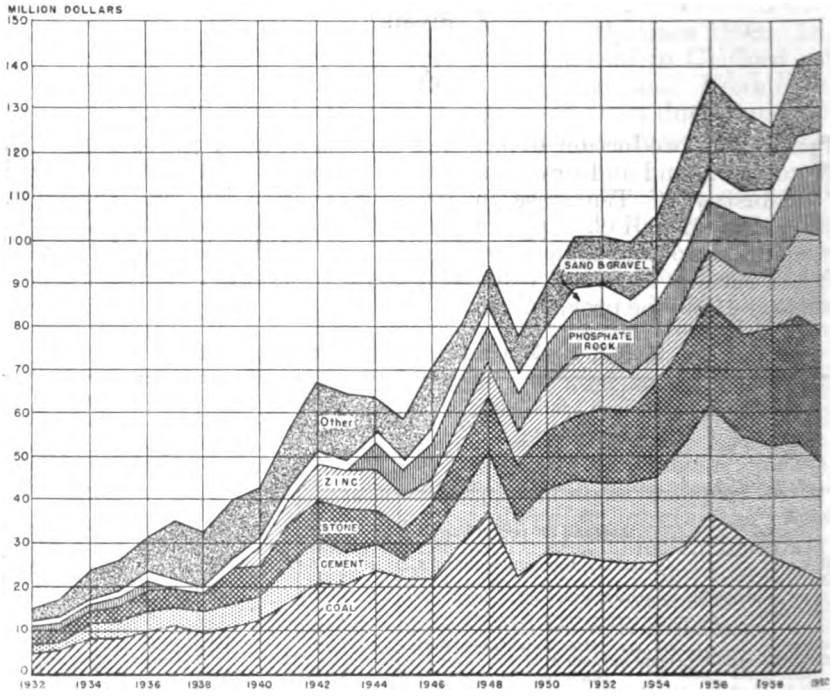

FIGURE 1.—Value of mineral production in Tennessee, 1932–60.

**Employment and Injuries.**—Total employment in the mineral industries decreased 2 percent below 1959. Employment decreased in all industries except metal mining, which increased 4 percent.

Injury experience was about the same. Lower frequency rates were recorded by nonmetal mines. There were 14 fatalities, compared with 25 in 1959 and 23 in 1958. There were no major disasters during the year.

The following were leading causes of injuries in the mineral industries: Handling materials, haulage, machinery, hand tools, and falls of persons. Causes of fatalities were: Falls of roof (8), falls of face (4), explosives (1), and drowning (1).

Tennessee Coal & Iron Division, United States Steel Corp., won the National Safety Competition award for underground metal mines at the Jefferson City mine. Tennessee Copper Co. placed second and fourth in the same contest at the Boyd and Calloway mines.

Digitized by Google

**Trends and Developments.**—Continued expansion of the East Tennessee zinc district was the outstanding development of the year. American Zinc Co. of Tennessee announced a contract with Tri-State

**TABLE 2.—Employment and injuries in the mineral industries**

| Year and industry | Active operations | Men working daily | Average active days | Man-hours worked | Fatal injuries | Nonfatal injuries | Injuries per million man-hours |
|---|---|---|---|---|---|---|---|

Zinc, Inc. (wholly owned subsidiary of the Consolidated Gold Fields of South Africa Ltd., London, England), whereby American Zinc agreed for Tri-State to take over the development and operation of an area near New Market, Tenn., where American had discovered a substantial tonnage of high-grade zinc ore. Tri-State will start sinking shafts at an early date. Before the end of 1961 they expect to finish constructing a concentrating mill with a daily capacity of 3,600 tons. American Zinc will ship part of the ore mined from its Jefferson County mines to this mill until Tri-State has completed enough underground development to supply the new mill capacity.

The Tennessee Valley Authority (TVA) began constructing the new $34-million Melton Hill Dam in Loudon County. The dam, 32d in the TVA system, was expected to be finished by June 1963, and will furnish navigation upstream to Clinton.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Barite.**—Five operators mined crude barite from six mines in four counties for oil-well drilling muds, chemicals, and other uses. The leading producer was Baroid Division of National Lead Co. Production increased 42 percent but was 85 percent below 1941, the record year.

**Cement.**—Four companies produced masonry cement at five plants in five counties; the leading producer was Marquette Cement Manufacturing Co. Shipments decreased 6 percent and were 8 percent below 1955, the record year. Consumption in Tennessee was 58 percent, and shipments were made to North Carolina (20 percent), Georgia (8 percent), South Carolina (7 percent), Alabama (2 percent), Kentucky (2 percent), and other States (3 percent).

Four companies produced portland cement at six plants in six counties. The leading producer was Volunteer Portland Cement Co. Shipments decreased 10 percent below the record of 1959. Raw materials used in cement included cement rock and limestone (86 percent), clay and shale (8 percent), gypsum (3 percent), and other (3 percent). Consumption in Tennessee was 44 percent, and shipments were made to North Carolina (28 percent), Georgia (17 percent), South Carolina (3 percent), Virginia (3 percent), and other States (5 percent).

The end uses of portland cement were as follows: Ready-mixed concrete (56 percent), concrete products (19 percent), highway contractors (11 percent), building material dealers (10 percent), and other (4 percent).

Marquette Cement Manufacturing Co. started a $5-million modernization program at the Nashville plant. The remodeling job was scheduled for completion by the end of 1961.

**Clays.**—Five companies mined ball clay at six mines in Henry and Weakley Counties. Leading producers were H. C. Spinks Clay Co., Inc., and United Clay Mines Corp. Production decreased 7 percent below the 1959 record. Tennessee led the Nation in producing ball clay.

Digitized by Google

In Henry County, Southern Clay Co. Inc., and Tennessee Absorbent Clay Co. mined fuller's earth for absorbent uses. Production declined 29 percent and was 56 percent below the record of 1956. Among the States, Tennessee ranked third in producing fuller's earth.

**TABLE 4.—Ball clay sold or used by producers, by uses**

| Use | 1959 | | | 1960 | | |
|---|---|---|---|---|---|---|
| | Short tons | Value | | Short tons | Value | |
| | | Total | Average per ton | | Total | Average per ton |
| Whiteware, etc. | 207,132 | $2,833,601 | $13.68 | 186,795 | $2,555,302 | $13.68 |
| Floor and wall tile | 56,236 | 775,395 | 13.79 | 48,578 | 665,946 | 13.71 |
| Heavy clay products | 3,456 | 34,560 | 10.00 | (1) | (1) | (1) |
| Art pottery | 180 | 2,376 | 13.20 | | | |
| Other [2] | 36,184 | 517,807 | 14.31 | 47,601 | 627,097 | 13.17 |
| Total | 303,188 | 4,163,739 | 13.73 | 282,974 | 3,848,345 | 13,60 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other."
[2] Includes enameling, firebrick and block, glass refractories, saggers, pins, stilts, and wads, exports, other uses, and uses indicated by footnote 1.

Thirteen companies mined miscellaneous clay at 15 mines in 10 counties for floor and wall tile, heavy clay products, lightweight aggregate, and cement. Leading counties were Knox and Davidson; leading producers were General Shale Products Corp. and W. G. Bush & Co. Inc. Production increased 19 percent but was 7 percent below the record of 1956.

**Feldspar.**—The Feldspar Corp. ground crude feldspar from North Carolina at its Erwin plant.

**Gem Stones.**—In Hawkins County, Willard Pratt collected barite specimens for sale as souvenirs.

**Lime.**—Standard Lime & Cement Co., Williams Lime Mfg. Co., and Victor Chemical Works produced quicklime and hydrated lime at Knoxville and Nashville for building, chemical, and industrial uses. Production decreased 11 percent. Consumption in Tennessee was 35 percent, and shipments were made to North Carolina (36 percent), Kentucky (15 percent), New York (4 percent), Georgia (3 percent), and other States (7 percent).

**Mica.**—International Minerals & Chemical Corp. recovered scrap mica from silt deposits in Davy Crockett Lake. Production increased 16 percent over 1959, the previous record year. Among the States, Tennessee ranked sixth in producing mica.

**Perlite.**—Tennessee Products & Chemical Corp. expanded crude perlite from Western States at the Nashville plant.

**Phosphate Rock.**—Nine companies mined and processed phosphate rock in Maury, Williamson, Giles, Davidson, and Hickman Counties. Leading producers were Monsanto Chemical Co. and Victor Chemical Works. Marketable production increased 10 percent, and was 2 percent above the record of 1958. Tennessee ranked third in the Nation in production of phosphate rock.

Hooker Chemical Corp. broke ground for a $6.4 million expansion of its Columbia, Tenn., phosphates plant. Addition of a third fur-

Digitized by Google

nace to reduce phosphate rock will increase Hooker's phosphorus capacity to 65,000 tons per year. Victor Chemical Works announced that it would construct a new kiln for producing nodulized phosphate rock to augment the two present kilns at its Mount Pleasant, Tenn., plant.

TABLE 5.—Phosphate rock sold or used by producers, by uses

| Use | 1959 | | | 1960 | | |
|---|---|---|---|---|---|---|
| | Long tons | Value | | Long tons | Value | |
| | | Total | Average per ton | | Total | Average per ton |
| Elemental phosphorus | 1,594,112 | $11,747,095 | $7.37 | 1,733,200 | $12,588,388 | $7.64 |
| Ordinary superphosphate [1] | 89,701 | 748,879 | 8.35 | 113,650 | 993,739 | 8.74 |
| Direct application to the soil | 69,600 | 591,636 | 8.50 | 64,157 | 599,736 | 9.35 |
| Other [2] | 21,882 | 178,738 | 8.17 | 16,496 | 137,626 | 8.34 |
| Total | 1,775,295 | 13,266,338 | 7.47 | 1,927,502 | 15,319,489 | 7.95 |

[1] Includes rock for phosphoric acid (wet process).
[2] Includes fertilizer filler, pig-iron blast furnace, and other uses.

**Pyrite.**—Tennessee Copper Co. recovered pyrite concentrate from sulfide ore mined in Polk County. Production was about the same as in 1957, the record year. Tennessee led the Nation in output of pyrite.

**Sand and Gravel.**—Thirty-eight companies mined sand and gravel at 45 mines in 28 counties. Leading counties were Shelby, Benton, and Davidson. Leading producers were Sangravl, Inc., Cumberland River Sand & Gravel Co., and Memphis Stone & Gravel Co., Inc. Production increased 1 percent over the 1959 record; 93 percent was washed. Of the total output, 70 percent was hauled by truck, 18 percent, by rail, and 12 percent, by water.

Construction began near Kingsport for a modern plate-glass plant. The $40 million facility for American-Saint Gobain Corp. will combine the ancient art of plate-glass manufacturing with the latest technological developments in electronic production and quality controls. The company was a major producer of flat glass products. Completion of the plant, which will cover almost 23 acres, was scheduled for 1962.

**Stone.**—Blue Ridge Stone Co. crushed 20,000 tons of granite in Carter County for concrete and roads. Seventy-six operators crushed limestone at 100 quarries in 55 counties. Leading counties were Davidson, Knox, and Hamilton. Leading producers were Lambert Bros. Division of Vulcan Materials Co. (Blount, Claiborne, Davidson, Hawkins, Humphreys, Knox, Roane, Sevier, Sullivan, and Williamson Counties), and Chattanooga Rock Products Division of Vulcan Materials Co. (Hamilton and Marion Counties). Production was 7 percent more than the 1959 record. Of the total production, 92 percent was hauled by truck and 8 percent, by rail.

John J. Craig Co., Appalachian Marble Co., and Knoxville Crushed Stone Co. crushed marble for terrazzo and other uses. Production decreased 9 percent and was 55 percent below the record of 1948. John J. Craig Co. (Hamil, Marmor, Crisp, and Lee quarries), Tennessee Marble Co. (Endsley, Eagle, and Luttrell No. 3 quarries), Gray Knox

Digitized by Google

Marble Co. (French Pink, Brown, and Gray Knox quarries), and Appalachian Marble Co. (Bond and Appalachian quarries) quarried dimension marble in Blount, Knox, and Union Counties. Production

decreased 25 percent and was 33 percent below the 1957 record. Tennessee ranked second in production of dimension marble. During the year, Vermont Marble Co. purchased Gray Knox Marble Co.

White Silica Sand Co., and Major Sand Co., Inc., crushed 76,000 tons of sandstone for roadstone. Eleven companies quarried dimension sandstone at 11 quarries in Cumberland and Fentress Counties

for rough architectural, sawed, and dressed building stone and for flagging. Leading producers were Tennessee Stone Co., Inc., and Crab Orchard Stone Co., Inc. Production decreased 1 percent and was 31 percent below the record of 1955.

**Vermiculite.**—Zonolite Co. exfoliated vermiculite from other States at its Nashville plant.

## MINERAL FUELS

**Coal.**—Bituminous coal was mined at 415 mines in 17 counties, compared with 480 mines in 17 counties in 1959. Leading counties were Anderson, Marion, and Campbell. Leading producers were Clinchfield Coal Co. (Meadow Creek mine), Pocahontas Fuel Co. (Morco mine), and Windrock Coal & Coke Co. (Dean mine). Production was about the same as in 1959 and was 33 percent below the 1956 record. Average production per mine increased from 12,300 to 14,300 tons.

Digitized by Google

In the northern part of the State (District 8), 267 mines in 9 counties produced 4,235,000 tons of coal, compared with 3,491,000 tons produced by 292 mines in 9 counties in 1959. Average production per mine increased from 12,000 to 15,900 tons. Underground mines produced 63 percent of the total; strip mines, 33 percent; and auger mines, 4 percent. Shipments were 61 percent by rail or water and 39 percent by truck. Captive tonnage was 3 percent of the total.

Equipment used at 196 underground mines included 114 cutting machines that cut 85 percent of the total, 156 power drills that drilled 84 percent, 81 locomotives, 39 shuttle cars, 9 rope hoists, 9 mother conveyors, 22 mobile loading machines that loaded 54 percent, 2 continuous-mining machines that loaded 14 percent, and 38 face conveyors that loaded 6 percent. Equipment used at 60 strip mines included 82 power shovels, 2 draglines, 63 bulldozers, 24 power drills, and 186 trucks. Equipment used at 11 auger mines included 11 coal-recovery augers, 2 bulldozers, 2 power drills, and 14 trucks. Nineteen percent of the coal was crushed.

In the southern part of the State (District 13), 148 mines in 8 counties produced 1,695,000 tons, compared with 2,422,000 tons produced by 188 mines in 8 counties in 1959. Average production per mine decreased from 12,900 to 11,500 tons. Underground and auger mines produced 79 percent of the total, and strip mines produced 21 percent. Shipments were 67 percent by rail or water and 33 percent by truck. The coal was sold in open market, mainly to TVA. Production in District 13 decreased partly owing to closing of the Coal Valley mine in Marion County by Tennessee Consolidated Coal Co.

Equipment used at 136 underground mines included 91 cutting machines, that cut 81 percent of the total, 146 power drills that drilled 86 percent, 30 locomotives, 9 shuttle cars, 1 rope hoist, 12 mother conveyors, 15 mobile loading machines that loaded 15 percent, and 14 conveyors that loaded 18 percent. Equipment used at 11 strip mines

**TABLE 11.—Coal production, by counties**

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |

included 16 power shovels, 2 draglines, 14 bulldozers, 7 power drills, and 22 trucks. Equipment used at 1 auger mine included 1 coal-recovery auger and 5 trucks. Of the total tonnage, 13 percent was crushed.

**Coke.**—Tennessee Products & Chemical Corp. produced metallurgical coke at byproduct coke ovens in Chattanooga. Peabody-Wright Corp. planned to build a chemical coke plant at Columbia, Tenn. Most of the products were to be used by existing chemical companies in Columbia. The plant was to be adjacent to the Hooker Chemical Co. operations, and Hooker would be one of the purchasers of the chemical coke, for use in producing elemental phosphorus. Coal tar and other byproducts may be shipped to other parts of the United States. The plant was scheduled for operation in early 1961.

**Natural Gas.**—Marketed production of natural gas increased 21 percent. At the end of the year there were 30 producing gas wells. Cumulative production of natural gas since 1916 was 3,289 million cubic feet.

**Petroleum.**—Production of crude petroleum was the same as in 1959. At yearend there were 27 producing oil wells. Cumulative production since 1916 was 615,000 barrels valued at $1,029,000.

## METALS

**Copper.**—Tennessee Copper Co. recovered copper concentrate from sulfide ore mined in Polk County. Production of recoverable copper increased 11 percent above the 1959 record. The company continued sinking the Cherokee shaft, which will connect with a haulage drift from the Central shaft on the 10th level.

**Ferroalloys.**—Shipments of ferromanganese, silicomanganese, ferrosilicon, ferrochromium, ferrochromic silicon, and ferrophosphorus totaled 83,000 tons valued at $10,861,000, compared with 135,700 tons valued at $23,519,000 in 1959.

**Gold.**—Tennessee Copper Co. recovered gold as a byproduct from smelting copper and zinc concentrates. Production increased 24 percent but was 82 percent below the record of 1930.

**Iron Ore.**—Rucker Mining Co. and Big Flag Springs Mining Co. mined brown iron ore in McMinn and Blount Counties. Walt Mining Co. mined red iron ore in Union County. Production of iron ore increased 61 percent but was 96 percent below the record of 1902.

**Manganese Ore.**—Virginia Iron, Coal & Coke Co. mined a small quantity of metallurgical-grade manganese ore in Carter County. Turner mines produced a small quantity of manganiferous ore in Unicoi County.

**Pig Iron.**—Tennessee Products & Chemical Corp. produced foundry, basic, low-phosphorous, malleable, and chrome-bearing pig iron in Rockwood and Wrigley. Shipments declined 17 percent. Imported iron ore, from Chile, amounted to 3 percent of the total iron ore consumed.

**Silver.**—Tennessee Copper Co. recovered silver as a byproduct from smelting copper and zinc concentrates. Production increased 8 percent but was 42 percent below the record of 1920.

**Zinc.**—Tennessee again led as a zinc-producing State. Production of recoverable zinc increased 2 percent over the 1959 record.

| 1957 | 172 | 6,020 | 54,407 | 49,241 | 54,579 | 55,261 |
| 1958 | 124 | 4,340 | 44,592 | 40,358 | 44,716 | 44,698 |
| 1959 | 99 | 3,465 | 59,739 | 54,306 | 59,838 | 57,771 |
| 1960 | 123 | 4,305 | 64,560 | 58,430 | 64,683 | 62,735 |
| Total | 23,872 | 578,435 | 3,775,015 | 2,777,521 | 3,798,887 | 3,355,956 |

American Zinc Co. of Tenn. operated the North Friends Station, Young, Coy, and Grasselli mines in Jefferson County, and the Mascot No. 2 mine in Knox County. New Jersey Zinc Co. operated the Jefferson City mine in Jefferson County and the Flat Gap mine in Hancock County. Tennessee Coal & Iron Division of United States Steel Corp. operated the Zinc Mine Works in Jefferson County. Tennessee Copper Co. recovered zinc concentrate from copper-zinc ores mined in Polk County. Total crude ore milled was 4,007,000 tons.

American Zinc Co. of Tenn. announced that its ore reserve in the East Tennessee Zinc District amounted to more than 5 million tons of 60-percent zinc concentrates. The company entered into an agreement with Tri-State Zinc, Inc., to develop a zinc property southwest of New Market, Tenn. The joint operation was to be known as New Market Zinc Co.

New Jersey Zinc Co. closed the Flat Gap mine at the end of the year for an indefinite period.

Digitized by Google

Exploration and development at zinc and copper-zinc mines included: Diamond drilling, 137,400 feet; percussion drilling, 41,263 feet; drifting, 36,625 feet; long-hole drilling, 22,247 feet; raising, 6,266 feet; churn drilling, 2,550 feet; sinking, 2,356 feet; crosscutting, 896 feet; and winzing, 36 feet.

## REVIEW BY COUNTIES

Mineral production was reported from 77 counties in the State, the same as in 1959; the leading counties were Jefferson, Knox, Polk, Maury, and Davidson. In addition to the commodities listed in table 14, small quantities of oil and gas were produced, county origin of which was undetermined.

**Anderson.**—The Moore mine (Pocahontas Fuel Co.) and the Dean and Windrock No. 2 mines (Windrock Coal & Coke Co.) were the leading producers of the 56 active coal mines. Ralph Rogers & Co. (Oak Ridge quarry) and Anderson County Highway Department (Taylor's Quarry No. 1) crushed limestone for concrete, roads, and stone sand. Lalite Corp. mined miscellaneous clay for lightweight aggregate.

**Bedford.**—Shelbyville Limestone Co. and Bedford County Highway Department (Delton Baker quarry) crushed limestone for concrete, roads, and railroad ballast.

**Benton.**—Seven mines produced sand and gravel for structural, paving, molding, glass, and grinding and polishing uses. The leading producers were Hardy Sand Co. (Silica and Camden mines) and Camden Gravel Co.

**Bledsoe.**—Eight coal mines were active; leading producers were the No. 1 mine (Hugh Allison Coal Co.), the No. 1 mine (Hankins Coal Co.), and the No. 3 mine (Dillard Coal Co.).

**TABLE 14.—Value of mineral production in Tennessee, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value[2] |
|---|---|---|---|
| Anderson | (3) | (3) | Coal, limestone, miscellaneous clay. |
| Bedford | (3) | (3) | Limestone. |
| Benton | $1,284,016 | $1,132,952 | Sand and gravel. |
| Bledsoe | 142,271 | 75,317 | Coal. |
| Blount | (3) | (3) | Marble, limestone, iron ore. |
| Bradley | (3) | (3) | Limestone. |
| Campbell | 2,183,716 | 2,624,577 | Coal, limestone, sandstone. |
| Cannon | 30,000 | (3) | Limestone. |
| Carroll | | (3) | Sand and gravel. |
| Carter | (3) | (3) | Limestone, sandstone, granite, manganese ore. |
| Claiborne | 691,637 | 978,119 | Coal, limestone. |
| Cocke | 48,480 | 82,128 | Limestone, barite. |
| Coffee | (3) | (3) | Limestone. |
| Cumberland | (3) | (3) | Sandstone, limestone, coal, sand and gravel. |
| Davidson | 8,162,786 | 10,249,335 | Cement, limestone, phosphate rock, sand and gravel, lime, miscellaneous clay. |
| Decatur | (3) | (3) | Limestone, sand and gravel. |
| De Kalb | 45,348 | 57,123 | Limestone. |
| Dickson | (3) | (3) | Do. |
| Fayette | 161,600 | 68,600 | Sand and gravel. |
| Fentress | (3) | 456,937 | Coal, limestone, sandstone. |
| Franklin | (3) | 4,368,947 | Cement, limestone, sand and gravel, miscellaneous clay. |
| Giles | (3) | (3) | Phosphate rock, limestone, sand and gravel. |
| Greene | (3) | (3) | Limestone, scrap mica, sand and gravel. |
| Grundy | 723,651 | 754,853 | Coal, limestone |
| Hamblen | 330,559 | 498,127 | Limestone. |

**TABLE 14.—Value of mineral production in Tennessee, by counties[1]—Continued**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value[2] |
|---|---|---|---|
| Hamilton | $7,122,063 | $6,684,360 | Cement, limestone, sand and gravel, coal, miscellaneous clay. |
| Hancock | (3) | (3) | Zinc ore. |
| Hardeman | 14,660 | 16,490 | Sand and gravel. |
| Hawkins | 53,550 | 19,022 | Limestone, gemstones. |
| Haywood | 65,000 | 80,142 | Sand and gravel. |
| Henderson | (3) | (3) | Do. |
| Henry | (3) | (3) | Ball clay, fuller's earth. |
| Hickman | (3) | (3) | Phosphate rock. |
| Humphreys | (3) | (3) | Limestone, sand and gravel. |
| Jefferson | (3) | (3) | Zinc ore, limestone. |
| Johnson | (3) | (3) | Limestone. |
| Knox | 16,972,602 | 16,607,235 | Cement, zinc ore, limestone, marble, lime, sand and gravel, miscellaneous clay. |
| Lauderdale | 44,350 | 75,379 | Sand and gravel. |
| Lincoln | (3) | 92,074 | Limestone. |
| Loudon | 41,870 | 116,374 | Miscellaneous clay, barite, limestone, sand and gravel. |
| Macon | 108,717 | 166,492 | Limestone. |
| Marion | (3) | (3) | Coal, cement, limestone. |
| Marshall | (3) | (3) | Limestone. |
| Maury | 9,728,406 | 10,701,807 | Phosphate rock, limestone. |
| McMinn | (3) | (3) | Limestone, barite, iron ore. |
| McNairy | (3) | (3) | Sand and gravel. |
| Meigs | (3) | (3) | Limestone. |
| Monroe | (3) | (3) | Limestone, sand and gravel, barite. |
| Montgomery | (3) | (3) | Limestone. |
| Morgan | 2,242,035 | 1,772,250 | Coal. |
| Obion | 103,600 | 92,000 | Sand and gravel. |
| Overton | 276,267 | 238,665 | Coal. |
| Perry | 25,770 | ---------- | |
| Polk | (3) | (3) | Copper, pyrite, zinc ore, silver, gold. |
| Putnam | 2,162,753 | (3) | Coal, limestone, sand and gravel. |
| Rhea | (3) | (3) | Limestone, coal, miscellaneous clay. |
| Roane | (3) | (3) | Limestone. |
| Robertson | (3) | (3) | Do. |
| Rutherford | (3) | (3) | Do. |
| Scott | 1,954,209 | 2,024,331 | Coal. |
| Sequatchie | (3) | (3) | Coal, limestone. |
| Sevier | 179,491 | 439,594 | Limestone. |
| Shelby | 1,773,982 | 1,560,284 | Sand and gravel, miscellaneous clay. |
| Smith | (3) | (3) | Limestone. |
| Stewart | (3) | (3) | Sand and gravel. |
| Sullivan | (3) | (3) | Cement, limestone, miscellaneous clay. |
| Sumner | (3) | (3) | Limestone, sand and gravel. |
| Tipton | (3) | (3) | Sand and gravel. |
| Unicoi | (3) | 426,104 | Sand and gravel, limestone, manganese ore. |
| Union | (3) | (3) | Marble, iron ore, limestone. |
| Van Buren | 223,261 | 192,470 | Coal. |
| Warren | (3) | (3) | Limestone, sand and gravel. |
| Washington | (3) | (3) | Limestone, miscellaneous clay. |
| Wayne | (3) | (3) | Sand and gravel, limestone. |
| Weakley | (3) | 1,910,144 | Ball clay. |
| White | (3) | (3) | Limestone, coal. |
| Williamson | (3) | (3) | Phosphate rock, limestone. |
| Wilson | 541,994 | 547,497 | Limestone. |
| Undistributed[4] | 83,299,356 | 78,329,271 | |
| Total | 140,738,000 | 143,439,000 | |

[1] The following counties are not listed because no production was reported: Cheatham, Chester, Clay, Crockett, Dyer, Gibson, Grainger, Hardin, Houston, Jackson, Lake, Lawrence, Lewis, Madison, Moore, Pickett, Trousdale.

[2] Petroleum and natural gas not listed by counties as data are not available; value included with "Undistributed."

[3] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."

[4] Includes value of petroleum and natural gas and values indicated by footnote 3.

**Blount.**—John J. Craig Co. (Crisp, Hamil, Marmor, and Lee quarries), Gray Knox Marble Co. (Brown and French Pink quarries), and Tennessee Marble Co. (Endsley quarry) quarried dimension marble for rough and dressed building stone and dressed monumental stone. John J. Craig Co. crushed marble for terrazzo and other uses. Lambert Bros. Division of Vulcan Materials Co. crushed lime-

Digitized by Google

stone for concrete, roads, and agstone at the Maryville quarry. Big Flag Spring Mining Co. mined brown iron ore at the Wilson mine.

**Bradley.**—Bradley Limestone Co., Inc., crushed limestone for concrete, roads, and railroad ballast at the Welch quarry.

**Campbell.**—Sixty-nine coal mines were active; leading producers were the No. 1 Strip mine (Dixie Pine Coal Co.), the Red Ash Strip mine (Price Coal Co.), and the No. 2 Strip mine (Howard Coal Co.). Key Limestone (LaFollette quarry) and Jellico Stone Co., Inc. (Jellico quarry), produced limestone for riprap, concrete, roads, and agstone. One producer crushed sandstone for concrete and roads.

**Cannon.**—Woodbury Stone Co. crushed limestone for concrete, roads, and agstone at the Norvell quarry.

**Carroll.**—Hardy Sand Co. mined structural and grinding and polishing sand at the Bruceton mine.

**Carter.**—Watauga Stone Co. crushed limestone for concrete, roads, railroad ballast, and stone sand. Major Sand Co., Inc., crushed sandstone for concrete and roads. Blue Ridge Stone Co. crushed granite for concrete and roads at the Greer quarry. Virginia Iron, Coal & Coke Co. (Stoney Creek mine) mined metallurgical grade manganese ore.

**Claiborne.**—Nineteen coal mines were active; leading producers were the No. 1 Strip mine (Rich Gap Coal Co.), the No. 1 mine (Harris Branch Coal Co.), and the No. 1 Auger mine (J & G Coal Co.). Lambert Bros. crushed limestone for concrete and roads.

**Cocke.**—Wolf Creek Mining Co., Inc. (Meyer mine), mined barite for chemicals. Cocke County Highway Department crushed limestone for concrete and roads at the Smith quarry.

**Coffee.**—Ralph Rogers & Co., Inc. (Coffee quarry), and Coffee County Highway Department crushed limestone for concrete, roads, and agstone.

**Cumberland.**—Ten companies quarried dimension sandstone for rough architectural, sawed and dressed building stone, and flagging. The leading producers were Tennessee Stone Co., Inc. (McGuire quarry) Crab Orchard Stone Co., Inc. (Peck quarry), and Turner Bros. Stone Co., Inc. Southern States Lime Mfg. Co. (Crab Orchard mine) and Cumberland County Highway Department (County quarry) crushed limestone for fluxing stone, concrete, roads, railroad ballast, agstone, glass, paper, rock dust for coal mines, filter beds, mineral food, and other uses. Thirteen coal mines were active; leading producers were the No. 2 Strip mine (Waters Coal Co.), the No. 7 Strip mine (Allen Bros. Coal Co.) and the No. 1 Strip mine (George Ed Lewis). Potter Sand & Gravel Co. mined structural, paving, and other sand and gravel.

**Davidson.**—Davidson County ranked fifth in total value of mineral production. Marquette Cement Mfg. Co. produced masonry and portland cements at the Nashville mill throughout the year. Seven quarries produced limestone for riprap, concrete, roads, agstone, asphalt filler, and fertilizer filler; the leading producers were Lambert Bros. (Danley, Hermitage, and Old Hickory quarries) and Menifee Crushed Stone Co. (Nashville quarry).

Monsanto Chemical Co. and Harsh Phosphate Co. mined marketable phosphate rock. Cumberland River Sand & Gravel Co. mined

Digitized by Google

structural and paving sand and gravel. Victor Chemical Works produced lime for industrial uses. W. G. Bush & Co., Inc., mined miscellaneous clay for heavy clay products. Tennessee Products & Chemical Corp. (Nashville plant) expanded crude perlite from Western States. Zonolite Co. exfoliated crude vermiculite from South Carolina and Montana at the Nashville mill.

**Decatur.**—Western Materials, Inc. (Parsons quarry), crushed limestone for concrete, roads, and agstone. Tinker Sand & Gravel Co. mined structural and paving sand and gravel at the Perryville mine.

**De Kalb.**—De Kalb County Highway Department crushed limestone for concrete and roads at the Chapman Hollow quarry.

**Dickson.**—Duke Lime & Stone Co. crushed limestone for concrete, roads, agstone, and stone sand at the Duke mine.

**Fayette.**—Fayette County Highway Department mined paving gravel at the County mine.

**Fentress.**—Twenty coal mines were active; leading producers were the Highland mine (Murphy Coal Co.), the Wilder mine (Wilder Coal Co.), and the new No. 3 mine (Hollis Miller Coal Co.). Frogge & Williams, Inc. (Wright quarry), crushed limestone for concrete, roads, and agstone. Kentucky-Tennessee Stone Co. quarried dimension sandstone for dressed building stone and flagging at the Jamestown quarry.

**Franklin.**—Marquette Cement Mfg. Co. produced masonry and portland cements at the Cowan mill throughout the year. Marquette Cement Mfg. Co. (Cowan quarry), Cowan Stone Co. (Cowan quarry and Anderson mine), and Franklin County Highway Department (Bostick quarry) crushed limestone for cement, concrete, roads, railroad ballast, agstone, glass, and other uses. Estill Springs Sand-Gravel Co. mined structural sand and gravel. Marquette Cement Mfg. Co. mined miscellaneous clay for use in cement.

**Giles.**—Monsanto Chemical Co. and International Minerals & Chemical Corp. (Wales mine) mined marketable phosphate rock for use in agriculture, pig-iron blast furnaces, and elemental phosphorus. Cedar Grove Lime Co. crushed limestone for concrete, roads, and agstone. Giles County Highway Department mined paving and fill gravel.

**Greene.**—Malone Bros. Co., Agricultural Lime Co., Inc. (Greenville quarry), and Greene County Highway Department (Ratcliffe quarry) crushed limestone for concrete, roads, and agstone. International Minerals & Chemical Corp. recovered scrap mica from silt deposits in Davy Crockett Lake. Nolichuckey Sand Co. (Bewley mine) and Buster Sand Co. mined structural sand and gravel.

**Grundy.**—Eight coal mines were active; leading producers were the No. 1 Strip mine (Ramsey Coal Co.), the Commando Strip mine (Phipps Coal Co.), and the Church Strip mine (Church Coal Co.). Viola White Lime Co. crushed limestone for concrete, roads, and agstone at the Old State quarry.

**Hamblen.**—White Pine Stone Co. crushed limestone for concrete and roads at the Hamblen quarry.

**Hamilton.**—Signal Mountain Portland Cement Division of General Portland Cement Co. produced masonry and portland cements at the Signal Mountain mill throughout the year. Chattanooga Rock

Digitized by Google

Products, Division of Vulcan Materials Co., crushed limestone for concrete, roads, railroad ballast, and agstone at the Chattanooga quarry. Dixie Sand & Gravel Co. (Dixie mine) mined structural sand and gravel. Twelve coal mines were active; leading producers were the Dill mine (Dill Coal Co.), the No. 1 mine (Dave Frizzell Coal Co.), and the No. 6 mine (Walter Frizzell). Hood Ceramic Corp. mined miscellaneous clay for floor and wall tile.

**Hancock.**—New Jersey Zinc Co. recovered zinc from zinc ores mined at the Flat Gap mine.

**Hardeman.**—Tri-State Sand Co. mined structural sand at the Saulsbury mine.

**Hawkins.**—Lambert Bros., crushed limestone for concrete and roads at the McCloud quarry. Willard Pratt collected a small quantity of gem stones (barite crystals).

**Haywood.**—Haywood County Highway Department mined paving gravel.

**Henderson.**—Ayers Mineral Co. mined molding sand at the Zane mine.

**Henry.**—Kentucky-Tennessee Clay Co. (Tennessee mine), H. C. Spinks Clay Co. (Henry mine), and Dixie Brick & Tile Co. (Puryear mine) mined ball clay for whiteware, floor and wall tile, firebrick and block, saggers, pins, stilts, and wads, heavy clay products, and for export. Southern Clay Co. Inc. (Porters Creek mine), and Tennessee Absorbent Clay Co. (Paris mine) mined fuller's earth for absorbent uses.

**Hickman.**—M. C. Boyle Phosphate Co. mined marketable phosphate rock at the Bratton mine for agricultural uses.

**Humphreys.**—Lambert Bros. crushed limestone for concrete, roads, railroad ballast, and agstone at the Rock Hill quarry. Sangravl Co., Inc., mined structural sand and gravel.

**Jefferson.**—Jefferson County led in total value of mineral production. American Zinc Co. of Tennessee (Young, Coy, Grasselli, and North Friend's Station mines), New Jersey Zinc Co. (Jefferson City mine), and Tennessee Coal & Iron Division of United States Steel Corp. (Zinc mine works) recovered zinc from zinc ores. Limestone was produced as a byproduct from zinc mines; this material was used for concrete, roads, railroad ballast, agstone, and stone sand.

**Johnson.**—Maymead Lime Co. crushed limestone for concrete, roads, and agstone.

**Knox.**—Knox County ranked second in total value of mineral production. Volunteer Portland Cement Co. produced masonry and portland cements at the Knoxville mill throughout the year. American Zinc Co. of Tennessee (Mascot No. 2 mine) mined zinc ore and recovered limestone as a byproduct. Gray Knox Marble Co. (Gray Knox quarry), Tennessee Marble Co. (Eagle quarry), and Appalachian Marble Co. (Appalachian and Bond quarries) produced dimension marble for rough and dressed building stone and for cut, dressed monumental stone. Appalachian Marble Co. and Knoxville Crushed Stone Co. crushed marble for terrazzo and other uses.

Nine quarries and one mine produced crushed limestone for concrete, roads, lime, railroad ballast, agstone, and cement. Leading producers were Volunteer Portland Cement Co. (Knoxville quarry)

Digitized by Google

and Lambert Bros. (City, Biagotti, Neuberts, and Kennedy quarries). Standard Lime & Stone Co., Division of American-Marietta Co., and Williams Lime Mfg. Co. produced lime for building, chemical, and industrial uses. Knoxville Sand & Gravel Co., Oliver King Sand-Lime Co., and Cameron Sand & Gravel Co. mined structural, paving, grinding and polishing, and engine sands, and structural and paving gravel. Four mines produced miscellaneous clay for cement, lightweight aggregate, and heavy clay products; Shalite Corp. was the leading producer.

**Lauderdale.**—Lauderdale County Highway Department mined paving gravel.

**Lincoln.**—Lincoln County Highway Department crushed limestone for concrete and roads.

**Loudon.**—Old Hickory Brick Co. (Greenback mine) mined miscellaneous clay for heavy clay products. B. C. Wood (Cedar Fork mine) and Smith Mines, Inc., mined barite. Cherokee Stone Co. crushed limestone for concrete and roads. Brooks Sand & Gravel Division of Vulcan Materials Co. mined structural sand.

**Macon.**—Dixon & Stubblefield crushed limestone for concrete, roads, and cement at the Langford quarry.

**Marion.**—Sixty-seven coal mines were active; leading producers were the Reels Cove mine (Tennessee Products & Chemical Corp.), the RC 51 mine (Thomas Coal Co.), and the Whitco Strip mine (Whitwell Coal Corp.). Penn-Dixie Cement Corp. produced portland cement at the Richard City mill. Signal Mountain Portland Cement Division (Bennetts Lake quarry), Penn-Dixie Cement Corp., and Marion Stone Co. (Ketchall quarry) crushed limestone for cement, concrete, roads, and agstone.

**Marshall.**—Lewisburg Limestone Co. crushed limestone for concrete, roads, and agstone.

**Maury.**—Maury County ranked fourth in total value of mineral production. Six mines produced marketable phosphate rock; leading producers were Monsanto Chemical Co. and Victor Chemical Works. Columbia Rock Products Corp. crushed limestone for concrete, roads, and agstone at the Theta Pike mine.

**McMinn.**—Floyd D. Webb Stone Co. (Webb quarry) and McMinn County Highway Department (Athens quarry) crushed limestone for concrete, roads, and agstone. National Lead Co. (Ballard mine) and McMinn Barium Corp. (Athens mine) mined barite. Rucker Mining Co. mined brown iron ore at the Nonaburg mine.

**McNairy.**—Worsham Bros. mined structural, paving, railroad ballast, and other sand and gravel.

**Meigs.**—Ten Mile Stone Co. and Meigs Stone Co. produced limestone for riprap, concrete, roads, and agstone.

**Monroe.**—Creighead Limestone Co. and Monroe County Highway Department (Howells quarry) crushed limestone for concrete and roads. Vonore Sand Co. mined structural sand. National Lead Co. mined barite at the Roy mine.

**Montgomery.**—Simpson Stone Co. (Simpson quarry) and Clarksville Stone Co. (Clarksville mine) crushed limestone for concrete, roads, and railroad ballast.

Digitized by Google

**Morgan.**—Forty-two coal mines were active; leading producers were the No. 7 and No. 10 mines (Brushy Mountain Coal Mines), and the No. 6 Strip mine (Allen Bros. Coal Co.).

**Obion.**—Obion County Highway Department mined paving gravel at the County mine.

**Overton.**—Fourteen coal mines were active; leading producers were the Branch Strip mine (Jarab, Inc.), the Pine Ridge mine (Pine Ridge Coal Co.), and the Love Joy Strip mine (Dixie Mining Co.).

**Polk.**—Polk County ranked third in total value of mineral production. Tennessee Copper Co. produced mixed sulfide ore at the Boyd, Calloway, Eureka, and Mary mines. The ore, concentrated in ore flotation mill, yielded copper, iron (pyrite), and zinc concentrates; gold and silver were recovered as byproducts from smelting the copper and zinc concentrates; the iron concentrate was roasted, yielding sulfur dioxide, for use mainly in manufacturing sulfuric acid, and iron oxide, which was sintered for use by iron and steel plants. The company continued development work at the Cherokee shaft.

**Putnam.**—The Meadow Creek mine (Clinchfield Coal Co.) was the only active coal mine. Algood Limestone Co. (Poteet quarry) and Putnam County Highway Department crushed limestone for concrete, roads, and agstone. Sand, Inc., mined structural and paving sand at the Monterey mine.

**Rhea.**—Rhea County Limestone Co. crushed limestone for concrete, roads, and agstone at the Dayton quarry. Seven coal mines were active; leading producers were the No. 1 mine (Kirkwood Fuel Co.), the No. 2 mine (Piney Knob Coal Co.), and the Bumbee mine (Norris Coal Co.). W. S. Dickey Clay Mfg. Co. mined miscellaneous clay for heavy clay products at the Graysville Clay mine.

**Roane.**—A. B. Long Quarries, Inc. (Swan Pond quarry), and Lambert Bros. (Rockwood quarry) produced limestone for riprap, concrete, roads, railroad ballast, agstone, and stone sand.

**Robertson.**—Porter Brown Limestone Co., crushed limestone for concrete, roads, and agstone.

**Rutherford.**—A&R Stone Co., Inc., crushed limestone for concrete, roads, agstone, and stone sand.

**Scott.**—Thirty-three coal mines were active; leading producers were the Straight Fork mine (Straight Fork Coal Co., Inc.), the Dean No. 2 Strip mine (Dean Coal Co., Inc.), and the Lassie No. 1 mine (Laddie Coal & Mining Co.).

**Sequatchie.**—Thirty-six coal mines were active; leading producers were the No. 1 Strip mine (Tennessee Steam Coal Co.), the 7–204 mine (Oak Coal Co.), and the Colton Strip mine (Walden Ridge Coal Co.). Dunlap Stone Co. crushed limestone for concrete, roads, and agstone at the Sequatchie quarry.

**Sevier.**—Lambert Bros. (Sevier quarry) and Sevier County Highway Department crushed limestone for concrete and roads.

**Shelby.**—Eight mines produced structural, paving, and fill sand and gravel. Leading producers were Cordova Sand & Gravel Co., Memphis Stone & Gravel Co. (York and East Plant mines), and W. S. Jordan Gravel Co. Moss Lightweight Aggregate Co. (Clay mine) and John A. Denie's Sons Co. (Memphis mine) mined miscellaneous clay for lightweight aggregate and heavy clay products.

Digitized by Google

**Smith.**—Oldham Limestone Co. produced limestone for riprap, concrete, roads, and agstone at the Rome quarry.

**Stewart.**—Sangravl Co., Inc., mined structural and paving sand and gravel at the Dover mine.

**Sullivan.**—Penn-Dixie Cement Corp. produced masonry and portland cements at the Kingsport mill throughout the year. Lambert Bros. crushed limestone for concrete, roads, and agstone. General Shale Products Co. and Penn-Dixie Cement Corp. mined miscellaneous clay for cement and heavy clay products.

**Sumner.**—Pilot Knob Limestone Co. and Ralph Rogers & Co., Inc., crushed limestone for concrete, roads, agstone, and stone sand. Sumner County Highway Department mined paving gravel.

**Tipton.**—Clyde Owen Sand & Gravel Co. and Tipton County Highway Department mined structural and paving sand and gravel.

**Unicoi.**—Brooks Sand & Gravel Division mined structural and paving sand, and structural, paving, and railroad ballast gravel. Turner Mines and James Rucker mined manganiferous ore at the Bumpass Cove mine. Unicoi County Highway Department crushed limestone for concrete and roads.

**Union.**—Tennessee Marble Co. quarried dimension marble for rough and dressed building stone at the Luttrell quarry. Walt Mining Co. mined red iron ore at the Riddle mine. Union County Highway Department crushed limestone for concrete and roads.

**Van Buren.**—Nine coal mines were active; leading producers were the D & H Strip mine (D & H Coal Co.), the No. 1 mine (I. E. Brown Coal Co.), and the No. 4 mine (Johnnie Hankins Coal Co.).

**Warren.**—Warren Limestone Co. (McMinnville mine) crushed limestone for concrete, roads, and railroad ballast. Cumberland Mountain Sand Co. mined structural sand.

**Washington.**—Washington County Highway Department crushed limestone for concrete and roads. General Shale Products Corp. mined miscellaneous clay for heavy clay products.

**Wayne.**—Hassell & Dowdy Sand & Gravel Co. (Baker mine) mined structural sand and gravel. Universal Limestone Co. crushed limestone for concrete, roads, and railroad ballast.

**Weakley.**—United Clay Mines Corp. (No. 6 mine), Bell Clay Co. (Collins mine), and H. C. Spinks Clay Co. (Gleason mine) mined ball clay for whiteware, art pottery, high-grade tile, rubber filler, pastes, and enameling.

**White.**—Sparta Limestone Co. and White County Highway Department crushed limestone for concrete, roads, and agstone. The No. 3 mine (Lester Broom Coal Co.) was the only active coal mine.

**Williamson.**—Monsanto Chemical Co. mined marketable phosphate rock for elemental phosphorus. Lambert Bros. (Franklin quarry) and Williamson County Highway Department (Globe quarry) crushed limestone for concrete, roads, and agstone.

**Wilson.**—Marquette Cement Mfg. Co. (Martha quarry), Wilson County Rock Products, Inc., and Lebanon Limestone Co. crushed limestone for cement, concrete, roads, and agstone.

# The Mineral Industry of Texas

**This chapter was prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and The University of Texas, Bureau of Economic Geology.**

By F. F. Netzeband,[1] Thomas R. Early,[2] and Roselle M. Girard [3]

MINERAL PRODUCTION in Texas remained below the record 1957 level of $4.5 billion for the third consecutive year. The 1960 total mineral value of $4.1 billion, 2 percent less than in 1959, generally reflected weaknesses exhibited by the Nation's economy after the first half of 1960. Only 10 of the 27 minerals and mineral fuels produced in Texas recorded increases from their 1959 levels.

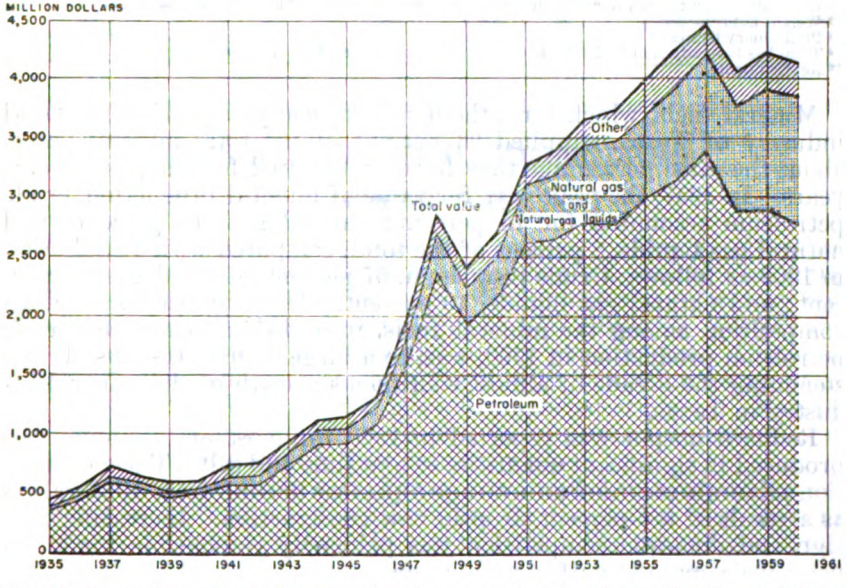

FIGURE 1.—Value of petroleum, natural gas, and natural gas liquids, and total value of mineral production in Texas, 1935–60.

[2] Excludes certain clays; value included with "Value of items that cannot be disclosed."
[3] Weight not recorded.
[4] Preliminary figures.
[5] Total has been adjusted to eliminate duplicating the value of clays and stone.
[6] Revised figure.

Mineral fuels, which form the dominant component of the mineral industry of Texas, supplied 93 percent of the total mineral value, about the same percentage they have contributed for the past several years. In 1957, the peak year for value of mineral production, crude petroleum accounted for 74 percent; natural gas, 11 percent; and natural gas liquids, 8 percent of the total, compared with distribution in 1960 as follows: Crude petroleum, 67 percent; natural gas, 16 percent; and natural gas liquids, 10 percent. Thus, increasing internal competition among the mineral fuels, in addition to reduced crude petroleum production in 1960, was, to a large degree, responsible for stemming the decade of almost continuous growth of the mineral industry in Texas.

Reduced output was reported in 1960 for most of the nonmetals produced in significant quantities except lime and salt. The construction minerals recorded an average 8-percent decline from 1959 values as a result of a 6-percent drop in new construction. Increasing foreign and domestic competition was primarily responsible for an 8-percent decrease in sulfur production.

The State's metal mining and metallurgical industry retained its importance in the State and the National economy. Brazoria County was again the Nation's major source of magnesium metal. The brown iron ores of Cass, Cherokee, and Morris Counties supplied a large part of the pig iron used by Texas metal manufacturers and fabricators. Uranium "yellow cake" was produced in the State's first uranium mill from uranium ores mined within the State. Texas' 18

Digitized by Google

metallurgical plants contributed significantly to U.S. supplies of aluminum, antimony, copper, lead, tin, and zinc.

Employment data are reported in table 2. Employment in mining and related industries reflected the slight downward movement characteristic of the mineral industry in 1960. However, the chemical industry continued its rapid expansion with a 4-percent increase in employment.

The Port Arthur refinery of Texaco, Inc., established a world's safety record for refineries with 7,647,716 man-hours without a lost-time injury.

**TABLE 2.—Employment data in mining and related industries**

| Industry | Employment | | Weekly hours worked | | Weekly earnings | |
|---|---|---|---|---|---|---|
| | 1959 [1] | 1960 | 1959 | 1960 | 1959 | 1960 |
| Manufacturing | 488,800 | 490,000 | 41.6 | 41.1 | $89.02 | $89.19 |
| Primary metals | 24,000 | 24,700 | 40.9 | 38.9 | 101.84 | 100.75 |
| Chemicals | 42,800 | 44,700 | 41.3 | 41.1 | 119.36 | 121.66 |
| Petroleum and coal products | 43,100 | 41,600 | 40.4 | 40.2 | 119.99 | 121.00 |

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

Oversupply of crude petroleum and certain refinery products resulted in severe proration of crude oil production, general weakening of crude prices, gasoline price wars, curtailment of exploratory and development drilling, lower employment and employee income, and lower financial returns to State and county governments. Crude oil producers and refiners were also faced with mounting competition for markets from both natural gas and imported crude oil. Natural gas and natural gas liquids were able to increase their output and, except for natural gasoline, their value as well.

Prorated oil production in Texas was limited to a record low of 104 days in 1960 with 8-day allowables for the period May through November, 19 days less than allowed in 1959. The oil and gas industry drilled 14,901 wells, a decrease of 15 percent from the 17,564 wells drilled during 1959. Exploratory drilling resulted in completion of 606 oil wells, 480 gas wells, and 2,922 dry holes; a success ratio of 27 percent, the same as in 1959. Of 10,893 development wells drilled, 7,255 produced oil, 1,203 produced gas, and 2,435 were dry holes.

Total crude stocks were reduced 7 percent to 85.4 million barrels; stocks of refined products rose 3 percent to a grand total of 86 billion barrels; gasoline stocks rose 15 percent to 36.3 billion barrels.

Natural gas sales gained 3 percent to 5,407 billion cubic feet; 55

Digitized by Google

percent or 2,976 billion cubic feet was shipped from the State. The number of producing gas wells increased 10 percent to 25,809 wells at yearend.

The world's first sextuple gas-well completion was made by Sunray Mid-Continent Oil Co. in North LaWard field in Jackson County. The well flowed 248 million cubic feet of gas a day through various chokes from 6 producing zones ranging from 4,600 to 6,650 feet. The world's largest natural gasoline and cycling plant, the 950-million-cubic-foot-per-day King Ranch plant of Humble Oil & Refining Co., began operating in September.

**Asphalt, Native.**—Uvalde County supplied all the native asphalt produced. Production was 18 percent lower than that of 1959, reflecting curtailed highway construction and maintenance operations as a result of inclement weather in the first quarter of the year.

**Carbon Black.**—The carbon black industry recovered 1,085 million pounds valued at $84 million—6 percent more than in 1959 and 53 percent of the entire domestic carbon black production. The industry consumed 124 billion cubic feet of natural gas for an average yield of 3.75 pounds of material per 1,000 cubic feet of gas, and 180 million gallons of gas liquids for an average yield of 4.32 pounds of material per 1,000 gallons of natural gas liquids. There were 24 producing carbon black plants, compared with 22 plants in 1959. Plants in the Panhandle counties—Carson, Gray, Hutchinson, Moore, and Wheeler—supplied 52 percent of the State output.

**Helium.**—Helium production from two plants, at Amarillo and Exell, declined 10 percent in 1960. The apparent production loss was due to production from the plant at Keyes, Okla., being shipped directly to markets since no helium storage facilities were available at the Oklahoma site. Helium recovered in excess of shipments in Texas was stored.

**Lignite.**—Lignite, used as fuel to generate electric power and as raw material for manufacturing activated carbon, was mined at open pits in Milam and Harrison Counties.

**Natural Gas.**—Marketed production of natural gas was a record 5,893 billion cubic feet, 3 percent more than the 1959 production. Gas wells produced 75 percent of the marketed gas; oil wells accounted for the remaining 25 percent. According to the Railroad Commission of Texas, an average of 25,809 gas wells were producing, compared with 23,381 gas wells in 1959. Of 14,901 wells completed during 1960, 1,683 were gas wells. Natural gas was produced in 180 counties.

Estimated natural gas reserve at yearend totaled 119,489,393 million cubic feet or 45 percent of the National reserve, according to American Gas Association statistics.

**TABLE 3.—Marketed production of natural gas[1]**

| Year | Million cubic feet | Value (thousands) | Year | Million cubic feet | Value (thousands) |
|---|---|---|---|---|---|
| 1951–55 (average) | 4,318,826 | $311,957 | 1958 | 5,178,073 | 517,807 |
| 1956 | 4,999,889 | 434,990 | 1959 | 5,718,933 | 617,651 |
| 1957 | 5,156,215 | 500,153 | 1960 | 5,892,704 | 665,876 |

[1] Comprises gas either sold or consumed by producers, including losses in transmission, amounts added to storage, and increases in gas pipelines.

Digitized by Google

**Natural Gas Liquids.**—The 1960 output of 7,357 million gallons of natural gas liquids, valued at $408 million, established a new record, and was 3 percent greater than the 1959 record output. As in 1959, LP gases accounted for nearly 61 percent of the recovered liquid. Principal industrial consumers were the expanding petrochemical and synthetic rubber industries. Natural gas liquids were produced in 100 counties.

There were 226 gasoline plants, 16 pressure maintenance plants, and 26 cycling plants recovering natural gas liquids at yearend. Eleven new gasoline plants were built during the year. They were the Alto Loma plant of Margaret Hunt Trust Estate in Galveston County; the Lake Houston plant of Natural Gas Engineering Co., Inc., in Harris County; the Bethel plant of Texaco, Inc., and the Cayuga plant of Tidewater Oil Co., in Anderson County; the Dyes plant of Valera Oil Co. in Taylor County; the Davis plant of Mesquite Gas Products, Inc., in Upton County; the H. J. Strawn plant of Midland Petrochemical Co., Inc., in Tom Green County; the Block No. 31 plant of Atlantic Refining Co. in Crane County; the Salt Creek plant of General Crude Oil Co. in Kent County; the Lamesa plant of Texaco-Seaboard, Inc., in Dawson County; and the Pampa plant of Amarillo Oil Co. in Gray County. Four gasoline plants were shut down during the year.

**TABLE 4.—Natural gas liquids production**

(Thousand gallons and thousand dollars)

| Year | Natural gasoline and cycle products | | LP gases | | Total | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 2,715,193 | $197,204 | 2,742,271 | $95,207 | 5,457,464 | $292,411 |
| 1956 | 2,964,609 | 216,378 | 3,731,047 | 144,745 | 6,695,656 | 361,123 |
| 1957 | 2,944,381 | 201,423 | 3,831,664 | 147,618 | 6,776,045 | 349,041 |
| 1958 | 2,871,589 | 204,501 | 3,786,575 | 151,896 | 6,658,164 | 356,397 |
| 1959 | 2,790,155 | 209,238 | 4,353,368 | 181,148 | 7,143,523 | 390,386 |
| 1960 | 2,880,906 | 207,583 | 4,476,142 | 200,478 | 7,357,048 | 408,061 |

According to the American Gas Association, the proved recoverable reserve of natural gas liquids increased to 3.6 billion barrels and amounted to 53 percent of the Nation's total reserve.

**Petroleum.**—Despite curtailed production, Texas retained leadership in crude petroleum reserve, facilities, and activities. It had the major share of the Nation's petroleum reserve, produced the greatest volume of crude oil, processed the largest volume of crude oil at its refineries, provided a major source of feedstock to the growing petrochemical industry, operated more drilling rigs and exploratory development projects, and invested more capital in improvement of its oil reserve than any other state.

Because of excessive stocks of crude oil and certain refined products, and continued weakness in demand for domestic crudes which prevailed through most of 1960, crude oil production declined 4 percent to 933.6 million barrels. Stocks of gasoline and distillate fuels remained substantially above normal requirements, resulting in general weaken-

Digitized by Google

ing of wholesale prices and gasoline price wars at the retail level. The imbalance of supply-demand resulted in strict proration of Texas crude oil production.

**TABLE 5.—Crude petroleum production**

(Thousand barrels and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 1,015,829 | $2,757,674 | 1958 | 940,166 | $2,872,38 |
| 1956 | 1,107,808 | 3,131,225 | 1959 | 971,978 | 2,85[illegible] |
| 1957 | 1,073,867 | 3,338,119 | 1960 [1] | 933,632 | 2,766,97 |

[1] Preliminary figures.

**TABLE 6.—Crude petroleum production, indicated demand, and stocks in 1960, by months**

(Thousand barrels)

| Month | Production | Indicated demand | Stocks originating in Texas | Month | Production | Indicated demand | Stocks originating in Texas |
|---|---|---|---|---|---|---|---|
| January | 84,147 | 87,520 | 107,759 | September | 75,029 | 75,086 | 96,33[illegible] |
| February | 79,488 | 78,224 | 109,023 | October | 75,333 | 75,891 | 95,80[illegible] |
| March | 83,412 | 79,082 | 113,353 | November | 75,797 | 73,869 | 97,72[illegible] |
| April | 77,905 | 78,747 | 112,511 | December | 80,039 | 77,154 | 100,62[illegible] |
| May | 75,936 | 80,892 | 107,555 | | | | |
| June | 75,063 | 78,331 | 104,237 | Total: | | | |
| July | 75,396 | 80,721 | 98,912 | 1960 | 933,632 | 944,151 | ---- |
| August | 76,087 | 78,584 | 96,415 | 1959 | 971,978 | 989,898 | ---- |

Crude oil output came from 197 counties—26 counties produced over 10 million barrels and 117 counties produced more than 1 million barrels. The five leading counties in order of value of output were Ector, Andrews, Crane, Scurry, and Gregg.

Texas had 192,627 producing oil wells at yearend, an increase of 3,693 or 2 percent over 1959. Average daily production amounted to 13.2 barrels per well, compared with 14.2 barrels per well in 1959.

The proved recoverable reserve of crude oil declined 101 million barrels to 14,758 million barrels as of January 1, 1961, according to the American Petroleum Institute. Exploratory drilling added 91 million barrels to the proved reserve; development drilling in the form of extensions and revisions added 704 million barrels. Texas had 47 percent of the total U.S. oil reserve and 48 percent of the total liquid-fuel reserve, including gas liquids.

Average indicated daily demand for crude oil amounted to 2,488,800 barrels, 8 percent less than in 1959.

Crude oil stocks as of December 31 amounted to 85.4 million barrels, of which 63.4 million barrels was in pipelines and tank farms, 7.3 million barrels in lease tanks, and 14.7 million barrels in storage at refineries.

Texas had nearly 70 oil refineries with a total daily crude capacity of 2.6 million barrels. Nearly 85 percent of the capacity was on the Gulf Coast adjacent to the Beaumont, Corpus Christi, and Houston areas. Refineries charged 801.8 million barrels of crude oil to stills during the year, 24 million barrels more than in 1959. Refinery output increased from 831.5 million barrels in 1959 to 855.4 million barrels. Most of the increase was gasoline, up 18.8 million barrels from 1959.

Industry expansions and new plants built are discussed in the County Review section. However, a few 1960 highlights are reported as follows: American Oil Co. added a 150,000-barrel-per-day crude running unit, a 47,600-barrel-per-day catalytic cracking unit, and a 14,600-barrel-per-day alkylation unit to its Texas City refinery; the

Digitized by Google

three new units replaced six units previously operating. Three units (a 12,000-barrel Houdry catalytic cracker, a 3,000-barrel thermocracker visbreaker, and a 1,850-barrel alkylation unit) at the Sinclair Refining Co. Corpus Christi refinery were shut down the last quarter of 1960. Phillips Petroleum Co. planned a 22 million-gallon-per-year high-purity benzene unit at its Sweeny refinery near Houston. The Railroad Commission of Texas reported a total of 350 proposed secondary recovery projects in about 70 counties, which were expected to recover an additional 750 million barrels of petroleum. The largest of these projects would be in the Spraberry Trend area in west Texas, with an estimated recovery of 200 million barrels. Mobil Oil Co. operated the State's first major field-wide pressure maintenance project (Parks field, Midland County), using propane injection followed by dry gas. Output of crude oil increased from 325 to 1,700 barrels per day. The project should recover 55 percent of oil in place, compared with 41 percent by conventional waterflood, and should extend the overall life of the 5,900-acre field from 6 to 12 years. A 20,000-barrel-per-day delayed-coker unit which will convert the heavy oil into lighter fractions as gasoline and fuel oil was added to the Beaumont refinery of Mobil Oil Co.

**TABLE 11.—Stocks of crude petroleum at refineries, tank farms, and gathering systems in 1960, by months**

(Thousand barrels)

| Month | Refineries | Tank farms and pipelines | Lease tanks | Total |
|---|---|---|---|---|
| January | 15,486 | 68,337 | 7,934 | 91,757 |

Petrochemicals.—The petrochemical industry of Texas maintained its dominant National position through new products, new plants, and expansions. There were 122 operating petrochemical plants most of which were along the Gulf Coast. More than half of the plants produced complex organic products, 4 produced nitrogen-based chemicals, 17 produced butadiene and synthetic rubber, and more than 40 recovered sulfur or produced carbon black. The [illegible] of petrochemicals, ethylene, propylene, butane, and benzene represented over half of the productive capacity. Ammonia, methanol, and xylene and inorganic chemicals, mainly sulfur, carbon black, and synthetic rubber, made up the remainder of petrochemical products output. Although the State's petrochemical industry was [illegible] petroleum-oriented, its ability to adapt itself to changing market needs from time to time gave promise of continued growth in the years to come. Natural-gas liquids, which are the principal raw materials of the petrochemical industry, [illegible]

Industries that consume large quantities of petrochemicals were expanding or building new facilities in Texas. [illegible] four synthetic rubber plants were in operation or under construction in the State. [illegible]

to Texas Gulf Refining operations when Texas Eastern Transmission Corp. completed a 90-mile connecting link between its "Little Big Inch" and the transmission system of Buckeye Pipeline Co. Texas refineries with "Little Big Inch" connections are: Humble Oil & Refining Co., Baytown; Phillips Petroleum Co., Sweeny; Gulf Oil Corp., Port Arthur; Texas City Refining Co. and Republic Oil Refining Co., Texas City; Crown Central Petroleum Co. and Shell Oil Co., Houston; and Mobile Oil Co., Texas Gas Corp., and Atlantic Refining Co., Beaumont. Industrial areas served by this combination of facilities are Toledo and Cleveland, Ohio, and Detroit, Mich.

## NONMETALS

The 15 nonmetals produced in 1960 were valued at $262 million, 6 percent of the State total mineral production value. The five principal nonmetal commodities, in order of value, were cement, sulfur, stone, sand and gravel, and salt. Production declines were reported for 10 of the 15 nonmetals; 2 of the 5 showing increases were lime and salt, which were consumed in large volumes by the expanding chemical industry.

Virtually all nonmetals except sulfur were produced for local markets because of their bulk weight and low unit price.

Important industry advances were made during the year. A $1 million plant to remove hydrocarbon and other trace impurities from "dark" sulfur and upgrade the product to premium "bright" sulfur was built at the Spindletop terminal of Texas Gulf Sulfur. A special process developed by the company permitted removal of the minor organic inclusions to yield a sulfur product preferred by most of the sulfur-consuming industry. Sulfur mining (Frasch) operations at Clemens Dome in Brazoria County were terminated by Jefferson Lake Sulfur Co. due to depletion of reserves. Talc production increased in the Allamoore district; deposits were developed by five talc producers. Pioneer Talc Co. continued operation of its new grinding mill; several other mining interests acquired mineral leases for exploratory work. A multimillion dollar expansion of the cement plant near Waco was begun by Universal Atlas Cement Division of U. S. Steel Corp. New facilities, which would double capacity to 2 million barrels of finished cement, included a second rotary kiln and accessory equipment, and a new and more efficient dust collection system. Near Van Horn, Continental Minerals Co. built a 100-ton-a-day mill to process barite ore from its Apache Mountain lease. A $500,000 automatic barite processing plant was built in Houston by International Minerals & Chemical Corp. The plant processed barite ores from Missouri, Mexico, Peru, and the Mediterranean area. Kaiser-Gypsum Co. built a $3- to $5-million gypsum products plant on the Houston ship channel, adjacent to the Olin-Mathieson Chemical Corp. plant. A $750,000 expansion program was begun at the Houston sulfur-chemical facility of Penn Salt Chemicals Corp; the new unit will produce a variety of alkyl mercaptans.

A 1-percent increase in barge rates on the Mississippi River system in the Gulf Intercoastal Canal, effective November 1, was proposed by the Waterways Freight Bureau. Specific rate increases included 11 cents a ton on bulk sulfur; 10 cents a ton on paper, pulp

Digitized by Google

wood, wood chips, limestone, sand and gravel, bauxite, iron ore, chrome, and salt; 6 cents a ton on phosphate rock and superphosphate; and 22 cents a ton on scrap iron.

**Barite.**—Crude barite from other states and foreign countries was processed in grinding plants in Cameron, Harris, Maverick, and Nueces Counties. Most of the material was processed for use in drilling mud for the oil and gas industry. Output was less than that of 1959, principally because of less drilling activity in the oil and gas industry.

**Bromine.**—The tonnage and value of bromine was 13 percent under that of 1959, reflecting excessive gasoline stocks and the growth of the compact car market. Ethyl-Dow Chemical Co., the Nation's foremost producer of bromine, operated its Freeport facilities at reduced rates throughout 1960.

**Cement.**—The cement industry expanded its production, storage, and handling facilities. There were 16 companies operating with total production capacity of 38.9 million barrels of cement, compared with 15 companies and capacity of 37.5 million barrels in 1959. The multimillion dollar, 1.4-million-barrel-per-year Midlothian plant of Texas Industries, Inc., in Ellis County began production late in 1960. Cement plants were in 11 counties compared with 10 in 1959. Operating at about 59 percent of capacity, output of the plants declined 16 percent in quantity and 13 percent in value. Five of the plants, comprising 34 percent of total capacity, were along the Gulf Coast and used over 2 million tons of shell in producing cement; the 11 remaining plants, in 8 inland counties, used over 4 million tons of limestone. Four of the cement plants used a dry process and accounted for 19 percent of installed capacity. The wet process was used by 12 plants with 81 percent of the capacity. Intrastate markets consumed 87 percent of the cement shipped in 1960.

**TABLE 13.—Destination of shipments of portland cement to Texas from mills**

| Year | Texas (thousand barrels) | Change, percent | |
|---|---|---|---|
| | | In Texas | In United States |
| 1951–55 (average) | 17,962 | | |
| 1956 | 20,954 | +1 | +6 |
| 1957 | 18,891 | −10 | −4 |
| 1958 | 22,323 | +18 | +6 |
| 1959 | 23,884 | +7 | +9 |
| 1960 | 20,195 | −15 | −7 |

**TABLE 14.—Portland cement produced and shipped**

(Thousand barrels and thousand dollars)

| Year | Production | Shipments | |
|---|---|---|---|
| | | Quantity | Value |
| 1951–55 (average) | 20,633 | 20,520 | $52,137 |

| 1957 | 21,845 | 21,547 | 66,201 |
| 1958 | 25,465 | 25,209 | 77,188 |
| 1959 | 27,111 | 27,215 | 85,022 |
| 1960 | 23,190 | 22,721 | 73,964 |

Digitized by Google

**Clays.**—Although the clay industry was an important segment of the State's economy and extensive deposits of common clay or shale are widely distributed, only deposits close to large metropolitan or industrial centers were exploited. Clay production decreased 15 percent in quantity and 11 percent in value, compared with 1959.

Miscellaneous clay provided 75 percent of the production, 34 percent of which was used in manufacture of cement. Other important uses included the manufacture of building brick, heavy clay products, and lightweight aggregate. Fire clay accounted for 22 percent of total clay produced. Most fire clay was used in heavy clay products, with smaller quantities being consumed in refractories, pottery, and stoneware. Bentonitic clays, including fuller's earth, were used principally as a filtering medium for mineral and vegetable oils, as a component of drilling muds, and as an absorbent or carrier for insecticides and fungicides.

**TABLE 15.—Clays sold or used by producers, by kinds**

(Thousand short tons and thousand dollars)

| Year | Bentonite | | Fire clay | | Miscellaneous clay | | Total [1] | |
|---|---|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951-55 (average) | 76 | $846 | 364 | $1,200 | 1,908 | $2,223 | 2,348 | $4,269 |
| 1956 | 161 | 1,183 | 483 | 1,007 | 2,502 | 2,575 | 3,146 | 4,765 |
| 1957 | 127 | 963 | 454 | 1,057 | 2,411 | 2,913 | 2,992 | 4,933 |
| 1958 | 121 | 889 | 501 | 1,135 | 3,097 | 3,400 | 3,719 | 5,424 |
| 1959 | 133 | 947 | 722 | 1,596 | 3,015 | 3,160 | 3,870 | 5,703 |
| 1960 | 116 | 873 | 715 | 1,668 | 2,471 | 2,517 | 3,302 | 5,058 |

[1] Incomplete total, excludes fuller's earth.

Clay production was reported from 44 counties by 69 producers; 33 of the counties reported miscellaneous clay, 10 reported fire clay, 4 reported bentonite, and 2 reported fuller's earth production. The five principal clay-producing counties, in order of output, were: Harris, Eastland, Rusk, Dallas, and Bastrop. The five principal producing companies were: Ideal Cement Co., Henderson Clay Products, Texas Lightweight Aggregate, General Portland Cement Co., and American Aggregate Co.

**Feldspar.**—A small amount of feldspar was stockpiled in Llano County to be ground and processed as roofing material.

**Fluorspar.**—Fluorspar, principally from foreign countries, was processed at mills in Brewster, Cameron, Fayette, and Harris Counties for use in chemical and metallurgical industries. Much of the fluorspar was used in manufacturing cryolite for consumption in aluminum reduction plants in Alabama, Arkansas, Oregon, and Washington.

**Gem Stones.**—Collection, preparation, and sale of gem stones by amateurs and dealers continued. The principal gem-type minerals found in Texas were agate, jasper, amethyst, apatite, chrysocolla, cinnabar, fluorspar, garnet, obsidian, opal, and agatized wood. Search for the stones centered in Brewster, Culberson, Hudspeth, Jeff Davis, Mason, Webb, and Zapata Counties.

Digitized by Google

**Graphite.**—Flake graphite was mined from open pits and processed in the mill of Southwestern Graphite Co. in Burnet County.

**Gypsum.**—Gypsum production declined 16 percent in volume and 17 percent in value from that of 1959, due largely to excess capacity for making gypsum-wallboard and building products and to a 6-percent drop in construction in the State. Production by seven producers, all from open-pit mines, was reported from five counties—Fisher, Hardeman, Hudspeth, Nolan, and Ward. Most of the crude gypsum was used in manufacturing lath and wallboard; the remainder was used principally in building plaster.

**TABLE 16.—Crude gypsum mined**

| Year | Short tons | Value | Year | Short tons | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 1,158,664 | $3,304,685 | 1958 | 1,240,050 | $4,120,[illegible] |
| 1956 | 1,156,956 | 3,623,005 | 1959 | 1,351,060 | 4,[illegible] |
| 1957 | 1,043,236 | 3,343,217 | 1960 | 1,131,034 | 3,[illegible] |

**Lime.**—Moderate expansion of the lime industry continued as demand by chemical and industrial users remained high. Consumption by chemical and industrial users amounted to 78 percent of total output; the remainder was used in construction. As in 1959, lime production was reported from 8 counties by 10 producers; the 3 leading counties in order of output were Nueces, Comal, and Travis Counties. About equal quantities of limestone and shell were used as basic raw material for lime production.

Most of the lime output, 94 percent, was consumed within the State: the major part was captive. Out-of-State shipments were sent mostly to adjoining states.

**TABLE 17.—Lime sold by producers**

| Year | Quicklime (short tons) | Hydrated lime (short tons) | Total | |
|---|---|---|---|---|
| | | | Short tons | Value (thousands) |
| 1951–55 (average) | 258,489 | 175,395 | 433,884 | $4,[illegible] |
| 1956 | 349,693 | 242,443 | 592,136 | 6,[illegible] |
| 1957 | 559,426 | 236,968 | 796,394 | 7,[illegible] |
| 1958 | 414,302 | 276,359 | 690,661 | 7,[illegible] |
| 1959 | 414,052 | 394,725 | 808,777 | 8,[illegible] |
| 1960 | 433,405 | 388,037 | 821,442 | 9,[illegible] |

The industry utilized 23 shaft kilns and 16 rotary kilns (total annual rated capacity, 1,287,000 tons), operating at about 64 percent of capacity. Principal chemical and industrial uses were in the manufacture of alkalies, paper and petrochemicals, and as metallurgical lime in open hearth and electric furnaces. A large quantity was used for purifying and softening water.

**Lithium.**—Lithium hydroxide was processed from lepidolite ores from Southern Rhodesia at the San Antonio plant of American Lithium Chemicals, Inc. During the year, this firm completed its contract to supply the Atomic Energy Commission with lithium hydroxide.

Digitized by Google

**Magnesium Compounds.**—Magnesium compounds were produced at the Freeport plant of Dow Chemical Co. A significant quantity of the magnesium oxide produced was processed to periclase, a basic refractory material, at the new Freeport plant of E. J. Lavino & Co.

**Natural Salines.**—Sodium sulfate was recovered from salt brines in Terry and Ward Counties by Ozark-Mahoning Co. Improved demand for salt cake resulted in increased production and the company was planning expansions at its Brownfield and Monahans facilities.

**Perlite (Expanded).**—Although no crude perlite had been produced in Texas since 1956, crude materials from New Mexico and Colorado were expanded at six plants in four counties. The expanded material was used as lightweight aggregate in concrete, as an aggregate in building plaster, and as loose-fill insulation. All plants were close to metropolitan and industrial markets.

**Phosphate Rock.**—Crude phosphate rock, shipped from Tennessee and Florida, was used as a component of mixed fertilizers. Substantial quantities of processed superphosphate and triple superphosphate were shipped from other states for use in fertilizer preparation.

**Salt.**—Salt recovered from vast salt domes of the Gulf Coast and salt beds of the coastal plains was a vital component of the growing chemical industry. Production increased 5 percent in quantity and 4 percent in value compared with 1959. Over 90 percent of the output was from brine wells drilled to salt domes in seven counties and to salt beds in four counties. Principal producing counties were Brazoria, Chambers, and Duval. Most of the brine was used in manufacturing chlorine, soda ash, and other chemicals. Other uses included paper and pulp manufacture, feed mixing, water softening, and meat preparation. Nearly all the salt was consumed by industries within the State.

**TABLE 18.—Salt sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951-55 (average) | 2,867 | $7,118 | 1958 | 3,843 | $15,115 |
| 1956 | 3,963 | 14,370 | 1959 | 4,519 | 17,498 |
| 1957 | 4,612 | 17,104 | 1960 | 4,756 | 18,222 |

**Sand and Gravel.**—The tonnage and value of sand and gravel declined 15 and 11 percent, respectively, compared with 1959, because of curtailed highway and building construction due to inclement weather during the first quarter and an overall 6-percent decline in construction contracts. Deposits of sand and gravel, usually near the larger streams, are extensive and widespread.

Production was reported from 97 counties. Commercial production supplied 90 percent of total output, and Government-and-contractor production accounted for the remaining 10 percent. Building and paving consumed 91 percent of the output. Other uses were glass manufacture, railroad ballast, engine and molding sand, sandblasting, filtering, and grinding. Over 90 percent of all sand and gravel produced was washed or otherwise prepared. Trucks handled 79 per-

Digitized by Google

cent; railroads, 19 percent; and waterways, 2 percent of the total shipments.

The average value of commercial sand and gravel in 1960 was $1.11 a ton; prepared material averaged $1.16 a ton. Most Government-and-contractor material was produced for the Texas Highway Department.

**TABLE 19.—Sand and gravel sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Commercial | | Government-and-contractor | | Total sand and gravel | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 18,126 | $18,800 | 3,891 | $1,019 | 22,017 | $19,819 |
| 1956 | 23,311 | 25,512 | 6,025 | 1,701 | 29,336 | 27,213 |
| 1957 | 19,155 | 21,979 | 4,530 | 1,448 | 23,685 | 23,427 |
| 1958 | 27,015 | 28,703 | 5,856 | 2,105 | 32,871 | 30,808 |
| 1959 | 29,520 | 32,098 | 5,775 | 2,628 | 35,295 | 34,726 |
| 1960 | 26,918 | 29,857 | 2,926 | 897 | 29,844 | 30,754 |

**Stone.**—The output of stone, including limestone and shell used in manufacture of cement and lime, declined 7 percent from 1959. The five leading stone producing (shell excluded) counties in order of production value were Bexar, Wise, Dallas, Comal, and Travis. The three leading counties producing shell were Chambers, Galveston, and Matagorda.

Of the total output, stone supplied 74 percent and shell, 26 percent. Limestone comprised 93 percent of the stone produced and sandstone, 6 percent; the remaining 1 percent was distributed among basalt, granite, caliche, marble, and miscellaneous stone. Crushed stone—mostly limestone—represented over 99 percent of total stone production. Principal uses for crushed stone were roadstone, concrete, aggregate, railroad ballast, cement, and lime. Shell dredged from shallow bays along the Gulf Coast totaled 10 million tons, about equal to the 1959 output; value of the shell was 8 percent above that of 1959.

**TABLE 20.—Stone sold or used by producers, by kinds**

(Thousand short tons and thousand dollars)

| Year | Limestone | | Sandstone | | Shell | | Miscellaneous | | Total[1] | |
|---|---|---|---|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value | Quantity | Value | Quantity | Value |
| 1956 | 18,706 | $18,357 | 1,286 | $1,244 | 12,018 | $15,483 | 700 | $636 | 32,773 | $35,350 |
| 1957 | 19,423 | 20,509 | 1,810 | 1,587 | 9,650 | 12,640 | (2) | (2) | 31,249 | 36,154 |
| 1958 | 25,470 | 24,794 | 997 | 851 | 9,035 | 12,684 | 404 | 803 | 36,076 | 40,912 |
| 1959 | 29,141 | 30,064 | 2,406 | 1,189 | 10,310 | 14,419 | 177 | 257 | 42,172 | 47,787 |
| 1960 | 26,620 | 26,208 | 1,816 | 1,036 | 10,304 | 15,798 | 159 | 212 | 39,029 | 45,088 |

[1] Includes other stone and stone indicated by footnote 2.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Total."

Digitized by Google

Principal uses were in cement and lime manufacture, concrete aggregate, and chemicals.

Dimension stone furnished only a small part of total stone tonnage, but its value contributed substantially to total value of stone production. Rough architectural stone accounted for 17 percent of dimension stone used, dressed building stone for 48 percent, and paving blocks for 35 percent. All stone was produced by quarry or open-pit methods. Trucks moved 27 percent of stone shipments; railroads, 9 percent; waterways, 19 percent; and unspecified, 45 percent.

**Sulfur.**—Output of native sulfur by the Frasch process was reported from six Gulf Coast counties by five producers. Production of byproduct sulfur from purification of natural gas and refinery gases was reported from 12 inland counties by 18 producers and from 2 Gulf Coast counties by 5 producers. Native sulfur (about 92 percent of total sulfur produced in 1960) decreased 8 percent in tonnage and 9 percent in value, compared with 1959. Increasing competition for both domestic and foreign markets was a major contributing factor for the decline. Major competition for domestic producers came from Mexican Frasch sulfur imports. However, recovered-sulfur producers made inroads in some small local markets. Canadian, Mexican, and French sulfur producers offered growing competition to U.S. export markets, particularly in Canada, Europe, and South America. All Frasch producers and several byproduct sulfur producers offered bulk sulfur to consumers. Special facilities were required to transport sulfur in bulk. Principal sulfuric acid uses were for fertilizers, chemicals, organic pigments, petroleum refining, and iron and steel production. Principal nonacid uses of sulfur were for paper-manufacturing, carbon disulfide, dyes, and other chemicals.

**TABLE 21.—Sulfur produced and shipped from Frasch mines**

(Thousand long tons and thousand dollars)

| Year | Production | Shipments | | Year | Production | Shipments | |
|---|---|---|---|---|---|---|---|
| | | Quantity | Value | | | Quantity | Value |
| 1951–55 (average) | 3,686 | 3,677 | $91,266 | 1958 | 2,588 | 2,616 | $61,621 |
| 1956 | 3,994 | 3,437 | 91,026 | 1959 | 2,519 | 2,970 | 68,998 |
| 1957 | 3,366 | 2,880 | 70,225 | 1960 | 2,679 | 2,747 | 62,855 |

**Talc and Soapstone.**—Talc and soapstone were produced in Gillespie and Hudspeth Counties by seven producers. Output was 10 percent greater in volume and 19 percent greater in value than in 1959. Most of the production came from the expanding Allamoore district in Hudspeth County. Pioneer Talc Co. operated its grinding mill at Allamoore; custom grinding gained during the year. Demand for talc in ceramic products increased materially. Other important uses included carrier for insecticides and fungicides, roofing materials, rubber, and paint. A considerable quantity was exported to Mexico.

Digitized by Google

**Vermiculite (Exfoliated).**—Vermiculite obtained from other states was expanded at four plants in three counties. Both tonnage and value decreased compared with 1959. Principal uses were as a lightweight aggregate for plaster and concrete and as loose-fill insulation.

**Water.**—Water requirements grew rapidly due to population growth and industrial expansion. Petroleum refining and petrochemical industries, important components of industrial expansion, generally require much more water per unit of product than other industries. Intensive study of the State water problem was made by Federal, State, and municipal agencies, and trade groups.

The Nation's first saline water conversion plant, capable of producing 1 million gallons of fresh water daily, was being built at Freeport. Construction of the $1.5 million plant began on August 30. The plant will utilize the long tube, vertical, multiple-effect distillation process. Dow Chemical Co. was authorized to develop an ion exchange process to minimize scale formation in the distillation units.

## METALS

Three metals (iron, mercury, and uranium) were mined, and one metal (magnesium) was recovered from sea water; their combined value was only a small fraction of mineral output value. However, Texas had 18 primary metallurgical plants which processed ores and other materials shipped in from other states and foreign countries. These plants recovered a variety of metals including aluminum, antimony, cadmium, copper, gold, silver, iron, lead, magnesium, mercury, manganese, tin, tungsten, and zinc. About a dozen secondary smelters processed scrap and residues of aluminum, copper, lead, tin, and zinc.

Important industry highlights include the following: The 86th Congress enacted a law allowing mining industry tax write-offs for total exploration costs up to $100,000, limited to $100,000 per year. A multimillion dollar expansion was planned at the Houston mill of Sheffield Division of Armco Steel Corp. New facilities were to include a combination slab and 160-inch plate mill which will produce plates 4 inches thick and 144 inches wide. Sheffield also contracted for 100 million cubic feet of oxygen a month to be delivered by pipeline from the new plant of Linde Co., Division of Union Carbide Corp. The steel company planned to increase the use of oxygen in its open-hearth and electric furnaces to increase productive capacity without additional capital investment. Sovereign Steel of Texas planned a $30 million direct reduction plant in the Palestine area that would produce sponge-iron or semisteel from marginal east Texas iron ores. Nichols Copper Refinery of Phelps-Dodge Corp., El Paso, resumed operations early in February after a prolonged labor strike.

The Federal Bureau of Mines conducted experiments on injection of solid-fuel fines directly into the smelting zone of a blast furnace to replace part of the coke burden. Results indicated that 20 to 24 percent of the coke requirements could be replaced by utilizing this method.[4]

Laboratory mineral-dressing tests were conducted on several limonite and siderite iron ores from the North Basin of the east Texas iron ore district by the Bureau of Mines. The most effective process proved to be magnetic separation of roasted ore.[5]

**Aluminum and Bauxite.**—Aluminum productive capacity advanced from 57,000 tons a year in 1950 to 385,000 tons a year in 1960, making Texas the second largest aluminum producing State. The multimillion dollar expansion program at the Point Comfort alumina works of Aluminum Company of America was essentially completed in 1960; most facilities of the second 375,000-tons-per-year unit were installed. The company was considering several alternate plans for a channel through Lavaca Bay to allow deep sea ore boats to reach their unloading dock. All Texas alumina refineries and aluminum reduction plants operated at reduced capacities during 1960.

**Petrochemicals.**—The petrochemical industry of Texas maintained its dominant National position through new products, installations, and expansions. There were 122 operating petrochemical plants most of which were along the Gulf Coast. More than half of the plants produced complex organic products, 6 produced nitrogen-based chemicals, 17 produced butadiene and copolymer products, and more than 40 recovered sulfur or produced carbon black. The aliphatics group of petrochemicals (ethylene, propylene, butylene, and acetylene) represented over half of the productive capacity. Aromatics (benzene, toluene, and xylene) and inorganic chemicals (ammonia, sulfur, and carbon black) supplied the remaining petrochemical productive capacity. Although the State's petrochemical industry was distinctly raw-material-orientated, availability of water transportation, particularly ocean freight from Gulf Coast ports and inland waterways of the Mississippi and Ohio Rivers, contributed significantly to advantages of the petrochemical industry's Gulf Coast locations.

Industries that consume large quantities of petrochemical products were expanding or building new facilities in Texas. For example, four companies were building or planning synthetic rubber plants having a combined capacity of 110,000 tons annually. Phillips Petroleum Co. was constructing a 25,000-ton-per-year butadiene plant at Borger; Firestore Tire & Rubber Co., a 30,000-ton-per-year polybutadiene plant at Orange; and Goodyear Tire & Rubber Co., a 30,000-ton-per-year plant at Beaumont. Goodrich-Gulf Chemical Co. planned a 25,000-ton-per-year polybutadiene plant at either Orange or at Institute, W. Va. Butyl rubber capacity of the Baytown refinery of Humble Oil & Refining Co. will range from 125 million pounds to 170 million pounds annually. The company planned to increase orthoxylene (an alternate to naphthalene) capacity from 44 million to 72 million pounds annually at its Baytown refinery. A $2 million Hydeal unit to produce 50 million gallons of benzene annually was being installed at the Texas City refinery of Plymouth Oil Co. Another $1 million Hydeal unit to produce 7 million gallons of benzene was added to the Corpus Christi refinery of Sun Tide Refining Co.

**Pipelines.**—Pipelines contributed to effectiveness and economy of major raw mineral fuels and stimulated distant markets by establishing cheaper means of transportation. Major pipeline expansion and construction projects were reported as follows: Construction began in April on the Nation's first LPG pipeline—a $71 million, 1,800-mile line which will move products from Texas and New Mexico to St. Paul, Minn., and Milwaukee, Wis. Capacity will be 50,000 barrels of products daily. A 1,080-mile, 60,000-barrel-per-day LPG pipeline will be built by Trans-Continental Gas Pipeline Corp. from Mont Belvieu, near Houston, to Danville, Va., with transfer terminals in Louisiana, Mississippi, Alabama, Georgia, North and South Carolina, and Virginia.

A $196 million, 1,890-mile pipeline to deliver 300 million cubic feet of gas daily from Western Texas and Oklahoma to the Los Angeles, Calif., area was completed by Trans-Western Pipeline Co. on August 9, with valve turning ceremonies at Needles, Calif. The project required 3 years to complete; pipeline construction, however, required only 9 months. Markets for new products in new areas were opened

Digitized by Google

to Texas Gulf Refining operations when Texas Eastern Transmission Corp. completed a 90-mile connecting link between its "Little Big Inch" and the transmission system of Buckeye Pipeline Co. Texas refineries with "Little Big Inch" connections are: Humble Oil & Refining Co., Baytown; Phillips Petroleum Co., Sweeny; Gulf Oil Corp., Port Arthur; Texas City Refining Co. and Republic Oil Refining Co., Texas City; Crown Central Petroleum Co. and Shell Oil Co., Houston; and Mobile Oil Co., Texas Gas Corp., and Atlantic Refining Co., Beaumont. Industrial areas served by this combination of facilities are Toledo and Cleveland, Ohio, and Detroit, Mich.

## NONMETALS

The 15 nonmetals produced in 1960 were valued at $262 million, 6 percent of the State total mineral production value. The five principal nonmetal commodities, in order of value, were cement, sulfur, stone, sand and gravel, and salt. Production declines were reported for 10 of the 15 nonmetals; 2 of the 5 showing increases were lime and salt, which were consumed in large volumes by the expanding chemical industry.

Virtually all nonmetals except sulfur were produced for local markets because of their bulk weight and low unit price.

Important industry advances were made during the year. A $1 million plant to remove hydrocarbon and other trace impurities from "dark" sulfur and upgrade the product to premium "bright" sulfur was built at the Spindletop terminal of Texas Gulf Sulfur. A special process developed by the company permitted removal of the minor organic inclusions to yield a sulfur product preferred by most of the sulfur-consuming industry. Sulfur mining (Frasch) operations at Clemens Dome in Brazoria County were terminated by Jefferson Lake Sulfur Co. due to depletion of reserves. Talc production increased in the Allamoore district; deposits were developed by five talc producers. Pioneer Talc Co. continued operation of its new grinding mill; several other mining interests acquired mineral leases for exploratory work. A multimillion dollar expansion of the cement plant near Waco was begun by Universal Atlas Cement Division of U. S. Steel Corp. New facilities, which would double capacity to 2 million barrels of finished cement, included a second rotary kiln and accessory equipment, and a new and more efficient dust collection system. Near Van Horn, Continental Minerals Co. built a 100-ton-a-day mill to process barite ore from its Apache Mountain lease. A $500,000 automatic barite processing plant was built in Houston by International Minerals & Chemical Corp. The plant processed barite ores from Missouri, Mexico, Peru, and the Mediterranean area. Kaiser-Gypsum Co. built a $3- to $5-million gypsum products plant on the Houston ship channel, adjacent to the Olin-Mathieson Chemical Corp. plant. A $750,000 expansion program was begun at the Houston sulfur-chemical facility of Penn Salt Chemicals Corp; the new unit will produce a variety of alkyl mercaptans.

A 1-percent increase in barge rates on the Mississippi River system in the Gulf Intercoastal Canal, effective November 1, was proposed by the Waterways Freight Bureau. Specific rate increases included 11 cents a ton on bulk sulfur; 10 cents a ton on paper, pulp

Digitized by Google

**Petrochemicals.**—The petrochemical industry of Texas maintained its dominant National position through new products, installations, and expansions. There were 122 operating petrochemical plants most of which were along the Gulf Coast. More than half of the plants produced complex organic products, 6 produced nitrogen-based chemicals, 17 produced butadiene and copolymer products, and more than 40 recovered sulfur or produced carbon black. The aliphatics group of petrochemicals (ethylene, propylene, butylene, and acetylene) represented over half of the productive capacity. Aromatics (benzene, toluene, and xylene) and inorganic chemicals (ammonia, sulfur, and carbon black) supplied the remaining petrochemical productive capacity. Although the State's petrochemical industry was distinctly raw-material-orientated, availability of water transportation, particularly ocean freight from Gulf Coast ports and inland waterways of the Mississippi and Ohio Rivers, contributed significantly to advantages of the petrochemical industry's Gulf Coast locations.

Industries that consume large quantities of petrochemical products were expanding or building new facilities in Texas. For example, four companies were building or planning synthetic rubber plants having a combined capacity of 110,000 tons annually. Phillips Petroleum Co. was constructing a 25,000-ton-per-year butadiene plant at Borger; Firestore Tire & Rubber Co., a 30,000-ton-per-year polybutadiene plant at Orange; and Goodyear Tire & Rubber Co., a 30,000-ton-per-year plant at Beaumont. Goodrich-Gulf Chemical Co. planned a 25,000-ton-per-year polybutadiene plant at either Orange or at Institute, W. Va. Butyl rubber capacity of the Baytown refinery of Humble Oil & Refining Co. will range from 125 million pounds to 170 million pounds annually. The company planned to increase orthoxylene (an alternate to naphthalene) capacity from 44 million to 72 million pounds annually at its Baytown refinery. A $2 million Hydeal unit to produce 50 million gallons of benzene annually was being installed at the Texas City refinery of Plymouth Oil Co. Another $1 million Hydeal unit to produce 7 million gallons of benzene was added to the Corpus Christi refinery of Sun Tide Refining Co.

**Pipelines.**—Pipelines contributed to effectiveness and economy of major raw mineral fuels and stimulated distant markets by establishing cheaper means of transportation. Major pipeline expansion and construction projects were reported as follows: Construction began in April on the Nation's first LPG pipeline—a $71 million, 1,800-mile line which will move products from Texas and New Mexico to St. Paul, Minn., and Milwaukee, Wis. Capacity will be 50,000 barrels of products daily. wood, wood chips, limestone, sand and gravel, bauxite, iron ore, chrome, and salt; 6 cents a ton on phosphate rock and super phosphate; and 22 cents a ton on scrap iron.

**Barite.**—Crude barite from other states and foreign countries was processed in grinding plants in Cameron, Harris, Maverick, and Nueces Counties. Most of the material was processed for use in drilling mud for the oil and gas industry. Output was less than that of 1959, principally because of less drilling activity in the oil and gas industry.

**Bromine.**—The tonnage and value of bromine was 13 percent under that of 1959, reflecting excessive gasoline stocks and the growth of the compact car market. Ethyl-Dow Chemical Co., the Nation's foremost producer of bromine, operated its Freeport facilities at reduced rates throughout 1960.

**Cement.**—The cement industry expanded its production, storage, and handling facilities. There were 16 companies operating with total production capacity of 38.9 million barrels of cement, compared with 15 companies and capacity of 37.5 million barrels in 1959. The multimillion dollar, 1.4-million-barrel-per-year Midlothian plant of Texas Industries, Inc., in Ellis County began production late in 1960. Cement plants were in 11 counties compared with 10 in 1959. Operating at about 59 percent of capacity, output of the plants declined 16 percent in quantity and 13 percent in value. Five of the plants, comprising 34 percent of total capacity, were along the Gulf Coast and used over 2 million tons of shell in producing cement; the 11 remaining plants, in 8 inland counties, used over 4 million tons of limestone. Four of the cement plants used a dry process and accounted for 19 percent of installed capacity. The wet process was used by 12 plants with 81 percent of the capacity. Intrastate markets consumed 87 percent of the cement shipped in 1960.

**TABLE 13.—Destination of shipments of portland cement to Texas from mills**

| Year | Texas (thousand barrels) | Change, percent | |
|---|---|---|---|
| | | In Texas | In United States |
| 1951–55 (average) | 17,982 | | |
| 1956 | 20,954 | +1 | +6 |
| 1957 | 18,891 | −10 | −5 |
| 1958 | 22,323 | +18 | +6 |
| 1959 | 23,884 | +7 | +9 |
| 1960 | 20,195 | −15 | −7 |

**Clays.**—Although the clay industry was an important segment of the State's economy and extensive deposits of common clay or shale are widely distributed, only deposits close to large metropolitan or industrial centers were exploited. Clay production decreased 15 percent in quantity and 11 percent in value, compared with 1959.

Miscellaneous clay provided 75 percent of the production, 34 percent of which was used in manufacture of cement. Other important uses included the manufacture of building brick, heavy clay products, and lightweight aggregate. Fire clay accounted for 22 percent of total clay produced. Most fire clay was used in heavy clay products, with smaller quantities being consumed in refractories, pottery, and stoneware. Bentonitic clays, including fuller's earth, were used principally as a filtering medium for mineral and vegetable oils, as a component of drilling muds, and as an absorbent or carrier for insecticides and fungicides.

**TABLE 15.—Clays sold or used by producers, by kinds**

(Thousand short tons and thousand dollars)

| Year | Bentonite | | Fire clay | | Miscellaneous clay | | Total [1] | |
|---|---|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951-55 (average) | 76 | $846 | 364 | $1,200 | 1,908 | $2,223 | 2,348 | $4,269 |
| 1956 | 161 | 1,183 | 483 | 1,007 | 2,502 | 2,575 | 3,146 | 4,765 |

| 1958 | 121 | 889 | 501 | 1,135 | 3,097 | 3,400 | 3,719 | 5,424 |
| 1959 | 133 | 947 | 722 | 1,596 | 3,015 | 3,160 | 3,870 | 5,703 |
| 1960 | 116 | 873 | 715 | 1,668 | 2,471 | 2,517 | 3,302 | 5,058 |

[1] Incomplete total, excludes fuller's earth.

Clay production was reported from 44 counties by 69 producers; 33 of the counties reported miscellaneous clay, 10 reported fire clay, 4 reported bentonite, and 2 reported fuller's earth production. The five principal clay-producing counties, in order of output, were: Harris, Eastland, Rusk, Dallas, and Bastrop. The five principal producing companies were: Ideal Cement Co., Henderson Clay Products, Texas Lightweight Aggregate, General Portland Cement Co., and American Aggregate Co.

**Feldspar.**—A small amount of feldspar was stockpiled in Llano County to be ground and processed as roofing material.

**Fluorspar.**—Fluorspar, principally from foreign countries, was processed at mills in Brewster, Cameron, Fayette, and Harris Counties for use in chemical and metallurgical industries. Much of the fluorspar was used in manufacturing cryolite for consumption in aluminum reduction plants in Alabama, Arkansas, Oregon, and Washington.

**Gem Stones.**—Collection, preparation, and sale of gem stones by amateurs and dealers continued. The principal gem-type minerals found in Texas were agate, jasper, amethyst, apatite, chrysocolla, cinnabar, fluorspar, garnet, obsidian, opal, and agatized wood. Search for the stones centered in Brewster, Culberson, Hudspeth, Jeff Davis, Mason, Webb, and Zapata Counties.

Digitized by Google

**Graphite.**—Flake graphite was mined from open pits and processed in the mill of Southwestern Graphite Co. in Burnet County.

**Gypsum.**—Gypsum production declined 16 percent in volume and 17 percent in value from that of 1959, due largely to excess capacity for making gypsum-wallboard and building products and to a 6-percent drop in construction in the State. Production by seven producers, all from open-pit mines, was reported from five counties—Fisher, Hardeman, Hudspeth, Nolan, and Ward. Most of the crude gypsum was used in manufacturing lath and wallboard; the remainder was used principally in building plaster.

**TABLE 16.—Crude gypsum mined**

| Year | Short tons | Value | Year | Short tons | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 1,158,664 | $3,304,685 | 1958 | 1,240,050 | $4,120,311 |
| 1956 | 1,156,956 | 3,623,005 | 1959 | 1,351,060 | 4,770,228 |
| 1957 | 1,043,236 | 3,343,217 | 1960 | 1,131,034 | 3,960,361 |

**Lime.**—Moderate expansion of the lime industry continued as demand by chemical and industrial users remained high. Consumption by chemical and industrial users amounted to 78 percent of total output; the remainder was used in construction. As in 1959, lime production was reported from 8 counties by 10 producers; the 3 leading counties in order of output were Nueces, Comal, and Travis Counties. About equal quantities of limestone and shell were used as basic raw material for lime production.

Most of the lime output, 94 percent, was consumed within the State; the major part was captive. Out-of-State shipments were sent mostly to adjoining states.

**TABLE 17.—Lime sold by producers**

| Year | Quicklime (short tons) | Hydrated lime (short tons) | Total | |
|---|---|---|---|---|
| | | | Short tons | Value (thousands) |
| 1951–55 (average) | 258,489 | 175,395 | 433,884 | $4,101 |
| 1956 | 349,693 | 242,443 | 592,136 | 6,555 |
| 1957 | 559,426 | 236,968 | 796,394 | 7,499 |
| 1958 | 414,302 | 276,359 | 690,661 | 7,148 |
| 1959 | 414,052 | 394,725 | 808,777 | 8,530 |
| 1960 | 433,405 | 388,037 | 821,442 | 9,057 |

The industry utilized 23 shaft kilns and 16 rotary kilns (total annual rated capacity, 1,287,000 tons), operating at about 64 percent of capacity. Principal chemical and industrial uses were in the manufacture of alkalies, paper and petrochemicals, and as metallurgical lime in open hearth and electric furnaces. A large quantity was used for purifying and softening water.

**Lithium.**—Lithium hydroxide was processed from lepidolite ores from Southern Rhodesia at the San Antonio plant of American Lithium Chemicals, Inc. During the year, this firm completed its contract to supply the Atomic Energy Commission with lithium hydroxide.

Digitized by Google

**Magnesium Compounds.**—Magnesium compounds were produced at the Freeport plant of Dow Chemical Co. A significant quantity of the magnesium oxide produced was processed to periclase, a basic refractory material, at the new Freeport plant of E. J. Lavino & Co.

**Natural Salines.**—Sodium sulfate was recovered from salt brines in Terry and Ward Counties by Ozark-Mahoning Co. Improved demand for salt cake resulted in increased production and the company was planning expansions at its Brownfield and Monahans facilities.

**Perlite (Expanded).**—Although no crude perlite had been produced in Texas since 1956, crude materials from New Mexico and Colorado were expanded at six plants in four counties. The expanded material was used as lightweight aggregate in concrete, as an aggregate in building plaster, and as loose-fill insulation. All plants were close to metropolitan and industrial markets.

**Phosphate Rock.**—Crude phosphate rock, shipped from Tennessee and Florida, was used as a component of mixed fertilizers. Substantial quantities of processed superphosphate and triple superphosphate were shipped from other states for use in fertilizer preparation.

**Salt.**—Salt recovered from vast salt domes of the Gulf Coast and salt beds of the coastal plains was a vital component of the growing chemical industry. Production increased 5 percent in quantity and 4 percent in value compared with 1959. Over 90 percent of the output was from brine wells drilled to salt domes in seven counties and to salt beds in four counties. Principal producing counties were Brazoria, Chambers, and Duval. Most of the brine was used in manufacturing chlorine, soda ash, and other chemicals. Other uses included paper and pulp manufacture, feed mixing, water softening, and meat preparation. Nearly all the salt was consumed by industries within the State.

**TABLE 18.—Salt sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 2,867 | $7,118 | 1958 | 3,843 | $15,115 |
| 1956 | 3,963 | 14,370 | 1959 | 4,519 | 17,498 |
| 1957 | 4,612 | 17,104 | 1960 | 4,756 | 18,222 |

**Sand and Gravel.**—The tonnage and value of sand and gravel declined 15 and 11 percent, respectively, compared with 1959, because of curtailed highway and building construction due to inclement weather during the first quarter and an overall 6-percent decline in construction contracts. Deposits of sand and gravel, usually near the larger streams, are extensive and widespread.

Production was reported from 97 counties. Commercial production supplied 90 percent of total output, and Government-and-contractor production accounted for the remaining 10 percent. Building and paving consumed 91 percent of the output. Other uses were glass manufacture, railroad ballast, engine and molding sand, sandblasting, filtering, and grinding. Over 90 percent of all sand and gravel produced was washed or otherwise prepared. Trucks handled 79 per-

Digitized by Google

cent; railroads, 19 percent; and waterways, 2 percent of the total shipments.

The average value of commercial sand and gravel in 1960 was $1.11 a ton; prepared material averaged $1.16 a ton. Most Government-and-contractor material was produced for the Texas Highway Department.

**TABLE 19.—Sand and gravel sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Commercial | | Government-and-contractor | | Total sand and gravel | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 18,126 | $18,800 | 3,891 | $1,019 | 22,017 | $19,819 |
| 1956 | 23,311 | 25,512 | 6,025 | 1,701 | 29,336 | 27,213 |
| 1957 | 19,155 | 21,979 | 4,530 | 1,448 | 23,685 | 23,427 |
| 1958 | 27,015 | 28,703 | 5,856 | 2,105 | 32,871 | 30,808 |
| 1959 | 29,510 | 32,098 | 5,775 | 2,628 | 35,295 | 34,726 |
| 1960 | 26,918 | 29,857 | 2,926 | 897 | 29,844 | 30,754 |

**Stone.**—The output of stone, including limestone and shell used in manufacture of cement and lime, declined 7 percent from 1959. The five leading stone producing (shell excluded) counties in order of production value were Bexar, Wise, Dallas, Comal, and Travis. The three leading counties producing shell were Chambers, Galveston, and Matagorda.

Of the total output, stone supplied 74 percent and shell, 26 percent. Limestone comprised 93 percent of the stone produced and sandstone, 6 percent; the remaining 1 percent was distributed among basalt, granite, caliche, marble, and miscellaneous stone. Crushed stone—mostly limestone—represented over 99 percent of total stone production. Principal uses for crushed stone were roadstone, concrete, aggregate, railroad ballast, cement, and lime. Shell dredged from shallow bays along the Gulf Coast totaled 10 million tons, about equal to the 1959 output; value of the shell was 8 percent above that of 1959.

**TABLE 20.—Stone sold or used by producers, by kinds**

(Thousand short tons and thousand dollars)

| Year | Limestone | | Sandstone | | Shell | | Miscellaneous | | Total[1] | |
|---|---|---|---|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value | Quantity | Value | Quantity | Value |
| 1956 | 18,706 | $18,357 | 1,286 | $1,244 | 12,018 | $15,483 | 700 | $636 | 32,773 | $35,350 |
| 1957 | 19,423 | 20,509 | 1,810 | 1,587 | 9,650 | 12,640 | (2) | (2) | 31,249 | 36,174 |

[2] Figure withheld to avoid disclosing individual company confidential data; included with "Total."

Digitized by Google

Principal uses were in cement and lime manufacture, concrete aggregate, and chemicals.

Dimension stone furnished only a small part of total stone tonnage, but its value contributed substantially to total value of stone production. Rough architectural stone accounted for 17 percent of dimension stone used, dressed building stone for 48 percent, and paving blocks for 35 percent. All stone was produced by quarry or open-pit methods. Trucks moved 27 percent of stone shipments; railroads, 9 percent; waterways, 19 percent; and unspecified, 45 percent.

**Sulfur.**—Output of native sulfur by the Frasch process was reported from six Gulf Coast counties by five producers. Production of byproduct sulfur from purification of natural gas and refinery gases was reported from 12 inland counties by 18 producers and from 2 Gulf Coast counties by 5 producers. Native sulfur (about 92 percent of total sulfur produced in 1960) decreased 8 percent in tonnage and 9 percent in value, compared with 1959. Increasing competition for both domestic and foreign markets was a major contributing factor for the decline. Major competition for domestic producers came from Mexican Frasch sulfur imports. However, recovered-sulfur producers made inroads in some small local markets. Canadian, Mexican, and French sulfur producers offered growing competition to U.S. export markets, particularly in Canada, Europe, and South America. All Frasch producers and several byproduct sulfur producers offered bulk sulfur to consumers. Special facilities were required to transport sulfur in bulk. Principal sulfuric acid uses were for fertilizers, chemicals, organic pigments, petroleum refining, and iron and steel production. Principal nonacid uses of sulfur were for paper-manufacturing, carbon disulfide, dyes, and other chemicals.

**TABLE 21.—Sulfur produced and shipped from Frasch mines**

(Thousand long tons and thousand dollars)

| Year | Production | Shipments | | Year | Production | Shipments | |
|---|---|---|---|---|---|---|---|
| | | Quantity | Value | | | Quantity | Value |
| 1951–55 (average) | 3,686 | 3,677 | $91,266 | 1958 | 2,588 | 2,616 | $61,621 |
| 1956 | 3,994 | 3,437 | 91,026 | 1959 | 2,519 | 2,970 | 68,998 |
| 1957 | 3,366 | 2,880 | 70,225 | 1960 | 2,679 | 2,747 | 62,855 |

**Talc and Soapstone.**—Talc and soapstone were produced in Gillespie and Hudspeth Counties by seven producers. Output was 10 percent greater in volume and 19 percent greater in value than in 1959. Most of the production came from the expanding Allamoore district in Hudspeth County. Pioneer Talc Co. operated its grinding mill at Allamoore; custom grinding gained during the year. Demand for talc in ceramic products increased materially. Other important uses included carrier for insecticides and fungicides, roofing materials, rubber, and paint. A considerable quantity was exported to Mexico.

Digitized by Google

**Vermiculite (Exfoliated).**—Vermiculite obtained from other states was expanded at four plants in three counties. Both tonnage and value decreased compared with 1959. Principal uses were as a lightweight aggregate for plaster and concrete and as loose-fill insulation.

**Water.**—Water requirements grew rapidly due to population growth and industrial expansion. Petroleum refining and petrochemical industries, important components of industrial expansion, generally require much more water per unit of product than other industries. Intensive study of the State water problem was made by Federal, State, and municipal agencies, and trade groups.

The Nation's first saline water conversion plant, capable of producing 1 million gallons of fresh water daily, was being built at Freeport. Construction of the $1.5 million plant began on August 30. The plant will utilize the long tube, vertical, multiple-effect distillation process. Dow Chemical Co. was authorized to develop an ion exchange process to minimize scale formation in the distillation units.

## METALS

Three metals (iron, mercury, and uranium) were mined, and one metal (magnesium) was recovered from sea water; their combined value was only a small fraction of mineral output value. However, Texas had 18 primary metallurgical plants which processed ores and other materials shipped in from other states and foreign countries. These plants recovered a variety of metals including aluminum, antimony, cadmium, copper, gold, silver, iron, lead, magnesium, mercury, manganese, tin, tungsten, and zinc. About a dozen secondary smelters processed scrap and residues of aluminum, copper, lead, tin, and zinc.

Important industry highlights include the following: The 86th Congress enacted a law allowing mining industry tax write-offs for total exploration costs up to $400,000, limited to $100,000 per year. A multimillion dollar expansion was planned at the Houston mill of Sheffield Division of Armco Steel Corp. New facilities were to include a combination slab and 160-inch plate mill which will produce plates 4 inches thick and 144 inches wide. Sheffield also contracted for 100 million cubic feet of oxygen a month to be delivered by pipeline from the new plant of Linde Co., Division of Union Carbide Corp. The steel company planned to increase the use of oxygen in its open-hearth and electric furnaces to increase productive capacity without additional capital investment. Sovereign Steel of Texas planned a $30 million direct reduction plant in the Palestine area that would produce sponge-iron or semisteel from marginal east Texas iron ores. Nichols Copper Refinery of Phelps-Dodge Corp., El Paso, resumed operations early in February after a prolonged labor strike.

**TABLE 22.—Smelters, refineries, and reduction plants in 1960**

| Product, company, and plant | Location, county | Material treated | Source of material |
|---|---|---|---|
| Aluminum: | | | |
| Aluminum Company of America: | | | |
| Point Comfort (alumina) | Calhoun | Bauxite | Foreign. |
| Point Comfort (reduction) | do | Alumina | |
| Rockdale (reduction) | Milam | do | |
| Reynolds Metals Co.: | | | |
| Sherwin (alumina) | San Patricio | Bauxite | Foreign. |
| San Patricio (reduction) | do | Alumina | |
| Antimony: National Lead Co.: Laredo smelter | Webb | Ore | Foreign. |
| Cadmium: American Smelting and Refining Company; electrolytic. | Nueces | Flue dust | Do. |
| Copper: | | | |
| American Smelting and Refining Company: El Paso smelter. | El Paso | Ore and concentrates. | Foreign and domestic. |
| Phelps Dodge Refining Corp.: Nichols refinery | do | Blister and anode | Domestic. |
| Iron: | | | |
| Lone Star Steel Co.: Daingerfield plant | Morris | Ore and scrap | Foreign and domestic. |
| Sheffield Division of Armco Steel Corp.: Houston plant. | Harris | do | Do. |
| Lead: | | | |
| American Smelting and Refining Company: El Paso smelter. | El Paso | Ore and concentrates. | Foreign and domestic. |
| Magnesium: The Dow Chemical Co.: Freeport plant. | Brazoria | Seawater | |
| Manganese: Tenn-Tex Alloy & Chemical Co | Harris | Ore | Foreign. |
| Mercury: Terlingua Mercury Corp | Presidio | do | Domestic. |
| Tin-Tungsten: Wah Chang Corp.: Texas City smelter. | Galveston | do | Foreign. |
| Zinc: | | | |
| American Smelting and Refining Company: | | | |
| Amarillo retort smelter | Potter | Ore and concentrates. | Domestic and foreign. |
| Corpus Christi electrolytic | Nueces | do | Foreign. |
| El Paso fuming plant | El Paso | Dusts and residues | |
| American Zinc Co. of Illinois: Machovec smelter | Moore | Concentrates and fumes. | Foreign and domestic. |

The Federal Bureau of Mines conducted experiments on injection of solid-fuel fines directly into the smelting zone of a blast furnace to replace part of the coke burden. Results indicated that 20 to 24 percent of the coke requirements could be replaced by utilizing this method.[4]

Laboratory mineral-dressing tests were conducted on several limonite and siderite iron ores from the North Basin of the east Texas iron ore district by the Bureau of Mines. The most effective process proved to be magnetic separation of roasted ore.[5]

**Aluminum and Bauxite.**—Aluminum productive capacity advanced from 57,000 tons a year in 1950 to 385,000 tons a year in 1960, making Texas the second largest aluminum producing State. The multimillion dollar expansion program at the Point Comfort alumina works of Aluminum Company of America was essentially completed in 1960; most facilities of the second 375,000-tons-per-year unit were installed. The company was considering several alternate plans for a channel through Lavaca Bay to allow deep sea ore boats to reach their unloading dock. All Texas alumina refineries and aluminum reduction plants operated at reduced capacities during 1960.

Digitized by Google

**Antimony.**—National Lead Co. recovered antimony from ores and concentrates imported from Mexico and Bolivia. Some of the antimony produced was for the account of the Commodity Credit Corp.

**Cadmium.**—The Corpus Christi electrolytic zinc plant of American Smelting & Refining Co. recovered cadmium from flue dust received from other zinc smelters.

**Cesium and Rubidium.**—Cesium and rubidium were recovered in Alkarb, a mixed potassium, rubidium, cesium carbonate, by San Antonio Chemicals, Inc.

**Copper.**—Blister copper was produced from ores and concentrates of other states and foreign countries at the El Paso copper smelter of American Smelting & Refining Co. Electrolytic-grade copper and fire-refined copper were produced at the Nichols refinery of Phelps-Dodge Refining Corp. Both the smelter and the refinery resumed operations in February after a prolonged labor dispute that began in August 1959.

**Ferroalloys.**—Manganese ores, mostly of foreign origin, were processed into ferroalloys at the Houston plant of Tenn-Tex Alloy & Chemical Co.

**Iron Ore and Pig Iron.**—The output of iron ore from open pits in Cass, Cherokee, and Morris Counties declined 3 percent in quantity and 9 percent in value, compared with 1959. Ore from Mexico and South America supplemented domestic ore for blast furnace feed. Pig iron production amounted to less than 70 percent of capacity.

Lone Star Steel Co. expanded the annual capacity of its rod mill to 36,000 tons of reinforcing bars and made further progress in the use of natural gas in the blast furnace. Use of natural gas resulted in a 15-percent increase in pig iron production capacity and a 15-percent decrease in coke consumption. Expansion projects at the Houston works of Sheffield Steel Division of Armco Steel Corp. included a new plate heat-treating line and new material handling facilities consisting of deep water dock unloading equipment.

**Lead.**—Lead ores and concentrates from Western States and Mexico were processed into base bullion at the El Paso lead smelter of American Smelting & Refining Co. Seven secondary lead smelters treated scrap material.

**Magnesium.**—Magnesium—the lightest of structural metals—was produced from sea water by Dow Chemical Co. Sea water averages 0.13 percent magnesium. Production was reported from the Freeport plant; the Velasco unit was idle throughout the year. Magnesium was increasingly used as an alloying constituent with aluminum and as a reducing agent to produce titanium.

**Mercury.**—Exploration in the Terlingua district furnished ore from which a minor quantity of mercury was recovered.

**Tin and Tungsten.**—Tin and tungsten were recovered from foreign ores and concentrates at the Texas City smelter of Wah Chang Corp. The tin smelter remained the only source of primary refined tin in the Western Hemisphere.

**Uranium.**—Uranium "yellow cake" was recovered at the $2 million. 300-ton-a-day uranium mill of Susquehanna-Western, Inc., at Falls City. The mill treated stockpiled ore from open pits in Karnes County.

Digitized by Google

**Zinc.**—A considerable part of the Nation's primary and secondary zinc-smelting capacity was in Texas. Three primary plants (two horizontal retort and one electrolytic) processed foreign and Western States ores and concentrates; secondary smelters in the Fort Worth-Dallas and Houston-Beaumont areas treated scrap material. Zinc metal prices were depressed throughout the year, principally because of excessive stocks of refined zinc.

## REVIEW BY COUNTIES

**Anderson.**—Mineral fuels output increased 11 percent in value to $17.9 million. Geophysical prospecting for oil and gas declined 50 percent to 35 crew-weeks; exploratory and development drilling declined 8 percent to 104 wells totaling 479,571 feet and resulted in 54 oil completions. Five new oilfields and three new oil pays were discovered. Natural gas liquids were recovered at seven gasoline plants.

**TABLE 23.—Value of mineral production in Texas, by counties [1]**

| County | 1959 [2] | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Anderson | $16,081,752 | $17,892,900 | Petroleum, natural gas, natural gas liquids. |
| Andrews | 220,520,907 | 212,522,900 | Petroleum, natural gas liquids, natural gas. |
| Angelina | 850,557 | 669,805 | Clays,, natural gas, petroleum. |
| Aransas | 11,894,032 | 11,239,700 | Petroleum, natural gas, natural gas liquids, shell. |
| Archer | 28,539,047 | 28,632,796 | Petroleum, natural gas liquids, natural gas, stone. |
| Atascosa | 18,450,998 | 16,522,486 | Petroleum, natural gas, natural gas liquids, sand and gravel. |
| Austin | 5,326,111 | 5,414,276 | Petroleum, natural gas, sand and gravel. |
| Bastrop | 767,434 | 799,133 | Clays, petroleum, natural gas. |
| Baylor | 9,126,621 | 9,203,400 | Petroleum, natural gas. |
| Bee | 23,145,703 | 14,100,865 | Natural gas, petroleum, natural gas liquids, stone. |
| Bell | 906,284 | 355,528 | Sand and gravel, stone. |
| Bexar | 19,851,918 | 16,932,301 | Cement, stone, sand and gravel, petroleum, clays. |
| Blanco | 23,896 | 148,901 | Stone, sand and gravel. |
| Borden | 39,054,219 | 31,652,700 | Petroleum, natural gas liquids, natural gas. |
| Bosque | 76,775 | ---------- | |
| Bowie | (3) | (3) | Sand and gravel, petroleum, natural gas. |
| Brazoria | 151,548,222 | 147,692,411 | Petroleum, natural gas, natural gas liquids, bromine, magnesium chloride, salt, sulfur, magnesium compounds, lime, sand and gravel. |
| Brazos | 46,180 | 323,700 | Stone, natural gas. |
| Brewster | 63,124 | 15,285 | Clays, mercury, gem stones. |
| Briscoe | (3) | (3) | Clays. |
| Brooks | 20,647,861 | 14,579,500 | Petroleum, natural gas. |

**TABLE 23.—Value of mineral production in Texas, by counties [1]—Continued**

| County | 1959 [2] | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Pecos | $59,687,052 | $55,154,800 | Petroleum, natural gas, natural gas liquids. |
| Polk | 5,722,157 | 4,799,360 | Petroleum, natural gas, sand and gravel, stone. |
| Potter | 13,631,649 | 10,359,659 | Natural gas, sand and gravel, helium, natural gas liquids. |
| Presidio | 4,500 | | |
| Randall | | 103,210 | Sand and gravel. |
| Reagan | 35,138,625 | 36,386,800 | Petroleum, natural gas liquids, natural gas, stone. |
| Red River | 82,350 | 110,900 | Petroleum. |
| Reeves | 6,102,778 | 8,823,573 | Petroleum, natural gas liquids, natural gas, sand and gravel, gem stones. |
| Refugio | 67,726,604 | 60,009,100 | Petroleum, natural gas, natural gas liquids. |
| Roberts | 5,382,360 | 4,868,700 | Petroleum, natural gas. |
| Robertson | 423,503 | (3) | Sand and gravel, petroleum, natural gas. |
| Runnels | 13,923,667 | 24,920,845 | Petroleum, natural gas, natural gas liquids, sand and gravel. |
| Rusk | 67,423,563 | 58,899,760 | Petroleum, natural gas liquids, natural gas, clays. |
| San Augustine | 12,134 | 25,978 | Stone. |
| San Jacinto | 1,586,768 | 1,580,125 | Petroleum, natural gas, sand and gravel. |
| San Patricio | 48,308,921 | 49,506,637 | Petroleum, natural gas, natural gas liquids, sand and gravel, stone. |
| Schleicher | 10,629,881 | 9,752,000 | Petroleum, natural gas liquids, natural gas. |
| Scurry | 142,971,257 | 122,706,025 | Petroleum, natural gas liquids, natural gas, clays. |
| Shackelford | 10,036,569 | 11,090,719 | Petroleum, natural gas, natural gas liquids, stone. |
| Shelby | 1,540,905 | 1,164,800 | Natural gas, petroleum. |
| Sherman | 8,558,798 | 18,007,200 | Do. |
| Smith | 11,593,865 | 13,437,998 | Petroleum, natural gas, natural gas liquids, clays, sand and gravel. |
| Starr | 23,091,911 | 26,056,743 | Petroleum, natural gas, natural gas liquids, sand and gravel, stone, clays. |
| Stephens | 10,284,927 | 9,949,738 | Petroleum, natural gas, natural gas liquids, sand and gravel. |
| Sterling | 1,926,402 | 2,337,500 | Petroleum, natural gas. |
| Stonewall | 23,820,498 | 21,234,253 | Petroleum, natural gas liquids, natural gas, sand and gravel. |
| Sutton | 1,334,987 | 847,200 | Natural gas, petroleum. |
| Tarrant | 12,681,049 | 9,768,900 | Cement, sand and gravel, stone. |
| Taylor | 14,135,417 | 15,731,580 | Petroleum, sand and gravel, stone, clays, natural gas. |
| Terrell | 74,836 | 170,400 | Natural gas. |
| Terry | 19,830,869 | 19,534,300 | Petroleum, natural gas liquids, sodium sulfate, sand and gravel, natural gas. |
| Throckmorton | 11,556,300 | 9,841,700 | Petroleum, natural gas. |
| Titus | 10,029,082 | 4,287,700 | Do. |
| Tom Green | 5,313,739 | 5,253,235 | Petroleum, natural gas liquids, sand and gravel, natural gas. |
| Travis | 3,123,279 | 3,510,713 | Stone, lime, sand and gravel, petroleum. |
| Trinity | 49,997 | 10,567 | Stone. |
| Tyler | 4,671,625 | 3,127,100 | Petroleum, natural gas. |
| Upshur | 6,278,641 | 5,205,088 | Petroleum, natural gas, sand and gravel. |
| Upton | 57,454,034 | 67,081,100 | Petroleum, natural gas, natural gas liquids. |
| Uvalde | 3,295,150 | (3) | Asphalt, sand and gravel, basalt. |
| Val Verde | 798,907 | 611,400 | Natural gas, petroleum. |
| Van Zandt | 23,102,948 | 20,813,618 | Petroleum, salt, natural gas liquids, natural gas. |
| Victoria | 23,417,332 | 24,913,070 | Natural gas, petroleum, sand and gravel, stone. |
| Walker | 194,450 | 125,716 | Clays, petroleum. |
| Waller | 41,318,513 | 36,658,077 | Natural gas, natural gas liquids, petroleum, sand and gravel. |
| Ward | 67,301,652 | 75,665,849 | Petroleum, natural gas, natural gas liquids, sodium sulfate, sand and gravel, salt, gypsum. |
| Washington | 559,961 | 607,700 | Petroleum, natural gas. |
| Webb | 5,353,154 | 6,233,740 | Petroleum, natural gas, sand and gravel, clays. |
| Wharton | 62,634,329 | 46,862,235 | Frasch sulfur, petroleum, natural gas, natural gas liquids. |
| Wheeler | 10,010,499 | 9,311,500 | Petroleum, natural gas, natural gas liquids. |
| Wichita | 32,533,957 | 34,549,358 | Petroleum, natural gas liquids, natural gas, sand and gravel, stone. |
| Wilbarger | 18,021,061 | 17,876,695 | Petroleum, natural gas, stone. |
| Willacy | 5,926,386 | 5,359,500 | Petroleum, natural gas. |
| Williamson | 2,561,148 | 2,688,855 | Stone, lime, petroleum. |
| Wilson | 1,907,559 | 1,734,496 | Petroleum, clays, sand and gravel, natural gas. |
| Winkler | 79,224,250 | 95,040,600 | Petroleum, natural gas, natural gas liquids. |
| Wise | 28,470,189 | 27,207,833 | Natural gas, petroleum, natural gas liquids, stone, clays. |
| Wood | 52,101,403 | 48,357,575 | Petroleum, natural gas liquids, natural gas. |
| Yoakum | 50,364,708 | 60,592,717 | Petroleum, natural gas liquids, natural gas, salt. |
| Young | 20,073,682 | 18,182,400 | Petroleum, natural gas liquids, natural gas, sand and gravel, stone. |
| Zapata | 2,405,647 | 2,397,000 | Petroleum, natural gas, natural gas liquids. |

**TABLE 23.—Value of mineral production in Texas, by counties [1]—Continued**

| County | 1959 [2] | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Zavala | $806,774 | $865,600 | Petroleum, natural gas. |
| Undistributed | 17,978,586 | 3,513,658 | |
| Total | 4,219,757,000 | 4,134,901,000 | |

[1] The following counties are not listed because no production was reported: Armstrong, Bailey, Bandera, Castro, Delta, Hood, Lamar, Mills, Parmer, Rains, Real, Rockwall, Sabine, San Saba, Somervell, and Swisher.
[2] Revised figures.
[3] Figure withheld to avoid disclosing individual company data; included with "Undistributed."

A $30 million steel mill to produce 1,000 tons per day of finished steel using the Strategic-Udy direct reduction process and electric smelting was planned for the Palestine area by Sovereign Steel of Texas. The company planned to exploit the low-grade brown ores of east Texas.

**Andrews.**—Andrews County ranked second in crude oil production and in total mineral value. Natural gas liquids were recovered at five gasoline plants. Underground storage for LP gases amounted to 525,000 barrels. Geophysical prospecting decreased 6 percent to 64 crew-weeks; exploratory and development drilling dropped nearly 50 percent to 392 wells totaling 3,063,876 feet. One new oilfield and six new oil pays were discovered. Sulfur was recovered from sour natural gas at the Andrews plant of Parker & Andrews Co. and at the Midland Farms plant of Pan American Petroleum Corp.

**Angelina.**—The value of minerals produced decreased 21 percent to $669,805 compared with 1959. Declines were reported for crude oil, natural gas, and clay. Geophysical prospecting increased to 28 crew-weeks.

**Aransas.**—Mineral value declined 6 percent compared with 1959. A gain in natural gas production did not offset combined losses in crude oil and shell. Geophysical prospecting declined about 60 percent to a total of 12 crew-weeks. Exploratory drilling resulted in discovery of one new oilfield. Natural gas liquids were recovered at the K. G. Pearce gasoline plant of Bay Petroleum Corp. Carbon black was produced from natural gas and liquid hydrocarbon in channel and furnace-type plants of United Carbon Co. Shell was dredged from shallow bays along the coast.

**Archer.**—The value of minerals produced approximated that of 1959. Exploratory and development drilling increased about 150 percent to 467 wells totaling 1,112,154 feet, resulting in 319 oil wells and 5 gas wells. Eight new oilfields and five new oil pays were discovered. Geophysical prospecting declined about 50 percent to a total of 20 crew-weeks. Natural gas liquids were recovered at the Holiday gasoline plant of Warren Petroleum Corp. Sandstone was quarried and crushed for paving gravel and roadstone for District 3 of Texas Highway Department.

**Atascosa.**—Value of mineral production declined 10 percent to $16.5 million compared with 1959. The loss resulted from a substantial decrease in crude oil and natural gas production. Geophysical prospecting and drilling activities declined over 20 percent. Exploratory drilling resulted in discovery of two new oilfields. Natural gas

Digitized by Google

liquids were recovered at the Jourdanton gasoline plant of Humble Oil & Refining Co. and the Pleasanton cycle plant of Lone Star Producing Co. National Sulphur Co. recovered sulfur from sour gas at its Karnes City plant. Glass sand and other industrial sands were produced by Espey Silica Sand Co.; building and paving sand and gravel were produced by West-Land Silica Co. District 15 of Texas Highway Department contracted for paving sand and gravel.

**Austin.**—The value of minerals was 2 percent greater than in 1959 due to increased production of natural gas and sand and gravel. Geophysical prospecting gained over 100 percent to 49 crew-weeks; exploratory and development drilling increased 42 percent and proved 6 oil wells and 2 gas wells. Building and paving sand and gravel were produced on contract for District 12 of Texas Highway Department and by Brazos River Sand and Gravel.

**Bastrop.**—The total value of mineral production increased 4 percent over 1959. Crude oil and natural gas accounted for nearly half of the county's mineral value. Geophysical prospecting increased over 50 percent to 57 crew-weeks; exploratory and development drilling declined about 21 percent to 14 starts, proving 2 oil wells. One new oil pay was discovered. Fire clay, used in building brick and heavy clay products, was mined from open pits by Elgin-Butler Brick Co., Elgin Standard Brick Manufacturing Co., and Payne Brick Co.

**Baylor.**—Mineral value approximated that of 1959. Exploratory and development drilling expanded over 300 percent with 145 wells totaling 285,098 feet. Drilling activity proved 70 oil wells but no gas wells; 2 new oil pays were discovered. Geophysical prospecting increased 60 percent to 16 crew-weeks.

**Bee.**—Minerals produced by the petroleum, natural gas, and crushed stone industries were valued at 39 percent less than in 1959 as crude oil and natural gas production declined. Exploratory and development drilling, totaling 81 wells and 381,464 feet, was 14 percent less than in 1959; three new oilfields were discovered. Geophysical prospecting increased 14 percent to 79 crew-weeks. Natural gas liquids were recovered at a cycling plant of Gasoline Production Corp. and at Burnell & North Pettus plants of Pan American Petroleum Corp. Crushed limestone, used for concrete aggregate and roadstone, was produced near Beeville by Heldenfels Bros.

**Bexar.**—Value of mineral production declined 15 percent due to less output of crude oil, cement, and stone. Exploratory and development drilling proved 25 oil wells. Dehydration equipment to recover liquid hydrocarbon from lean gas streams was installed at the San Antonio plant of Lone Star Producing Co. Crude oil was processed at the San Antonio refineries of Flint Chemical Co. and Howell Refining Co.

The 5-year contract to supply lithium hydroxide to the Atomic Energy Commission from the San Antonio plant of American Lithium Chemicals, Inc., was completed. The company was considering producing other lithium chemicals for use in aluminum reduction cells. Portland and masonry cements were produced at San Antonio plants of Longhorn Portland Cement Co. and San Antonio Portland Cement Co. Both companies quarried limestone and clay from open pits for use in making cement. Five producers quarried and crushed limestone for use as concrete aggregate, roadstone, riprap, and railroad

Digitized by Google

ballast; contractors produced crushed limestone for District 13 of the Texas Highway Department. Sand and gravel, used mostly for paving purposes, was processed at six plants by eight producers. District 15 of the Texas Highway Department contracted for paving sand and gravel. Fire clay and miscellaneous clay for brick, heavy clay products, and lightweight aggregate were mined from open pits by Alamo Clay Products Co., Southern Co., and Barrett Industries.

**Borden.**—Mineral fuels produced were 19 percent less in total value than in 1959 as crude oil and gas liquid outputs were reduced. Natural gas liquids were recovered at the Big Spring gasoline plant of Reef Corp. Geophysical prospecting decreased over 70 percent in 1960; exploratory and development drilling dropped more than 50 percent. Drilling activities proved 42 oil wells.

**Brazoria.**—Brazoria County ranked first in natural gas production and third in total mineral value. Total mineral value declined 3 percent due to production losses in crude oil, bromine, and sulfur, notwithstanding increases for natural gas, natural gas liquids, salt, and magnesium compounds. Geophysical prospecting dropped about 25 percent; exploratory and development drilling remained at the 1959 pace with 96 starts totaling 569,806 feet, proving 36 oil wells and 11 gas wells. One new oilfield and five new oil pays were discovered. Natural gas liquids were recovered at four gasoline plants during the year. Carbon black was produced from natural gas at Sweeny No. 204 channel plant of Columbia Carbon Co. Phillips Petroleum Co. processed crude oil at its Sweeny refinery.

Annual styrene capacity of Dow Chemical Co.'s Freeport plant was to be expanded to more than 8 million tons; styrene is used in manufacture of synethic rubber, polystyrene plastics, and other plastics. The company also expanded its polyethylene capacity by more than 67 percent. New facilities at the Sweeny plant of Phillips Chemical Co. increased annual ethylene capacity to nearly 600 million pounds. Pan American Petroleum Corp. completed new facilities at its Old Ocean gasoline plant; daily input capacity was increased to 570 million cubic feet of natural gas.

Native sulfur was recovered by the Frasch process from Hoskins Mound Dome of Freeport Sulphur Co. and Clemens Dome of Jefferson Lake Sulphur Co. Bromine, used in manufacture of ethylene dibromide, was recovered from sea water by Ethyl-Dow Chemical Co. Magnesium chloride, used to produce magnesium metal, and other magnesium compounds were recovered from sea water at the Freeport plant of Dow Chemical Co.; lime produced from shell was used in the process. The company also recovered salt as brine from wells for use in manufacture of organic and inorganic chemicals. Paving gravel and crushed sandstone were prepared on contract for District 17 of Texas Highway Department.

**Brooks.**—Value of minerals produced was 29 percent less than in 1959 due to drastic curtailment of crude oil production. Geophysical prospecting increased 124 percent to 47 crew-weeks. Exploratory and development drilling declined 44 percent to 30 wells totaling 141,252 feet; 5 new oil pays were discovered. United Carbon Co., Inc., produced carbon black from natural gas at its Dixie channel plant.

Digitized by Google

**Brown.**—Mineral value increased 6 percent compared with 1959, due to increased production of natural gas and stone. Exploratory and development drilling totaling 164,529 feet proved 15 oil wells and 4 gas wells; 1 new oilfield was discovered. Miscellaneous clay, used in the manufacture of brick and heavy clay products, was produced from open pits by Texas Brick Co. Limestone was quarried and crushed for concrete aggregate and riprap by G. C. McBride, Inc.

**Burnet.**—Mineral output was valued at $2.1 million, 11 percent under the 1959 value. Southwestern Graphite Co. mined flake graphite from open pits and processed the ore at its mill near Burnet. Crude vermiculite was expanded at the Burnet plant of Texas Vermiculite Co. Crushed granite for riprap and dimension granite for dressed architectural stone and paving blocks were quarried and prepared by Texas Crushed Stone Co. and Texas Granite Corp. Crushed limestone was produced for riprap, flux, railroad ballast, agricultural purposes, concrete aggregate, paint filler, asphalt filler, and glass manufacturing by Pure Stone Co. and Texas Construction Material Co.

**Caldwell.**—Mineral value was 4 percent less than in 1959. Exploratory and development drilling, totaling 90 wells and 221,165 feet, proved 77 oil wells. Crude oil output, amounting to 3 million barrels, accounted for all mineral production from the county.

**Calhoun.**—Value of minerals produced was nearly 11 percent less than in 1959. Geophysical prospecting declined 50 percent. Exploratory and development drilling, totaling 564,228 feet, proved 3 oil wells and 44 gas wells; 3 new oil pays were discovered. Natural gas liquids were recovered at the Hyser gasoline plant of Humble Oil & Refining Co. and the Point Comfort plant of Aluminum Company of America. Polyethylene capacity of the Seadrift and Texas City plants of Union Carbide Chemicals Co. was expanded by 170 million pounds annually.

Aluminum Company of America completed the sixth pot line at its Point Comfort reduction works, increasing annual capacity to 140,000 tons of metal. The third and fourth units of the new alumina plant were essentially completed during 1960; the two units completed in 1959 operated throughout the year. Total annual capacity of the plant will be 750,000 to 1 million tons per year, depending on type of ore processed. Also completed was a 200-ton-per-day cryolite recovery unit. Lime was manufactured from shell at the company's new alumina plant. Shell was dredged from shallow bays by Bauer Dredging Co., and Smith Brothers Dredging Co., Inc. Paving sand was produced on contract for District 13 of Texas Highway Department.

**Callahan.**—There was an 11-percent decrease in the value of mineral production due to curtailed production of both crude oil and natural gas. Exploratory and development drilling totaled 459,117 feet and proved 23 oil wells; one new oilfield was discovered.

**Cameron.**—Mineral production was 148 percent greater in value than in 1959. Geophysical prospecting increased 140 percent to a total of 69 crew-weeks; exploratory and development drilling gained 60 percent. Facilities costing $2.5 million were added to the Brownsville petrochemical plant of Union Carbide Co.; acetic acid, acetic anhydride, and methyl and ethyl ketone were to be produced. Oxides were

Digitized by Google

produced from foreign ores at the new Brownsville plant of National Paint & Manganese Co. for use in the ceramic industry.

**Carson.**—There was a 19-percent decline in the value of minerals produced compared with 1959. Exploratory and development well drilling totaled 390,726 feet, 30 percent less than in 1959. Natural gas liquids were recovered at three gasoline plants. Cabot Carbon Co. produced carbon black from natural gas at its Schoeber channel plant. Building and paving sand and gravel were produced by various operators during the year.

**Cass.**—The value of minerals produced was essentially the same as in 1959. Geophysical prospecting increased 43 percent to 120 crew-weeks; exploratory and development drilling declined 42 percent. One new pay was discovered. Iron ore was mined from open pits by S. E. Evans Mining Co., Inc.

**Chambers.**—There was a 24-percent decline in value of minerals produced, compared with 1959, due to production drops in crude oil, natural gas liquids, and shell. Geophysical prospecting continued at about the same pace as in 1959; exploratory and development drilling declined 36 percent to a total of 66 wells. The projects proved 21 oil wells and 11 gas wells; 2 new oilfields and 6 new oil pays were discovered. Natural gas liquids were recovered at the Anahuac gasoline plant of Humble Oil & Refining Co. Crude oil was refined at the Winnie refinery of Texas Gas Corp. Over 5 million tons of shell was dredged from bays of Chambers County by W. D. Haden Co. and Parker Brothers & Co., Inc., for use as aggregate in concrete, in manufacture of paper and magnesium metal, as poultry grit, and as filler. Diamond Alkali Co. obtained salt in brine from domes near Barbers Hill for use in manufacture of industrial chemicals.

**Cherokee.**—Mineral value declined 15 percent compared with 1959, because of considerably lower crude oil output. Geophysical prospecting totaled 40 crew-weeks; exploratory and development drilling, totaling 162,586 feet, proved 5 oil wells and 1 gas well. Natural gas liquids were recovered at the Neches gasoline plant of Humble Oil & Refining Co. Brown iron ore was strip-mined near Jacksonville by L. D. Haberle Mining Corp. for use by the cement industry; Sheffield Steel Corp. mined the ore from pits near Rusk for its blast furnace at Houston. Fire clay, used in manufacturing fire brick, was mined from open pits by General Refractories Co.

**Clay.**—Mineral production declined 6 percent in value due to declines in crude oil and natural gas liquid outputs. Natural gas liquids were recovered at the gasoline plant of Otha H. Grimes. Exploratory and development drilling increased 40 percent to 129 wells, proving 103 oil wells; 1 new oilfield and 3 new oil pays were discovered. Geophysical prospecting amounted to 5 crew-weeks.

**Cochran.**—Mineral output, valued at $22 million, was 15 percent less than in 1959. Production losses in crude oil and natural gas liquids were greater than a gain in natural gas output. Natural gas liquids were recovered at the Lehman gasoline plant of Cities Service Oil Co. Exploratory and development drilling, totaling 39 wells, was 56 percent less than in 1959.

**Coke.**—Production loss in crude oil was greater than combined gains in natural gas and natural gas liquid outputs and resulted in a 29-

Digitized by Google

percent reduction in total mineral value, compared with 1959. Exploratory drilling resulted in discovery of two new oilfields and four new pays. Natural gas liquids were recovered at the Jameson plant of Sun Oil Co. and the Perkins plant of Union Texas Natural Gas Corp. Montgomery Sand & Gravel Co. recovered building and paving sand and gravel; District 7 of Texas Highway Department contracted for crushed limestone for use as concrete aggregate and roadstone.

**Coleman.**—The value of mineral production was 5 percent greater than in 1959 as most mineral outputs registered modest gains. Natural gas liquids were recovered at four gasoline plants. Exploratory and development drilling, totaling 135 wells and 420,281 feet, proved 66 oil wells and 16 gas wells. Molding sand and glass sand were produced by Santa Anna Silica Sand Co., Inc., at its plant near Santa Anna. Miscellaneous clay, used in making heavy clay products, was mined from open pits near Coleman by Martin Brick Co. Crushed limestone was quarried and prepared for use as concrete aggregate and roadstone by T. E. Sanderford.

**Colorado.**—Mineral production, valued at $20.4 million, was 6 percent less than in 1959 due to reduced output of crude oil, natural gas, and sand and gravel. Natural gas liquids were recovered at the Sheridan cycling plant of Shell Oil Co. and the Chesterville plant of Tennessee Gas Transmission Co. Geophysical prospecting totaled 79 crew-weeks; exploratory and development drilling, totaling 370,805 feet, proved 2 oil wells and 23 gas wells. Building and paving sand and gravel were mined from pits near Columbus, Eagle Lake, Alleyton, Altair, and Glidden by four producers at eight operations; District 13 of Texas Highway Department contracted for 131,826 tons of paving sand and gravel.

**Comal.**—Mineral production increased 4 percent in value compared with 1959 and included stone, lime and sand and gravel. Limestone from open pits near New Braunfels was used in manufacturing lime by United States Gypsum Co. Servtex Materials Co. quarried limestone from pits near Ogden for use as railroad ballast, riprap, concrete aggregate, and agricultural limestone. Building and paving sand and gravel were obtained from open pits by one commercial producer and by construction crews of District 15 of Texas Highway Department.

**Comanche.**—Production losses in crude oil, natural gas, and miscellaneous clay resulted in a 48-percent decline in total value of mineral production. Exploratory and development drilling, totaling 14 wells and 40,827 feet, proved 1 oil well and 3 gas wells. Miscellaneous clay was mined from open pits by De Leon Brick Co.

**Cooke.**—Mineral output valued at $32.1 million included crude oil, natural gas liquids, natural gas, stone, and sand and gravel. Geophysical prospecting totaled 12 crew-weeks. Exploratory and development drilling, totaling 716,835 feet, resulted in 142 oil wells; 1 new oilfield and 2 new oil pays were discovered. Natural gas liquids were recovered at the Walnut Bend gasoline plant of Union Texas Natural Gasoline Corp. and the Sivells Bend gasoline plant of Standard Oil Co. of Texas. Crude oil was processed at the Gainesville refinery of Tydal Co. Paving sand and gravel was produced by Texhoma Mate-

Digitized by Google

rials Co.; limestone was quarried and crushed for concrete aggregate and roadstone by contractors for District 3 of Texas Highway Department.

**Crane.**—Crane County ranked third in crude oil production and fifth in total mineral value. Mineral fuels, valued at $121.9 million, gained 17 percent over 1959. Natural gas liquids were recovered from five gasoline plants. Exploratory drilling resulted in discovery of three new oilfields and eight new oil pays. Sulfur was recovered from sour gas at the Crane gasoline plant of Phillips Petroleum Co. and the Waddell plant of Warren Petroleum Corp.

**Crockett.**—Production of mineral fuels, valued at $26.2 million, was 6 percent greater than in 1959 due to increases in natural gas and natural gas liquid output. Natural gas liquids were recovered at the Todd Ranch gasoline plant of Continental Oil Co. Exploratory drilling accounted for one new oil pay. Geophysical prospecting amounted to 36 crew-weeks.

**Culberson.**—Production of crude oil and natural gas, valued at $3.6 million, was 68 percent more than that of 1959. Geophysical prospecting declined 50 percent to 79 crew-weeks; exploratory and development drilling declined 77 percent. Continental Minerals Co. was building an 80- to 100-ton-per-day barite processing mill to produce material for use in heavy drilling muds.

**Dallas.**—Mineral production was valued at $18.6 million, 23 percent less than in 1959, and included cement, sand and gravel, and clay. The value of production of most construction materials declined. Portland and masonry cements were produced from limestone quarried at Cement City by Lone Star Cement Co. and at Eagle Ford 1 and 2 by Trinity Portland Cement Division of General Portland Cement Co. About 4 million tons of sand and gravel was prepared at 17 plants by 13 producers. District 18 of Texas Highway Department contracted for paving sand and gravel. Crude perlite, mined in other Western States, was expanded at the Irving plant of Texas Lightweight Products Co. and the Dallas plant of Texas Vermiculite Co. for use as lightweight aggregate in concrete, building plaster, and loose-fill insulation. Both plants also exfoliated crude vermiculite for use as lightweight aggregate and loose-fill insulation. Miscellaneous clay, used in manufacturing building brick, heavy clay products, and lightweight aggregate, was mined from open pits at the Mesquite plant of Ferris Brick Co. and the Dallas plant of Dallas Lightweight Aggregate Co. Both cement companies recovered surface clays for use in manufacturing cement.

**Dawson.**—Mineral value approximated that of 1959. Natural gas liquids were recovered at the Lamesa gasoline plant of Texaco Seaboard, Inc. Limestone was quarried and crushed at an open pit near O'Donnell for concrete aggregate and roadstone by Lone Star Materials, Inc. Exploratory and development wells, totaling 381,731 feet, proved 32 oil wells; 4 new oilfields were discovered. Geophysical prospecting amounted to 92 crew-weeks, 33 percent more than in 1959.

**Denton.**—There was a 34-percent increase in mineral value compared with 1959, due to gains in natural gas, clay, and sand and gravel production. Exploratory and development drilling proved three oil wells and four gas wells; this was the first gas discovery in the county.

Digitized by Google

The new zone is the Cordell sand of Pennsylvania age; additional production also was indicated in the Caddo formation. Paving sand and gravel was produced by commercial operators and by contractors for District 18 of Texas Highway Department. Limestone was quarried and prepared by contractors for District 18 of Texas Highway Department. Acme Brick Co. mined fire clay from pits near Denton.

**De Witt.**—Production of crude oil, natural gas, sand and gravel, and stone was valued at $8.9 million, approximating the 1959 value. Geophysical prospecting increased 86 percent to 262 crew-weeks. Exploratory and development drilling, totaling 495,675 feet, proved 8 oil wells and 20 gas wells; 1 new oilfield and 2 new oil pays were discovered. Limestone was quarried and crushed for concrete aggregate and roadstone by various producers and by contractors for District 13 of Texas Highway Department. Paving sand and gravel was produced by several operators.

**Dickens.**—Value of minerals produced was 20 percent less than in 1959 due to declines in output of crude oil and sand and gravel. Exploratory and development drilling, totaling 33,742 feet, resulted in 4 dry holes. Contractors quarried and crushed limestone for concrete aggregate and roadstone for District 25 of Texas Highway Department. R. W. Mize mined pit-run gravel for fill.

**Dimmit.**—Mineral fuel production was 15 percent greater than in 1959, due primarily to increased crude oil output. Exploratory drilling accounted for two new oilfields and five new oil pays. Crude oil was processed at the Carrizo Springs refinery of Texstar Petroleum Co.

**Duval.**—Mineral production, which included crude oil, natural gas, natural gas liquids, and salt, was valued at $44.1 million, about the same as in 1959. Exploratory drilling resulted in discovery of two new oilfields and four new oil pays. Natural gas liquids were recovered at the Hagist gasoline plant of Goliad Corp. Columbia Southern Chemical Corp. recovered salt in brine from wells near San Diego for use in manufacturing industrial chemicals.

**Eastland.**—Output of crude oil, natural gas liquids, natural gas, and clay was valued at $5.6 million—18 percent greater than in 1959. All mineral fuels registered modest gains in output. Natural gas liquids were recovered at four gasoline plants. Exploratory and development drilling, totaling 31 wells and 89,472 feet, resulted in 10 oil wells and 6 gas wells. Geophysical prospecting amounted to 7 crew-weeks compared with 3 in 1959. Fire clay and miscellaneous clay used in manufacturing lightweight aggregate, floor and wall tile, brick, and pottery were mined from open pits near Ranger by American Aggregate Co.; near Eastland, by Texas Lightweight Aggregate Co.; and near Cisco, by Texeramics Co. and N. D. Gallagher Clay Products Corp.

**Ector.**—Ector County ranked first in both crude oil production and total mineral value. Exploratory and development drilling declined 52 percent to 352 wells totaling 2,031,243 feet; 2 new fields and 8 new pays were discovered.

**Ellis.**—Value of minerals produced was 191 percent greater than in 1959 due largely to added cement production. The multimillion dollar, 1.4-million-barrel-a-year Midlothian cement plant of Texas Industries, Inc., began production late in the year. Limestone was

Digitized by Google

quarried and crushed for use in manufacturing cement at the Midlothian plant. Miscellaneous clay, used in brick and heavy clay products, was mined from open pits near Ferris by Acme Brick Co. and Ferris Brick Co., and from pits near Palmer by Barron Brick Co. Paving gravel was prepared at the Taylor pit by Taylor Gravel Co.

**El Paso.**—Mineral production declined 26 percent compared with 1959. Southwestern Portland Cement Co. quarried limestone and shale from open pits for use in manufacturing portland and masonry cements at its El Paso works. El Paso refineries of Standard Oil Co. of Texas and Texaco, Inc., processed crude oil. Limestone was quarried and crushed for concrete aggregate and roadstone by McMillan Quarries, Inc., and Vowell Material Co. Industrial sand and building sand and gravel were prepared by El Paso Sand Products Co. Structural and paving sand and gravel were prepared on contract for the U.S. Army Corps of Engineers.

**Erath.**—Value of mineral output was 13 percent greater than in 1959. Limestone was quarried and crushed for District 2 of Texas Highway Department. Crude oil and natural gas production was reported during the year.

**Fannin.**—Building and paving sand and gravel were produced by one operator; sandstone was quarried and crushed for use as concrete aggregate and roadstone by contractors for District 2 of Texas Highway Department.

**Fayette.**—Mineral production was valued at $1.2 million, 8 percent less than in 1959. Building and paving sand and gravel were recovered from pits near LaGrange by Thorstenberg Materials Co.; District 13 of Texas Highway Department contracted for crushed limestone and building and paving sand and gravel. Bentonitic clay, used principally in preparing heavy drilling mud, and fuller's earth were recovered from open pits near Flatonia by Milwhite Co., Inc., and Flatonia Fuller's Earth Co.

**Fisher.**—Mineral value declined 18 percent to $14.2 million, compared with 1959, because of significantly reduced petroleum activity. One new oilfield was discovered through exploratory drilling; geophysical prospecting amounted to 20 crew-weeks. Natural gas liquids were recovered at the Claytonville and "F" gasoline plants of Claytonville Gasoline Co. and the Velta plant of Texas Pacific Coal & Oil Co. Crude gypsum, used in manufacture of wallboard, plaster, and other building products, was mined from open pits near Hamlin by Celotex Corp. and from pits near Rotan by National Gypsum Co. Building and paving sand was prepared by one producer.

**Foard.**—Mineral production was valued at $2.8 million, 7 percent greater than in 1959. Geophysical prospecting amounted to 46 crew-weeks, compared with 38 in 1959. Exploratory and development wells, totaling 253,638 feet of drilling, proved 11 oil wells; no new oilfields or oil pays were discovered. Limestone was quarried and crushed by contractors for District 25 of Texas Highway Department.

**Fort Bend.**—Declines in the value of crude oil, clay, sand and gravel, and sulfur production were not offset by increases in natural gas and salt, resulting in a 9-percent drop in the value of mineral output. Geophysical prospecting amounted to 11 crew-weeks, compared with 39 crew-weeks in 1959. Exploratory and development drilling

Digitized by Google

amounted to 63 wells and 296,734 feet of hole, resulting in 33 oil wells and 3 gas wells; 1 new oil pay was discovered. Native sulfur was recovered by the Frasch method from Orchard Dome by Duval Sulphur & Potash Co. and from Long Point Dome by Jefferson Lake Sulphur Co. Texas Lightweight Aggregate Co. mined miscellaneous clay from pits near Missouri City for use in manufacturing lightweight aggregate. Salt-in-brine and evaporated salt were prepared at Blue Ridge Works of United Salt Corp. Paving sand and gravel was produced under contract for District 12 of Texas Highway Department.

**Franklin.**—Value of mineral fuels was 93 percent greater than in 1959 due to increased production of petroleum and natural gas liquids. Geophysical prospecting totaled 10 crew-weeks. Exploratory and development wells, totaling 108,098 feet, resulted in 2 oil wells and 5 gas wells. Natural gas liquids were recovered at the New Hope cycling plant of Tidewater Oil Co.; sulfur was also recovered from sour gas at the plant.

**Freestone.**—The 110-percent increase in value of mineral production, compared with 1959, was due to production increases in crude oil and natural gas. Exploratory and development drilling, totaling 240,523 feet, proved 7 oil wells and 15 gas wells during the year. Miscellaneous clay, used in manufacturing brick and heavy clay products, was mined from open pits near Teague by Teague Brick & Tile Co. Limestone was quarried and crushed for concrete aggregate and roadstone by East Texas Stone Co.

**Frio.**—Crude oil, natural gas, and natural gas liquids accounted for most of the $5.1 million mineral value. Paving gravel was produced by crews of District 15 of Texas Highway Department.

**Gaines.**—Mineral value of Gaines County declined 3 percent, to $71.4 million, as losses in petroleum output were greater than gains in natural gas production. Geophysical prospecting amounted to 107 crew-weeks; drilling of 145 exploratory and development wells proved 110 oil wells and 5 gas wells. Natural gas liquids were recovered at the Seminole plant of Phillips Petroleum Co. and the West Seminole plant of Cities Service Oil Co. Sulfur and carbon black were recovered from sour natural gas at the Seminole No. 67 plant of Columbian Carbon Co. Limestone was quarried and crushed for concrete aggregate and roadstone by one producer.

**Galveston.**—The value of mineral production in Galveston County was 6 percent greater than that of 1959 as production gains were reported for both natural gas and crude oil. Geophysical prospecting declined 40 percent, compared with 1959, to 87 crew-weeks. Exploratory and development drilling declined 6 percent to 91 wells and proved 52 oil wells and 10 gas wells; 1 new oilfield and 1 new oil pay were discovered. Crude oil was processed at three refineries having a combined daily capacity of 240,000 barrels. At its Texas City refinery, American Oil Co. began construction of a two-stage pipe-still with a fractionation system capable of handling 150,000 barrels per day, a 47,600-barrel-per-day catalytic cracking unit, and a 14,600-barrel-per-day alkylation unit. Sulfur was recovered at the new multimillion dollar Frasch sulfur mine of U.S. Sulphur Corp. at High Island Dome near Galveston. Natural gas liquids were recov-

Digitized by Google

ered at the Alta Loma gasoline plant of the Margaret Hunt Trust Estate. Shell was dredged from shallow bays at Galveston by Horton & Horton for use principally as roadstone and in manufacturing cement. Paving sand was prepared by construction crews of the City of Galveston.

**Garza.**—Value of minerals produced in Garza County declined 14 percent as crude oil production was severely curtailed. Geophysical prospecting declined 33 percent to 37 crew-weeks; exploratory and development drilling declined 59 percent to 77 wells totaling 333,105 feet. Building sand and gravel was produced by one operator.

**Gillespie.**—Mineral value increased 33 percent to $116,655 compared with 1959. Talc was strip mined on contract for Southwestern Talc Corp. Five operators produced a total of 66,760 tons of building and paving sand and gravel. Bear Mountain Quarries mined and prepared rough monumental granite. Crushed limestone was produced on contract for concrete aggregate and roadstone for District 14 of Texas Highway Department.

**Glasscock.**—There was a 55-percent gain in mineral value in 1960 due to increased production of crude oil and natural gas. Geophysical prospecting during the year declined 36 percent to 9 crew-weeks; exploratory and development drilling increased 35 percent to 27 wells and resulted in 7 oil wells. Limestone was quarried and crushed by contractors for concrete aggregate and roadstone for District 7 of Texas Highway Department.

**Goliad.**—Declines in both oil and gas production resulted in a 6-percent loss in total mineral value. Geophysical prospecting increased 13 percent to 35 crew-weeks. Exploratory and development drilling dropped 23 percent to 53 wells and proved 4 oil wells and 28 gas wells; 1 new oil pay was discovered. Natural gas liquids were recovered at the Burnell-North Pettus cycling plant of Pan American Petroleum Corp. in Bee County.

**Gonzales.**—Mineral value declined 45 percent to $168,077. Building and paving sand and gravel were produced by Gonzales Gravel Co.; District 13 of Texas Highway Department contracted for paving gravel. Bentonitic clays were mined from open pits by Baroid Division of National Lead Co. and Southern Clay Products Co. Geophysical prospecting declined over 80 percent to 40 crew-weeks.

**Gray.**—Reductions in oil and gas production were offset by increased natural gas liquid output so that total mineral value approximated that of 1959. Geophysical prospecting was limited to 8 crew-weeks; exploratory and development drilling, totaling 158 wells and 437,384 feet, resulted in 102 oil wells and 38 gas wells. Natural gas liquids were recovered at eight gasoline plants; carbon black was recovered at three channel plants and one furnace plant.

**Grayson.**—There was a 13-percent decline in total value of mineral production compared with 1959. Losses in crude oil and natural gas liquid output exceeded increased natural gas production. Natural gas liquids were recovered at eight plants operated by five companies. Geophysical prospecting dropped 15 percent to 73 crew-weeks. Exploratory and development drilling increased 50 percent to 66 wells and proved 44 oil wells and 5 gas wells; 1 new oilfield and 6 new oil pays were discovered. Two producers quarried and prepared lime-

Digitized by Google

**Howard.**—A 5-percent decline in mineral value was due entirely to curtailed crude oil production. Cosden Petroleum Corp. processed crude oil at its Big Spring refinery. Carbon black was recovered from hydrocarbon liquids at the Dixon furnace plant of Cabot Carbon Co. West Texas Sand & Gravel Co. prepared building and paving sand and gravel. Cosden Petroleum Corp expanded styrene capacity of its Big Spring chemical plant to 60 million pounds per year, ortho-xylene capacity to 80 million pounds per year, and metaxylene capacity to 3 million pounds per year due to increased demand for phthalic anhydride and isophthalic acid. A new 50-million-pound-per-year carbon black plant using United Carbon Co. processes was planned for the Big Spring area by Sid Richardson Carbon Co.

**Hudspeth.**—Increased talc production resulted in a 7-percent increase in total mineral value. Talc used in ceramics, insecticides, paint, roofing, rubber, and joint cement was recovered from open pits near Allamoore by five producers. Pioneer Talc Co. operated its grinding mill at increased capacity. Crude gypsum, used as a retarder in cement by Southwestern Portland Cement Co., was mined from open pits near Sierra Blanca. Rhyolite was quarried and crushed by Gifford-Hill & Co., Inc., at a quarry near Penwell.

**Hutchinson.**—Production increases in both natural gas and natural gas liquids more than compensated for crude oil production losses and the value of mineral production increased 4-percent to $64.9 million. Drilling activity by the oil and gas industry declined 15 percent. Carbon black was recovered at four furnace plants and one channel plant. Natural gas liquids were recovered at eight gasoline plants. A 25,000-ton-per-year cis-4 polybutadiene plant was built by Phillips Chemical Co. adjacent to its Borger butadiene plant. Tri-City Sand & Gravel Co. and Borger Readi-Mix Co. produced building and paving sand and gravel. Salt in brine was recovered from underground salt beds by Phillips Petroleum Co. for use in its petrochemical complex at Borger.

**Irion.**—Increases in natural gas and natural gas liquids production failed to compensate for losses in crude oil production, with the result that total mineral value declined 1 percent to $2.1 million, compared with 1959. Geophysical prospecting increased over 100 percent to 25 crew-weeks; exploratory and development drilling gained 21 percent to 69 wells totaling 152,513 feet and proved 22 oil wells and 1 gas well. Mertzon Corp. recovered natural gas liquids at its Mertzon gasoline plant.

**Jack.**—Mineral value increased 15 percent as the petroleum and natural gas industries reported improved production. Geophysical prospecting increased 67 percent to a modest 10 crew-weeks; exploratory and development drilling declined over 43 percent to 141 wells totaling 480,507 feet. Bryson Pipeline & Refining Co. processed crude oil at its Bryson refinery. Natural gas liquids were recovered at the Black Hawk gasoline plant of Black Hawk Gasoline Corp., the Brazos plant of Brazos River Gas Co., and the Jupiter plant of Welstream Equipment Corp.

**Jackson.**—Gains in natural gas production were greater than crude oil losses, resulting in a 4-percent increase in total mineral value. Geophysical prospecting rose 12 percent to 64 crew-weeks; and ex-

Digitized by Google

ploratory and development drilling rose 20 percent to 175 wells totaling 908,546 feet and proved 25 oil wells and 72 gas wells. Cycling plants of Francitas Gas Co. and Sunray Mid-Continent Oil Co. and the Vanderbilt Gasoline plant of Socony Mobil Oil Co., Inc., recovered natural gas liquids. Contractors recovered and prepared paving sand and gravel from open pits for District 13 of Texas Highway Department. The world's first sextuple well completion was recorded by Sunray Mid-Continent Oil Co. with production from 6 gas zones at depths from 4,683 to 6,634 feet. A $400,000 expansion of the Carancahua Bay gasoline plant of Sunray Mid-Continent Oil Co. doubled its capacity to 60 million cubic feet of gas per day; natural gas liquids recovery was increased by 30 million gallons per day.

**Jasper.**—Moderate increases in crude oil production resulted in a 10-percent increase in total mineral value compared with 1959. Natural gas output approximated that of 1959. Exploratory and development drilling decreased 52 percent to 11 wells totaling 124,515 feet and proved 2 oil wells and 1 gas well.

**Jefferson.**—Crude oil, natural gas, and sulfur accounted for over 90 percent of the county total mineral value. Production of all three commodities rose, resulting in an 18-percent increase in total mineral value to $62.8 million compared with 1959. Although geophysical prospecting declined 57 percent to 67 crew-weeks, exploratory and development drilling rose 17 percent to 132 wells totaling 1,012,086 feet.

A $1 million filtration plant to upgrade sulfur by removing organic and other trace impurities was built at the Spindletop operations of Texas Gulf Sulphur Co. Texaco, Inc., added a 30-million-gallon-per-year benzene facility to its Port Arthur refinery; new equipment included a unifier-catalytic reforming unit, a Udex extraction unit, and other treating and fractionating facilities. The company's Port Arthur refinery set a world's safety record for the refining industry by operating 7.6 billion man-hours without a lost-time injury. Mobil Chemical Co. was building the world's largest high-purity ethylene plant adjacent to its Beaumont refinery. Capacity will be 380 million pounds per year, with initial production scheduled for the first quarter of 1961. Mobil Oil Co. added a 20,000-barrel-per-day delayed-coking unit to its Beaumont refinery. The synthetic rubber copolymer capacity of the Port Neches plant of Texas-U.S. Chemical Co. was increased 10 percent. Koppers Co., Inc., increased high-pressure polyethylene capacity of its Port Arthur facilities to 46 million pounds per year. Facilities to produce 50 million pounds per year of caprolactan from cyclohexane were added to the Beaumont plant of E. I. du Pont de Nemours & Co., Inc. A synthetic rubber plant based on isoprene and butadiene was built by Goodyear Tire & Rubber Co. The first commercial Hydrar unit to produce high-purity cyclohexane from benzene was put on stream at the Port Arthur refinery of Gulf Oil Corp. Six refineries, with a total daily throughput capacity of 986,000 barrels, processed crude oil in the county. Natural gas liquids were recovered at the Texas Gasoline plant of Texas Gas Corp. Native sulfur was recovered by the Frasch process from Spindletop Dome and Fannett Dome by Texas Gulf Sulphur Co. and from refinery gases of the Port Arthur refinery of Gulf Oil Corp. by Olin-Mathieson Chemical Corp. Texas Brine

Digitized by Google

Corp. recovered salt in brine from wells near Gladys City. Brick and heavy clay products were made from miscellaneous clay mined from open pits by Beaumont Brick Co., Inc. C. A. McKinley Sons, Inc., produced building sand and gravel.

**Jim Hogg.**—Value of mineral production rose 72 percent to $8.4 million because of a sizable increase in crude oil and natural gas production. Exploratory and development drilling increased 28 percent to 95 wells totaling 393,175 cubic feet and proved 64 oil wells and 12 gas wells.

**Jim Wells.**—Crude oil and natural gas production both contributed to the 15-percent decline in mineral value. The industry drilled 76 wells totaling 452,535 feet and proved 17 oil wells and 23 gas wells. Natural gas liquids were recovered at the La Gloria cycle plant of La Gloria Oil & Gas Co. and the Seeligson gasoline plant of Mobil Oil Co., Inc.

**Johnson.**—Reductions in lime and stone production resulted in a 15-percent decline in total mineral value. Lime for chemical and industrial uses and for construction was produced from limestone quarried by Texas Lime Co. The company also quarried and crushed limestone for riprap, concrete aggregate, roadstone, mineral food, and soil conditioner. Various contractors quarried and crushed limestone for concrete aggregate and roadstone for District 18 of Texas Highway Department. Building and paving sand and gravel were produced by Aggregates Producers, Inc.

**Jones.**—Total mineral value approximated the 1959 value as increases in natural gas production almost offset losses in crude oil and natural gas liquid output. Exploratory and development drilling decreased 30 percent to 177 wells totaling 642,659 feet and proved 78 oil wells. Petroleum Products Co. processed crude oil at its Lueders refinery. Natural gas liquids were recovered at the Wimberly No. 1 gasoline plant of Texas Natural Gasoline Corp. West Texas Stone Co. quarried and prepared rough architectural and dressed building stone. Limestone quarried in Shackelford County was prepared for rough architectural and dressed building stone by Lueders Limestone Co. Building and paving sand and gravel were produced by one operator.

**Karnes.**—Production of the State's first uranium oxide ($U_3O_8$) and increased production of crude oil, natural gas, and natural gas liquids accounted for the 45-percent increase in mineral value. The uranium mill, which cost about $2.4 million and had a rated capacity of 300 tons of ore per day, was put in operation by Susquehanna-Western, Inc. Uranium ores recovered from open pits in the Falls City area will be treated at the mill. Natural gas liquids were recovered at the Capeza Creek and Karnes City gasoline plants of United Gas Pipeline Co. Exploratory and development drilling increased nearly 100 percent to 72 wells totaling 702,975 feet and proved 40 oil wells and 4 gas wells. Sulfur was recovered from sour gas at the Fashing plant of Warren Petroleum Corp.

**Kaufman.**—Curtailment of crude oil production resulted in an 18-percent decline in total mineral value, compared with 1959. Limestone was quarried and crushed for concrete aggregate and roadstone by various producers for Districts 1 and 18 of Texas Highway Department.

Digitized by Google

**Kenedy.**—The increase in natural gas production was greater than decreases for crude oil and natural gas liquid production so that total mineral value was 6 percent greater than in 1959. Natural gas liquids were recovered at the Julian Pasture cycle plant of Humble Oil & Refining Co. Exploratory and development drilling totaling 81,117 feet proved 1 oil and 1 gas well.

**Kent.**—The 2-percent reduction in total mineral value was due entirely to curtailed crude oil output which was responsible for nearly 90 percent of the county mineral value. The Senn Gravel Co. prepared building sand and gravel.

**Kimble.**—Total mineral value declined 25 percent compared with 1959; all commodities—petroleum, natural gas, and sand and gravel—had lower output. Weirich Bros., Inc., prepared building and paving sand and gravel.

**King.**—Sizable curtailment of crude oil production was responsible for the 32-percent decline in total mineral value to $2.4 million. A moderate increase in natural gas production was reported. Exploratory and development drilling reduced by 39 percent to a total of 104,551 feet, proved 2 oil wells.

**Kleberg.**—Total mineral value advanced 160 percent to $54 million as production of crude oil, natural gas, and natural gas liquids rose. Geophysical prospecting declined 40 percent to 30 crew-weeks; exploratory and development drilling advanced 8 percent to 55 wells totaling 415,464 feet and proved 20 oil wells and 24 gas wells. Humble Oil & Refining Co. completed the world's largest cycling plant, the King Ranch plant 15 miles south of Kingsville, with a daily capacity of 950 million cubic feet to recover 1.2 million gallons of natural gas liquids daily. Natural gas liquids also were recovered at the May gasoline plant of Cities Service Oil Corp. Evaporated salt was prepared from brine by the Trace Elements Corp., Division of United Salt Co.

**Knox.**—The value of mineral production was 14 percent greater than in 1959 due to greater crude oil production, which accounted for over 90 percent of the total value. There were 73 oil wells proven in the county, although exploratory and development drilling declined nearly 40 percent to 373,340 feet.

**Lamb.**—Increases in crude oil production resulted in a 27-percent increase in total mineral value to $2.3 million compared with 1959. Seven development wells and 4 exploratory wells totaling 47,718 feet proved 6 oil wells. Crude oil production amounted to 2.3 million barrels.

**La Salle.**—Moderate increases in crude oil and natural gas production resulted in a 14-percent increase in the county total mineral value compared with 1959. Geophysical prospecting increased 40 percent to 31 crew-weeks; exploratory and development drilling dropped 27 percent to 36 wells totaling 241,576 feet and proved 5 oil wells and 4 gas wells.

**Lavaca.**—Increases in natural gas liquids recovery offset production losses in crude oil and natural gas and the value of mineral production rose 16 percent above that of 1959. New facilities at the Provident City gasoline plant of Shell Oil Co. increased propane recovery from 21,000 to 33,000 gallons per day and natural gasoline recovery

Digitized by Google

stone for concrete aggregate, riprap, and roadstone. Southwest Sand Co. produced building sand.

**Gregg.**—Gregg County was the State's fifth largest crude oil producer. Significant production curtailment of crude oil and natural gas liquids resulted in an 11-percent reduction in total mineral value. Natural gas liquids were recovered at five gasoline plants. The 35 exploratory and development wells, totaling 210,768 feet, constituted a 26-percent decrease from 1959. Crude oil was processed at the Longview refineries of Premier Oil & Refining Co. and Skelly Oil Co., and at the Gladewater refinery of Gladewater Refining Co.

**Grimes.**—A gain in natural gas output increased the value of mineral production to $544,200. Geophysical prospecting declined 27 percent to 19 crew-weeks; 2 exploratory wells proved 1 gas discovery.

**Guadalupe.**—Mineral production, valued at $12.3 million, was 4 percent greater than in 1959 due to moderate increases in crude oil and sand and gravel output. Exploratory and development drilling declined 25 percent to 49 wells and 141,056 feet, resulting in 38 oil wells. Building and paving sand and gravel were produced by two operators; paving gravel was produced on contract for District 15 of Texas Highway Department. Fraser Brick & Tile Co. mined miscellaneous clay for brick and heavy clay products from open pits near McQueeney.

**Hamilton.**—Value of natural gas and sand and gravel production was 20 percent less than in 1959. Paving sand and gravel was produced by one operator. Geophysical prospecting totaled 28 crew-weeks.

**Hansford.**—The 21-percent decline in value of mineral fuel production was due largely to a reduction in natural gas output. Natural gas liquids were recovered at the Hansford and Sherman gasoline plants of Phillips Petroleum Co.

**Hardeman.**—Geophysical prospecting declined 62 percent to 38 crew-weeks. Exploratory and development drilling increased 22 percent to 11 wells and resulted in 3 oil wells; 1 new oil pay was discovered. Bestwall Gypsum Co. mined gypsum from open pits near Acme for manufacturing wallboard, plaster, and other building products. Limestone was quarried and prepared as concrete aggregate and roadstone for District 25 of Texas Highway Department.

**Hardin.**—Mineral production, valued at $25.2 million, was 12 percent less than in 1959. The loss was due to moderate declines in both crude oil and natural gas liquid output. Geophysical prospecting increased 19 percent to 37 crew-weeks. Exploratory and development drilling dropped 3 percent to 106 wells totaling 457,205 feet; 1 new oilfield and 1 new oil pay were discovered. Natural gas liquids were recovered at the Nos. 25 and 26 cycling plants of Sinclair Oil & Gas Co.

**Harris.**—Value of mineral production declined 7 percent compared with that of 1959. Natural gas liquids were recovered at four gasoline plants and two cycling plants. Carbon black was produced from liquid hydrocarbons at the Eldon furnace plant of J. M. Huber Corp. Crude oil was processed at seven refineries having a combined daily throughput of 715,000 barrels. Geophysical prospecting declined 52 percent to 21 crew-weeks and drilling, 25 percent to 125 wells; 2 new oil pays were discovered. Sulfur was recovered from refinery gases at the Baytown plant of Stauffer Chemical Co., the Deer Park plant of

Digitized by Google

Shell Chemical Corp., and the Houston plant of Sinclair Refining Co. A multimillion dollar expansion was made at the Houston mill of Sheffield Division of Armco Steel Corp. New facilities included a slab mill and a 160-inch plate mill which produces plates 4 inches thick and 144 inches wide. This equipment permits rolling all grades of carbon and alloy plates in a wide variety of lengths, widths, and thicknesses. The capacities of the open hearth and electric furnaces were increased through the addition of pure oxygen without additional capital expenditures. Lone Star Steel continued improvement of its practice of introducing natural gas into the blast furnace as a fuel and reductant, thus reducing coke burden and increasing pig iron capacity.

Sheffield Steel requested permission of the U.S. Army Corps of Engineers to build a 10,000-ton raw material handling and storage dock on the Houston ship channel. A $1 million detinning plant to produce high-yield steel scrap and refined electrolytic tin was planned for the Houston area by Vulcan Detinning Division of Vulcan Materials Co.

Portland and masonry cements were manufactured from shell by Lone Star Cement Corp., Ideal Cement Co., and Trinity Division of General Portland Cement Corp. The three cement producers also recovered clay from open pits for manufacturing their cement.

Miscellaneous clay was mined from open pits near Houston and used in manufacture of brick and heavy clay products by Acme Brick Co., J.M. Cordell & Sons, Inc., and Houston Brick & Tile Co. Crude perlite and vermiculite from other states was expanded at the Houston plants of Perlite of Houston, Inc., Vermiculite Products, Inc., and Tri-Lite Corp. for use as lightweight aggregate in concrete and plaster and as loose-fill insulation.

Salt was mined underground and prepared as rock salt and block salt at the Hockley plan of United Salt Co. and was obtained in brine from wells near Houston by Texas Brine Co.

Lime was manufactured from oystershell at the Pasadena plant of Champion Paper & Fiber Co. for use in paper and fiberboard manufacture, at the Houston plant of Nyotex Chemical Co. for use in manufacture of industrial chemicals, and at the Houston plant of Sheffield Division of Armco Steel as a metallurgical flux. Barite from foreign countries and from other states was crushed and ground for use in drilling muds at the Houston plants of Barite Division, National Lead Co., and Milwhite Co., Inc.

Building and paving sand and gravel were produced by five companies; District 12 of Texas Highway Department contracted for paving sand and gravel.

Many additions and plant expansions occurred in the petroleum refining and petrochemical industries in Harris County. A 70-million-pound-per-year styrene monomer plant using a "styrene-from-gasoline" process was planned for the Houston area by Sinclair-Koppers Chemical Co. The plant will recover pure ethylbenzene from a mixed xylene stream. A pilot plant to product 30 million pounds per year of maleic anhydride was built by Petro-Tex Chemical Corp. The Carwin Co. built a 1-million-pound-per-year isocyanates plant. A new research and development center which will include a laboratory with adjacent polymer development facilities was planned for the

Digitized by Google

Houston area by United Carbon Co. The company also increased the capacity of its copolymer plant from 150 to 200 million pounds per year to meet new demand for a series of new black master batch compounds for improved truck tire rubber. A plant to produce an additional 600 tons per day of oxygen and 100 tons per day of nitrogen was built by Linde Co., Division of Union Carbide, on the Houston ship channel. Pipelines from the new and existing facilities will deliver 140 tons per day of oxygen to the Sheffield Steel plant and 250 tons per day of oxygen and 150 tons per day of nitrogen to the Houston plant of Diamond Alkali Co. Oxygen to other customers will be supplied in cylinders. Phillips Petroleum Co. contracted for two refrigerated propane-ammonia barges. Each barge will carry 1,700 tons of anhydrous ammonia refrigerated to minus 28° F. A $1 million, highly automated rubber plant to produce mixtures of carbon black with polyethylene and polypropylene to be used for cable insulating material and plastic pipe was built at Houston by Columbian Carbon Co. J. M. Huber Corp. increased the carbon black capacity of its Baytown plant from 110 to 193 tons per day at a cost of $2.5 million. Low pressure polyolefin capacity of the Houston plant of Celanese Chemical Co. was increased from 40 million pounds to 50 million pounds per year. The company also expanded its high-density linear polyethylene capacity to 50 million pounds per year. Acetylene capacity of the Deer Park plant of Diamond Alkali Co., was increased by 40 million pounds per year, and new facilities to increase present polymer capacity (polyvinyl chlorides) were also being added.

Sulfuric acid facilities were being added to the La Porte plant of Du Pont. Pennsalt Chemicals Corp. added alkyl mercaptan facilities to its Houston plant. Humble Oil & Refining Co. increased the butyl-x rubber capacity of its Baytown plant to more than 170 million pounds per year. The company also completed a $30 million, 40-million-pound-per-year polypropylene plant. Half the production was to be made to specifications of Spencer Chemical Co. Vacuum capacity of the company's Baytown refinery was increased from 157,000 barrels to 179,000 barrels; catalytic hydrogen treatment capacity was raised from 65,000 barrels to 82,300 barrels daily. A 17-million-gallon underground storage cavity in a salt dome near Houston was developed by Tuloma Gas Products Co. Capacity of the "Little Big Inch" pipeline of Texas Eastern Transmission Co., a 4,468-mile system from Houston, Tex., to Moundsville, W. Va., was increased to nearly 16 million barrels. The company Mt. Belvieu underground LPG storage cavity was enlarged from 320,000 barrels to 550,000 barrels.

**Harrison.**—The 14-percent decline in mineral value was due to reduction in natural gas and natural gas liquid outputs. Exploratory and development drilling declined 18 percent to 129 wells totaling 504,684 feet. Natural gas liquids were recovered at six gasoline plants. Brick, heavy clay products, stoneware, and pottery were manufactured from miscellaneous clay and fire clay mined from open pits near Waskom by Acme Brick Co. and from pits near Marshall by Marshall Brick Co. and Marshall Pottery Co. Lignite mined from open pits was used in manufacturing several grades of activated

Digitized by Google

carbon by the D'Arco Division of Atlas Powder Co. Crude oil was refined at the Waskom refinery of Natural Gas Corp.

**Hartley.**—Value of crude oil and natural gas was 27 percent less than in 1959. Geophysical prospecting increased 180 percent to 31 crew-weeks; only 2 exploratory wells were drilled during the year, both of which were dry holes.

**Haskell.**—Crude oil, natural gas, and stone production was valued at $12.4 million, 20 percent more than in 1959. The increase was due to greater crude oil and stone production. Of 165 exploratory and development wells drilled, 90 were oil wells; geophysical prospecting totaled 9 crew-weeks. Limestone was quarried and crushed for concrete aggregate and roadstone by contractors for District 2 of Texas Highway Department.

**Hemphill.**—The 3-percent increase in mineral value was caused by limited improvement in natural gas and sand and gravel outputs. Geophysical prospecting increased 25 percent to 15 crew-weeks; exploratory and development drilling declined 22 percent compared with 1959. Building and paving sand and gravel were produced by several operators.

**Henderson.**—Mineral value declined 2 percent to $7 million because of modest losses in crude oil and natural gas liquid production. Geophysical prospecting increased 300 percent to 64 crew-weeks; exploratory and development drilling gained 100 percent to 34 wells totaling 124,672 feet. Natural gas liquids were recovered at the Trinidad gasoline plant of Lone Star Gas Co. Brick, heavy clay products, fire brick, and refractory shapes were manufactured from fire and miscellaneous clays mined from open pits near Athens by Athens Brick Co., Inc., Harbison-Walker Refractories Co., Texas Clay Products Co., and Athens Tile & Pottery Co.

**Hidalgo.**—There was a 13-percent decline in total value of minerals produced in Hidalgo County as crude oil and natural gas outputs were curtailed. Natural gas liquids were recovered at the gasoline plant of Delhi-Taylor-Mayfair Oil Corp. and the Tabasco plant of Anchor Gasoline Corp. Crude oil was processed at the La Blanca refinery of Cactus Petroleum, Inc., and the McAllen refinery of Caddo Refining Co.

**Hockley.**—The 10-percent decline in mineral value was due to a major reduction in output of crude oil. Geophysical prospecting declined 23 percent, and exploratory and development drilling declined 6 percent compared with 1959. Natural gas liquids were recovered at three gasoline plants. Sulfur was recovered at the Slaughter gasoline plant of Pan American Corp.

**Hopkins.**—Declines in the output of crude oil and natural gas liquids resulted in a 1 percent decrease in the value of mineral production. Humble Oil & Refining Co. recovered natural gas liquids at its Pickton gasoline plant. A. P. Green Fire Brick Co. of Texas manufactured fire brick and refractory shapes from strip-mined fire clay.

**Houston.**—Mineral value declined 43 percent because of a significant decline in crude oil production and a smaller decline in natural gas. Geophysical prospecting increased over 50 percent to 25 crew-weeks; drilling activity gained 5 percent to 143,542 feet of hole and proved 2 gas extensions.

615629—61——64

Digitized by Google

**Howard.**—A 5-percent decline in mineral value was due entirely to curtailed crude oil production. Cosden Petroleum Corp. processed crude oil at its Big Spring refinery. Carbon black was recovered from hydrocarbon liquids at the Dixon furnace plant of Cabot Carbon Co. West Texas Sand & Gravel Co. prepared building and paving sand and gravel. Cosden Petroleum Corp expanded styrene capacity of its Big Spring chemical plant to 60 million pounds per year, ortho-xylene capacity to 80 million pounds per year, and metaxylene capacity to 3 million pounds per year due to increased demand for phthalic anhydride and isophthalic acid. A new 50-million-pound-per-year carbon black plant using United Carbon Co. processes was planned for the Big Spring area by Sid Richardson Carbon Co.

**Hudspeth.**—Increased talc production resulted in a 7-percent increase in total mineral value. Talc used in ceramics, insecticides, paint, roofing, rubber, and joint cement was recovered from open pits near Allamoore by five producers. Pioneer Talc Co. operated its grinding mill at increased capacity. Crude gypsum, used as a retarder in cement by Southwestern Portland Cement Co., was mined from open pits near Sierra Blanca. Rhyolite was quarried and crushed by Gifford-Hill & Co., Inc., at a quarry near Penwell.

**Hutchinson.**—Production increases in both natural gas and natural gas liquids more than compensated for crude oil production losses and the value of mineral production increased 4-percent to $64.9 million. Drilling activity by the oil and gas industry declined 15 percent. Carbon black was recovered at four furnace plants and one channel plant. Natural gas liquids were recovered at eight gasoline plants. A 25,000-ton-per-year cis-4 polybutadiene plant was built by Phillips Chemical Co. adjacent to its Borger butadiene plant. Tri-City Sand & Gravel Co. and Borger Readi-Mix Co. produced building and paving sand and gravel. Salt in brine was recovered from underground salt beds by Phillips Petroleum Co. for use in its petrochemical complex at Borger.

**Irion.**—Increases in natural gas and natural gas liquids production failed to compensate for losses in crude oil production, with the result that total mineral value declined 1 percent to $2.1 million, compared with 1959. Geophysical prospecting increased over 100 percent to 23 crew-weeks; exploratory and development drilling gained 21 percent to 69 wells totaling 152,513 feet and proved 22 oil wells and 1 gas well. Mertzon Corp. recovered natural gas liquids at its Mertzon gasoline plant.

**Jack.**—Mineral value increased 15 percent as the petroleum and natural gas industries reported improved production. Geophysical prospecting increased 67 percent to a modest 10 crew-weeks; exploratory and development drilling declined over 43 percent to 141 wells totaling 480,507 feet. Bryson Pipeline & Refining Co. processed crude oil at its Bryson refinery. Natural gas liquids were recovered at the Black Hawk gasoline plant of Black Hawk Gasoline Corp., the Brazos plant of Brazos River Gas Co., and the Jupiter plant of Welstream Equipment Corp.

**Jackson.**—Gains in natural gas production were greater than crude oil losses, resulting in a 4-percent increase in total mineral value. Geophysical prospecting rose 12 percent to 64 crew-weeks; and ex-

Digitized by Google

ploratory and development drilling rose 20 percent to 175 wells totaling 908,546 feet and proved 25 oil wells and 72 gas wells. Cycling plants of Francitas Gas Co. and Sunray Mid-Continent Oil Co. and the Vanderbilt Gasoline plant of Socony Mobil Oil Co., Inc., recovered natural gas liquids. Contractors recovered and prepared paving sand and gravel from open pits for District 13 of Texas Highway Department. The world's first sextuple well completion was recorded by Sunray Mid-Continent Oil Co. with production from 6 gas zones at depths from 4,683 to 6,634 feet. A $400,000 expansion of the Carancahua Bay gasoline plant of Sunray Mid-Continent Oil Co. doubled its capacity to 60 million cubic feet of gas per day; natural gas liquids recovery was increased by 30 million gallons per day.

**Jasper.**—Moderate increases in crude oil production resulted in a 10-percent increase in total mineral value compared with 1959. Natural gas output approximated that of 1959. Exploratory and development drilling decreased 52 percent to 11 wells totaling 124,515 feet and proved 2 oil wells and 1 gas well.

**Jefferson.**—Crude oil, natural gas, and sulfur accounted for over 90 percent of the county total mineral value. Production of all three commodities rose, resulting in an 18-percent increase in total mineral value to $62.8 million compared with 1959. Although geophysical prospecting declined 57 percent to 67 crew-weeks, exploratory and development drilling rose 17 percent to 132 wells totaling 1,012,086 feet.

A $1 million filtration plant to upgrade sulfur by removing organic and other trace impurities was built at the Spindletop operations of Texas Gulf Sulphur Co. Texaco, Inc., added a 30-million-gallon-per-year benzene facility to its Port Arthur refinery; new equipment included a unifier-catalytic reforming unit, a Udex extraction unit, and other treating and fractionating facilities. The company's Port Arthur refinery set a world's safety record for the refining industry by operating 7.6 billion man-hours without a lost-time injury. Mobil Chemical Co. was building the world's largest high-purity ethylene plant adjacent to its Beaumont refinery. Capacity will be 380 million pounds per year, with initial production scheduled for the first quarter of 1961. Mobil Oil Co. added a 20,000-barrel-per-day delayed-coking unit to its Beaumont refinery. The synthetic rubber copolymer capacity of the Port Neches plant of Texas-U.S. Chemical Co. was increased 10 percent. Koppers Co., Inc., increased high-pressure polyethylene capacity of its Port Arthur facilities to 46 million pounds per year. Facilities to produce 50 million pounds per year of caprolactan from cyclohexane were added to the Beaumont plant of E. I. du Pont de Nemours & Co., Inc. A synthetic rubber plant based on isoprene and butadiene was built by Goodyear Tire & Rubber Co. The first commercial Hydrar unit to produce high-purity cyclohexane from benzene was put on stream at the Port Arthur refinery of Gulf Oil Corp. Six refineries, with a total daily throughput capacity of 986,000 barrels, processed crude oil in the county. Natural gas liquids were recovered at the Texas Gasoline plant of Texas Gas Corp. Native sulfur was recovered by the Frasch process from Spindletop Dome and Fannett Dome by Texas Gulf Sulphur Co. and from refinery gases of the Port Arthur refinery of Gulf Oil Corp. by Olin-Mathieson Chemical Corp. Texas Brine

Digitized by Google

Corp. recovered salt in brine from wells near Gladys City. Brick and heavy clay products were made from miscellaneous clay mined from open pits by Beaumont Brick Co., Inc. C. A. McKinley Sons, Inc., produced building sand and gravel.

**Jim Hogg.**—Value of mineral production rose 72 percent to $9.4 million because of a sizable increase in crude oil and natural gas production. Exploratory and development drilling increased 28 percent to 95 wells totaling 393,175 cubic feet and proved 64 oil wells and 12 gas wells.

**Jim Wells.**—Crude oil and natural gas production both contributed to the 15-percent decline in mineral value. The industry drilled 78 wells totaling 452,535 feet and proved 17 oil wells and 23 gas wells. Natural gas liquids were recovered at the La Gloria cycle plant of La Gloria Oil & Gas Co. and the Seeligson gasoline plant of Mobil Oil Co., Inc.

**Johnson.**—Reductions in lime and stone production resulted in a 15-percent decline in total mineral value. Lime for chemical and industrial uses and for construction was produced from limestone quarried by Texas Lime Co. The company also quarried and crushed limestone for riprap, concrete aggregate, roadstone, mineral food, and soil conditioner. Various contractors quarried and crushed limestone for concrete aggregate and roadstone for District 18 of Texas Highway Department. Building and paving sand and gravel were produced by Aggregates Producers, Inc.

**Jones.**—Total mineral value approximated the 1959 value as increases in natural gas production almost offset losses in crude oil and natural gas liquid output. Exploratory and development drilling decreased 30 percent to 177 wells totaling 642,659 feet and proved 78 oil wells. Petroleum Products Co. processed crude oil at its Lueders refinery. Natural gas liquids were recovered at the Wimberly No. 1 gasoline plant of Texas Natural Gasoline Corp. West Texas Stone Co. quarried and prepared rough architectural and dressed building stone. Limestone quarried in Shackelford County was prepared for rough architectural and dressed building stone by Lueders Limestone Co. Building and paving sand and gravel were produced by one operator.

**Karnes.**—Production of the State's first uranium oxide ($U_3O_8$) and increased production of crude oil, natural gas, and natural gas liquids accounted for the 45-percent increase in mineral value. The uranium mill, which cost about $2.4 million and had a rated capacity of 300 tons of ore per day, was put in operation by Susquehanna-Western, Inc. Uranium ores recovered from open pits in the Falls City area will be treated at the mill. Natural gas liquids were recovered at the Capeza Creek and Karnes City gasoline plants of United Gas Pipeline Co. Exploratory and development drilling increased nearly 100 percent to 72 wells totaling 702,975 feet and proved 40 oil wells and 4 gas wells. Sulfur was recovered from sour gas at the Fashing plant of Warren Petroleum Corp.

**Kaufman.**—Curtailment of crude oil production resulted in an 18-percent decline in total mineral value, compared with 1959. Limestone was quarried and crushed for concrete aggregate and roadstone by various producers for Districts 1 and 18 of Texas Highway Department.

Digitized by Google

**Kenedy.**—The increase in natural gas production was greater than decreases for crude oil and natural gas liquid production so that total mineral value was 6 percent greater than in 1959. Natural gas liquids were recovered at the Julian Pasture cycle plant of Humble Oil & Refining Co. Exploratory and development drilling totaling 81,117 feet proved 1 oil and 1 gas well.

**Kent.**—The 2-percent reduction in total mineral value was due entirely to curtailed crude oil output which was responsible for nearly 90 percent of the county mineral value. The Senn Gravel Co. prepared building sand and gravel.

**Kimble.**—Total mineral value declined 25 percent compared with 1959; all commodities—petroleum, natural gas, and sand and gravel—had lower output. Weirich Bros., Inc., prepared building and paving sand and gravel.

**King.**—Sizable curtailment of crude oil production was responsible for the 32-percent decline in total mineral value to $2.4 million. A moderate increase in natural gas production was reported. Exploratory and development drilling reduced by 39 percent to a total of 104,551 feet, proved 2 oil wells.

**Kleberg.**—Total mineral value advanced 160 percent to $54 million as production of crude oil, natural gas, and natural gas liquids rose. Geophysical prospecting declined 40 percent to 30 crew-weeks; exploratory and development drilling advanced 8 percent to 55 wells totaling 415,464 feet and proved 20 oil wells and 24 gas wells. Humble Oil & Refining Co. completed the world's largest cycling plant, the King Ranch plant 15 miles south of Kingsville, with a daily capacity of 950 million cubic feet to recover 1.2 million gallons of natural gas liquids daily. Natural gas liquids also were recovered at the May gasoline plant of Cities Service Oil Corp. Evaporated salt was prepared from brine by the Trace Elements Corp., Division of United Salt Co.

**Knox.**—The value of mineral production was 14 percent greater than in 1959 due to greater crude oil production, which accounted for over 90 percent of the total value. There were 73 oil wells proven in the county, although exploratory and development drilling declined nearly 40 percent to 373,340 feet.

**Lamb.**—Increases in crude oil production resulted in a 27-percent increase in total mineral value to $2.3 million compared with 1959. Seven development wells and 4 exploratory wells totaling 47,718 feet proved 6 oil wells. Crude oil production amounted to 2.3 million barrels.

**La Salle.**—Moderate increases in crude oil and natural gas production resulted in a 14-percent increase in the county total mineral value compared with 1959. Geophysical prospecting increased 40 percent to 31 crew-weeks; exploratory and development drilling dropped 27 percent to 36 wells totaling 241,576 feet and proved 5 oil wells and 4 gas wells.

**Lavaca.**—Increases in natural gas liquids recovery offset production losses in crude oil and natural gas and the value of mineral production rose 16 percent above that of 1959. New facilities at the Provident City gasoline plant of Shell Oil Co. increased propane recovery from 21,000 to 33,000 gallons per day and natural gasoline recovery

Digitized by Google

from 50,000 to 55,000 gallons per day. The oil and gas industry doubled geophysical prospecting to 171 crew-weeks and increased exploratory and development drilling nearly 32 percent to 37 wells totaling 169,410 feet, to prove 24 gas wells. Natural gas liquids were recovered at the Wilcox gasoline plant of Goliad Corp. and the Provident City plant of Shell Oil Co. Sandstone was quarried and prepared as concrete aggregate and roadstone by contractors for District 13 of Texas Highway Department.

**Leon.**—A moderate reduction in crude oil and natural gas production resulted in an 18-percent decline in total mineral value to $2.6 million compared with 1959. The industry spent 17 crew-weeks in geophysical prospecting and drilled 21 exploratory and development wells totaling 155,850 feet, and proved 5 oil and 2 gas wells.

**Liberty.**—The 11-percent decline in mineral production value, to $44.6 million, was due to moderate reductions in crude oil and natural gas output. Fuels accounted for over 80 percent of the county mineral value. The Hull gasoline plant of Southwest Industries, Inc., recovered natural gas liquids. The 114 wells drilled by the industry proved 61 oil wells and 4 gas wells. Texas Gulf Sulphur Co. mined native sulfur by the Frasch process at Moss Bluff Dome. Underground storage of 3.3 million gallons of LP gas and ethane was maintained by Socony Mobil Oil Co. Natural gas and LPG were used in producing acetone, formaldehyde, acetic acid, acetaldehyde, and hexylene at the Bishop Chemical plant of Celanese Corp. of America. Building and paving sand and gravel were prepared by Texas Construction Materials Co., as well as industrial sand used for blast, engine, and hydrofrac. Paving sand and gravel was prepared by contractors for Texas Highway Department.

**Limestone.**—The value of mineral production declined 34 percent to $1.2 million, due to moderate losses in petroleum and natural gas production, which accounted for about 90 percent of the total mineral value, and to a reduction in stone quarrying. The oil and gas industry reduced geophysical prospecting 70 percent to 12 crew-weeks; exploratory and development drilling increased 90 percent to 36 wells totaling 165,900 feet, and proved 9 oil wells and 6 gas wells. Miscellaneous clay, used in manufacturing building brick and heavy clay products, was mined from open pits by Barron Brick Co.

**Lipscomb.**—Major increases in crude oil and natural gas production resulted in a 91-percent increase in total mineral value as compared with 1959. Drilling of 53 wells, totaling 375,536 feet, proved 15 oil wells and 19 gas wells.

**Live Oak.**—Significant reductions in crude oil, natural gas, and sand and gravel production lowered mineral value 16 percent to $11.7 million. The oil and gas industry increased geophysical prospecting 100 percent to 200 crew-weeks but curtailed exploratory and development drilling over 40 percent to 91 wells totaling 531,623 feet to prove 11 oil wells and 18 gas wells.

**Llano.**—Production losses in stone and feldspar lowered total mineral value 3 percent compared with 1959. Feldspar was mined from open pits by the Moss Estate. Marble was quarried and prepared as roofing material and paint filler by Dezendorf Marble Co. Monumental granite was quarried and prepared by Premier Granite Quar-

Digitized by Google

ries. A graphitic schist was quarried and prepared as a filter medium by Graphilter Corp.

**Loving.**—Increases in crude oil and natural gas production resulted in a 46-percent increase in total mineral value to $9.3 million compared with 1959. Although exploratory and development drilling declined 50 percent to 85 wells and 388,092 feet, there were 65 proven oil wells.

**Lubbock.**—Singular reductions in output of crude oil and sand and gravel resulted in a 41-percent decline in total mineral value to $1.4 million compared with 1959. Seven oil wells were proved through drilling 16 exploratory and development wells totaling 90,931 feet; 53 crew-weeks were spent in geophysical prospecting. Building and paving sand and gravel were prepared from open pits by Caprock Sand & Gravel Co.

**Lynn.**—Curtailed crude oil production resulted in a 3-percent decline in total mineral value to $1.4 million compared with 1959. Of 22 exploratory and development wells drilled, totaling 104,770 feet, 8 proved to be oil wells.

**Marion.**—The value of mineral output amounted to $6 million, 36 percent less than in 1959. Geophysical prospecting by the oil and gas industry increased 100 percent to 24 crew-weeks; of 25 wells drilled during the year totaling 122,154 feet, 15 proved to be oil wells. Natural gas liquids were recovered at the Jefferson gasoline plant of Arkansas-Louisiana Chemical Co.

**Martin.**—The 78-percent increase in mineral value was due primarily to increased crude oil production. Geophysical prospecting increased 145 percent to 76 crew-weeks. Exploratory and development drilling amounted to 27 wells, totaling 263,126 feet, and resulted in 22 oil wells; 3 new fields and 2 new oil pays were discovered. Anchor Petroleum Co. maintained a 440,000 barrel underground storage of LPG.

**Matagorda.**—The value of mineral production rose 22 percent to $38.2 million due to increased oil, natural gas, sand and gravel, and shell production; moderate declines were reported for natural gas liquids and clay production. Geophysical prospecting amounted to 208 crew-weeks. There was a 56-percent increase in exploratory and development drilling to 167 wells totaling 1,387,259 feet, proving 47 oil wells and 42 gas wells of which 6 were new oilfields and 20 new oil pays. Natural gas liquids were recovered at one cycle plant and two gasoline plants. Pal-Port Clay Products Corp. mined miscellaneous clay from open pits for manufacturing brick and heavy clay products. Contractors produced paving sand and gravel for District 12 of Texas Highway Department. Matagorda Shell Co. dredged shell from adjoining bays. Limestone was quarried and crushed for concrete aggregate and roadstone by one producer.

**Maverick.**—A significant decline was reported in the value of mineral production. Of 264 wells drilled, totaling 471,300 feet, 200 proved oil wells and 8 proved gas wells. Barite from foreign sources was ground for use as heavy drilling mud by Tejas Barite Co., Ltd. Humble Pipeline Co. built a 63-mile 8-inch crude line and gathering system from Sacatosa field to Humble's main pipeline system at Pearsall. Previous noneconomic oil production in Sacatosa field became a profitable multipay operation following Continental Oil

Digitized by Google

Co.'s experimental fracturing project. A new gas processing plant with a daily capacity of 55 million cubic feet was built near Palacios by Tennessee Oil & Refining Co.; the plant will recover about 58,000 gallons of gas liquids per day.

**McLennan.**—Mineral value decreased 12 percent to $4.2 million due to losses in cement, clays, sand and gravel, and stone production. Universal Atlas Cement Co. mined limestone and clay from open pits near its Waco plant for manufacturing portland and masonry cements. The company began a $2 million expansion program to double the cement capacity of its Waco operations to 2 million barrels. New facilities included a second rotary kiln and grinding and accessory equipment. Limestone was quarried and crushed for concrete aggregate and roadstone by various contractors for Texas Highway Department. Building limestone was quarried and dressed by Tonk Quarry. Building and paving sand and gravel were prepared by four producers.

**McMullen.**—Mineral value declined 20 percent to $7.1 million, compared with 1959. Of 112 wells drilled, totaling 504,507 feet, 30 proved oil wells and 17 proved gas wells. Trans-Jeff Chemical Corp. built a sulfur recovery plant near Tilden. Paving sand and gravel was prepared for Texas Highway Department by various producers.

**Medina.**—Mineral value, 90 percent of which was due to oil production, was 7 percent greater than in 1959. D'Hanis Brick & Tile Co. mined miscellaneous clay from open pits to use in manufacturing building brick and heavy clay products. Various contractors produced paving sand and gravel for Texas Highway Department.

**Midland.**—Value of minerals produced declined 6 percent to $44.2 million, compared with 1959. Exploratory and development drilling declined 23 percent to 89 wells totaling 822,091 feet, of which 40 were oil wells and 46 were gas wells. Natural gas liquids were recovered at four gasoline plants. Underground LPG storage by Cities Service Production Co. and El Paso Natural Gas Co. amounted to 300,000 barrels. Perlite from other states was expanded at the plant of Perlite Industries, Inc., for use in plaster, acoustical walls, and loose-fill insulation. Limestone was quarried and crushed by one operator for concrete aggregate and roadstone. A 20-million-cubic-foot-per-day gas processing plant was built in the Azalea Strawn and Devonian gas distillate area by Odessa Natural Gasoline Co. and Warren Petroleum Corp.

**Milam.**—Mineral output increased 22 percent in value, compared with 1959. Lignite, used as a fuel in generating electric power for the Rockdale reduction works of Aluminum Company of America, was mined from open pits by Industrial Generating Co. The Rockdale plant of Alcoa operated five of its six potlines. Alumina from the company's new Point Comfort refinery was used in the operation. Building sand and gravel was produced by one operator.

**Mitchell.**—Mineral production declined 5 percent to $7.6 million, compared with 1959, due primarily to losses in oil production. Exploratory and development drilling of 67 wells totaling 171,119 feet proved 56 oil wells. Building and paving sand and gravel were prepared by one producer. Crude oil was processed at the Colorado City refinery of Cosden Oil Co.

Digitized by Google

**Montague.**—A 2-percent decline of mineral value was due to reduced output of crude oil and natural gas liquids. Natural gas production increased. The 37-percent increase in exploratory and development drilling to 125 wells totaling 259,815 feet resulted in 85 oil wells. Natural gas liquids were recovered at the Bowie gasoline plant of Bowie Gasoline Co. Building and paving sand and gravel were prepared by one operator. Contractors prepared paving gravel and crushed sandstone for concrete aggregate and roadstone for District 3 of Texas Highway Department.

**Montgomery.**—Mineral value declined 7 percent to $27.5 million, compared with 1959. The oil and gas industry spent 63 crew-weeks in geophysical prospecting and drilled 10 wells totaling 103,588 feet, a decline of 38 percent. The decline in mineral value was due to the drop in oil production; natural gas, natural gas liquids, and sand and gravel output increased. Natural gas liquids were recovered at one cycling plant and two gasoline plants during the year. Jeff Chemical Co. consumed propane in producing acetaldehyde, methanol, and sodium formate at its Conroe petrochemical plant. Carbon black was recovered from hydrocarbon liquid at Monroe No. 63 furnace plant of Columbian Carbon Co. Contractors produced paving sand and gravel for District 12 of Texas Highway Department.

**Moore.**—Mineral production declined 5 percent in value to $45.9 million, compared with 1959. Significant production losses were reported for oil, natural gas liquids, and helium; only natural gas output increased substantially. Underground LPG storage by Shamrock Oil & Gas Corp. amounted to 1.3 million barrels; the company also operated a 30-ton-per-day sulfur recovery plant at its McKee gasoline plant. Phillips Chemical Co. used natural gas in producing ammonia, nitric acid, and nitrogen solutions. The Machovec zinc retort smelter of American Zinc Co. of Illinois, operating at reduced capacity, treated ores and concentrates from other states and from foreign countries. Natural gas liquids were recovered at six gasoline plants; crude oil was processed at the McKee plant of Shamrock Oil & Gas Corp. Carbon black was produced from hydrocarbon liquids at the Continental furnace plant of Continental Carbon Co.

**Morris.**—The 19-percent decline in mineral value was due largely to lower production of sand and gravel and brown iron ores. The oil and gas industry increased geophysical prospecting 36 percent to 30 crew-weeks; 4 exploratory and development wells were drilled, all of which were dry holes. Brown ores were mined from open pits by Lone Star Steel Co. and upgraded at its ore mill at Lone Star for blast furnace feed. Lone Star installed a new spiral-weld pipe mill, enlarged a stretch reducing mill, and installed a rod mill that would use both skelp-trim and pig iron.

**Motley.**—Mineral value increased 37 percent compared with 1959, due to increases in production of petroleum and sand and gravel. Geophysical prospecting by the oil and gas industry increased 130 percent to 55 crew-weeks; exploratory and development drilling declined to 10 wells totaling 53,484 feet, with 5 oil wells proved. Building and paving sand and gravel were prepared by four producers.

**Nacogdoches.**—Mineral value decreased 7 percent to $2.9 million, compared with 1959, due primarily to reduced natural gas production.

Digitized by Google

Geophysical prospecting increased 100 percent to a total of 16 crew-weeks; 4 development wells proved 4 oil wells. Miscellaneous clay used in manufacturing brick and heavy clay products was mined from open pits by Acme Brick Co.

**Navarro.**—There was a 4-percent decline in mineral value to $ million, compared with 1959, due to declines in output of major mineral products—oil, natural gas, clay, and sand and gravel. Miscellaneous clay, used in manufacturing building brick and heavy clay products, was mined from open pits by Whiteselle Brick-Lumber Co. Exploratory and development drilling by the oil and gas industry declined 30 percent to 176 wells, totaling 181,447 feet, and proved 123 oil wells. Building and paving sand and gravel were prepared by two producers.

**Nolan.**—Mineral output was valued at $27.5 million, a 32-percent decrease from 1959. Reduced production of petroleum, natural gas, and natural gas liquids was chiefly responsible for the decrease. Natural gas liquids were recovered at five plants. Lone Star Cement Corp. quarried and prepared limestone and mined miscellaneous clay from pits for manufacturing portland and masonry cements at its Maryneal plant. U.S. Gypsum Co. and the Flintkote Co. mined gypsum from open pits near Sweetwater for use as portland cement retarder, agricultural uses, and in manufacturing plaster, wallboard, lath, and other gypsum products for the building industry. Building and paving sand and gravel were prepared by Hillsdale Gravel Co.

**Nueces.**—The value of mineral production decreased 8 percent to $78 million compared with 1959. Nueces was the second largest gas producing county. The mineral output value declined principally because of reduced petroleum allowable. A styrene unit to cost over $1 million was being constructed by Sunray Mid-Continent Oil Co., subsidiary of Suntide Refinery Co., at its Corpus Christi refinery. Completion was scheduled for 1961. All the output from this refinery, a proposed 60 million pounds per year, was sold under long-term contract. Benzene, to be used as raw material for styrene, was produced in a Udex unit and a new Hydeal unit adjacent to the new styrene unit. This addition will bring the company benzene production to about 1,350 barrels per day. Delhi-Taylor Oil Co. continued its petrochemical expansion with construction of a plant at Corpus Christi with capacity to produce about 70 million pounds per year of high-purity orthoxylene. Orthoxylene is used in producing phthalic anhydride for polyester plastics and plasticizers and alkyd resins. Robstown Clay Products Co. used local clay in manufacturing brick and heavy clay products. Natural gas liquids were recovered at seven gasoline and four cycling plants. Columbian Carbon Co. recovered carbon black at its Corpus Christi No. 56 channel plant. Building and paving sand and gravel were prepared by Heldenfels Bros. and M. P. Wright, Jr. Shell, used for concrete aggregate and the manufacture of lime and cement, was dredged from shallow bays surrounding the county by Corpus Christi Shell Co., Heldenfels Bros., General Dredging Co., and Matagorda Shell Co. Portland and masonry cements were manufactured from shell and local clays at the Corpus Christi plant of Halliburton Portland Cement Co. Lime for in-

Digitized by Google

dustrial, chemical, and building purposes was manufactured from shell by Columbia-Southern Chemical Corp.

**Ochiltree.**—The value of mineral production was $17.1 million, an increase of 8 percent over 1959. This increase reflected the continued development of petroleum and natural gas fields. Three new oilfields and eight new oil pays were discovered. Natural gas liquids were recovered at the Spearman gasoline plant of Northern Natural Gas Co. and Skelly Oil Co. Capacity of the Northern Natural Gas Co. plant was being doubled to 200 million cubic feet daily, which will result in a 16,000-gallon-per-day increase in recovered liquids.

**Oldham.**—The value of sand and gravel and crude oil was 37 percent less than in 1959. Building sand and gravel was prepared by Western Aggregates, Inc., and Western Sand & Gravel Co., Inc.

**Orange.**—The value of mineral production decreased 13 percent from 1959, resulting in a total value of $12.3 million. The county produced approximately 28 billion cubic feet of natural gas and over 2 million barrels of crude oil. Natural Gas Liquids Corp. was constructing a new processing plant on the Sabine River to process natural gas condensate, distillate, and natural gasoline and to produce 98-octane gasoline; capacity of the plant will be approximately 20,000 barrels per day. Allied Chemical Corp. completed a new high-density polyethylene plant. Firestone Tire & Rubber Co. was increasing its butadiene capacity from 40,000 to 70,000 tons per year, and completed a 30,000-ton polyisoprene plant late in 1960. Natural gas liquids were recovered at the Phoenix Lake plant of Ohio Oil Co. Portland cement was manufactured from shell and clay at the Orange cement plant of Texas Portland Cement Co.

**Palo Pinto.**—Total mineral production value was $2.3 million, a 4-percent gain over 1959; petroleum, natural gas, and natural gas liquids accounted for the major part of mineral value. Lone Star Gas Co. recovered natural gas liquids at its Gordon gasoline plant. Miscellaneous clay, used in manufacturing brick, tile, and heavy clay products, was mined from open pits near Mineral Wells by Texeramics, Inc., Texas Vitrified Pipe Co., Reliance Clay Products Co., and Bill Williams Materials Corp. Mineral Wells Sand & Gravel Co. recovered building and paving sand and gravel from pits near Mineral Wells.

**Panola.**—Value of mineral production declined from $61.5 million in 1959 to $53.7 million, a 13-percent decrease. Development drilling proved 32 oil and 4 gas wells and exploratory drilling proved 1 oil well. Panola County ceased to be the largest natural gas producer in the State, ranking third with production of 254.7 billion cubic feet.

**Parker.**—Mineral production increased slightly over 1959, attaining a total value of $2.5 million. The production of natural gas liquids recovered at the Springtown gasoline plant of Lone Star Gas Co. provided most of the value. Miscellaneous clay, used in manufacturing brick and heavy clay products, was mined from open pits near Bennett by Acme Brick Co. and Mineral Wells Clay Products Co.

**Pecos.**—A decline of 8 percent in value of mineral production was chiefly the result of reduced oil production; total value amounted to $55.2 million. Socony Oil Co., Inc., completed a major gas discovery well in the Delaware Basin, in northwest Pecos County, with a cal-

Digitized by Google

culated open flow of 102 million cubic feet of gas, plus 1,500 barrels of distillate per day. Flow pressure was reported at more than 10,000 pounds, reportedly the highest in the West Texas-New Mexico region. Spurred on by this new discovery, geophysical prospecting increased 72 percent. Natural gas liquids were recovered at the Puckett gasoline plant of Phillips Petroleum Co. and the Santa Rosa plant of Pecos County.

**Polk.**—The value of mineral production declined 16 percent compared with that of 1959. The total amounted to $4.8 million. Special industrial sands were recovered from pits near Corrigan and prepared by Texas Construction Material Co. In addition, crushed sandstone was produced for concrete aggregate and roadstone; however, the greatest contributors to the value of mineral output were petroleum and natural gas.

**Potter.**—Reduced output was recorded for all minerals and the value of mineral production declined 24 percent from 1959. Reduced production of natural gas and closing of the Texas Sand & Gravel Co. Kritser limestone plant were major factors in the decline. Helium was produced and refined at the Government-owned plant near Amarillo. Natural gas liquids were recovered at the Fain and Turkey Creek gasoline plants of Amarillo Oil Co. Building and paving sand and gravel were recovered and processed from pits near Amarillo by Panhandle Gravel, Inc., and Texas Sand & Gravel Co., Ltd. The Texaco, Inc., refinery at Amarillo processed crude oil. Both geophysical prospecting, as reflected by the number of crew-weeks, and drilling increased over 1959.

**Reagan.**—Total value of mineral production increased 4 percent to $36.4 million. Mineral fuels accounted for most of the total. The Big Lake plant of Barnhart Hydrocarbon Co. utilized the modified Claus process to recover sulfur from sour gas.

**Reeves.**—Increased production of natural gas and natural gas liquids was responsible for a 45-percent increase in value of mineral production. Phillips Petroleum Co. owned and operated the Tunstill gasoline plant near Orla. The plant processed natural gas from Tunstill, Mason, and North Mason fields. Natural gas liquids were also processed at Ramsey No. 16 gasoline plant of Continental Oil Co. F. M. Reeves & Sons, Inc., prepared building and paving sand and gravel.

**Refugio.**—Total value of mineral production amounted to $60 million, an 11-percent decrease over 1959. The 13.5 million barrels of crude oil produced was somewhat less than 1959 production. The decrease contributed to the overall decline in mineral value. Drilling activity remained remarkably stable during the year, totaling 122 new wells drilled, of which only 28 were dry holes. Eight oil pays were discovered. Humble Oil & Refining Co. recovered natural gas liquids at its A.G.S.C.O. and Tom O'Connor gasoline plant.

**Runnels.**—Runnels County continued its outstanding increase in production of petroleum and natural gas with a 79-percent increase in value over 1959. Production of 7.1 million barrels of crude oil more than doubled the 1959 output; a similar increase was recorded in production of natural gas. Drilling of both development and exploratory wells continued, with a total of 186 wells being drilled. Of the 186

Digitized by Google

wells, 103 dry holes were recorded, and 21 new oilfields and 3 gasfields were discovered.

**Rusk.**—Natural gas liquids were recovered at the East Texas plant of Humble Oil & Refining Co., the Giles plant of Parade Co., and Plants 19 and 21 of Sinclair Oil & Gas Co. A dehydration plant with capacity of 46 million cubic feet per day was built by Lone Star Gas Co. Miscellaneous and fire clays used in brick and heavy clay products were mined from open pits near Henderson by J. M. Cordell & Sons, Inc., and Henderson Clay Products, Inc. These activities in addition to production of 16.6 million barrels of petroleum, accounted for the total mineral value of $58.9 million, a 13-percent decrease from that of 1959.

**San Patricio.**—Production of over 12.2 million barrels of crude oil and 74 billion cubic feet of natural gas accounted for over 90 percent of the $49.5 million mineral value. Development and exploratory drilling for oil and gas declined 43 percent, with only 87 wells being drilled. During the year 12 oilfields and 17 gasfields were discovered. Natural gas liquids were recovered at the Redfish Bay gasoline plant of Sunray Mid-Continent Oil Co., Plant No. 20 of Sinclair Oil & Gas Co., the Portilla gasoline plant of Superior Oil Co., and the Plymouth cycling plant of Plymouth Oil Co. Fordyce Gravel Co. and Heldenfels Bros. quarried and prepared crushed limestone for concrete aggregate and roadstone. Building and paving sand and gravel were prepared by Fordyce Gravel Co. The Sherwin alumina plant and the San Patricio aluminum reduction works of Reynolds Metals Co. operated at about the same rate as in 1959.

**Schleicher.**—Production of petroleum, natural gas, and natural gas liquids was responsible for the $9.8 million total mineral value, an 8-percent decline from the 1959 value. Three oilfields and new oil pays were discovered during the year. Sinclair Oil & Gas Co. recovered natural gas liquids at its No. 23 gasoline plant.

**Scurry.**—Scurry County ranked fourth in crude oil production and fourth in total mineral value. Production of 33.7 million barrels of oil, in addition to considerable quantities of natural gas and natural gas liquids, was valued at $122.7 million, 14 percent lower than in 1959. Drilling declined 55 percent. Miscellaneous clay was mined from open pits for brick and heavy clay products by Southwestern Brick & Tile Co.

**Shackelford.**—Mineral fuels output totaled $11.1 million, an 11-percent increase over 1959. Three new oilfields and two new oil pays were discovered through exploratory drilling. Oil from a secondary recovery operation in the Bluff Creek reservoir increased petroleum production. Natural gas liquids were recovered at the No. 1 gasoline plant of Marshall R. Young and the Graridge No. 1 plant of Graridge Corp. Building stone was quarried and prepared by Lueders Limestone Co.

**Sherman.**—The rapid increase of the natural gas industry in Sherman County resulted in a 110-percent increase in mineral value, totaling $18 million. Drilling produced 12 new gas wells.

**Smith.**—A 16-percent increase in mineral production value to $13.4 million was reported. Over 3 million barrels of crude oil and 19.4

Digitized by Google

billion cubic feet of natural gas were produced. Of 39 exploratory wells drilled, 5 produced oil and 2 produced gas. Natural gas liquids were recovered by the Chapel Hill gasoline plant of Etexas Producers Gas Co. and the Chapel Hill cycling plant of Lone Star Producing Co. Crude oils were processed at the Tyler refinery of LaGloria Oil & Gas Co. Miscellaneous clay, used to manufacture brick and heavy clay products, was mined from open pits by Reliance Clay Products Co. Industrial sands for foundry use were processed by H. J. Ellis Sand Co.

**Starr.**—Mineral output valued at $26.1 million, 13 percent greater than 1959, reflected a major increase in production of natural gas and a slight increase in production of petroleum and sand and gravel. Increased interest in oil and gas properties was evidenced by 107 crew-weeks spent on geophysical prospecting. In addition, exploratory drilling discovered 27 gas and 9 oil wells. Two plants of Sun Oil Co. and the Rincon gasoline plant of Continental Oil Co. recovered natural gas liquids. Crushed limestone was quarried and prepared for concrete aggregate and roadstone by Fordyce Gravel Co. Valley Brick & Tile Co. mined miscellaneous clay from open pits for manufacture of brick and heavy clay products.

**Stephens.**—A value of $9.9 million was reported for mineral output. In addition to the 2.2 million barrels of crude oil and the 14.9 billion cubic feet of natural gas produced, building sand and gravel was obtained from open pits by Taylor Brothers. Exploratory drilling resulted in discovery of seven oilfields and six oil pays.

**Stonewall.**—Production of petroleum dominated the mineral industry in the county and reduced petroleum production was responsible for an 11-percent decline in the total value of minerals produced. The Stonewall plant of Cities Service Co. processed gases from various fields in the area and recovered natural gas liquids. Building and paving sand and gravel were recovered from open pits by Hamlin Sand & Gravel Co., Inc.

**Tarrant.**—Mineral output was valued at $9.8 million and was based on production of cement, sand and gravel, and stone. Trinity Division of General Portland Cement Co. quarried and prepared crushed limestone for manufacturing portland and masonry cements. Carruthers Cutstone Co. processed limestone for building purposes. Contractors produced limestone for District 2 of Texas Highway Department. Building and paving sand and gravel were prepared by 12 producers. Mica was ground and prepared by Western Mica Co.

**Taylor.**—Petroleum accounted for over 95 percent of the total mineral value of $15.7 million. A total of 329 development and exploratory wells were drilled. Clay, used in manufacturing building brick, was mined from open pits by Abilene Brick Co. H. B. Zachry & Co. quarried and prepared crushed limestone for concrete aggregate and roadstone. Building and paving sand and gravel were prepared by Atlas Sand & Gravel Co. and Caton Sand & Gravel Co. Debco Corp. processed crude oil at its Abilene refinery.

**Terry.**—The $19.5 million mineral production value was approximately the same as that in 1959. The Adair gasoline plant of Amerada Petroleum Corp. and the Wellman plant of Chillgas Corp. recovered natural gas liquids. Carbon black was recovered from natural

Digitized by Google

gas and natural gas liquids at the Seagraves No. 64 furnace plant of Columbia Carbon Co. Sodium sulfate was recovered from brine at the Brownfield plant of Ozark-Mahoning Co. Paving sand and gravel for Texas Highway Department was processed by various producers.

**Throckmorton.**—As a result of decreased oil production, total mineral value dropped 15 percent; 525.1 million cubic feet of natural gas and 3.2 million barrels of crude oil were produced.

**Titus.**—Output of petroleum declined sharply. The total $4.3 million mineral production value was 57 percent below that of 1959. American Petrofina Co. of Texas processed crude oil at its Mt. Pleasant refinery.

**Tom Green.**—A total mineral production value of $5.3 million was reported, essentially the same as in 1959. Montgomery Sand & Gravel Co. and other producers prepared building and paving sand and gravel.

**Travis.**—Value of mineral production increased 12 percent over that of 1959, principally because of increased production of stone, sand and gravel, and lime. Austin White Lime Co. quarried and prepared limestone for manufacturing lime, which was used by building, agricultural, and chemical industries. From limestone quarried in Williamson County, Texas Quarries, Inc., prepared dressed building stone. In addition, limestone was quarried and crushed for riprap, metallurgic flux, railroad ballast, concrete aggregate, and roadstone by Austin White Lime Co. and Texas Crushed Stone Co. Building and paving sand and gravel were prepared by Capital Aggregates, Inc., and Travis Materials, Inc. Contractors produced crushed limestone for Districts 2 and 14 of Texas Highway Department.

**Upshur.**—Mineral production, valued at $5.2 million, was 17 percent less than in 1959. Thirty development wells were completed during the year. Big Sandy Sand & Gravel Co. prepared building and industrial sand.

**Upton.**—Continued development of petroleum, natural gas, and natural gas liquid resources increased total value of mineral production to $67.1 million, a 17-percent increase over 1959.

**Uvalde.**—Native asphalt was quarried and prepared for road surfacing material, from pits near Dabney by White's Uvalde Mines and near Blewett by Uvalde Rock Asphalt Co. Basalt for riprap, concrete aggregate, roadstone, and railroad ballast was quarried and prepared by Southwest Stone Co. The D & D Gravel Co. prepared building and paving sand and gravel.

**Van Zandt.**—The value of mineral fuels and salt produced was $20.8 million, 10 percent less than the 1959 value. The oil and gas industry produced 3.8 billion cubic feet of natural gas and 5 million barrels of crude oil. Pure Oil Co. recovered natural gas liquids at its Van gasoline plant. Morton Salt Co. recovered rock salt from underground mines and salt in brine from wells near Grand Saline.

**Victoria.**—A 6-percent increase in value of mineral production to $24.9 million was reported. The oil and gas industry spent 49 crew-weeks in geophysical prospecting and completing 6 oil and 25 gas development wells. In addition, exploratory drilling proved 3 oil wells and 11 gas wells. Building and paving sand and gravel were

Digitized by Google

prepared from pits by Fordyce Gravel Co., Gulf Materials Co., and Heldenfels Bros. Limestone for concrete aggregate and roadstone was quarried and crushed by Fordyce Gravel Co.

Waller.—Production of natural gas and natural gas liquids accounted for over 90 percent of total value of mineral production. Output was valued at $36.7 million, 11 percent below that of 1959. Katy cycling plant of Humble Oil & Refining Co. recovered natural gas liquids. Paving and construction sand and gravel were prepared for District 12 of Texas Highway Department and Waller County Road and Bridge Department.

Ward.—Ward County ranked 10th in value of minerals produced with a total of $75.7 million, an increase of 12 percent over 1959. This was principally effected by increased petroleum production. Approximately 22.6 million barrels of crude oil and 28.3 billion cubic feet of natural gas were produced. Cabot Carbon Co. increased the capacity of its Estes plant to 25 million cubic feet daily and the liquid recovery to 37,500 gallons per day. Salt was obtained from brine by Montex Chemical Co. Sodium sulfate was recovered from salt wells and dry lake brines at the Monahans plant of Ozark-Mahoning Co. Permian Sand & Gravel Co., Inc., prepared building and paving sand and gravel from Anderson pit near Grand Falls and mined gypsum from the Johnson pit near Pyote.

Webb.—A 16-percent increase in value of mineral production resulted from increased crude oil production. Antimony ores from Mexico and Bolivia were processed at the Laredo Smelter of National Lead Co. Miscellaneous clay used in brick and heavy clay products was mined from open pits by Richard Chavana and E. C. Delachica Clay Co. Building sand and gravel was prepared by Aldape Sand & Gravel Co.

Wharton.—Reduced demand for petroleum and sulfur resulted in a 25-percent decrease in total mineral value compared with 1959. The reduction of petroleum production also affected recovery of casinghead gas, and it too declined sightly. Sulfur, the county's principal revenue-producing mineral, declined sharply in value from 1959. Texas Gulf Sulfur Co. continued mining sulfur by the Frasch process at Boling Dome.

Wheeler.—Mineral fuel production, valued at $9.3 million, was 7 percent less than in 1959. The McLean-28 gasoline plant of Warren Petroleum Co. recovered natural gas liquids. Carbon black was recovered from natural gas and natural gas liquids at the Norrick furnace plant of United Carbon Co.

Wichita.—Production of petroleum was responsible for over 90 percent of the $34.5 million mineral production value. Wichita Falls refineries of American Petrofina, Inc., and Continental Oil Co. refined crude oil. Natural gas liquids were recovered at four gasoline plants. Sandstone was quarried and crushed for concrete aggregate and roadstone. Paving sand and gravel was prepared by contractors for District 3 of Texas Highway Department. Northwest Materials Co. and Wichita Sand & Gravel Co. prepared building and paving sand and gravel.

Digitized by Google

**Wilbarger.**—A decline of 1 percent in total mineral value to $17.9 million was due to a slight decrease in crude oil production. Districts 2 and 3 of Texas Highway Department received crushed limestone from county contractors.

**Williamson.**—Williamson County, one of the State's leading stone and lime producers, increased its value of mineral production 5 percent. Limestone was quarried and prepared for use in lime by Round Rock White Lime Co. and White Stone Lime Co. Rough, architectural, and dressed building stone were quarried and prepared by Leander Limestone Corp., Texas Quarries, Inc., and San-Tex Stone Quarry, Inc. Limestone was quarried and crushed by various producers for use as concrete aggregate, roadstone, fertilizer, filler, and other industrial uses.

**Wilson.**—Mineral production, valued at $1.7 million, was 9 percent less than in 1959. Fire clay, used in heavy clay products, was mined from open pits near Saspamco by W. F. Dickey Clay Manufacturing Co.

**Winkler.**—The county ranked seventh in total value of mineral production with $95 million, a 20-percent increase over 1959. Increased production of crude oil and natural gas was primarily responsible for the increase. Development and exploratory drilling proved 168 oil and 22 gas wells; 6 new oilfields and 3 new gas pays were discovered. Cabot Carbon Co. recovered carbon black from natural gas at its Kermit furnace plant. Sulfur was recovered at the Keystone plant of Sid Richardson Gasoline Co.

**Wise.**—Mineral production value was $27.2 million, a 4-percent drop from 1959. Petroleum, natural gas, natural gas liquids, and limestone were the major mineral products. Acme Brick Co. mined miscellaneous clay from pits near Bridgeport for use in manufacturing heavy clay products. Limestone was quarried and prepared for concrete aggregate and roadstone by Bridgeport Stone Co., Gifford-Hill & Co., Inc., Southwest Stone Co., and Wesco Stone Corp.

**Wood.**—Petroleum, natural gas, and natural gas liquids were the only mineral commodities produced. Mineral production totaled $18.4 million, a decline of 7 percent from 1959. The Kaska gasoline plant of Kaska Corp. and the Hawkins gasoline plant of Natural Gasoline Corp. recovered natural gas liquids.

**Yoakum.**—A 20-percent increase in mineral production resulted from increased petroleum production. The Wasson gasoline plant of Shell Oil Co., and the Prentice plant of Honolulu Oil Corp. recovered natural gas liquids. Frontier Chemical Co. recovered salt in brine from wells near Denver City.

**Young.**—Total mineral value of $18.2 million was 9 percent under the 1959 value. The oil and gas industry discovered 15 new oilfields and oil pays during the year. Over 5 million barrels of crude oil were recovered. Crude oil was processed at the Graham refinery of Graytex Corp. Pitcock Bros. prepared building and paving sand and gravel. Contractors quarried and crushed limestone for concrete aggregate and roadstone for District 2 of Texas Highway Department.

# The Mineral Industry of Utah

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Utah Geological and Mineralogical Survey.**

By William H. Kerns,[1] F. J. Kelly,[1] and D. H. Mullen [1]

THE TOTAL VALUE of Utah's mineral output in 1960 was $431 million, a gain of $58 million over 1959. Most of this advance resulted from a $51 million increase in the value of copper production. Of the total value, metals accounted for 57 percent; fuels, 37 percent; and nonmetals, 6 percent.

The value of metals was up 30 percent from 1959, primarily because of the aforementioned rise in production of copper and in associate byproducts gold, silver, and molybdenum. This major increase in copper production resulted from a nearly full-year's operation at the State's largest copper mine, which was active during only part of 1959. The labor strike, which idled the mine in August 1959, was settled by February 1960; and full production was reached in March. The value of iron-ore shipments from Utah deposits was $4 million greater than that of 1959 because of a 12-month operation in 1960 compared with a 7-month activity in 1959. A nationwide steelworkers' strike had idled the mines from July until November of 1959. Lead and zinc each gained $1 million in value of output. In contrast, uranium ore and vanadium (recovered as a byproduct of uranium ore) dropped nearly $10 million from 1959.

Production of fuels, with a total value of $159.8 million, increased $536,000, compared with that of 1959. An $11 million decrease in value of petroleum (crude) output was nearly balanced by substantial increases in the value of coal, natural gas, natural gas liquids, and gilsonite produced.

Total value of products from the nonmetal segment of the industry was $28 million, a $1 million increase over the 1959 total. This advance resulted from increased value of output for lime, phosphate rock, potassium salts, and salt that more than offset decreases in cement, sand and gravel, and stone.

Numerous construction, exploration, and development programs affecting the mineral industry of Utah were begun or completed during the year. In the metals field, Utah Copper Division, Kennecott Copper Corp., completed a major addition to the powerplant and started a modification of the Garfield smelter. Kennecott also began a spiral-haulage excavation in its open-pit mine. Utah Construction & Mining Co. began construction of a new beneficiation plant to

[1] Commodity-industry analyst, Bureau of Mines, Denver, Colo.

**TABLE 1.—Mineral production in Utah [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Asphalt and related bitumens, native: Gilsonite short tons | 379,362 | $9,385 | 383,037 | $10,027 |
| Carbon dioxide, natural thousand cubic feet | 69,625 | 5 | 60,425 | 4 |
| Clays [2] thousand short tons | 185 | 484 | 143 | 416 |
| Coal do | 4,545 | 27,982 | 4,955 | 31,478 |
| Copper (recoverable content of ores, etc.) short tons | 144,715 | 88,855 | 218,049 | 139,547 |
| Fluorspar do | (3) | (3) | 1,912 | 21 |
| Gem stones | (4) | 134 | (4) | 72 |
| Gold (recoverable content of ores, etc.) troy ounces | 239,517 | 8,383 | 368,255 | 12,889 |
| Iron ore (usable) thousand long tons, gross weight | 2,842 | 19,979 | 3,334 | 23,452 |
| Lead (recoverable content of ores, etc.) short tons | 36,630 | 8,425 | 39,368 | 9,055 |
| Lime thousand short tons | 90 | 1,773 | 127 | 2,502 |
| Manganese ore and concentrate (35 percent or more Mn) short tons, gross weight | 1,511 | 124 | | |
| Natural gas million cubic feet | 38,921 | 5,527 | 51,040 | 9,767 |
| Petroleum (crude) thousand 42-gallon barrels | 39,959 | 114,283 | [r] 37,599 | [r] 103,921 |
| Pumice thousand short tons | 39 | 81 | 60 | 134 |
| Salt do | 209 | 2,453 | 231 | 3,055 |

| Value of items that cannot be disclosed: Barite, cement, clays (kaolin), gypsum, molybdenum, natural gas liquids, perlite, phosphate rock, potassium salts, pyrites, and values indicated by footnote 3 | | 27,396 | | 36,047 |
| Total Utah [5] | | [r] 373,515 | | 431,386 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Excludes kaolin; included with "Value of items that cannot be disclosed."
[3] Figure withheld to avoid disclosing individual company confidential data.
[4] Weight not recorded.
[5] Preliminary figure.
[6] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.
[r] Revised figure.

treat iron ore from its mine in Iron County. Bear Creek Mining Co. and its parent company, Kennecott Copper Corp., continued an extensive exploration and development program for lead and zinc on lease holdings in the East Tintic mining district. Other companies, including The Anaconda Company, Cerro Corp., United Park City Mines Co., New Park Mining Co., and Keystone Mining Co., conducted exploration and development for lead and zinc on Utah mineral deposits. Several companies were exploring newly discovered beryllium mineralization in the Topaz-Spor Mountain area and conducting metallurgical tests on samples collected. Minerals Engineering Co. purchased the Howe Sound Co. cobalt refinery near Salt Lake City and planned to convert the plant to produce vanadium pentoxide from out-of-State material.

In the coal industry, Columbia-Geneva Steel Division, United States Steel Corp., installed a new-type coal dryer at its coal-cleaning plant at Wellington. A major contribution to the petroleum industry of Utah was the development of the Northwest Lisbon field, the first to yield petroleum from the Devonian formation in the Paradox basin.

A significant nonmetal development was the completion of additional cement-storage facilities at the Ideal Cement Co. Devil's Slide cement plant. Portland Cement Co. of Utah continued construction

Digitized by Google

to double the capacity of its Salt Lake City plant. The Utah Lime and Stone Co. began operating a new hydrated-lime plant at Dolomite. San Francisco Chemical Co. began constructing a phosphate plant near Vernal. Texas Gulf Sulphur Co. and Delhi-Taylor Oil Corp. signed an agreement for development of a potash deposit in the Cane Creek area near Moab.

**Employment and Injuries.**—Preliminary employment and injuries data (excluding the petroleum industry) compiled by the Federal Bureau of Mines are shown in table 2. The nonferrous mining, milling, smelting, and refining industry (excluding uranium mining and processing) accounted for two-thirds of the man-hours worked and 5 of the 14 fatal injuries in Utah's mineral industry. Cumulatively, the coal, asphalt and related bitumens, and coke industry was second to the nonferrous industry in employment and fatal injuries; the uranium industry was third.

**Legislation and Government Programs.**—Four Office of Mineral Exploration (OME) contracts executed in 1960 for exploration at four mines in Utah are shown in table 3. During the year, New Park Mining Co. continued work on an exploration contract executed in 1958 under the Defense Minerals Exploration Administration (DMEA), now administered by the OME, for lead-zinc-copper exploration at the Mayflower-Galena mine in Wasatch County.

**TABLE 2.—Employment and injuries in the mineral industries[1] in 1960[2]**

| Industry | Number of operations | Average number of men employed | Total man-hours worked | Injuries | | Frequency rate (injuries per million man-hours) |
|---|---|---|---|---|---|---|
| | | | | Fatal | Nonfatal | |
| Nonferrous (excluding uranium) | 128 | 7,777 | 21,835,752 | 5 | 206 | 9.7 |
| Uranium | 191 | 1,321 | 2,296,980 | 4 | 62 | 28.7 |
| Ferrous | 7 | 511 | 973,992 | ---- | 4 | 4.1 |
| Sand and gravel | 107 | 440 | 751,629 | ---- | 12 | 16.0 |
| Stone | 29 | 424 | 904,056 | ---- | 5 | 5.5 |
| Nonmetal (other than sand and gravel and stone) | 37 | 587 | 1,085,880 | ---- | 59 | 54.3 |
| Coal, asphalt and related bitumens, and coke | 55 | 3,103 | 5,227,622 | 5 | 136 | 27.0 |
| Total | 554 | 14,163 | 33,075,951 | 14 | 484 | 15.1 |

[1] Excludes petroleum industry.

# REVIEW BY MINERAL COMMODITIES

## METALS

**Beryllium.**—Beryllium exploration in the United States in 1960 was highlighted by intensive prospecting in the Topaz-Spor Mountain area of western Utah (near Delta). Reports of the discovery of major beryllium deposits in this region interested a number of companies. Vitro Minerals Corp. and Beryllium Resources, Inc., the major claim holders, were actively engaged in exploration and metallurgical testing to determine the economics of ore-processing techniques. The ore mineral, tentatively identified as bertrandite, is disseminated in a volcanic tuff underlying a bed of rhyolite.

In August, Vitro Minerals Corp. executed a contract with OME for beryllium exploration in the Topaz Mountain area. Under the contract, OME would participate to the extent of 50 percent of approved costs up to $75,000. Other companies prospecting or exploring in the area included E. I. du Pont de Nemours & Co., Inc., United States Steel Corp., Combined Metals Reduction Co., Food Machinery & Chemical Corp., International Minerals & Chemical Corp. (IMC), and Minerva Oil Co.-The New Jersey Zinc Co.

**Cobalt.**—Minerals Engineering Co. and Susquehanna-Western, Inc., purchased the Howe Sound Co. cobalt refinery 20 miles west of Salt Lake City. The plant was to be converted to produce vanadium pentoxide for uses in nuclear energy, alloy steels, and vehicle smog-control devices. To assure a source of raw material, the companies signed a 5-year contract with Mineral Products Division of Food Machinery & Chemical Corp. in May for vanadium-bearing slag resulting from treatment of phosphatic ores in Idaho and Montana. Previous plans of Minerals Engineering for new refining facilities adjacent to its Salt Lake City tungsten plant were set aside.

**Copper.**—Utah continued to rank second only to Arizona in copper output. The value of copper production accounted for 33 percent of the total value of minerals produced in the State. Copper production increased 51 percent in quantity and 58 percent in value compared with 1959. Production of copper advanced from 990 tons in January to 16,400 tons in February, 20,100 tons in March, and 21,200 tons in April. Copper production averaged 19,900 tons per month for the remaining 8 months with monthly figures either above or below the April output.

billion cubic feet of natural gas were produced. Of 39 exploratory wells drilled, 5 produced oil and 2 produced gas. Natural gas liquids were recovered by the Chapel Hill gasoline plant of Etexas Producers Gas Co. and the Chapel Hill cycling plant of Lone Star Producing Co. Crude oils were processed at the Tyler refinery of LaGloria Oil & Gas Co. Miscellaneous clay, used to manufacture brick and heavy clay products, was mined from open pits by Reliance Clay Products Co. Industrial sands for foundry use were processed by H. J. Ellis Sand Co.

**Starr.**—Mineral output valued at $26.1 million, 13 percent greater than 1959, reflected a major increase in production of natural gas and a slight increase in production of petroleum and sand and gravel. Increased interest in oil and gas properties was evidenced by 107 crew-weeks spent on geophysical prospecting. In addition, exploratory drilling discovered 27 gas and 9 oil wells. Two plants of Sun Oil Co. and the Rincon gasoline plant of Continental Oil Co. recovered natural gas liquids. Crushed limestone was quarried and prepared for concrete aggregate and roadstone by Fordyce Gravel Co. Valley Brick & Tile Co. mined miscellaneous clay from open pits for manufacture of brick and heavy clay products.

**Stephens.**—A value of $9.9 million was reported for mineral output. In addition to the 2.2 million barrels of crude oil and the 14.9 billion cubic feet of natural gas produced, building sand and gravel was obtained from open pits by Taylor Brothers. Exploratory drilling resulted in discovery of seven oilfields and six oil pays.

**Stonewall.**—Production of petroleum dominated the mineral industry in the county and reduced petroleum production was responsible for an 11-percent decline in the total value of minerals produced. The Stonewall plant of Cities Service Co. processed gases from various fields in the area and recovered natural gas liquids. Building and paving sand and gravel were recovered from open pits by Hamlin Sand & Gravel Co., Inc.

**Tarrant.**—Mineral output was valued at $9.8 million and was based on production of cement, sand and gravel, and stone. Trinity Division of General Portland Cement Co. quarried and prepared crushed limestone for manufacturing portland and masonry cements. Carruthers Cutstone Co. processed limestone for building purposes. Contractors produced limestone for District 2 of Texas Highway Department. Building and paving sand and gravel were prepared by 12 producers. Mica was ground and prepared by Western Mica Co.

**Taylor.**—Petroleum accounted for over 95 percent of the total mineral value of $15.7 million. A total of 329 development and exploratory wells were drilled. Clay, used in manufacturing building brick, was mined from open pits by Abilene Brick Co. H. B. Zachry & Co. quarried and prepared crushed limestone for concrete aggregate and roadstone. Building and paving sand and gravel were prepared by Atlas Sand & Gravel Co. and Caton Sand & Gravel Co. Debco Corp. processed crude oil at its Abilene refinery.

**Terry.**—The $19.5 million mineral production value was approximately the same as that in 1959. The Adair gasoline plant of Amerada Petroleum Corp. and the Wellman plant of Chillgas Corp. recovered natural gas liquids. Carbon black was recovered from natural

Digitized by Google

gas and natural gas liquids at the Seagraves No. 64 furnace plant of Columbia Carbon Co. Sodium sulfate was recovered from brine at the Brownfield plant of Ozark-Mahoning Co. Paving sand and gravel for Texas Highway Department was processed by various producers.

**Throckmorton.**—As a result of decreased oil production, total mineral value dropped 15 percent; 525.1 million cubic feet of natural gas and 3.2 million barrels of crude oil were produced.

**Titus.**—Output of petroleum declined sharply. The total $4.3 million mineral production value was 57 percent below that of 1959. American Petrofina Co. of Texas processed crude oil at its Mt. Pleasant refinery.

**Tom Green.**—A total mineral production value of $5.3 million was reported, essentially the same as in 1959. Montgomery Sand & Gravel Co. and other producers prepared building and paving sand and gravel.

**Travis.**—Value of mineral production increased 12 percent over that of 1959, principally because of increased production of stone, sand and gravel, and lime. Austin White Lime Co. quarried and prepared limestone for manufacturing lime, which was used by building, agricultural, and chemical industries. From limestone quarried in Williamson County, Texas Quarries, Inc., prepared dressed building stone. In addition, limestone was quarried and crushed for riprap, metallurgic flux, railroad ballast, concrete aggregate, and roadstone by Austin White Lime Co. and Texas Crushed Stone Co. Building and paving sand and gravel were prepared by Capital Aggregates, Inc., and Travis Materials, Inc. Contractors produced crushed limestone for Districts 2 and 14 of Texas Highway Department.

**Upshur.**—Mineral production, valued at $5.2 million, was 17 percent less than in 1959. Thirty development wells were completed during the year. Big Sandy Sand & Gravel Co. prepared building and industrial sand.

**Upton.**—Continued development of petroleum, natural gas, and natural gas liquid resources increased total value of mineral production to $67.1 million, a 17-percent increase over 1959.

**Uvalde.**—Native asphalt was quarried and prepared for road surfacing material, from pits near Dabney by White's Uvalde Mines and near Blewett by Uvalde Rock Asphalt Co. Basalt for riprap, concrete aggregate, roadstone, and railroad ballast was quarried and prepared by Southwest Stone Co. The D & D Gravel Co. prepared building and paving sand and gravel.

**Van Zandt.**—The value of mineral fuels and salt produced was $20.8 million, 10 percent less than the 1959 value. The oil and gas industry produced 3.8 billion cubic feet of natural gas and 5 million barrels of crude oil. Pure Oil Co. recovered natural gas liquids at its Van gasoline plant. Morton Salt Co. recovered rock salt from underground mines and salt in brine from wells near Grand Saline.

**Victoria.**—A 6-percent increase in value of mineral production to $24.9 million was reported. The oil and gas industry spent 49 crew-weeks in geophysical prospecting and completing 6 oil and 25 gas development wells. In addition, exploratory drilling proved 3 oil wells and 11 gas wells. Building and paving sand and gravel were

Morton Salt Co. recovered rock salt from underground mines and salt in brine from wells near Grand Saline.

**Victoria.**—A 6-percent increase in value of mineral production to $24.9 million was reported. The oil and gas industry spent 49 crew-weeks in geophysical prospecting and completing 6 oil and 25 gas development wells. In addition, exploratory drilling proved 3 oil wells and 11 gas wells. Building and paving sand and gravel were

Digitized by Google

prepared from pits by Fordyce Gravel Co., Gulf Materials Co., and Heldenfels Bros. Limestone for concrete aggregate and roadstone was quarried and crushed by Fordyce Gravel Co.

**Waller.**—Production of natural gas and natural gas liquids accounted for over 90 percent of total value of mineral production. Output was valued at $36.7 million, 11 percent below that of 1959. Katy cycling plant of Humble Oil & Refining Co. recovered natural gas liquids. Paving and construction sand and gravel were prepared for District 12 of Texas Highway Department and Waller County Road and Bridge Department.

**Ward.**—Ward County ranked 10th in value of minerals produced with a total of $75.7 million, an increase of 12 percent over 1959. This was principally effected by increased petroleum production. Approximately 22.6 million barrels of crude oil and 28.3 billion cubic feet of natural gas were produced. Cabot Carbon Co. increased the capacity of its Estes plant to 25 million cubic feet daily and the liquid recovery to 37,500 gallons per day. Salt was obtained from brine by Montex Chemical Co. Sodium sulfate was recovered from salt wells and dry lake brines at the Monahans plant of Ozark-Mahoning Co. Permian Sand & Gravel Co., Inc., prepared building and paving sand and gravel from Anderson pit near Grand Falls and mined gypsum from the Johnson pit near Pyote.

**Webb.**—A 16-percent increase in value of mineral production resulted from increased crude oil production. Antimony ores from Mexico and Bolivia were processed at the Laredo Smelter of National Lead Co. Miscellaneous clay used in brick and heavy clay products was mined from open pits by Richard Chavana and E. C. Delachica Clay Co. Building sand and gravel was prepared by Aldape Sand & Gravel Co.

**Wharton.**—Reduced demand for petroleum and sulfur resulted in a 25-percent decrease in total mineral value compared with 1959. The reduction of petroleum production also affected recovery of casinghead gas, and it too declined sightly. Sulfur, the county's principal revenue-producing mineral, declined sharply in value from 1959. Texas Gulf Sulfur Co. continued mining sulfur by the Frasch process at Boling Dome.

**Wheeler.**—Mineral fuel production, valued at $9.3 million, was 7 percent less than in 1959. The McLean-28 gasoline plant of Warren Petroleum Co. recovered natural gas liquids. Carbon black was recovered from natural gas and natural gas liquids at the Norrick furnace plant of United Carbon Co.

**Wichita.**—Production of petroleum was responsible for over 90 percent of the $34.5 million mineral production value. Wichita Falls refineries of American Petrofina, Inc., and Continental Oil Co. refined crude oil. Natural gas liquids were recovered at four gasoline plants. Sandstone was quarried and crushed for concrete aggregate and roadstone. Paving sand and gravel was prepared by contractors for District 3 of Texas Highway Department. Northwest Materials Co. and Wichita Sand & Gravel Co. prepared building and paving sand and gravel.

Digitized by Google

**Wilbarger.**—A decline of 1 percent in total mineral value to $17.9 million was due to a slight decrease in crude oil production. Districts 2 and 3 of Texas Highway Department received crushed limestone from county contractors.

**Williamson.**—Williamson County, one of the State's leading stone and lime producers, increased its value of mineral production 5 percent. Limestone was quarried and prepared for use in lime by Round Rock White Lime Co. and White Stone Lime Co. Rough, architectural, and dressed building stone were quarried and prepared by Leander Limestone Corp., Texas Quarries, Inc., and San-Tex Stone Quarry, Inc. Limestone was quarried and crushed by various producers for use as concrete aggregate, roadstone, fertilizer, filler, and other industrial uses.

**Wilson.**—Mineral production, valued at $1.7 million, was 9 percent less than in 1959. Fire clay, used in heavy clay products, was mined from open pits near Saspamco by W. F. Dickey Clay Manufacturing Co.

**Winkler.**—The county ranked seventh in total value of mineral production with $95 million, a 20-percent increase over 1959. Increased production of crude oil and natural gas was primarily responsible for the increase. Development and exploratory drilling proved 168 oil and 22 gas wells; 6 new oilfields and 3 new gas pays were discovered. Cabot Carbon Co. recovered carbon black from natural gas at its Kermit furnace plant. Sulfur was recovered at the Keystone plant of Sid Richardson Gasoline Co.

**Wise.**—Mineral production value was $27.2 million, a 4-percent drop from 1959. Petroleum, natural gas, natural gas liquids, and limestone were the major mineral products. Acme Brick Co. mined miscellaneous clay from pits near Bridgeport for use in manufacturing heavy clay products. Limestone was quarried and prepared for concrete aggregate and roadstone by Bridgeport Stone Co., Gifford-Hill & Co., Inc., Southwest Stone Co., and Wesco Stone Corp.

**Wood.**—Petroleum, natural gas, and natural gas liquids were the only mineral commodities produced. Mineral production totaled $48.4 million, a decline of 7 percent from 1959. The Kaska gasoline plant of Kaska Corp. and the Hawkins gasoline plant of Natural Gasoline Corp. recovered natural gas liquids.

**Yoakum.**—A 20-percent increase in mineral production resulted from increased petroleum production. The Wasson gasoline plant of Shell Oil Co., and the Prentice plant of Honolulu Oil Corp. recovered natural gas liquids. Frontier Chemical Co. recovered salt in brine from wells near Denver City.

**Young.**—Total mineral value of $18.2 million was 9 percent under the 1959 value. The oil and gas industry discovered 15 new oilfields and oil pays during the year. Over 5 million barrels of crude oil were recovered. Crude oil was processed at the Graham refinery of Graytex Corp. Pitcock Bros. prepared building and paving sand and gravel. Contractors quarried and crushed limestone for concrete aggregate and roadstone for District 2 of Texas Highway Department.

# The Mineral Industry of Utah

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Utah Geological and Mineralogical Survey.**

By William H. Kerns,[1] F. J. Kelly,[1] and D. H. Mullen [1]

THE TOTAL VALUE of Utah's mineral output in 1960 was $431 million, a gain of $58 million over 1959. Most of this advance resulted from a $51 million increase in the value of copper production. Of the total value, metals accounted for 57 percent; fuels, 37 percent; and nonmetals, 6 percent.

The value of metals was up 30 percent from 1959, primarily because of the aforementioned rise in production of copper and in associate byproducts gold, silver, and molybdenum. This major increase in copper production resulted from a nearly full-year's operation at the State's largest copper mine, which was active during only part of 1959. The labor strike, which idled the mine in August 1959, was settled by February 1960; and full production was reached in March. The value of iron-ore shipments from Utah deposits was $4 million greater than that of 1959 because of a 12-month operation in 1960 compared with a 7-month activity in 1959. A nationwide steelworkers' strike had idled the mines from July until November of 1959. Lead and zinc each gained $1 million in value of output. In contrast, uranium ore and vanadium (recovered as a byproduct of uranium ore) dropped nearly $10 million from 1959.

Production of fuels, with a total value of $159.8 million, increased $536,000, compared with that of 1959. An $11 million decrease in value of petroleum (crude) output was nearly balanced by substantial increases in the value of coal, natural gas, natural gas liquids, and gilsonite produced.

Total value of products from the nonmetal segment of the industry was $28 million, a $1 million increase over the 1959 total. This advance resulted from increased value of output for lime, phosphate rock, potassium salts, and salt that more than offset decreases in cement, sand and gravel, and stone.

Numerous construction, exploration, and development programs affecting the mineral industry of Utah were begun or completed during the year. In the metals field, Utah Copper Division, Kennecott Copper Corp., completed a major addition to the powerplant and started a modification of the Garfield smelter. Kennecott also began a spiral-haulage excavation in its open-pit mine. Utah Construction & Mining Co. began construction of a new beneficiation plant to

**TABLE 1.—Mineral production in Utah [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Asphalt and related bitumens, native: Gilsonite short tons | 379,362 | $9,385 | 383,037 | $10,030 |
| Carbon dioxide, natural thousand cubic feet | 69,625 | 5 | 60,425 | 4 |
| Clays [2] thousand short tons | 185 | 484 | 143 | 416 |
| Coal do | 4,545 | 27,982 | 4,955 | 31,476 |
| Copper (recoverable content of ores, etc.) short tons | 144,715 | 88,855 | 218,049 | 139,547 |
| Fluorspar do | (3) | (3) | 1,912 | 51 |
| Gem stones | (4) | 134 | (4) | 72 |
| Gold (recoverable content of ores, etc.) troy ounces | 239,517 | 8,383 | 368,255 | 12,889 |
| Iron ore (usable) thousand long tons, gross weight | 2,842 | 19,979 | 3,334 | 23,442 |
| Lead (recoverable content of ores, etc.) short tons | 36,630 | 8,425 | 39,398 | 9,219 |
| Lime thousand short tons | 90 | 1,773 | 127 | 2,672 |
| Manganese ore and concentrate (35 percent or more Mn) short tons, gross weight | 1,511 | 124 | ---- | ---- |
| Natural gas million cubic feet | 38,921 | 5,527 | 51,040 | 9,187 |
| Petroleum (crude) thousand 42-gallon barrels | 39,959 | 114,283 | [5] 37,599 | [5] 103,471 |
| Pumice thousand short tons | 39 | 81 | 60 | 134 |
| Salt do | 209 | 2,453 | 231 | 3,092 |
| Sand and gravel do | 8,843 | 6,436 | 6,848 | 6,152 |
| Silver (recoverable content of ores, etc.) thousand troy ounces | 3,734 | 3,390 | 4,783 | 4,329 |
| Stone thousand short tons | 3,338 | 4,048 | 1,837 | 3,087 |
| Uranium ore short tons | 1,210,654 | 37,310 | 1,089,757 | 27,843 |
| Vanadium do | 536 | (3) | 462 | (3) |
| Zinc (recoverable content of ores, etc.) do | 35,223 | 8,101 | 35,476 | 9,153 |
| Value of items that cannot be disclosed: Barite, cement, clays (kaolin), gypsum, molybdenum, natural gas liquids, perlite, phosphate rock, potassium salts, pyrites, and values indicated by footnote 3 | ---- | 27,396 | ---- | 36,047 |
| Total Utah [6] | ---- | [7] 373,515 | ---- | 431,396 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Excludes kaolin; included with "Value of items that cannot be disclosed."
[3] Figure withheld to avoid disclosing individual company confidential data.
[4] Weight not recorded.
[5] Preliminary figure.
[6] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.
[7] Revised figure.

treat iron ore from its mine in Iron County. Bear Creek Mining Co. and its parent company, Kennecott Copper Corp., continued an extensive exploration and development program for lead and zinc on lease holdings in the East Tintic mining district. Other companies, including The Anaconda Company, Cerro Corp., United Park City Mines Co., New Park Mining Co., and Keystone Mining Co., conducted exploration and development for lead and zinc on Utah mineral deposits. Several companies were exploring newly discovered beryllium mineralization in the Topaz-Spor Mountain area and conducting metallurgical tests on samples collected. Minerals Engineering Co. purchased the Howe Sound Co. cobalt refinery near Salt Lake City and planned to convert the plant to produce vanadium pentoxide from out-of-State material.

In the coal industry, Columbia-Geneva Steel Division, United States Steel Corp., installed a new-type coal dryer at its coal-cleaning plant at Wellington. A major contribution to the petroleum industry of Utah was the development of the Northwest Lisbon field, the first to yield petroleum from the Devonian formation in the Paradox basin.

A significant nonmetal development was the completion of additional cement-storage facilities at the Ideal Cement Co. Devil's Slide cement plant. Portland Cement Co. of Utah continued construction

Digitized by Google

to double the capacity of its Salt Lake City plant. The Utah Lime and Stone Co. began operating a new hydrated-lime plant at Dolomite. San Francisco Chemical Co. began constructing a phosphate plant near Vernal. Texas Gulf Sulphur Co. and Delhi-Taylor Oil Corp. signed an agreement for development of a potash deposit in the Cane Creek area near Moab.

**Employment and Injuries.**—Preliminary employment and injuries data (excluding the petroleum industry) compiled by the Federal Bureau of Mines are shown in table 2. The nonferrous mining, milling, smelting, and refining industry (excluding uranium mining and processing) accounted for two-thirds of the man-hours worked and 5 of the 14 fatal injuries in Utah's mineral industry. Cumulatively, the coal, asphalt and related bitumens, and coke industry was second to the nonferrous industry in employment and fatal injuries; the uranium industry was third.

**Legislation and Government Programs.**—Four Office of Mineral Exploration (OME) contracts executed in 1960 for exploration at four mines in Utah are shown in table 3. During the year, New Park Mining Co. continued work on an exploration contract executed in 1958 under the Defense Minerals Exploration Administration (DMEA), now administered by the OME, for lead-zinc-copper exploration at the Mayflower-Galena mine in Wasatch County.

**TABLE 2.—Employment and injuries in the mineral industries[1] in 1960[2]**

| Industry | Number of operations | Average number of men employed | Total man-hours worked | Injuries | | Frequency rate (injuries per million man-hours) |
|---|---|---|---|---|---|---|
| | | | | Fatal | Nonfatal | |
| Nonferrous (excluding uranium) | 128 | 7,777 | 21,835,752 | 5 | 206 | 9.7 |
| Uranium | 191 | 1,321 | 2,296,980 | 4 | 62 | 28.7 |
| Ferrous | 7 | 511 | 973,992 | ------- | 4 | 4.1 |
| Sand and gravel | 107 | 440 | 751,629 | ------- | 12 | 16.0 |
| Stone | 29 | 424 | 904,096 | ------- | 5 | 5.5 |
| Nonmetal (other than sand and gravel and stone) | 37 | 587 | 1,085,880 | ------- | 59 | 54.3 |
| Coal, asphalt and related bitumens, and coke | 55 | 3,103 | 5,227,622 | 5 | 136 | 27.0 |
| Total | 554 | 14,163 | 33,075,951 | 14 | 484 | 15.1 |

[1] Excludes petroleum industry.
[2] Preliminary figures.

**TABLE 3.—OME contracts executed in 1960**

| County and contractor | Property | Commodity | Contract | |
|---|---|---|---|---|
| | | | Date 1960 | Total amount[1] |
| Juab: | | | | |
| Brennan Hannifin | Bullion Beck mine | Lead-zinc-copper | May 3 | $47,550 |

# REVIEW BY MINERAL COMMODITIES

## METALS

**Beryllium.**—Beryllium exploration in the United States in 1960 was highlighted by intensive prospecting in the Topaz-Spor Mountain area of western Utah (near Delta). Reports of the discovery of major beryllium deposits in this region interested a number of companies. Vitro Minerals Corp. and Beryllium Resources, Inc., the major claim holders, were actively engaged in exploration and metallurgical testing to determine the economics of ore-processing techniques. The ore mineral, tentatively identified as bertrandite, is disseminated in a volcanic tuff underlying a bed of rhyolite.

In August, Vitro Minerals Corp. executed a contract with OME for beryllium exploration in the Topaz Mountain area. Under the contract, OME would participate to the extent of 50 percent of approved costs up to $75,000. Other companies prospecting or exploring in the area included E. I. du Pont de Nemours & Co., Inc., United States Steel Corp., Combined Metals Reduction Co., Food Machinery & Chemical Corp., International Minerals & Chemical Corp. (IMC), and Minerva Oil Co.-The New Jersey Zinc Co.

**Cobalt.**—Minerals Engineering Co. and Susquehanna-Western, Inc., purchased the Howe Sound Co. cobalt refinery 20 miles west of Salt Lake City. The plant was to be converted to produce vanadium pentoxide for uses in nuclear energy, alloy steels, and vehicle smog-control devices. To assure a source of raw material, the companies signed a 5-year contract with Mineral Products Division of Food Machinery & Chemical Corp. in May for vanadium-bearing slag resulting from treatment of phosphatic ores in Idaho and Montana. Previous plans of Minerals Engineering for new refining facilities adjacent to its Salt Lake City tungsten plant were set aside.

**Copper.**—Utah continued to rank second only to Arizona in copper output. The value of copper production accounted for 33 percent of the total value of minerals produced in the State. Copper production increased 51 percent in quantity and 58 percent in value compared with 1959. Production of copper advanced from 990 tons in January to 16,400 tons in February, 20,100 tons in March, and 21,200 tons in April. Copper production averaged 19,900 tons per month for the remaining 8 months with monthly figures either above or below the April output.

The increase in copper production reflected an 11-month operation in 1960 by the leading copper producer, Utah Copper, compared with only a 7½-month operation in 1959. The labor strike, which idled the mine, mill, smelter, and refinery in mid-August 1959, was settled by the beginning of February; but the operation did not reach full production until March. In its annual report, Kennecott Copper stated that 28.1 million tons of ore was mined and milled from the Utah Copper open-pit mine, compared with 19.7 million tons in 1959. Copper recovered from all sources at this mine was 215,125 tons in 1960, compared with 142,352 tons in 1959. Copper content of the ore mined was 16.2 pounds per ton—0.1 pound below the 1959 average. In October, the company placed in operation a $16 million, 75,000-kw. addition to the 100,000-kw. powerplant. A $10 million improvement and modification program at the Garfield smelter, acquired from the American Smelting and Refining Co. (Asarco), was begun during the year, to adapt the custom smelter to Kennecott's needs. In August, an excavation project scheduled for completion in 9 months was begun in the Utah Copper open-pit mine. The project involved a spiral approach to the 5,490-foot tunnel, 150 feet below the existing working level of the pit. When the spiral is connected with the new tunnel, the ore from the pit will be hauled downhill and out the new tunnel rather than uphill to the 5,840-foot-level tunnel presently in use.

The U.S. and Lark mine of the United States Smelting Refining and Mining Co., second-ranking Utah copper producer, operated throughout the year with 2 shifts on an alternate 5- and 6-day-per-week basis. Late in the year, the deepening of an internal inclined shaft in the Lark section of the mine was started to prepare lower levels for mining. The ore from the U.S. and Lark mine was treated in the company Midvale flotation mill, which operated throughout the year on an alternate 5- and 6-day-per-week basis. Demolition of the company smelter buildings at Midvale, continuing under contract, was nearly completed by yearend. Of the total copper produced, 94 percent was recovered from copper ore and 5 percent from copper precipitates (produced by leaching copper dump material). The remaining 1 percent came from miscellaneous classes of ore and material, including some copper recovered as a byproduct of uranium ores.

Majestic Oil and Mining Co. made commitments for opening of the Bawana copper deposit near Milford. This action was made possible through an agreement between the company and Bogdanich Development Co., lessees of the property from Cerro Verde Mining Co. Plans were made to develop the property as an open-pit mine and to renovate a 350-ton-per-day mill near Milford to treat the ore.

**Gold.**—Gold output increased 54 percent ($4.5 million), over that of 1959. This advance directly reflected the increased copper production inasmuch as 96 percent of the gold was recovered as a byproduct of copper.

Kennecott's Utah Copper Bingham open-pit copper mine accounted for most of the State's gold output, followed by the U.S. and Lark, Mayflower-Galena, and United Park City mines, in descending order of output.

Digitized by Google

**Iron Ore.**—Production of iron ore shipped increased 500,000 long tons in quantity and $3.9 million in value over 1959. The output came from seven mines operated by four companies in Iron County. The Columbia Iron Mining Co., a subsidiary of United States Steel Corp., which is the State's largest iron-ore producer, shipped ore from the Desert Mound and Iron Mountain mines to Columbia-Geneva Steel Division plants at Geneva and Ironton. The Colorado Fuel and Iron Corp. (CF&I) shipped ore (mined under contract by Utah Construction & Mining Co. from the Blowout, Comstock, and Duncan mines) to its pig iron and steel plant at Pueblo, Colo. Utah Construction shipped ore from its Excelsior (Iron Springs) mine to consumers in Utah, primarily to Columbia-Geneva Steel. Utah Construction, in its annual report, stated that a total of 683,515 tons of ore was mined and shipped during the year, compared with 598,128 tons in 1959 and that a $1.3 million beneficiation plant was being installed to improve product quality and to allow more efficient use of ore reserves. Lambeth Bros., lessees from Helene E. Beatty, marketed ore from the Alberts Iron Nos. 1, 2, and 3 claims.

**TABLE 8.—Usable iron ore shipments**

(Thousand long tons and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 4,027 | $19,126 | 1959 | 2,842 | $19,979 |
| 1956 | 4,002 | 27,508 | 1960 | 3,331 | 23,862 |
| 1957 | 4,156 | 30,383 | | | |
| 1958 | 3,514 | 25,202 | 1906–60 | 60,498 | 256,775 |

**Lead.**—Lead production was 8 percent greater than in 1959. The annual weighted average price for lead was 11.7 cents in 1960, compared with 11.5 cents in 1959. Most of the lead came from lead-zinc ore produced at the U.S. and Lark mine at Bingham in Salt Lake County, operated by the United States Smelting Refining and Mining Co. The lead-zinc ore was treated in the company flotation mill at Midvale.

Other major producers of lead from lead-zinc ores included the United Park City and Mayflower-Galena mines. These mines plus the U.S. and Lark accounted for 95 percent of the State's total lead production.

In 1960, OME contracts for a total of $325,190 were executed for lead-zinc exploration programs at three Utah mines. The contractors and the Federal Government were to participate equally in the total amount of the contracts. Data concerning the contracts are shown in table 3.

Significant exploration and development programs were reported at lead-zinc mines. Bear Creek Mining Co. had been exploring lease holdings of approximately 11,000 acres in the East Tintic mining district, Tooele County, since September 1956. The property was owned by Tintic Standard Mining Co. and its subsidiaries and Chief Consolidated Mining Co. Bear Creek completed 9,700 feet of surface rotary and diamond drilling. In May, Bear Creek assigned its lease to the parent company, Kennecott. Bear Creek continued in charge

Digitized by Google

of surface drilling. Beginning in May, Kennecott operated the Burgin shaft and the underground workings and completed 1,600 feet of underground development and 8,500 feet of diamond drilling. A 440-foot, 25-degree incline winze from the 1,050-foot level (1,000 feet west of the Burgin shaft) was being sunk to determine the lower limit and continuity of the ore.

The Anaconda Company obtained an option from McFarland & Hullinger, mine contractors, on 21 claims comprising the Scranton lead-zinc mine 8 miles north of Eureka and planned extensive geological mapping and sampling on the property. Cerro Corp., in a joint venture with Chief Consolidated Mining Co. and Armet Co., completed a preliminary exploration program for silver-bearing lead ore at the Holt mine near Enterprise in Iron County; however, the company made no announcement of future plans regarding the sinking of a new shaft and unwatering the mine. Marvel Mining Co. discovered high grade lead-silver oxide ore on claims in the Clifton mining district in western Tooele County and made shipments of this ore to the Tooele smelter of International Smelting and Refining Co. Index-Daley Mines Co. announced that it would drive a 1,300-foot exploration tunnel at the Creole mine near Minersville. Heinecke Bros. was to continue to mine silver-bearing lead-zinc ore from the upper levels of the mine and operate the 100-ton-per-day mill on the property. United Park City Mines Co. completed a 400-foot incline winze to develop a silver-bearing lead-zinc ore body in the Humbug formation in the Park City mining district. Keystone Mining Co., through an agreement with United Park City Mines Co., began an exploration project financed equally by Keystone and OME to explore for silver-bearing lead-zinc ore at the Keystone mine adjoining United Park City properties. Under this agreement Keystone was allowed the use of United Park City facilities and equipment. New Park Mining Co. continued its reported $750,000 exploration and development program for silver-bearing lead-zinc ore at its Park City properties. Company officials reported that ore with a greater value was developed and that the ore reserve was increased beyond the rate of withdrawal during the year.

**Molybdenum.**—The entire production of molybdenum was recovered as a byproduct of copper ore from the Utah Copper mine of Utah Copper. The molybdenum was recovered as a molybdenite concentrate by flotation of the copper concentrate produced at the company Arthur and Magna mills.

**Silver.**—Silver production increased 28 percent (1 million troy ounces), principally because of major advance in output from the State's leading gold, silver, and copper producer, Utah Copper. The U.S. and Lark and United Park City mines also were important contributors to the total. The three mines accounted for 90 percent of the silver production. Fifty-five percent was recovered from copper ore, 39 percent from lead-zinc ore, and the remainder from other classes of ore and materials.

**Tungsten.**—Minerals Engineering Co. produced high-purity ammonium paratungstate at its refinery in Salt Lake City from concentrate recovered from ore mined from the company's Calvert Creek property near Dillon, Mont.

[2] F.o.b. mine value; base price, grade premiums, and exploration allowance.
[3] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."

**Uranium.**—Uranium ore production, from 312 operations in 9 counties, was 10 percent below that of 1959 in quantity and 25 percent less in value. The grade of the ore declined from 0.36 percent $U_3O_8$ (7.2 pounds per ton) in 1959 to 0.30 percent (6.0 pounds per ton). The major drop was in San Juan County although the county continued to lead the State, followed by Emery and Grand Counties.

Processing plants at Mexican Hat, Moab, and Salt Lake City operated throughout the year. Contracts for the purchase of uranium oxide concentrate by the Atomic Energy Commission (AEC) from Vitro Chemical Co. at Salt Lake City, which were to expire on March 31, 1962, and Texas-Zinc Minerals Corp., which were to expire December 31, 1966, were being reviewed to adjust production rates to meet anticipated requirements of AEC through 1966. The upgrading plant at Green River was operated by Union Carbide Nuclear Co. Ore treated at the plant was shipped to a processing plant at Rifle, Colo.

The AEC invited bids for the purchase and removal of equipment from the Government-owned buying station and sampling plant at Moab. The station, opened early in 1955, had been placed on standby November 1, 1956, when the Uranium Reduction Co. mill began operating and provided a market for ores in the area. The proposed sale of the Government-owned processing plant at Monticello to operators of uranium mills, probably in process units, also was announced. The plant, with a daily capacity of 350 tons of crude ore, closed December 31, 1959. Although not unsafe, the equipment was classified as radioactive, a classification that would preclude bidding by anyone not possessing a uranium oxide purchase contract.

**Vanadium.**—Uranium ores containing significant quantities of vanadium oxide were processed at mills in southwestern Colorado and northwestern New Mexico where the vanadium was recovered. The vanadium recovered from such ores produced in Emery, Garfield,

Digitized by Google

Grand, San Juan, and Wayne Counties was credited to Utah. The quantity recovered in 1960 was 14 percent less than that of 1959.

**Zinc.**—Zinc output slightly exceeded that of 1959, and the value increased 13 percent ($1.1 million) because of the advance in the annual weighted average price from 11.5 cents per pound in 1959 to 12.9 cents in 1960. The leading zinc producers—U.S. and Lark, United Park City, and Mayflower-Galena—together supplied 88 percent of the zinc output.

## MINERAL FUELS

**Asphalt and Related Bitumens.**—Gilsonite (uintahite) production from six mines in Uintah and Duchesne Counties increased 1 percent in quantity and 7 percent in value over that of 1959. American Gilsonite Co., operating the Bonanza mines in Uintah County, continued to develop and improve hydraulic mining methods.

**Carbon Dioxide.**—Carbon dioxide production came from the Navajo and Coconino formations in the Farnham Dome field in Carbon County. The gas, transported to Wellington by pipeline, was converted to dry ice and liquid carbon dioxide.

**Coal.**—Bituminous coal production, from 45 underground mines in 7 counties, increased 9 percent above that of 1959. Nearly half (49 percent) of the output was used in manufacturing coke for use in steel plants in Utah and California. Two counties, Carbon and Emery, accounted for 98 percent of the coal produced. Carbon County led with 75 percent. Independent Coal & Coke Co. completed its 1-mile tunnel connecting the Kenilworth and Castle Gate mines. Columbia-Geneva Steel completed a coal-drying plant, the first of its kind west of the Mississippi River, at its cleaning plant at Wellington.

**TABLE 10.—Coal production, by counties**

(Excludes mines producing less than 1,000 short tons)

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Average value per ton [1] | Short tons | Average value per ton [1] |
| Carbon | 3,446,396 | $6.30 | 3,697,694 | $6.50 |
| Emery | 988,809 | 5.76 | 1,136,786 | 5.96 |
| Garfield | | | 1,035 | 5.50 |
| Iron | 42,393 | 4.91 | [2] 49,786 | [2] 5.04 |
| Kane | 1,300 | 4.91 | ([2]) | ([2]) |
| Sevier | 47,250 | 6.00 | 49,310 | 5.91 |
| Summit | 18,409 | 4.44 | 20,082 | 4.42 |
| Total | 4,544,557 | 6.16 | 4,954,693 | 6.35 |

[1] Value received or charged for coal f.o.b. mine including selling cost. (Includes a value for coal not sold but used by producers, such as mine fuel and coal coked as estimated by producer at average prices that might have been received if such coal had been sold commercially).

[2] Production of Kane County combined with Iron County to avoid disclosing individual company confidential data.

**Natural Gas.**—The quantity of marketed natural gas from fields in six counties and residual gas from natural gas plants in three counties was 40 percent above that of 1959. A full year's operation of the El

Digitized by Google

Paso plant at Aneth, completed late in 1959, accounted for much of the increase. Oil-well gas processed at plants was 71 percent of the usable gas produced. Nine new gas fields were discovered, four each in Grand and Uintah Counties, and one in Carbon. Fourteen successful development wells (10 in Uintah County and 4 in Grand) also were completed. An additional outlet for natural gas from the Westwater area in Grand County was provided when the 6-inch, 9-million-cubic-foot-per-day pipeline was completed by Grand Valley Transmission Co. in November. The line connected with those of the Pacific Northwest Pipeline system of El Paso Natural Gas Co.

**Natural Gas Liquids.**—Natural gasoline, butane, and propane were recovered from plants in the Clay Basin field in Daggett County, the Red Wash field in Uintah County, and the Aneth field in San Juan County. The quantity recovered was nearly twice that of 1959, and the increase was entirely from the 100-million-cubic-foot-per-day El Paso Natural Gas Co. plant in the Aneth field. Natural gasoline, representing 20 percent of the natural gas liquids recovered, was largely from plants in the Clay Basin and Red Wash fields. The liquids recovered at the Aneth plant were separated at the El Paso Natural Gas Co. Wingate fractionation plant at Wingate, N. Mex. Standard Oil Co. of California began construction of a 40-million-cubic-foot-per-day gasoline plant at Red Wash field in Uintah County.

**Petroleum.**—Petroleum production, from 796 wells in 5 counties, fell 6 percent below the 1959 figure. Gains were recorded in Grand and Uintah Counties; a substantial decline was noted in San Juan County. Much of the drop was in the Greater Aneth area, particularly the Aneth, White Mesa, and Ratherford fields. Other fields in the area, Cahone Mesa, Ismay, and McElmo Creek, accounted for substantial gains. The designation of the Northwest Lisbon field as the "discovery of the year" in 1959 was fully justified. The producing area was extended to the southeast and to the north. The field, discovered late in 1959, was the first in the Paradox basin to yield petroleum from Devonian formations.

Drilling declined, with completion of 96 exploratory and 147 development wells compared with 101 exploratory and 217 development wells in 1959. The decline in development drilling was largely the result of the official establishment of 80-acre spacing in the Aneth area. Drilling in the fields had been on 80-acre spacing and few additional wells were required. Other development drilling was in Uintah County, particularly in the Red Wash-Walker Hollow area. Exploratory drilling in San Juan, Uintah, Grand, and Duchesne Counties represented 83 percent of all exploratory drilling in the State. Six discoveries were made, five in San Juan County and one in Duchesne County. The success ratio for exploratory drilling was 16 percent, that for development drilling was 85 percent, and that for all drilling was 58 percent.

Four refineries in the Salt Lake City area operated the entire year. Throughput was 31.2 million barrels of crude oil, an increase of 3 percent over that of 1959.

## NONMETALS

**Barite.**—One firm continued to be the only local outlet for barite. Ore mined by Heinecke Bros. (Beaver County), D. J. Garrick (Juab County), and Lyle Tiller (Tooele County) was shipped to a Salt Lake City grinding plant operated by Custom Milling Co. All the ground barite was sold to the oil-well drilling industry.

**Cement.**—Production and shipments of portland and masonry cements decreased 6 and 8 percent, respectively, compared with 1959. The decline was attributed, at least in part, to a reduced volume of building and highway construction. Ideal Cement Co., with a 2-kiln plant at Devil's Slide, Morgan County, was the major producer. At its plant, the company completed a $2 million project which consisted

Digitized by Google

primarily of nine new 36- by 140-foot-high silos and four bins having a total storage capacity of 200,400 barrels.[2]

Portland Cement Co. of Utah operated its Salt Lake City cement plant throughout 1960 and continued its $2.5 million construction program designed to double plant capacity. This project was to be completed early in 1961.

Clays.—Because of a general decline in the demand for building brick and other heavy clay products, output of fire and miscellaneous clay or shale dropped 23 percent in 1960. Also, production of bentonite decreased slightly but the output of halloysite (kaolin-type clay) increased; mine shipments of fuller's earth remained about the same. The Filtrol Corp. Dragon halloysite mine in Juab County was the major producer of clay in 1960. Brick and other clay-products plants were operated by Interstate Brick Co., Utah Fire Clay Co., United Brick Co., and Harrisville Brick Co., which processed nearly all the fire clay and miscellaneous clay. Western Clay & Metals Co., Sevier County; American Mud & Chemical Corp., Garfield County; and Macco Corp., Morgan County, mined all the fuller's earth and bentonite.

Fluorspar.—The resumption of mining operations at the Fluorine Queen (Chesley & Black) and Bell Hill mines (Larsen Industries, Inc.), plus the continued operation of the Lost Sheep mine by Willden Bros., boosted fluorspar sales in 1960 to 1,900 tons, valued at $51,000. Mine production was 2,366 tons, from which 2,228 tons of upgraded concentrate was produced. Shipments were to steel and cement manufacturers.

Gem Stones. The value of gem and ornamental stones collected was estimated at $72,000—a 46-percent drop from 1959. Data obtained from individuals, societies, and dealers indicated a substantial decline in the value of petrified wood collected in Garfield County and geodes gathered in Juab County. The following areas within selected counties were the centers of activity in 1960: Box Elder (Lucin); Garfield (Escalante and Circle Cliffs); Juab (Levan and Jericho); Millard (Black Rock, Delta, and Milford); Tooele (Cedar Mountain, Dugway, and Vinehouse Springs); and Wayne (Harrisville and Thousand Lake Mountain Range).

Gypsum. The output of crude gypsum mined by Bestwall Gypsum Co. and United States Gypsum Co. decreased 11 percent in quantity over 1959. Both companies continued to operate wallboard plants near Sigurd.

Lime. A 6% increase in the output of quicklime and hydrated lime was recorded over 1959. Production of all types of lime by [illegible] companies was valued at [illegible]. The largest and most modern [illegible] in the State. Lime-burning capacity at [illegible] was increased [illegible]. Thirteen shaft and 2 rotary kilns [illegible] various purposes were operated by 5 companies [illegible]. The Utah Lime and Stone Co. [illegible] Lime & Stone Co. Although Utah produced the [illegible] of lime, [illegible] were made to Nevada, California

[illegible] Bureau of Mines, New York Range Petroleum [illegible]

Colorado, Idaho, Montana, Nevada, Oregon, Washington, Wyoming, and Canada.

Utah Marblehead Lime Co. produced dead-burned dolomite at its Delle operation. The Utah Lime and Stone Co. began operating its new lime plant at Dolomite during 1960. The new plant had five Ellernan kilns, a hydrator, and a pulverizing and milling unit.[3]

**Perlite.**—Production of crude and expanded perlite and the industry structure were the same as in 1959. Acme Lite-Wate Products, Inc., mined crude material in Beaver County and expanded it at a plant in Salt Lake City. Bestwall Gypsum Co. continued to expand perlite at Sigurd.

**Phosphate Rock.**—In April, San Francisco Chemical Co. began constructing a phosphate plant near Vernal. Unit No. 1 of the concentrating plant was scheduled for operation early in 1961. The facility was planned for a 250-ton-per-hour (6,000-ton-per-day) crushing plant, and grinding, desliming, flotation, filtration, and drying equipment with a concentrate capacity of 200,000 tons per year. From the Vernal plant, the concentrate will be shipped to Garfield where Western Phosphates, Inc., will convert it to phosphoric acid, triple superphosphate, and ammonium phosphate.

San Francisco Chemical Co. also operated the Bradley phosphate rock mine in Rich County. Output from the Bradley mine was shipped to Sage, Wyo., for milling, and the upgraded product was shipped to Western Phosphates at Garfield for manufacturing elemental phosporus. Because of a copper strike in 1959, which resulted in a low output of byproduct sulfuric acid at the Garfield copper smelter, Western Phosphates did not secure enough sulfuric acid to operate at capacity. With settlement of the strike early in 1960, an adequate supply of acid again became available and the Bradley mine and Western Phosphates resumed full-scale production.

**Potash.**—An 8-percent increase was recorded in the production of manure salts and muriate of potash from the Wendover facilities of Bonneville, Ltd. In its annual report covering the year ending June 30, 1960, the company stated that because of reduced precipitation in the area, Great Salt Lake had receded to its lowest level in recorded history and much less brine than usual was collected in the Bonneville ditches. The installation of large booster pumps to recover brine from outlying areas was begun. In addition, a long-range brine-supply research program was established in cooperation with the University of Utah. The company also reported that five draglines were used to dig and clean ditches, instead of the usual two. This activity, the report stated, was considered imperative to maintain production in the event of another dry season.

The extensive potash reserves in the Cane Creek area near Moab received national attention during 1960 through the signing of an agreement between Delhi-Taylor Oil Corp. and Texas Gulf Sulphur Co. covering the development of the deposits. By the end of the year, Texas Gulf's Board of Directors approved a $25 million project which included a 2,700- to 2,800-foot mine shaft and refinery. Also under

[3] Intermountain Industry & Engineering, Utah Lime Opens New Plant: Vol. 62, No. 6, June 1960, p. 82.

Digitized by Google

way were negotiations for construction of an 18-mile road from Moab to the plant site and 36 miles of connecting rail line.

**Pumice.**—Greater production of pumice (scoria) by Christensen Construction Co. and Central Utah Block Co. in Millard County, and the addition of Melvin Bradshaw in Beaver County and Ralph Memmott in Millard County to the list of producers boosted output to 60,000 tons, a 54 percent gain over 1959. All the scoria mined was used in manufacturing building block and other structural products.

**Pyrites.**—With the settlement of a labor strike at the Garfield copper smelter early in 1960, adequate quantities of byproduct sulfur dioxide gas became available to the Garfield Chemical and Manufacturing Corp. sulfuric acid plant. As a consequence, the pyrites shipments to Garfield by United States Smelting Refining and Mining Co. were 51 percent below 1959 shipments. United States Smelting recovered pyrites as a byproduct at the company's Midvale lead-zinc concentrator.

**Salt.**—Increased harvests from the four major salt operations resulted in an 11-percent gain in sales of salt. Morton Salt Co. was the leading producer, followed by Utah Salt Co., Leslie Salt Co., and Solar Salt Co. The latter three firms maintained facilities in Tooele County, and Morton operated in Salt Lake County. Royal Crystal Salt Co. (Sanpete County) and Poulson Bros. Salt Co. (Sevier County), with mines near Redmond, were the only rock-salt operators. Lake Crystal Salt Co. reported a reduction in output from its Box Elder County solar-evaporation facility. Utah Salt Co. and Van Waters and Rogers, Inc., formed Wendover Specialties, Inc., to produce and distribute salt products. A plant to make salt blocks for animal feed was built and placed in operation.

**Sand and Gravel.**—Cutbacks in highway construction in Iron, Juab, Weber, Sevier, Salt Lake, and other counties were largely responsible for the 23-percent decline in the quantity of sand and gravel used in 1960. There were 62 commercial and 40 Government-and-contractor operations actively engaged in mining sand and gravel, an increase of 3 operations over 1959. Salt Lake County continued to be the largest producer with production of 2.2 million tons of aggregate by 13 commercial and 2 highway-contractor operators. A report[4] showed that from July 1, 1956, to December 31, 1960, Utah completed 40.1 miles of road to full and acceptable interstate standards and improved 29.2 miles to standards adequate for present traffic, for a total of 69.3 miles open to traffic. On the basis of this mileage, the State ranked 38th in the United States. However, in terms of work in progress on the Interstate System, Utah ranked 31st, with 183.5 miles in construction, engineering, or right-of-way status. Utah had completed to full or acceptable interstate standards only 4 percent of the 934 miles of highway allocated to the State.

**Stone.**—The cessation of stone quarrying in 1960 in Box Elder County (valued at $2 million in 1959) was only partially offset by gains in the output of stone produced in Cache, Tooele, and Utah Counties. The net result was a 1.5-million-ton or 45-percent reduction in the tonnage of all types of stone quarried. The completion of con-

struction work on the Southern Pacific Co. Great Salt Lake railroad causeway resulted in the closing of Box Elder County quarries which were the source of $2 million worth of crushed limestone and sandstone produced in 1959. More road construction in Cache County, and increased use of limestone as a flux and for lime manufacture in Tooele and Utah Counties were responsible for increased stone production in these counties. Resumption of full-scale production at the major copper operations stimulated the demand for additional quantities of limestone.

**Sulfuric Acid.**—The Garfield sulfuric acid plant of Garfield Chemical and Manufacturing Corp. operated throughout the year, and output increased considerably over the 1959 total. This plant, jointly owned by Kennecott Copper Corp. and Asarco, ranked second in the Nation in the production of byproduct sulfuric acid. In 1960, the plant was equipped with a new scrubber system designed to recover

Digitized by Google

sulfur dioxide previously lost. According to Kennecott's annual report, the new equipment will increase acid production by 50 tons per day. Acid plants also were operated by Texas-Zinc Minerals Corp. at Mexican Hat and by U.S. Steel at Provo.

**TABLE 14.—Stone production in 1960, by counties**

| County | Short tons | Value | County | Short tons | Value |
|---|---|---|---|---|---|
| Cache | 113,899 | $227,345 | Summit | 1,107 | $7,929 |

[1] Includes rough construction, dressed, and sawed stones.
[2] Includes stone used in coal dust, cement, lime, trestle fill, landscaping, roofing granules, feed supplement, and soil conditioner.
[3] Includes stone used in railroad ballast, asphalt filler, coal dust, poultry grit, cement, lime, landscaping, and roofing granules.

Digitized by Google

**Talc.**—The Ogden mill of Tri-State Minerals Co. nearly doubled its shipments of ground talc. Crude talc mined in California and Montana was shipped to Ogden for grinding. The finished product was consumed by ceramic, insecticide, paint, and toilet-preparations manufacturers.

**Vermiculite.**—Mines in Montana continued to supply crude vermiculite to the Salt Lake City exfoliating plant of Vermiculite-Intermountain, Inc. Sales of the finished product remained about the same as in 1959. Most of the material sold was used as insulation.

## REVIEW BY COUNTIES

**Beaver.**—Uranium ore shipped from the Desert View, Mystery Sniffer, and Mercury Sec. 14 mines to plants in Salt Lake City and Lakeview, Oreg., for processing represented 46 percent of the total value of mineral production in the county. Output of gold, silver, copper, lead, and zinc from three active mines and cleanup material at one mill accounted for one-third of the total value, and nonmetals—primarily pumice, perlite, and sand and gravel—comprised the remainder.

**Box Elder.**—Cessation of stone quarrying by Morrison-Knudsen Co., Inc., substantially lowered the total value of mineral production. Completion of the railroad causeway across Great Salt Lake in 1959 eliminated the demand for fill material, and stone production dropped to zero. Heinecke Bros. recovered a small quantity of barite from the Silver Horn mine near Milford. The ore was shipped to Salt Lake City for grinding.

**Carbon.**—Bituminous coal from 25 mines represented 93 percent of the total value of mineral production in the county. Six companies produced more than 100,000 tons each and accounted for 90 percent of all coal produced. They were Columbia-Geneva Steel at the Columbia and Geneva mines; Kaiser Steel Corp. at the Sunnyside Nos. 1, 2, and 3, and the "B" Canyon mines; Independent Coal & Coke Co. at the Castle Gate Nos. 2 and 4, Clear Creek No. 3, Kenilworth, and O'Connor No. 1 mines; Carbon Fuel Co. at the Carbon Fuel mine; Lion Coal Corp. at the Wattis mine; and Knight Ideal Coal Co. at the Knight Ideal Nos. 2 and 3 mines. Completion of the 1-mile tunnel from the Kenilworth mine to the Castle Gate mine by Independent Coal & Coke Co. substantially reduced production costs. All surface operations at the Kenilworth mine were closed.

Columbia-Geneva Steel completed a coal-drying plant as a complement to the coal-cleaning plant at Wellington completed in 1959. The coal fed to the dryer is maintained in a fluidized condition by upward-moving hot gases under pressure. The drying is accomplished as the coal floats in the stream of hot pressurized air over a refractory brick constriction plate. The dryer was the first of its kind to be built west of the Mississippi River.

Pacific States Steel Corp. of Niles, Calif., announced its intention to exercise an option to purchase, from the Heiner Coal Co., a reserve of 35 million tons of coking coal in three separate seams on 5,720 acres in Carbon County. The property consisted of 640 acres of leased State land, 4,920 acres of leased Federal land, and 160 acres of pri-

| Wayne | 28,924 | [3] 5,593 | Gem stones, uranium ore, copper, lead, silver. |
| Weber | 569,162 | 586,008 | Sand and gravel, clays. |
| Undistributed [4] | 3,067,748 | 3,329,978 | |
| Total [5] | [2] 373,515,000 | 431,396,000 | |

[1] Value of petroleum is preliminary.
[2] Revised figure. [3] Excludes vanadium. [4] Includes vanadium and some sand and gravel and gem stones. [5] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.

vately owned surface land. The corporation needed coking coal for its integrated steel plant being built at Niles, Calif. The privately owned surface lands acquired will be available for mine improvement, tipple, storage, trackage, and coke ovens if the corporation decides to conduct such operations in Utah.

Minerals Development Co., a subsidiary of Heiner Coal Co., acquired control of 2,400 acres of leased coal lands, one-half from Book Cliffs Coal Co. and one-half from Malcom McKinnon.

Natural gas from that portion of the Clear Creek field lying in Carbon County was marketed through pipelines. Carbon dioxide from the Farnham Dome field was transported by pipeline to a process-

Digitized by Google

ing plant at Wellington for conversion into dry ice and liquid carbon dioxide. A new gasfield, Stone Cabin, was discovered in August. The discovery well flowed 1.5 million cubic feet of gas a day from the Wasatch formation at depths of 3,949 to 3,967 and 4,260 to 4,274 feet.

**Daggett.**—Natural gas from 10 wells in the Clay Basin field was processed at the Mountain Fuel Supply Co. gasoline plant; the natural gasoline recovered was used as blending stock at refineries in Salt Lake City. Residual gas was marketed through company pipelines.

**Duchesne.**—Petroleum production from four fields was 14 percent below that of 1959. The principal producing field was the Duchesne. The Rock Creek and Starr Flat fields had been abandoned at yearend. One new unnamed field was discovered in January. The discovery well pumped 19 barrels of oil a day from an open hole in the Green River formation at a depth of 2,330 to 2,746 feet. Gilsonite was produced by Standard Gilsonite Co. at the Parriette mine.

**Emery.**—Emery County ranked second in the production of bituminous coal and uranium ore, the combined value representing 99 percent of the value of mineral production in the county. Forty-one percent of the output of bituminous coal was used at Utah steel plants for the manufacture of coke. Leading producers were Columbia-Geneva Steel at the Geneva mine in Carbon and Emery Counties, and United States Fuel Co. at the King mine, also in Carbon and Emery Counties. Minerals Development Co. acquired the Book Cliffs Coal Co. in November. The purchased property consisted of mine equipment, coal contracts, and 320 acres of coal lands adjoining those of U.S. Steel.

Natural gas produced from three wells in the Flat Canyon field and a portion of the Clear Creek field was marketed through pipelines.

Uranium ore, produced at 47 operations, was 39 percent above that of 1959. Major producers were Four Corners Oil & Minerals Co., Union Carbide Nuclear Co., Shattuck Denn Mining Corp., and Welch United Corp. The ore was shipped to processing plants in Utah and Colorado. Uranium ores in the Temple Mountain district contained a significant quantity of vanadium which was recovered from those ores processed at mills in Colorado.

**Garfield.**—Uranium ore, produced at 37 operations, accounted for 81 percent of the total value of mineral production in the county. The major producer in terms of value was Harold C. Ekker, with 11 operations in the Henry Mountains and Little Rockies districts. The ore was processed in Colorado where vanadium oxide contained in some of the ores also was recovered. Coal was produced by Twitchell-Munson Coal Co. at the Alvey mine.

Mine production of bentonite dropped to 850 tons in 1960 because of reduced activity at the American Mud & Chemical Corp. mine and plant near Cannonville. The county continued to rank second in the collection of gem and ornamental stones even though the total value dropped from $33,000 in 1959 to $14,000 in 1960; in both years petrified wood and agate were the principal stones in terms of value.

**Grand.**—Petroleum production from four fields was 56 percent above that of 1959. Major output was from the Big Flat field. Natural gas was produced at six wells in the Bar X field. Three new gasfields and a new producing horizon were discovered. The discovery well at the

Digitized by Google

Jim Creek field, completed in July, flowed 612,000 cubic feet of gas a day from the Morrison formation at a depth of 5,184 feet. At the Diamond Ridge field, discovered in February, the discovery well flowed 1 million cubic feet of gas a day from the Dakota sandstone at a depth of 7,254 to 7,284 feet. The Bryson Canyon field was discovered in October, and the discovery well flowed 6.1 million cubic feet of gas a day from the Dakota sandstone at a depth of 4,264 to 4,392 feet and 7.2 million cubic feet of gas a day from the Morrison formation at a depth of 4,403 to 4,476 feet. In the Stateline field, a well completed in April flowed 1.3 million cubic feet of gas a day from the Dakota sandstone at a depth of 3,859 to 3,896 feet and 2.5 million cubic feet of gas a day from the Cedar Mountain formation at a depth of 3,956 to 3,978 feet.

Uranium ore from 45 operations represented 79 percent of the total value of all mineral production in the county. Major production was by Union Carbide Nuclear Co. in the Polar Mesa district; Thornburg Mining Co. in the Seven Mile Canyon district; and Climax Uranium Co. in the Yellow Cat, Cane Canyon, and Polar Mesa districts. Nearly all the output was processed at plants in Colorado where a significant quantity of vanadium contained in the ore was recovered. Uranium Reduction Co. operated its 1,500-ton-a-day processing plant at Moab throughout the year. Some crude ore came from mines in the county; however, the greatest part was from mines in San Juan County.

**Iron.**—Shipments of iron ore from seven mines west of Cedar City in Iron County constituted the entire output of iron ore from Utah in 1960. The leading producer, Columbia Iron Mining Co., shipped ore from the Desert Mound and Iron Mountain mines. Utah Construction & Mining Co. mined and shipped iron ore from the Blowout, Comstock, and Duncan mines for CF&I. In addition, Utah Construction produced iron ore from its Excelsior (Iron Springs) mine. Utah Construction began construction of a $1.3 million iron ore treatment plant, the first in this area, to improve the quality of the ore and extend the ore reserves. Iron ore was shipped from the Alberts Nos. 1, 2, and 3 claims by Lambeth Bros., lessees for Helene E. Beatty. Iron ore shipments from Iron County increased 17 percent in quantity and 20 percent in value.

Coal production from three mines was 14 percent above that of 1959. Koal Kreek Coal Co. operated the Jones-Bulloch mine; Tucker Coal Co., the Tucker mine; and Webster Coal Co., the Webster mine.

**Juab.**—Nonmetals again contributed 75 percent of the value of mineral production. Halloysite from the Dragon mine of Filtrol Corp. headed the list of minerals. The ore produced from this property was shipped to the company's Salt Lake City plant for processing. The region around Delta supplied all of the metallurgical-grade fluorspar produced in Utah, and the county ranked first in the value of gem and ornamental stones collected. D. J. Garrick mined the bulk of the State output of barite from a property near Trout Creek.

Uranium ore from the Yellow Chief mine, operated by Topaz Uranium Co., was 27 percent greater than in 1959 and represented 18 percent of the total value of mineral production in the county. The entire output was processed at Salt Lake City.

Digitized by Google

Lead, zinc, gold, silver, and copper were recovered from lead-zinc ore produced from three mines. In addition, significant quantities of these metals were recovered from material shipped from the Godiva dump by the Godiva Mining and Milling Co.

**Kane.**—Most of the value of mineral production came from coal mined at the Smirl-Alton coal mine by W. J. Smirl. Recovery and sale of gem stones accounted for the remainder.

**Millard.**—Except for small quantities of zinc, lead, copper, silver, and gold, the $150,000 value of mineral output was supplied by nonmetals. In terms of value, pumice (scoria), from mines near Fillmore and Flowell by Christensen Construction Co., Central Utah Block Co., and Ralph Memmott, was the most important commodity. The construction of highways in the county stimulated an increase in the quarrying of sand and gravel. Obsidian, agate, and petrified wood gathered were valued at $4,800.

**Morgan.**—Principally because of a decline in cement shipments from the Devil's Slide plant of Ideal Cement Co., the value of mineral production decreased 5 percent from 1959. Declines in output were also recorded for limestone used in the manufacture of cement, clay used in the manufacture of brick and other heavy clay products, and sand and gravel used in highway construction.

Small quantities of lead, zinc, and silver were recovered from ore produced at the Morgan Argentine mine by Continental Exploration Co.

**Piute.**—Uranium ore from four mines operated by Vanadium Corp. of America represented 94 percent of the total value of mineral production in the county. The entire output was processed at Salt Lake City. Small quantities of gold, silver, copper, lead, and zinc were recovered from gold-silver and zinc ore produced from the Bully Boy and Deer Trail mines, respectively.

**Rich.**—Increased shipments of phosphate rock from the Bradley mine of San Francisco Chemical Co. doubled the value of mineral production in Rich County. Crude material from this property was transported to the company's Sage, Wyo., mill for upgrading. More intensive highway construction for the Utah State Road Commission resulted in increased output of sand and gravel.

**Salt Lake.**—Mineral production from Salt Lake County represented 44 percent of the total value of mineral output from the State. Copper production alone accounted for three-quarters ($139.4 million) of the $188.5 million value of mineral production in the county. A large part of the gold and silver and all of the molybdenum were recovered as byproducts of the treatment of copper ore. Copper production increased 51 percent in quantity and 58 percent in value, compared with 1959, mainly because from mid-August 1959 until late February 1960, a labor strike had idled the Utah Copper mining, milling, smelting, and refining complex, the county and State's leading copper producer. In 1960 the company completed a major addition to the powerplant at the Garfield smelter, began to modify the smelter operation, and began a spiral-haulage excavation in the company's open-pit mine.

The U.S. and Lark mine, second-largest copper, gold, and silver

Digitized by Google

producer and the largest lead and zinc producer in Utah, operated throughout the year. Lead-zinc ore from the mine was treated in the company Midvale mill. Lead concentrate was shipped to the International Smelting and Refining Co. Tooele plant and the Asarco East Helena (Mont.) plant; zinc concentrate went to the Anaconda (Mont.) plant. In addition, gold-silver ore from the mine was shipped directly to the International Smelting Tooele plant. United States Smelting Refining and Mining Co. also shipped zinc slag from the Midvale smelter dump to the Tooele plant and treated custom ore purchased by the company and by International Smelting at the Midvale mill. In its Tooele plant, International Smelting treated zinc slag produced from the Murray smelter dump. Some lead-zinc ore produced from the Wasatch Drainage Tunnel by Cardiff Industries, Inc., was treated in the Midvale mill and some was shipped directly to the Tooele smelter.

Nonmetals continued to supply products necessary for construction and the production and processing of metals. The county was the major source of sand and gravel for residential and industrial construction. Cement produced by Portland Cement Co. of Utah was a significant factor in the construction activity of the mineral industry. A substantial quantity of limestone was quarried and used in manufacturing of cement and lime. The need for large amounts of lime stemmed from the use of lime in the processing of copper ores. Great Salt Lake was the principal source of salt in Utah, and solar-evaporation facilities made Salt Lake County the leading producer. A small quantity of byproduct pyrite was shipped to Garfield for the manufacture of sulfuric acid.

Oil refineries in the Salt Lake City area operated the entire year. Throughput was 31.2 million barrels of crude oil, an increase of 3 percent over that of 1959. A fire and explosion in the catalytic cracking unit of the Utah Oil Refining Co. 35,700-barrel-a-day refinery at Salt Lake City caused damage to the unit estimated at $250,000. Two workmen were killed and two injured. The removal of a valve that released hot oil onto pipes carrying crude oil heated to 900 degrees started the fire and resulting explosion that took seven Salt Lake City fire companies 4 hours to extinguish.

The 600-ton-a-day uranium processing plant of Vitro Chemical Co. at Salt Lake City operated the entire year. In October the operating rate was reduced to 500 tons of ore a day to establish a more economical operating rate until March 31, 1962, when the contract for the purchase of uranium oxide concentrate by AEC was to expire. Negotiations with AEC continued for a purchase contract for 1962–66.

San Juan.—San Juan County led in the production of petroleum, natural gas, natural gas liquids, uranium ore, and vanadium. Production of petroleum from 618 wells in 17 fields was 9 percent below that of 1959. The decline was almost entirely in the Aneth, Ratherford, and White Mesa fields in the Greater Aneth area. Notable gains were recorded in the McElmo, Cahone Mesa, and Recapture Creek fields. The need for secondary recovery operations in the Aneth area had been studied for a considerable period. Primary methods will recover an estimated 16 to 18 percent of the original oil reserve; water flooding

Digitized by Google

and repressuring with gas over a period of 11 to 15 years would increase the recovery to about 30 percent at a cost of $12 to $14 million. One secondary-recovery unit in the McElmo Creek field was formed by Humble Oil and Refining Co. estimated to cost from $3 to $4 million. Other units were to be formed and plans were considered for 4 units consisting of 500 wells and 50,000 producing acres.

The No. 1 Northwest Lisbon well, completed on January 4, was aptly described by some as the "well of the year." The discovery well flowed 587 barrels of oil a day at a depth of 8,251 to 8,348 feet from the McCracken (Devonian) formation, and the first in the State from Devonian. A second well, completed in June, flowed 272 barrels of oil a day and 686,000 cubic feet of gas a day from Mississippian formations at a depth of 8,767 to 8,830 feet. This well established the importance of Mississippian formation in the field and was followed by other completions, one of which flowed 1,288 barrels of oil and 2.8 million cubic feet of gas a day. Other discoveries included a well southwest of the Ismay field that pumped 14 barrels of oil a day, one in the Gothic Mesa area that flowed 98 barrels of oil a day from the Paradox formation, and a third to the west that pumped 14 barrels of oil a day from the Hermosa formation. At yearend a well at Anido Creek, 7 miles south of the White Mesa-Aneth area and 8 miles northeast of the Boundary Butte field in Arizona, was nearing completion. Details of the rate of recovery were not available, but a substantial flow was reported.

Development drilling was done in and around the Greater Aneth area fields. In the White Mesa-Southern McElmo Creek area, 33 successful wells were completed; to the north in the Aneth-McElmo Creek-Recapture Creek area, 26 were completed; and in the Ismay field, the most easterly in the Utah portion of the Paradox basin, 13 were completed. These completions made the effective length of the field nearly 5 miles.

Oil-well gas from the Greater Aneth area was processed at the El Paso Natural Gas Co. 100-million-cubic-foot-a-day gas plant at Aneth. Natural gas liquids were separated at the company Wingate fractionation plant in New Mexico. Residual gas was marketed through pipelines to consumers in California.

Uranium ore from 170 operations was 15 percent below that of 1959. The average grade of ore shipped declined from 0.37 percent $U_3O_8$ (7.4 pounds per ton) to 0.31 percent (6.2 pounds per ton) in 1960. Major producers included The Hidden Splendor Mining Co., Standard Metals, Homestake Mining Co., Utex Exploration Co., Inc., Texas-Zinc Minerals Corp., and Hecla Mining Co. The ore was processed in mills at Mexican Hat, Moab, Salt Lake City, and in southwestern Colorado. Ores containing significant quantities of vanadium were processed at mills in southwestern Colorado where the vanadium was recovered. Texas-Zinc Minerals Corp. operated its 1,000-ton-a-day uranium ore processing plant at Mexican Hat and recovered concentrate containing gold, silver, copper, lead, and zinc as a byproduct of some San Juan County uranium ores.

**Sanpete.**—Clays, salt, and sand and gravel accounted for 86 percent of the total value of Sanpete County mineral production. Cox Bros.;

Digitized by Google

Hales Sand & Gravel; and De Mar W. Brimhall Construction, contractors for the State highway department; and construction crews of Ephrain City Corp. mined 181,500 tons of building and paving gravel. A salt deposit near Redmond was worked by Morton Salt Co. (formerly Royal Crystal Salt Co.). From a deposit near Sterling, Azome Utah Mining Co. recovered clay for use as a soil conditioner and for poultry feed.

Dry natural gas produced at Joe's Valley field by Three States Natural Gas Co. was 59 percent below that of 1959. The gas was marketed through pipelines.

**Sevier.**—Seventy-eight percent of the value of mineral output in Sevier County resulted from the production and sale of nonmetals. The extraction and calcining of gypsum near Sigurd accounted for most of the value. United States Gypsum Co. and Bestwall Gypsum Co., the mine producers, operated wallboard plants in conjunction with their mines. Fuller's earth and bentonite were mined and processed by Western Clay & Metals Co. Poulson Bros. Salt. Co. produced rock salt. Coal production from the Southern Utah Fuel Co. No. 1 mine was 4 percent more than that of 1959. Uranium ore from the Helms mine was shipped to plants at Salt Lake City and Moab for processing.

**Summit.**—The value of gold, silver, copper, lead, and zinc output represented $4.2 million (88 percent) of the $4.8 million combined value of all minerals produced in the county. The United Park City mines operated by United Park City Mines Co. and block leasers was the leading producer. To reduce the cost of operation, the company eliminated overtime pay by switching its employees from a 48-hour week to a 40-hour week and issued small block leases in fringe areas that could not be economically worked by the company's using normal operating procedures. United Park City and Keystone Mining Co. conducted a joint exploration and development program at the Keystone mine, and lead-zinc ore recovered as a result of this work was treated at the United States Smelting Midvale mill. McFarland & Hullinger, lessees, shipped fluxing material from the Daly mine dump, owned by United Park City Mines Co., to the Utah Copper Garfield copper smelter.

Coal production, all from the Chappel Coal Co., was 9 percent above that of 1959.

**Tooele.**—The mineral industry of Tooele County continued to set records in 1960. Production of nonmetal mineral products accounted for 99 percent of the $6.1 million value of mineral output. The county ranked first in shipments of lime, second in salt production, third in quarrying of clays, and was the only source of potash in the State. Limekilns were in use at The Utah Lime and Stone Co. and Utah Marblehead Lime Co. operations. The latter plant produced the only dead-burned dolomite in the Rocky Mountain region. Salt for industrial and human consumption was harvested at solar-evaporation facilities of Leslie Salt Co. and Solar Salt Co. Utah Salt Co. recovered byproduct solar-evaporation salt from the brine ponds of the Bonneville, Ltd., potash operation. Large quantities of limestone and

Digitized by Google

dolomite were mined for use in manufacturing lime, and United States Smelting Refining and Mining Co. recovered oolitic limesand at Stansbury Island.

International Smelting and Refining Co. reclaimed cold slag from the Tooele lead smelter dump and treated it in its zinc-fuming plant primarily to recover zinc; however, some silver, copper, and lead also were recovered. International Smelting treated State and out-of-State custom ores, concentrates, and materials in its lead smelter and zinc-fuming plant at Tooele. McFarland & Hullinger conducted development work at the Ophir Unit mine, owned by United States Smelting Refining and Mining Co., and shipped lead-zinc ore produced to the United States Smelting Midvale mill for treatment. Shipments of small lots of gold, lead, and lead-zinc ores, each less than 100 tons, were made from seven other mines.

**Uintah.**—Petroleum production from 172 wells in 5 fields was 16 percent above that of 1959. Notable increases were recorded at the Ashley Valley and Red Wash fields. Five new gasfields were discovered. The discovery well at the White River field, completed in November, flowed 1.25 million cubic feet of gas a day from the Wasatch formation at a depth of 6,422 to 6,432 feet. The Coyote Wash field was discovered in January. The discovery well flowed 325,000 cubic feet of gas a day from the Wasatch formation at a depth of 4,888 to 5,004 feet. A well, 5.5 miles southwest of the discovery well in the Uintah Unit, discovered in 1959, was completed in May and flowed 2.2 million cubic feet of gas a day from the Wasatch formation at a depth of 5,061 to 5,606 feet. The Rock House field, 5.5 miles south of the Southman Canyon field, was discovered in October. The discovery well flowed 12.5 million cubic feet of gas a day from the Wasatch formation at a depth of 4,144 to 5,008 feet, and 900,000 cubic feet of gas a day from the Mesaverde at a depth of 5,362 to 5,382 feet. The Fence Canyon field, 10 miles northwest of the Westwater field in Grand County, was discovered in April. Initial flow of the discovery well was 5.2 million cubic feet of gas a day from the Dakota sandstone at a depth of 8,544 to 8,580 feet.

Development drilling was confined largely to the Red Wash-Walker Hollow area where 25 oil wells and 1 gas well were completed. In the Chapita Wells field, six gas wells were drilled. Two gas wells were drilled in the Ute Trail field and one in the Ashley Valley field.

California Oil Co. operated its natural-gas plant in the Red Wash field and recovered natural gasoline that was used as a blending stock at refineries in the Salt Lake City area. Residual gas was marketed through pipelines. Standard Oil Co. of California began the construction of a 40-million-cubic-foot-a-day natural-gas plant in the Red Wash field. The natural gas liquids recovered were to be used at the Standard Oil Co. refinery at Salt Lake City and the residual gas were to be sold to pipeline companies for distribution to consumers.

Gilsonite mined at the Bonanza mine by American Gilsonite Co. and at the Little Bonanza, Little Emma, and Warner-Quinlan mines by G. S. Ziegler & Co. and contractors was slightly above that of 1959. American Gilsonite Co., the major producer, further improved its mining method using high-pressure hydraulic nozzles suspended

Digitized by Google

through vertical drill holes from the surface to a drift at the bottom of the 1,600-foot shaft. Water, delivered at a pressure of 2,500 pounds per square inch to the nozzles suspended through the drill holes, removes the gilsonite as the nozzles are slowly rotated. The broken gilsonite falls to the floor of the drift where it is transported to the shaft by a stream of low-pressure water; after crushing it is pumped to the surface. The method eliminates the necessity of men working along the underground faces and requires no timber. The crushed and sized gilsonite was pumped to the surface and transported through a 72-mile pipeline to the refinery near Fruita, Colo., where it was processed to recover gasoline, diesel fuel, and metallurgical coke.

**Utah.**—Clay mining operations were reduced from seven to six in 1960; clay output declined 51 percent. Clay mines operating at a substantially lower rate of production were the North and Northeast pits of Loyd R. Stubbs, Fawn mine of Western Fire Clay Co., Powell mine of Interstate Brick Co., No. 24 pit of United Brick Co., and the Clinton property of Utah Fire Clay Co. The Keigley quarry of U.S. Steel and the Lakeside pit of Lakeside Lime & Stone Co. produced 48 percent more limestone. Stone from the Keigley mine was used almost entirely as a flux at the U.S. Steel iron smelter, and the Lakeside stone was calcined to produce quicklime and hydrated lime.

The entire output of gold, silver, copper, lead, and zinc came from gold-silver ore produced at two operations. G. Wm. Wortley, lessee, recovered material from the Eureka Standard dump, owned by Eureka Standard Consolidated Mining Co., and shipped it to the Utah Copper Garfield copper smelter. A small quantity of ore was produced and marketed from Tintic Standard Mining Co. Iron Blossom mine by Glen Larsen, lessee.

**Wasatch.**—Except for small quantities of sand and gravel and stone, the entire mineral production in the county comprised gold, silver, copper, lead, and zinc recovered from copper and lead-zinc ores at the Mayflower-Galena and United Park City mines. All of the ore from the Mayflower-Galena mine (owned by New Park Mining Co.) was produced by the Mayflower Lease consisting of an average of 94 professional miners working as independent contractors. New Park continued an exploration and development program begun at this mine in 1958 with financial assistance under DMEA, administered by OME. The program provided for 6,000 feet of drifting west of the shaft, 2,600 feet of crosscutting, 11,000 feet of diamond drilling, and 20,000 feet of long-hole drilling. The contract provided for participation by the Federal Government to the extent of 50 percent of the $564,880 estimated cost.

Part of the United Park City Mines Co. operation at the United Park City mines (described under Summit County) is in Wasatch County. Ore produced from the section of the mine in Wasatch County was credited to Wasatch County.

**Washington.**—Emerald L. Cox shipped crude copper ore containing small quantities of silver, lead, and zinc from the Apex mine to the Asarco El Paso (Tex.) copper smelter. Other mineral products from the county included sand and gravel and crushed sandstone (for use

Digitized by Google

in highway construction), gem stones (gathered by collectors and dealers), and petroleum (all from the Virgin field).

**Wayne.**—Uranium ore produced from the Big Jim and Congress mines was shipped to mills in Colorado for processing. The ore contained a significant quantity of vanadium, which was recovered. Gem stones were collected by "rock hounds" and dealers. A small shipment of copper ore containing small quantities of silver, lead, and zinc was made from the Osborn mine to the International Smelting Tooele plant.

**Weber.**—Most of the value of mineral output came from sand and gravel produced for building and highway construction. Miscellaneous clay production, all from the Harrisville Brick Co. operation at Harrisville, was comparable with that of 1959.

# The Mineral Industry of Vermont

By James R. Kerr[1]

THE VALUE of Vermont's mineral output in 1960 decreased 2 percent because of the cessation of crushed-slate production. Greatly increased output of other stone, particularly crushed limestone for the construction of the new U.S. Route 2 from Montpelier to Burlington, did not offset the loss of the higher unit-priced slate. Sand and gravel production decreased 22 percent; that of other commodities remained relatively stable.

Rutland County, with its valuable marble and slate deposits, led in value of mineral production. Washington and Orleans Counties followed, with granite and asbestos, their leading minerals, respectively.

TABLE 1.—Mineral production in Vermont[1]

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Gem stones | (2) | $1 | (2) | $1 |
| Sand and gravel short tons | 2,320,327 | 1,590 | 1,809,152 | 1,218 |
| Stone do | 944,298 | 17,372 | 2,114,377 | 17,444 |
| Value of items that cannot be disclosed: Asbestos, clays, lime, talc | | 4,420 | | 4,240 |
| Total Vermont[3] | | 23,359 | | 22,879 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Weight not recorded.
[3] Total adjusted to eliminate duplicating value of stone.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Asbestos.**—Production of chrysotile asbestos continued at virtually the same rate as during the previous year. Shipments were of 25 grades with selling prices ranging from $30 to $440 per ton and averaging $90.91 per ton compared with $95.66 per ton in 1959.

**Clays.**—Production of miscellaneous clay, chiefly for building brick, remained at the same rate as in 1959. Mine development and mill

[1] Commodity-industry analyst, Bureau of Mines, Pittsburgh, Pa.

Digitized by Google

construction for a new clay operation continued at Monkton in Addison County.

**Gem Stones.**—Collectors and gem dealers obtained specimens of jasper, graphite, talc, and garnet at scattered locations throughout the State.

**Lime.**—Production of quicklime and hydrate lime, chiefly for chemical and other industrial uses, continued at virtually the same rate as in 1959.

**Mica, Reconstituted.**—Specially delaminated mica scrap was used by the Samica Corp. (subsidiary of Minnesota Mining & Manufacturing Co.) to produce reconstituted mica at Rutland.

**Sand and Gravel.**—Commercial production of sand and gravel decreased 15 percent chiefly due to a 34-percent decrease in production of gravel for paving uses. Paving sand output decreased at a much smaller rate, indicating the substitution of crushed stone for gravel in some paving applications and pointing to the completion of the road-base segment of many projects. Building sand and gravel output increased 31 percent. The average value of sand and gravel increased $0.11 to $1.05 per ton. The percentage of commercial output washed, screened, or otherwise prepared increased 16 percent to comprise 79 percent of total output substantiating the significant increase in price per ton.

Production of Government-and-contractor sand and gravel as reported by the Vermont State Highway Department decreased 28 percent in 1960. Production was reported from all 14 counties but in most cases on a smaller scale than 1959, indicating the completion of some projects. Chittenden, Grand Isle, and Washington Coun-

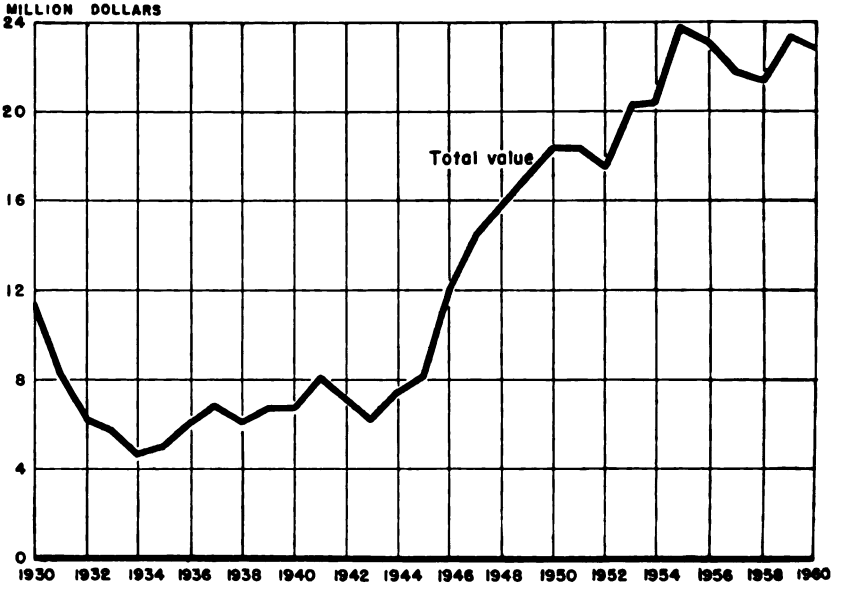

FIGURE 1.—Total value of mineral production in Vermont, 1930–60.

Digitized by Google

ties reversed the Statewide trend. Greatest activity by far was in Chittenden County where construction of the new U.S. Route 2 was in progress. Government-and-contractor operations are not summarized in the individual county reviews but are listed in table 2.

**TABLE 2.—Sand and gravel production by Government-and-contractor operations, by counties**

(Short tons)

| County | 1959 | 1960 | County | 1959 | 1960 |
|---|---|---|---|---|---|
| Addison | 88,945 | 76,222 | Orange | 61,211 | 5,800 |
| Bennington | 163,971 | 38,574 | Orleans | 115,676 | 2,900 |
| Caledonia | 13,880 | 12,406 | Rutland | 250,688 | 64,765 |
| Chittenden | ---------- | 229,194 | Washington | 95,732 | 145,096 |
| Essex | 122,186 | 37,519 | Windham | 86,730 | 57,763 |
| Franklin | 14,700 | 11,284 | Windsor | 143,938 | 76,017 |
| Grand Isle | ---------- | 63,497 | Unspecified | ---------- | 79,911 |
| Lamoille | 98,845 | 7,250 | Total | 1,256,502 | 908,198 |

**Stone.**—The closing of all slate operations by Central Commercial Co. on December 31, 1959, and the subsequent dismantling of plants resulted in a loss of more than $1 million in the mineral income of the State. Tripled output of crushed limestone for roadbuilding purposes, because of its low unit value, did not offset this loss. Output of dimension granite increased because of a 4-times-greater output of rough architectural building stone. Production of rough monumental stone, comprising 90 percent of total granite output, decreased 7 percent. Output of dimension marble and slate remained relatively stable. Output of crushed sandstone and miscellaneous stone (serpentine) was reported by the State highway department for highway construction.

**Talc.**—Output of talc declined slightly following a 2-year rise. The No. 2 Waterbury mine of Eastern Magnesia Talc Co., Inc. ceased operations on December 27. The Ward Hill mine of this company reported only drilling and exploration work. Talc was ground and consumed chiefly in roofing, rubber, and paper.

## REVIEW BY COUNTIES

**Addison.**—Vermont Associated Lime Industry quarried limestone for concrete aggregate and lime manufacture at New Haven. Lime was sold for chemical, industrial, and building uses. Vermont Kaolin Corp. did not commence operations at Monkton as expected but spent the year in mill construction and mine development.

**Bennington.**—William E. Daily produced building and paving sand and gravel, and Burgess Bros. produced fill sand and gravel at a portable crusher near Bennington.

**Caledonia.**—Paving sand and gravel was produced by the Caledonia Sand & Gravel Co., Inc. at a portable plant at St. Johnsbury. The Vermont State Highway Department produced serpentine for roadstone uses.

**Chittenden.**—Sand and gravel used mostly for building and paving was produced at five operations, the leading of which were Cass

Digitized by Google

Warner at Essex Junction and W. C. Kirby at Burlington. Vermont Associated Lime Industries, Inc. quarried limestone just outside the city limits of Winooski for agricultural limestone and for lime manufacture. The company was installing a continuous hydrator at Winooski to replace an outdated facility at New Haven where the Winooski lime output had been sent for hydration. Other construction planned by the company included an additional fine crusher to augment the pulverizing facilities for agstone and an additional primary crusher in the quarry which will greatly boost capacity. The Vermont State Highway Department produced over 500,000 tons of crushed limestone for construction of the new U.S. Route 2 Thruway. In addition, Rowe Contracting Co. and L. A. Demers Crushed Rock Co. produced crushed limestone chiefly for this highway project. The Drury Brick Co., Inc. mined miscellaneous clay from an open pit near Essex Junction for manufacturing building brick.

**TABLE 3.—Value of mineral production in Vermont, by counties**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Addison | $168,220 | (1) | Stone, lime, sand and gravel. |
| Bennington | (1) | (1) | Sand and gravel. |
| Caledonia | (1) | (1) | Sand and gravel, stone. |
| Chittenden | 394,524 | $1,372,177 | Stone, sand and gravel, lime, clay. |
| Essex | (1) | 51,471 | Sand and gravel. |

[1] Figure withheld to avoid disclosing individual company confidential data; included with undistributed.
[2] Includes gem stones and some sand and gravel that cannot be assigned to specific counties, and values indicated by footnote 1.

**Essex.**—A. Booska produced sand and gravel for paving.

**Franklin.**—The Swanton Lime Works, Inc., quarried limestone at Swanton and produced crushed stone, chiefly for roadstone, agstone, papermills, and mineral food. S. H. Evanson produced sand at a stationary plant near Swanton, chiefly for building, but also for grinding and engine sand. Ray Dubois produced a small tonnage of sand for use on icy roads.

**Grand Isle.**—The Vermont Marble Co. quarried marble at the La Motte quarry at Isle La Motte on an island in Lake Champlain.

**Lamoille.**—Eastern Magnesia Talc Co., Inc., mined crude talc near Johnson for grinding at the company mill. Ground output was sold for roofing, paper, and paint. A small quantity of crude talc was shipped to a foundry in Ohio. Albert Nadeau produced paving sand and gravel at a portable plant near Johnson, and Kenneth Farr produced sand and gravel for a variety of uses at Elmore.

Digitized by Google

**Orange.**—Dimension granite for rough monumental stone was quarried by the Rock of Ages Corp., Pirie Division, near Williamstown. Willard Martin produced paving gravel at a portable plant near Bethel, and Levi Lemieux produced miscellaneous sand and gravel at a stationary plant near Barre Town.

**Orleans.**—Vermont Asbestos Mines, Div. of the Ruberoid Co., mined and processed chrysotile asbestos at the Lowell quarry and mill. Twenty-five grades of asbestos were sold at varying prices, dependent on length and quality of fibre or other controlling feature. Paving sand and gravel was produced at a stationary plant near Danville by H. G. Calkins. Harry Jipner produced paving gravel.

**Rutland.**—Dimension marble was quarried at five locations and processed at four mills in the county by Vermont Marble Co. The Green Mountain Marble Co., Division of Georgia Marble Co., operated an underground quarry and mill at West Rutland. Central Commercial Co., the leading slate producer in the State in 1959, ceased operations at the end of 1959 and was dismantling its plants in 1960. No crushed slate was produced. Dimension slate was produced at 18 operations of Vermont Structural Slate, Hilltop Slate Co., Taran Brothers Inc., John Hadeka, and Culvert Slate Co., Inc., in decreasing order of value of production. Structural and sanitary uses and flagging were chief uses of slate. White Pigment Corp. produced crushed limestone at the Florence quarry for whiting and miscellaneous uses such as flooring, plastics, wire drawing, and fabrics. Vermarco Lime Co. produced crushed limestone, chiefly for roadstone and agstone, at the Loveland quarry at Florence. Sand and gravel was produced at four plants, principally for building and paving uses. Vermont Marble used its sand production in sawing marble. Rutland Fire Clay Co. continued to use material from its miscellaneous clay stockpile to produce fire-clay mortar.

**Washington.**—The Rock of Ages Corp. produced rough monumental granite at the Graniteville quarry (Graniteville), the Wetmore and Morse quarries (Barre), and E. L. Smith quarry (Barre). Charles A. Pellette (Barre) and Wells Lamson Quarry Co., Inc. (Websterville) also produced rough monumental granite. The latter company also produced crushed granite for roadstone. Eastern Magnesia Talc Co. completed operations at the Waterbury mine in December 1960. The exploration work at the company's Ward Hill mine at Waterbury did not prove profitable and was stopped. Sand and gravel, chiefly for building and paving, was produced at five plants, the largest of which was Kings Pit near Barre.

**Windham.**—Vermont Talc Co. produced talc near Windham for grinding at its mill at Chester, Windsor County. Output was used chiefly in insecticides, roofing, and paper. Brattleboro Sand & Gravel Co., Brattleboro, and West River Sand & Gravel Co., West Townshend, produced paving sand and gravel.

**Windsor.**—Vermont Marble Co. produced dimension and crushed marble at the Rochester quarry. Barre Building Granite Corp. produced dimension marble for rough architectural building uses plus a small tonnage for riprap. Eastern Magnesia Talc Co. mined talc near Reading for grinding at its mill at Chester. The ground talc

Digitized by Google

was used for roofing. The company reported no operation at the Gassets mill and Hammondsville mine during 1960. Vermont Concrete Pipe produced building and paving sand and gravel at a stationary plant near Windsor, and Colonial Sand & Gravel produced paving sand and gravel near Sharon.

# The Mineral Industry of Virginia

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Virginia Division of Mineral Resources.**

By Robert W. Metcalf,[1] James L. Calver,[2] and Stanley A. Feitler [1]

ALTHOUGH the value of Virginia's mineral output declined 8 percent to $204 million, it was the fourth highest year on record, surpassed only by 1959, 1957, and 1956. Most commodities declined in both quantity and value, but tonnage of clays and stone both established records. Increased activity in the stone industry was chiefly due to the continued road improvement and highway construction in many parts of the State. Production of iron oxide

**TABLE 1.—Mineral production in Virginia [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays.....thousand short tons | 1,346 | $1,397 | 1,348 | $1,395 |
| Coal.....do | 29,769 | 139,224 | 27,838 | 122,723 |
| Gem stones | (2) | 4 | (2) | 5 |
| Lead (recoverable content of ores, etc.).....short tons | 2,770 | 687 | 2,152 | 504 |
| Lime.....thousand short tons | 765 | 8,168 | 711 | 8,028 |
| Manganese ore (35 percent or more Mn) short tons, gross weight | 6,232 | 499 | | |
| Mica, sheet.....pounds | 108 | 1 | 103 | 1 |
| Natural gas.....million cubic feet | 2,280 | 597 | 2,227 | 604 |
| Petroleum (crude).....thousand 42-gallon barrels | 6 | (3) | [4] 6 | (3) |
| Sand and gravel.....thousand short tons | 8,452 | 12,369 | 7,666 | 11,432 |
| Silver (recoverable content of ores, etc.).....troy ounces | 905 | 1 | | |
| Stone.....thousand short tons | 17,787 | 31,447 | [5] 19,358 | [5] 33,019 |
| Zinc (recoverable content of ores, etc.) [6].....short tons | 20,334 | 4,662 | 19,865 | 5,142 |
| Value of items that cannot be disclosed: Aplite, portland cement, masonry cement, feldspar, gypsum, iron ore (pigment material), kyanite, manganese ore, ferruginous (10 to 35 percent Mn, 1959), pyrites, salt, soapstone, titanium concentrate (ilmenite and rutile), and values indicated by footnote 3 | | [7] 28,848 | | 25,958 |
| Total Virginia [8] | | [7] 222,501 | | 203,819 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Weight not recorded.
[3] Figure withheld to avoid disclosing individual company confidential data.
[4] Preliminary figure.
[5] Final figure; supersedes figure given in commodity chapter.
[6] Recoverable zinc valued at the yearly average price of prime western slab zinc, East St. Louis market. Value established after transportation, smelting, and manufacturing charges have been added to the value of ore at the mine.
[7] Revised figure.
[8] Total adjusted to eliminate duplicating value of clays and stone.

Digitized by Google

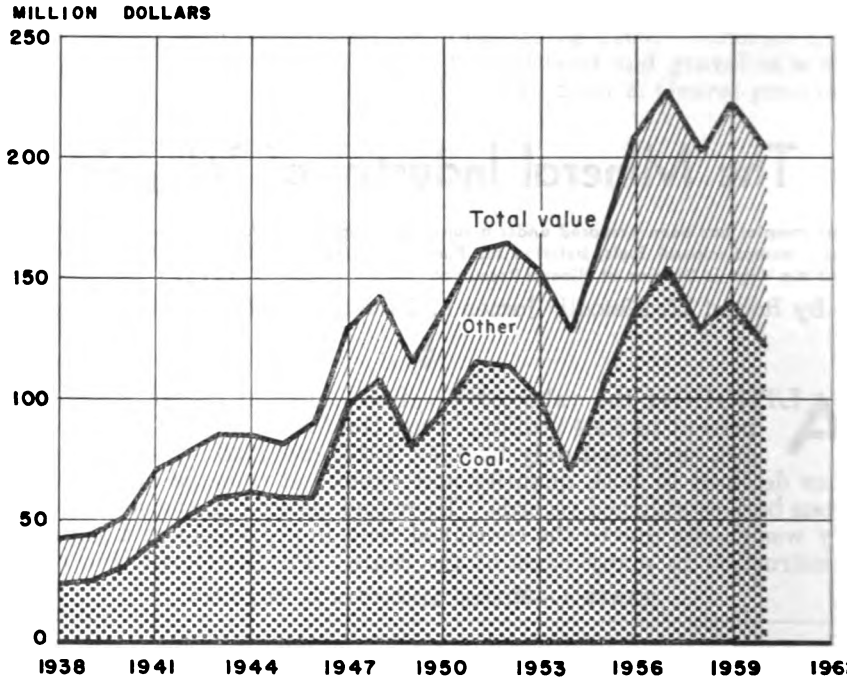

FIGURE 1.—Value of coal and total value of mineral production in Virginia, 1938–60.

pigments and soapstone also were higher than in 1959. All other minerals, including metals and nonmetals, decreased from 2 percent to more than 30 percent. Bituminous coal, the leading commodity in terms of both quantity and value, declined 6 percent in tonnage and 12 percent in value. Output of lead was 22 percent less than in 1959, chiefly due to a 4-month strike. Production of zinc decreased only 2 percent. Of the commodities used extensively by the construction industries, sand and gravel decreased 9 percent, portland cement 15 percent, and gypsum 16 percent.

The chief minerals, in order of value of production, were coal, stone, cement, sand and gravel, and lime. The value of fuels comprised 60 percent of the total value of mineral production in the State (63 percent in 1959). The value of nonmetals accounted for 37 percent of the total, and the value of metals, 3 percent.

**Employment and Injuries.**—Injury frequency in selected metal and nonmetal industries (excluding coal) was less than in 1959. No fatalities were reported in the metal and nonmetal classifications, compared with two in 1959. Nonfatal injuries declined markedly except for clay mines. Of the 24 coal mine fatalities reported in 1960, 22 were underground and 2 were at associated surface facilities. One of the surface fatalities was a haulage accident, and the second was by a miscellaneous cause. Fourteen of the underground fatalities were due to falls of roof, and two to falls of face, rib, or pillar; three

Digitized by Google

were underground haulage accidents, two were caused by electricity, and one was caused by machinery. These data reemphasize the danger of falls of rock and point to the need for increased safety programs.

**TABLE 2.—Employment and injuries for selected mineral industries**

| Industry | Average number of men working | Total man-hours | Total number of lost time injuries | | Number of injuries per million man-hours | |
|---|---|---|---|---|---|---|
| | | | Fatal | Nonfatal | Fatal | Nonfatal |
| 1959: | | | | | | |
| Coal mines | 14,139 | 22,386,900 | 22 | 1,022 | .98 | 45.65 |
| Metals [1] | 471 | 838,338 | ---------- | 32 | ---------- | 38.17 |

[1] Includes mine and mill data and officeworkers.
[2] Excludes mill data and officeworkers.
[3] Excludes clay mines, also nonmetal mill and officeworkers.
[4] Includes cement and lime plants having no quarry operations; excludes officeworkers.
[5] Excludes officeworkers.
[6] Preliminary data.
[7] Data not available.

**Trends and Developments.**—Continued active interest in raw materials for road construction was particularly evident in Virginia because of the new and improved highway-building program. A new publication on highway construction materials described deposits and producing areas of stone and sand and gravel according to the geological provinces in which they occur.[3] A brief account of the geology and physical test data is given to enable prospective producers to determine the suitability of a particular material for construction purposes. Additional evidence of the interest in Virginia mineral and water resources was shown in a study of the structural history of the rocks in the Lexington area [4] and a description and detailed tabulation of well-log data in Albermarle County.[5]

The increased demand for sand and gravel and stone for aggregate resulted in new and enlarged raw materials plants, particularly plants for quarrying and processing stone for use in road and highway construction. The Lower Chesapeake Bay Bridge-Tunnel near Norfolk will bring about a large consumption of aggregate and riprap in that area.

**Legislation and Government Programs.**—Small amounts of mica were purchased from miners in Amelia County for the national stockpile.

Digitized by Google

The mica was purchased by the Government through the General Services Administration (GSA), Spruce Pine (N.C.) and Franklin (N.H.) Materials Purchase Depots. Government buying of metallurgical manganese ore of 35 percent or more manganese content under the Defense Production Act carlot purchase program was discontinued in August 1959. Small shipments only were made after that date to complete contracts in effect.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

**Coal.**—Virginia ranked sixth among coal-producing States. Coal mined in Virginia totaled 27.8 million short tons, 6 percent less than in the 1959, peak year. Value of coal production also declined (12 percent) from 1959 resulting in a 6-percent drop in average value per ton. The value of coal production represented 60 percent of the total mineral valuation of the State. A wide variety of coals were mined and prepared for domestic and industrial use, low- and high-volatile coals as well as a small quantity of semianthracite consumed in domestic heating. Eight counties contributed to the coal output, although four of these—Buchanan, Dickenson, Wise, and Russell—accounted for 91 percent of the total tonnage. Output of strip and auger coal was 8 and 9 percent less, respectively, than in the preceding year. Production from underground mines was nearly 1.5 million tons less than in 1959. The total number of mines was 1,268, only 10 mines less than in 1959. Of these, 1,201 were deep mines, 35 were strip operations, and 32 were auger mines. Slightly more than half the total underground output was loaded mechanically, and 88 percent of the mechanically loaded tonnage was loaded by 160 mobile loading machines, 10 more machines than in 1959. Most of the remainder was cut and loaded by 17 continuous mining machines. In addition a small tonnage was hand-loaded on face or room conveyors. Equipment used at the underground mines included 955 cutting machines, 1,343 handheld and postmounted coal drills, 20 mobile drills, and 117 roof and rock drills. Deep-mine haulage consisted of 489 animals, 657 trolley locomotives, 367 battery locomotives, and 38 other locomotives. Intermediate haulage was by 238 cable-reel and 3 battery shuttle cars and by 57 portable and 7 stationary rope hoists. There also were 54 mother conveyors averaging 1,935 feet in length.

Mechanical methods cleaned 48 percent of the total production. Most of the coal was cleaned by wet-washing methods other than jigs. Twenty-eight cleaning plants were active. Tonnage crushed comprised 31 percent of the total, compared with only 17 percent in 1959. Dust-allaying and anti-freezing preparations, mostly oil and combinations of calcium chloride and oil, treated 12 percent of the tonnage, compared with 9 percent in 1959.

Equipment used at stripping operations included 66 power shovels (mostly less than 3-cubic-yard capacity), 4 carryall scrapers, 40 bulldozers, 13 horizontal and 6 vertical overburden drills, and 67 trucks of 10-ton average capacity. Equipment at auger mines included 31

Digitized by Google

augers, 27 bulldozers, and 26 trucks of average 11-ton capacity. The average haul to a tipple was 6 miles, compared with 8 miles in 1959.

Total man-hours worked at bituminous coal mines in 1959 was 22,386,900 according to final data. The average number of men worked daily totaled 14,139. These men worked an average of 199 active days at 1,357 operations. Injuries included 22 fatal accidents and 1,022 nonfatal accidents. Injury severity rate per million hours was 46.63.

**TABLE 3.—Bituminous coal production and value, by counties**

(Thousand short tons and thousand dollars)

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value [1] | Quantity | Value [1] |
| Buchanan | 10,320 | $44,997 | 10,568 | $44,216 |
| Dickenson | 7,569 | 35,401 | 7,120 | 29,665 |
| Lee | 451 | 1,680 | 616 | 2,261 |
| Montgomery | 16 | 46 | 9 | 33 |
| Russell | 2,564 | 13,081 | 2,284 | 11,104 |
| Scott | 14 | 62 | 16 | 70 |
| Tazewell | 2,500 | 15,107 | 1,751 | 10,688 |
| Wise | 6,335 | 28,850 | 5,474 | 24,686 |
| Total | 29,769 | 139,224 | 27,838 | 122,723 |

[1] Value received or charged for coal f.o.b. mine, including selling cost. (Includes value for coal not sold but used by producer, such as mine fuel, and coal coked as estimated by producer at average prices that might have been received if such coal had been sold commercially.)

**Coke.**—Coke was produced only in Wise County at more than 600 ovens operated by five companies. Most of these ovens were beehive ovens although one company operated a battery of Mitchell or rectangular type ovens. The rectangular ovens, about 30 feet long and 5 feet high, were first manufactured at Braddock, Pa., in 1907 and have been used intermittently since that date. After burning, the coke is pushed out one end of the kiln. No byproducts are recovered. About one-fifth of the coke ovens are hand drawn, and the balance are machine drawn. The annual coke capacity of these ovens is about 350,000 net tons.

**Fuel Briquets and Packaged Fuel.**—Production of packaged fuel totaled 982 short tons. No production of fuel briquets was reported. Two plants were active. The consumption of these materials had declined radically chiefly due to the increased use of fuel oil and natural gas in domestic heating. Reports from producers showing destination of briquets indicated that 36,729 short tons were sold or used in Virginia in 1960, an increase of 14 percent over 1959. This was contrary to the national trend, as the quantities shipped to most of the larger consuming States were less than in 1959.

**Petroleum and Natural Gas.**—Approximately the same quantities of petroleum and natural gas were produced as in 1959. No new oil wells were completed, and no new discoveries of oil were made. Discovery of a small quantity of natural gas was reported. Crude oil was produced only in the Rose Hill field, Lee County. Production of natural gas was chiefly from wells in Dickenson and Buchanan Counties. Four new natural gas wells were completed—three in Buchanan County and one in Wise County; one other well in Buchanan County was dry. A well drilled in Dickenson County was tempo-

Digitized by Google

rarily abandoned when the rig burned. Natural gas was obtained from the Big Lime, Berea Sand, and Devonian shale formations. According to the American Gas Association, reserves of natural gas as of December 31 totaled 33,290 million cubic feet, a decrease of 14 percent from yearend 1959. All reserves were nonassociated, that is, represented free gas not in contact with crude oil in the reservoir.

The natural gas produced, other than that used in drilling operations, was distributed through three pipeline companies—Hope Natural Gas Co., Kentucky-West Virginia Gas Co., and United Fuel Gas Company. Firms active in drilling for natural gas included United Producing Co., United Fuel Gas Co., Cabot Corp., and Clinchfield Coal Co. A wildcat well was reported being drilled in King William County in the Atlantic Coastal Plain area.

The only petroleum refinery operated in Virginia was that of American Oil Co. at Goodwin Neck near Yorktown, York County. This company's facilities included skimming, cracking, and coking. Crude oil capacity was 34,000 barrels per day, and cracked- and reformed-gasoline capacity totaled 17,300 barrels per day. A research laboratory at this plant was concerned chiefly with special problems relating to manufacturing lead-free gasoline.

Another petroleum research laboratory, that of Texaco Experiment, Inc., Richmond, Henrico County, was conducting fundamental research on combustion processes and the development of propulsion systems for missiles and space vehicles. Most of the research was under contract with U.S. defense agencies.

## NONMETALS

**Aplite.**—Three firms operated mines and plants near Piney River in Amherst and Nelson Counties. Aplite, formerly used almost entirely for glass making and other ceramic uses, was being used increasingly for roofing granules, as an aggregate in concrete and roadstone, and as a component of brick and block. Production of aplite for all purposes was slightly higher than in 1959.

A fourth company, near Montpelier, Hanover County, converted its operations from exclusive production of ilmenite and rutile and began to produce chiefly aplite, with byproducts including mica, sphene, and ilmenite and rutile. By the end of the year, only small quantities of material for experimental and testing purposes had been shipped.

**Cement.**—Shipments of portland and masonry cements declined 15 and 14 percent, respectively, compared with 1959. One firm, operating two plants, produced portland cement in Botetourt and Norfolk Counties. One of these plants used the dry process and the other the wet process. Another firm operated a dry process plant in Augusta County and a fourth firm, in Warren County, produced masonry cement only. Two of the three plants manufacturing portland cement also produced masonry cement. Captive limestone, shale, calcareous marl, and sand were mined by the cement companies. General-use and moderate-heat portland cement was the principal type marketed. Moderate quantities of high-early-strength cement also were produced. All portland cement, except a small quantity shipped by water, was

Digitized by Google

shipped by railroad. Most was shipped in bulk and the remainder in paper bags.

The distribution of portland cement by types of consumer was 55 percent to ready-mixed concrete companies, 25 percent to concrete-product manufacturers, 7 percent to highway contractors, and the balance to other contractors, Federal, State, and local government agencies, and miscellaneous customers. Most of the portland cement shipments were to Virginia and the neighboring States of North Carolina and West Virginia. The distribution of masonry cement was largely to Virginia, North Carolina, West Virginia, and the District of Columbia. Smaller shipments were made to Pennsylvania, certain New England States, and other destinations.

**Clays.**—Production of clay increased slightly over 1959 and rose to a new high. Output was miscellaneous clay or shale, used chiefly in making building brick and other heavy clay products. Other markets included lightweight aggregate and portland cement manufacture. Seventeen firms mined and processed clay in 17 counties from 22 mines. The chief producing counties in order of value of output were: Botetourt, Prince William, Nansemond, Chesterfield, and Buckingham. According to preliminary data, 68 men worked 127,908 man-hours and experienced only two lost-time nonfatal accidents.

**TABLE 4.—Clays sold or used by producers**

| Year | Short tons | Value | Year | Short tons | Value |
|---|---|---|---|---|---|
| 1951-55 (average) | 861,758 | $869,132 | 1958 | 1,152,850 | $1,143,160 |
| 1956 | 1,000,019 | 1,032,665 | 1959 | 1,346,014 | 1,396,433 |
| 1957 | 893,255 | 986,302 | 1960 | 1,347,766 | 1,394,665 |

**Feldspar.**—Tonnage and value of ground and crude feldspar were substantially less than in 1959. Potash and mixed potash-soda feldspar were produced from four mines and ground in a mill at Bedford. Chief uses for the ground feldspar were pottery and enamel. Small quantities were consumed in abrasives, welding-rod coating, and brick facing.

**Gem Stones.**—Mineral collectors and hobbyists reported finding gems and mineral specimens in Amelia, Madison, and Nelson Counties. Gems collected included amazonite (Amelia County), unakite and epidote (Madison County), and rutile (Nelson County). Coverage of the collection of gem materials was not complete and possibly many additional specimens were collected. Gems and mineral specimens were obtained in past years from Amelia (albite, cleavelandite, garnet), Page (epidote, onyx), Prince Edward (amazonite, amethyst, kyanite), and Rockbridge (unakite) Counties.

**Gypsum.**—United States Gypsum Co. mined and processed crude gypsum at Plasterco in Washington County. Output was less than in 1959. Products included calcined gypsum and plasterboard. Both domestic and imported gypsum were calcined by the same firm at a plant in Norfolk. Imported gypsum from Nova Scotia was sold by a number of fertilizer firms in the Norfolk area, largely for use as an agricultural land dressing.

Digitized by Google

**Kyanite.**—Crude ore mined and sales of refined kyanite remained about the same as in 1959. Kyanite Mining Corp. operated two mines and flotation plants, one in Buckingham County and one in Prince Edward County. Part of the flotation concentrate was pulverized for special uses at the company Pamplin (Appomattox County) processing plant.

**Lime.**—Output of lime decreased 7 percent, compared with 1959. A large part was captive production. As in 1959 chemical and industrial uses comprised 95 percent of the total output which was mainly quicklime (92 percent). Both agricultural and chemical lime decreased but building lime showed a small increase. Shell was used by two companies in lime manufacture in the Norfolk area. The chief lime-producing counties were Giles, Smyth, and Shenandoah. Smaller tonnages were burned in Frederick, Tazewell, Isle of Wight, and Norfolk Counties.

Among the chemical applications for which quicklime was used were the manufacture of calcium carbide, the making of paper and whiting, and the manufacture of alkalies; quicklime was also used as a flux in steelmaking. Uses for hydrated lime included water purification, leather tanning, and sewerage- and trade-waste treatment. Lime for building use was largely hydrated, and both quicklime and hydrated lime were used for agricultural purposes.

**TABLE 5.—Lime sold or used by producers, by uses**

| Year | Agricultural | | Building | | Chemical and other industrial | | Total | |
|---|---|---|---|---|---|---|---|---|
| | Short tons | Value | Short tons | Value | Short tons | Value | Short tons | Value |
| 1951–55 (average) | 20,059 | $238,938 | 9,566 | $111,549 | 432,847 | $4,370,981 | 462,472 | $4,721,468 |
| 1956 | 25,125 | 322,644 | 3,572 | 41,914 | 483,649 | 5,561,357 | 512,346 | 5,925,915 |

[2] Figure withheld to avoid disclosing individual company confidential data; included in total.

**Mica.**—A small quantity of hand-cobbed and full-trim mica, mined in Amelia County, was sold through the GSA Spruce Pine (N.C.) and Franklin (N.H.) Purchase Depots. Richmond Mica Corp., Newport News, wet ground domestic and foreign scrap mica for use in paint, rubber, wallpaper, plastics, and other applications.

**Nitrogen Compounds.**—Nitrogen compounds were manufactured at Hopewell (Prince George County) by Allied Chemical Corp., Nitrogen Division. Products, which included ammonia, urea solution, ammonium sulfate, and other nitrogen compounds, were used chiefly as fertilizer ingredients.

**Perlite.**—Perlite shipped from Colorado was expanded at Hopewell (Prince George County) chiefly for use as building plaster.

**Pyrites.**—The Gossan mine in Carroll County yielded pyrites (pyrrhotite) which was used in the manufacture of sulfuric acid at Pulaski

Digitized by Google

by General Chemical Division, Allied Chemical Corp. Production declined sharply compared with 1959.

**Salt.**—Production of salt brine declined 6 percent compared with 1959. The salt was used principally in the manufacture of chlorine and soda ash, and other chemicals. Output was obtained from underground salt beds at Saltville, Smyth County, in the southwestern part of the State.

**Sand and Gravel.**—Production of sand and gravel declined 9 percent in quantity and 8 percent in value to 7.7 million short tons valued at $11.4 million. Output for building purposes decreased 31 percent, and production for paving increased 39 percent over 1959. Building and paving uses comprised 93 percent of commercial production. Of the total output, building and paving uses comprised 43 and 53 percent, respectively, compared with 52 percent for building and 37 percent for paving in 1959. Other types of sand and gravel produced included glass, molding, grinding, polishing, engine, filtration, railroad ballast, fill, and miscellaneous sand (including sand for ice control and other purposes). Sand comprised slightly less than half the total output. The average value per ton increased to $1.49 from $1.46 in 1959. Production was reported from 29 counties, compared with 32 in 1959. Output by commercial operators comprised 97 percent of the total production; the balance was reported by State, Federal, and local government agencies. There were 39 commercial producers operating 43 sand and/or gravel pits in 24 counties. The principal counties in order of size of production were Henrico, Fairfax, Chesterfield, Prince George, and Princess Anne.

**Soapstone.**—Both output of crude and sales of ground soapstone were greater than in 1959. Two firms—one each in Franklin and Nelson Counties—mined, crushed or ground soapstone for consumption in roofing, rubber, foundry facings, and insecticides. Soapstone used as dimension stone is included with miscellaneous stone in the stone section of this chapter.

**Stone.**—Continued active building and highway construction resulted in a 9-percent increase in output of stone over 1959. Production rose to 19.4 million short tons, a new record. Stone continued to rank second in tonnage and value among minerals produced in the State. Concrete and highway construction accounted for 67 percent of the stone produced, and stone used for cement and lime comprised 11 and 7 percent of total output, respectively. Types of stone produced were limestone, granite, basalt, sandstone, marble, miscellaneous stone (including soapstone, greenstone, and crushed and broken aplite), calcareous marl, slate, and shell. Shell was recovered as a byproduct of the oyster and mollusk fishing industries. The chief uses for this material were for agstone and lime manufacture. Limestone comprised 64 percent of total stone, and granite and basalt combined totaled 32 percent. Crushed and broken stone comprised the bulk of output, but a small amount of dimension sandstone and miscellaneous stone was produced. The principal stone-producing counties in order of output were Loudon, Washington, Fairfax, Botetourt, and Campbell. Commercial stone was produced in 50 counties by 83 producers, and 7 State or municipal agencies in 11 counties produced Government-and-contractor store. Four companies in three

[3] Includes fill, and other sand (1960).

counties produced and marketed shell. Commercial stone producers were as follows: Limestone, 54 companies (62 quarries); granite, 14 companies (17 quarries); basalt, 8 companies (8 quarries); sandstone, 9 companies (9 quarries); marble, 1 company (1 quarry); miscellaneous stone, 4 companies (4 quarries); calcareous marl, 3 companies (3 quarries); and slate, 3 companies (3 quarries). According to preliminary data, 3,628 men (excluding officeworkers) worked 7,511,422 man-hours in the stone industries. Lost-time injuries totaled 172, resulting in an injury frequency rate of 22.90 injuries per million man-hours of exposure.

Crushed and sized slate was produced for roofing granules by Blue Ridge Slate Corp. near New Canton, Buckingham County. Roofing granules also were prepared from aplite by two companies in Nelson County.

**Sulfur.**—American Oil Co. recovered hydrogen sulfide from fuel gas for conversion to elemental sulfur at its Yorktown refinery, York County. Shipments of sulfur were 17 percent higher than in 1959.

## METALS

**Ferroalloys.**—E. J. Lavino & Co. produced ferromanganese in two blast furnances at Reusens, a suburb of Lynchburg.

**Iron and Steel.**—Newport News Shipbuilding & Drydock Co. (Newport News) operated three electric furnaces producing ingot and casting steel. Roanoke Electric Steel Corp. produced ingot and casting steel at its electric furnace in Roanoke.

**Iron Ore (Pigment Material).**—One company produced crude natural iron oxide pigments near Hiwassee. Pigments included sienna, umber, ocher, and other natural red and yellow iron oxides. The same company produced finished iron oxide pigments at two plants, one near Hiwassee and the other at Pulaski. Both natural and manufactured iron oxide pigments were marketed. A second company produced a wide range of finished natural and manufactured iron oxide pigments at its plant in Franklin County near Henry.

**Lead and Zinc Ores.**—Output of recoverable zinc decreased 2 percent in quantity. The average value per ton rose slightly. Production of lead, however, declined more than one-fifth, owing to a 113-day strike at the Ivanhoe and Austinville Mines in Wythe County. Ore mined at the Ivanhoe and Austinville plants was treated at the Austinville mill. Zinc-lead ores were mined in Wythe County, and zinc ore was produced at Timberville in Rockingham County. The Timberville plant operated the entire year. Zinc concentrate was shipped for treatment to Josephtown and Palmerton, Pa., and to East Chicago, Ind. Lead concentrate was shipped to Palmerton, Pa., Omaha, Nebr., and Carteret, N.J. Lead concentrate also was exported to Japan.

**TABLE 8.—Mine production of recoverable silver, lead, and zinc**

| Year | Silver | | Lead | | Zinc | |
|---|---|---|---|---|---|---|
| | Troy ounces | Value | Short tons | Value | Short tons | Value [1] |
| 1951–55 (average) | [2] 1,597 | [2] $1,446 | 3,081 | $910,007 | 14,497 | $3,816,092 |
| 1956 | 1,874 | 1,696 | 3,035 | 952,990 | 19,196 | 5,180,616 |
| 1957 | 1,745 | 1,579 | 3,143 | 898,898 | 23,080 | 5,277,476 |
| 1958 | 2,023 | 1,831 | 2,934 | 686,556 | 18,472 | 3,807,853 |
| 1959 | 866 | 784 | 2,770 | 637,100 | 20,334 | 4,661,792 |
| 1960 | | | 2,152 | 503,568 | 19,885 | 5,142,275 |

[1] Recoverable zinc valued at the yearly average price of prime western slab zinc, East St. Louis market. Value established after transportation, smelting, and manufacturing charges have been added to the value of ore at the mine.
[2] Average of 1953, 1954, and 1955; no output reported 1951–52.

**Manganese Ore.**—Because the Government discontinued purchasing of domestic carlot manganese ore in 1959, no shipments of manganese ore were supplied to the Government's stockpiles during 1960. No output or sales of manganese ore for commercial use or consumption were reported.

**TABLE 9.—Manganese ore and manganiferous ore shipped from mines**

| Year | Short tons | Value | Year | Short tons | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 12,959 | $1,056,843 | 1958 [2] | 8,184 | $648,479 |
| 1956 [1] | 20,231 | 1,901,983 | 1959 [1] | 6,232 | 499,315 |
| 1957 | 12,655 | 1,057,462 | 1960 | | |

[1] Incomplete total; excludes a small quantity of ferruginous manganese ore.
[2] Includes 56 tons of ferruginous manganese valued at $1,120.

**Silver.**—No silver was recovered as byproduct of the lead concentrate produced at Austinville owing to the closing of the American Smelting & Refining Co. smelter at Federal, Ill., which formerly processed this material.

**Titanium Concentrate.**—Output of titanium concentrate consisted mainly of ilmenite plus a small quantity of rutile. Production decreased significantly, compared with 1959. Ilmenite was produced by American Cyanamid Co. at Piney River (Amherst County) for consumption chiefly in manufacturing titanium pigments. Metal and Thermit Corp. produced both ilmenite and rutile.

## REVIEW BY COUNTIES

The Virginia Department of Highways produced Government-and-contractor sand and gravel in six counties; some tonnage also was mined in unspecified counties. Most of this output was by State crews, and most was washed and screened, or otherwise prepared. Counties in which Government-and-contractor sand and gravel was produced were Accomack, Hanover, Nelson, Northampton, Northumberland, and Pittsylvania. One county highway department (Henrico) also produced paving sand and gravel with its own crews. All Government-and-contractor sand and gravel produced was used in paving and for maintenance of roads and streets.

Digitized by Google

**Albemarle.**—Superior Stone Co., Division of American-Marietta Co. mined granite at its Red Hill quarry, and Charlottesville Stone Co. produced crushed basalt near Charlottesville. The output of both quarries was sold for concrete aggregate and roadstone.

S. L. Williamson Co., Inc., Charlottesville, dredged pit-run sand for use in highway construction.

Soapstone was produced at Alberene, and serpentine was produced near Schuyler by the Alberene Stone Division of the Georgia Marble Co. This company also operated two soapstone quarries in Nelson County.

**Alleghany.**—Limestone was mined and prepared for concrete aggregate and roadstone by W. G. Mathews, Jr., Inc., at a quarry near Lowmoor.

**Amelia.**—The Rutherford mineral-collecting area near Amelia Courthouse yielded amazonite and garnet.

Hand-cobbed and full-trimmed mica was produced by W. D. Baltzley, Joe L. Snyder, and J. E. Wilson from the Baltzley No. 5 and No. 6 mines. This mica was sold through the GSA Purchase Depots at Franklin, N.H., and Spruce Pine, N.C.

**Amherst.**—Aplite was quarried by Riverton Lime & Stone Co., Division of Chadbourn Gotham, Inc. The output was processed in the company's adjacent plant in Nelson County near Piney River. The finished material was sold for the manufacture of glass, as granules for asphalt roofing paper and shingles, and as crushed stone for concrete aggregate.

American Cyanamid Company mined and sold ilmenite at its Piney River operations for consumption at its adjacent titanium-pigment plant. Production was less than in 1959.

Smiley Sand Co. operated a dredge north of Lynchburg to produce washed and screened building sand.

**Appomattox.**—Limestone was mined and ground for soil conditioning by the Virginia Department of Agriculture & Immigration at a State-owned plant. Kyanite Mining Corp. operated a grinding plant at Pamplin where flotation concentrate from its Dillwyn and Cullen plants were pulverized for special applications.

**Augusta.**—Lehigh Portland Cement Co. mined limestone and shale for use in portland and masonry cement at its Fordwick plant. General-use and high-early-strength portland cements and masonry cement were produced by the dry process in six kilns for consumption in Virginia, North Carolina, and West Virginia.

Limestone was mined, crushed, and sized for concrete aggregate and roadstone by Valley Stone Co., Belmont Trap Rock Co., Inc., and Augusta Stone Corp., all near Staunton. The Virginia Department of Agriculture & Immigration ground limestone for agstone, and the Virginia Department of Highways mined and crushed limestone for highway construction and maintenance.

Processed and bank-run building sand were produced by Katie L. Weeks from a deposit north of Raphine.

**Bath.**—Limestone was mined and prepared for highway construction and maintenance by the Virginia Department of Highways at a quarry near Millboro.

Digitized by Google

**Bedford.**—Potash and potash-soda feldspar was produced from four mines by Clinchfield Sand & Feldspar Corp. The company mill at Bedford ground the feldspar for use chiefly in making pottery and enamel. Ground feldspar was shipped mostly to Maryland, Ohio, Pennsylvania, and New Jersey.

Blue Ridge Stone Co., Roanoke, quarried limestone in Bedford County for concrete aggregate, roadstone, railroad ballast, stone sand, and agstone.

**Bland.**—Limestone riprap was produced near White Gate by the Bland Correctional Farm.

**Botetourt.**—Both tonnage and value of limestone were greater than in 1959, and Botetourt continued to be the leading limestone producing county. Two companies operating three quarries mined and prepared limestone for a wide variety of uses. James River Hydrate & Supply Co., Buchanan, and Liberty Limestone Corp., with two quarries near Buchanan, produced limestone for concrete aggregate, roadstone, filler for fertilizer, agstone, chemical uses, and railroad ballast, in order of decreasing quantity. Minor tonnages were sold for metallurgical flux, asphalt filler, stone sand, cattle food additive, papermaking, and mine dusting. Lone Star Cement Corp. produced limestone for use in manufacturing cement at its Cloverdale plant. The company produced both air-entrained and non-air-entrained general-use and high-early-strength portland cements as well as masonry cement in four 340-foot by 9-foot rotary kilns.

**TABLE 10.—Value of mineral production in Virginia, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value [2] |

[4] Excludes sand and gravel; included with "Undistributed."
[5] Excludes stone and clays; included with "Undistributed."
[6] Excludes stone; included with "Undistributed."
[7] Excludes manganese ore (10 to 35 percent Mn) and (35 percent or more Mn); included with "Undistributed."
[8] Includes value of natural gas and petroleum; part of value of gem stones, manganese ore (35 percent or more Mn) (1959), stone (1959), and sand and gravel (1960), for which commodities complete distribution by counties was not available; and values indicated by footnote 3.
[9] Revised figure.

Production of clay declined, but the county continued as the chief clay-producing county. Webster Brick Co., Inc. (formerly Roanoke-Webster Brick Co., Inc.), and Virginia Lightweight Aggregate Corp., both with plants at Webster near Roanoke, produced miscellaneous clay and shale for use in heavy clay products and lightweight aggregate, respectively.

**Brunswick.**—Granite was quarried and prepared for use as concrete aggregate, roadstone, and riprap by Southern Materials Co., Inc., at the Rawlings quarry.

Miscellaneous clay and shale was mined by Brick & Tile Corp. (Lawrenceville) for use in manufacturing building brick. Four men

Digitized by Google

working a 5-day week produced enough raw material to keep the company's tunnel kiln operating 365 days.

**Buchanan.**—Bituminous coal production totaled 10.6 million short tons, an increase of 2 percent over 1959. The county was first among Virginia coal-producing counties, with 38 percent of the State total produced from its 800 active mines. Most of the coal came from underground operations. Small quantities were mined at strip and auger mines. Equipment used at underground mines included 881 handheld and postmounted drills and 16 rock drills. Haulage facilities included 269 animals, 646 locomotives, 3,537 mine cars, 58 shuttle cars, and 30 rope hoists; 10 main conveyors and 558 cutting machines were used. Equipment used at auger mines included 8 augers, 1 diesel power shovel, 5 bulldozers, 2 power drills, and 8 trucks.

Leading producers of bituminous coal including Harman Mining Corp., Island Creek Coal Co., Jewel Ridge Coal Corp., Panther Coal Co., and Oakwood Red Ash Coal Corp. Principal seams from which coal was recovered were the Red Ash, Blair, Splashdam, Jewell, and Jewell Ridge seams.

United Producing Co. and United Fuel Gas Co. completed three successful natural gas wells in the Berea sand, the Big Lime, and the Devonian shale formation. One other well was dry, and another was drilled through the Berea sand and was awaiting testing at the end of the year. The gas produced was distributed mostly through the pipelines of Hope Natural Gas Co. although a sizable quantity was delivered to the United Fuel Gas Co. pipelines.

**Buckingham.**—Slate was quarried, sawed, and split by LeSueur-Richmond Slate Corp. and Arvonia-Buckingham Slate Co., Inc., at quarries near Arvonia. Williams Slate Co. which, as of June 30, 1959, had merged with Arvonia Buckingham Slate Co., Inc., was operated as a part of that firm in 1960. Blue Ridge Slate Corp. produced crushed slate for roofing granules from its Dutch Gap quarry near New Canton.

Miscellaneous clay and shale was mined and processed at Bremo Bluff by Solite Corp. for use in the manufacture of lightweight aggregate. The raw material was trucked about one-half mile from the open-pit mine to a crushing plant and then conveyed to six rotary kilns which converted it to a lightweight product.

Kyanite was produced by Kyanite Mining Corp. at its Willis Mountain mine and Dillwyn mill for use in special refractories and other ceramics products.

**Campbell.**—Rockydale Stone Service Corp., near Concord, and Blue Ridge Stone Corp., near Lynchburg, mined and crushed large tonnages of limestone for use as concrete aggregate and roadstone. Virginia Greenstone Co., Inc., Lynchburg, produced dressed building stone, bakery-oven hearthstones, rubble, and random broken flagging at its Virginia Greenstone quarry.

**Caroline.**—Prepared and bank-run sand and gravel for building, fill, and other uses were produced by Dyson Sand & Gravel Co. at its stationary plant near Milford and by Mattaponi Sand and Gravel Co. near Point Eastern.

**Carroll.**—Lump ore and fine pyrrhotite concentrate were produced from the Gossan mine near Galax, by General Chemical Division,

Digitized by Google

Allied Chemical Corp. The pyrrhotite was used as a raw material for the manufacture of sulfuric acid at the General Chemical plant in Pulaski.

**Chesterfield.**—Miscellaneous clay or shale was produced at open-pit mines near Richmond for use in making building brick by Redford Brick Co., Richmond Clay Products Corp., Southside Brick Works, Inc., and Daniels Brick and Tile Co., Inc.

Chesterfield County continued to rank third in output of sand and gravel although less tonnage was produced than in 1959. Southern Materials Co., Inc., operating a dredge at Kingsland Reach on the James River, produced washed and screened sand and gravel for use as concrete aggregate in highway construction and sand for water filtration. More than 70 percent of the county output was shipped by water, and the remainder by railroad.

**Clarke.**—J. C. Digges & Son, White Post, and Elmer Kenney Lime Co., Berryville, mined, pulverized, and air-dried calcareous marl for agricultural use. Limestone was mined and prepared for concrete aggregate and roadstone by Stuart M. Perry, Inc., at a quarry near Berryville. Virginia Department of Highways mined limestone for use in highway construction and maintenance at the Double Toll Gate quarry.

**Craig.**—An operation was opened by Castle Sands Co. at New Castle where sandstone was quarried for concrete aggregate, roadstone, and other uses.

**Culpeper.**—Culpeper Stone Co., Inc., Culpeper, mined sandstone for use as concrete aggregate and roadstone. Culpeper Sand Co. (Culpeper) prepared sand for building and paving at a stationary plant.

**Dickenson.**—Bituminous coal production dropped 6 percent, but the county maintained its second ranking position among coal producing counties. The number of mines decreased to 100 from 114 in 1959. Ninety-eight percent of the tonnage was obtained from underground mines. Power drills used in underground mining included 93 handheld and postmounted drills, 20 mobile drills, and 30 rock drills. Haulage included 54 animals, 107 locomotives, 753 mine cars, 60 shuttle cars, and 10 rope hoists. Principal producers included Clinchfield Coal Co., Baker Coal Co., Cassell Coal Co., and Dotson Bros. Coal Co. Coal seams mined included Upper Banner, Lower Banner, Clintwood, Tiller, and Jawbone.

Natural gas was produced by the Clinchfield Coal Co. from the Big Lime and Devonian shale formations. One well was drilled through the Berea sand to a depth of 5,481 feet where the tools were lost. After unsuccessful "fishing" operations and a fire in the rig, the hole was temporarily abandoned. Natural gas produced was distributed through the pinelines of the Kentucky-West Virginia Gas Co.

**Dinwiddie.**—Southern Materials Co., Inc., mined and crushed granite for roadstone at its Jack quarry near Petersburg. Shale for use in manufacturing heavy clay products at its plant near Richmond was produced under contract near Dinwiddie, Virginia, by Daniels Brick & Tile Co., Inc.

**Fairfax.**—Sand and gravel operations in Fairfax County accounted for 24 percent of the State total. Seven plants were active; five produced only prepared (washed and screened) material, and two pro-

Digitized by Google

duced bank-run sand and gravel. Output was used entirely for building and paving. Among the larger producers were L. S. Sorber & Co., Northern Virginia Construction Co. Inc., Virginia Sand & Gravel Co. Inc., Modern Sand & Gravel Corp., and Alexandria Sand & Gravel Corp. All shipments were by truck.

Granite was quarried and prepared for use as concrete aggregate, roadstone, railroad ballast, and riprap by W. E. Graham & Sons, Division of Vulcan Materials Co. at a quarry near Occoquan. Fairfax Quarries, Inc., produced basalt (traprock) for concrete and roadstone at a quarry near Fairfax. Oystershell was used to make poultry grit and lime by Herbert Bryant, Inc., Alexandria.

**Fauquier.**—Basalt (traprock) was mined and prepared for use as concrete aggregate and roadstone by Riverton Lime & Stone Co., Division of Chadbourn, Gotham, Inc. (Paris) and W. W. Sanders Quarry (Warrenton). Millbrook Quarries, Inc. (Broad Run), mined and crushed limestone conglomerate for concrete aggregate and roadstone. Dimension sandstone was produced for flagging, rough facing stone, and rubble by J. W. Costello, The Plains, and James Edward Corum, Broad Run.

**Franklin.**—Soapstone was mined by Blue Ridge Talc Co., Inc., at its King-Ramsey mine near Henry. Output was marketed for use in foundry facings and insecticides. This firm also produced a wide variety of manufactured iron oxide pigments at its Henry plant.

**Frederick.**—Frederick County ranked third in the production of limestone, but output decreased compared with 1959. Three companies, operating four quarries at Clearbrook, Winchester, Middletown, and Stephens City, mined and prepared limestone for a wide variety of uses. Major quantities were sold for metallurgical flux, concrete aggregate, glass, lime, agstone, paper, and cement. M. J. Grove Lime Co., Division of The Flintkote Co. produced quicklime and hydrated lime at its Stephens City plant from captive limestone. Output was sold for mason's lime, agricultural lime, and chemical and other industrial uses. Shipments were principally to Maryland, Virginia, Pennsylvania, North Carolina, and Delaware. The plant was equipped with eight kilns—one of which was an Azbe-type vertical shaft—one batch hydrator, and one continuous hydrator.

Shenandoah Brick & Tile Corp. near Winchester mined shale for manufacturing building brick.

Virginia Glass Sand Corp. (Winchester) recovered and processed sand near Gore for use in the manufacture of glass. A small part of the output was used in building construction.

**Giles.**—Giles County moved up in rank from third to second in production of limestone, although tonnage and value decreased 3 percent and 9 percent respectively compared with 1959. Standard Lime & Cement Co., Division of American-Marietta Co., and National Gypsum Co., with quarries near Kimballton, and Virginian Limestone Corp. and Ripplemead Lime Co., Inc., with quarries near Ripplemead, mined and prepared limestone principally for lime, concrete aggregate, and roadstone. Smaller quantities were sold for metallurgical flux, stone sand, coal-mine dusting, agstone, and railroad ballast.

Digitized by Google

Both National Gypsum Co. and Standard Lime & Cement Co., Division of American-Marietta Co., with plants near Kimballton, produced lime in coal-fired rotary kilns. Most of the output was for chemical and other industrial uses but some was used for agriculture and mason's lime. Ripplemead Lime Co., Inc., produced a small quantity of mason's and chemical lime in a coal-fired vertical kiln at its Ripplemead plant.

**Goochland.**—Royal Stone Corp. mined and crushed quartzite for concrete aggregate and roadstone at its quarry near Hylas. Granite was mined and sized for roadstone by Boscobel Granite Corp. at its Manakin Quarry.

**Greensville.**—Trego Stone Corp. near Skippers quarried and crushed granite for concrete roadstone, riprap, and railroad ballast. Output was shipped mostly by railroad.

**Hanover.**—The Verdon granite quarry near Doswell, formerly owned by J. E. Baker Co., was operated by General Crushed Stone Co. Crushed granite produced was used for building, highway construction, and railroad ballast.

Metals and Minerals Division, Metal & Thermit Corp., produced ilmenite and rutile at its Beaverdam plant near Montpelier. In the future, aplite for roofing granules will be the principal product rather than ilmenite and rutile as in the past. Titanite and mica also will be recovered as byproducts.

**Henrico.**—Henrico County continued to lead in sand and gravel production, accounting for 27 percent of the State total. Southern Materials Co., Inc., recovered sand and gravel with a floating dredge and shipped the output by water. Commonwealth Sand & Gravel Corp., Carter Sand and Gravel Co., Inc., and West Sand & Gravel Co., Inc., processed sand and gravel in stationary plants and shipped the product by truck and railroad. The entire output was used in construction.

Tidewater Crushed Stone Co., Richmond, mined and crushed granite for building and highway construction and riprap.

**Henry.**—Martinsville Stone Corp. and Snyder Stone Quarry both near Martinsville produced crushed granite for concrete aggregate and roadstone in stationary plants. Output was shipped by truck. The Public Works Department of Martinsville prepared crushed granite for road building and maintenance.

**Highland.**—Virginia Department of Highways produced roadstone at the Hightown limestone quarry.

**Isle of Wight.**—Battery Park Fish & Oyster Co. used stockpiled oystershell to manufacture lime in a coal-fired pot kiln. Output was hydrated and sold for soil conditioner. Dudley C. Waltrip discontinued gravel production.

**King William.**—Fox Co., Aylett, produced sand and gravel for building and paving at a portable plant. Of interest was a wildcat well being drilled 25 miles northeast of Richmond in the Atlantic coastal plain area. This is a new area for oil or gas exploration.

**Lee.**—Bituminous coal output increased 37 percent over 1959. Sixty-three mines were active, of which 57 were underground mines, 2 were strip mines, and 4 were auger mines. Sixty-one percent of the coal

Digitized by Google

came from underground operations. Equipment used underground included 51 handheld and postmounted drills and 49 cutting machines. Haulage consisted of 10 animals, 26 locomotives, and 278 mine cars. Strip mine equipment included 1 diesel power shovel, 2 bulldozers, 1 horizontal drill and 4 trucks or tractor trailers. Auger mines used 4 augers, 4 bulldozers, and 1 truck. Chief producing companies included Wisco Coal Corp. (both strip and auger), Darby Fuels, Inc., Betsy Darby Coal Co., B & G Coal Co., and Virginia Lee Coal Co., Inc. The principal coal seams mined were No. 5 and Nos. 11 and 12.

The Rose Hill field continued to be the only crude oil producing area in Virginia. Output was small and was consumed locally.

Limestone was mined and processed for concrete aggregate, roadstone, agriculture, railroad ballast, stone sand, and dusting coal mines by the Kentucky-Virginia Stone Co., Inc., at its Wheeler Quarry near Gibson Station. Woodway Stone Co. (Woodway) produced limestone for concrete aggregate, roadstone, and agriculture.

**Loudon.**—Chantilly Crushed Stone, Inc., produced crushed basalt at its Arcola quarry for runway construction and approaches at the new international airport near the District of Columbia. Part of the crushed basalt produced by Virginia Trap Rock, Inc., and Arlington Stone & Macite Co., both near Leesburg, also was used in construction of the new airport. The balance was used for building and highway construction. Bull Run Stone Co. near Manassas mined and crushed granite for concrete aggregate and roadstone.

**Louisa.**—Limestone was mined, crushed, and screened for concrete aggregate and roadstone at a quarry near Gordonsville by Superior Stone Division of American-Marietta Co.

**Madison.**—Mineral collectors and hobbyists collected unakite and epidote near Syria in the Rose River area.

**Mecklenburg.**—W. E. Graham & Sons Division of Vulcan Materials Corp., Boydton, mined and crushed granite for concrete aggregate and roadstone. The finished stone was delivered to consumers by truck and railroad.

**Montgomery.**—Limestone was mined and prepared for concrete aggregate, roadstone, and agricultural use by Montgomery Limestone Corp., Christiansburg. Velvet Sand Co., Inc., near Ironto, mined and crushed sandstone for building and highway construction. One underground mine operated by Jones & Keister Coal Co. produced a small quantity of semianthracite for domestic heating. Old Virginia Brick Co., Inc., mined shale at Elliston for the manufacture of building brick.

**Nansemond.**—Calcareous marl was mined at Chuckatuck by the Lone Star Cement Corp. to supply its South Norfolk cement plant, Norfolk County. Lone Star also dredged clay from the James River for cement manufacture. Webster Brick Co., Inc., mined miscellaneous clay near Suffolk for building brick.

**Nelson.**—Dimension and ground soapstone were produced at Alberene Stone Division of the Georgia Marble Co. at its plant near Schuyler. Blocks of soapstone were sawed and prepared for architectural and laboratory applications. Irregular-shaped slabs were sold for flagging. Spalls and trimming waste were ground for roofing,

Digitized by Google

rubber, filler, and other uses. The company operated two quarries in Nelson County and two in Albemarle County.

Aplite was mined by Consolidated Feldspar Department of International Minerals & Chemical Corp. and Buffalo Mines, Inc., near Piney River. These two companies and Riverton Lime & Stone Co., Division of Chadbourn Gotham, Inc., also had crushing and grinding plants. Riverton Lime & Stone Co. obtained its crude material in a quarry adjacent to its mill, but across the border in Amherst County. Most of the output was reduced to minus 20-mesh and sold for the manufacture of glass. Both Buffalo Mines, Inc., and Riverton Lime & Stone Co., sold part of their output for concrete aggregate, roadstone, roofing granules, and other uses. Aplite for glass was shipped chiefly to New Jersey, Ohio, West Virginia, Illinois, and Virginia.

Rutile and aplite were among the minerals collected by hobbyists in Nelson County.

**Norfolk.**—Lone Star Cement Corp. used calcareous marl and clay mined in Nansemond County in making cement at its South Norfolk plant. The wet process was used to manufacture general-use portland cement in three 219- by 7.3-foot kilns. The entire output was consumed in Virginia and North Carolina.

Reliance Fertilizer & Lime Corp., Norfolk, manufactured lime in a coal-fired pot kiln from oystershell purchased from J. H. Miles & Co., Inc., and Ballard Fish & Oyster Co., Inc., both of Norfolk. The lime was hydrated and sold for agricultural uses in Virginia and North Carolina.

Interstate Division of Commonwealth Sand and Gravel Corp. operated a dredge near Norfolk to recover sand for use as railroad ballast and for paving and building construction.

Domestic and imported gypsum was calcined by United States Gypsum Co. at a plant at Norfolk for plaster and other products. Crude gypsum imported from Nova Scotia was ground and prepared as a soil dressing by fertilizer plants in or near Norfolk.

Virginia Smelting Co., West Norfolk, produced zinc sulfate, a zinc pigment used in the manufacture of rayon, and for agricultural purposes, paint and varnish processing, in flotation reagents, glue manufacture, and medicinals.

**Nottaway.**—Granite was quarried and crushed for roadstone and concrete at the stationary plant of the Burkeville Stone Corp., Inc., Burkeville.

**Orange.**—Webster Brick Co., Inc., mined miscellaneous clay near Orange for use in making building brick.

**Patrick.**—A. C. Wilson Construction Co. mined and crushed granite for concrete aggregate and roadstone at its Patrick Springs quarry and plant.

**Pittsylvania.**—Granite was quarried for concrete aggregate and roadstone by Superior Stone Co., Division of American-Marietta Co. near Danville. The Public Works Department of the city of Danville prepared roadstone from granite mined by its own crew.

Sand was washed and screened in portable plants by Marshall Sand & Gravel Co. and Kendall Sand Works (both of Danville) for building, paving, and fill.

Digitized by Google

Lightweight aggregate was manufactured at a two-kiln plant near Leaksville Junction by Virginia Solite Corp. Raw material came from a miscellaneous clay deposit just over the State line in North Carolina.

**Powhatan.**—Virginia Stone & Construction Co. quarried and prepared granite for concrete aggregate and roadstone.

**Prince Edward.**—Kyanite was produced at the Baker Mountain mine and beneficiated at the Cullen flotation plant by the Kyanite Mining Corp. The prepared product was used in high-temperature refractories and special ceramic bodies.

**Prince George.**—With sand and gravel production higher in both tonnage and value than in 1959, Prince George County continued to rank fourth among sand and gravel producing counties in the State. Friend Sand & Gravel Co., Inc., produced material for building, paving, and filtration at its Whitehill plant. Southern Materials Co., Inc., discontinued operating its Bryan Rock & Sand Co. plant and expanded production of sand and gravel for building and paving at its Puddledock plant (started in 1959). Gravel for highway construction was produced by Hitch Gravel Corp. at its Powell's Creek plant.

Perlite was expanded by Virginia Perlite Corp., Hopewell, from Colorado raw materials. The expanded product was sold mostly for building plaster, although sizable quantities were used as concrete aggregate and as soil conditioner.

Allied Chemical Corp., Nitrogen Division, Hopewell, manufactured nitrogen compounds for use in fertilizer. The products included solid and solution ammonium nitrate, ammonium nitrate-limestone, urea solutions, and other nitrogen compounds.

**Princess Anne.**—Although output of sand was 35 percent less than in 1959, the county continued to lead in production of sand for industrial uses. Operating at and near Norfolk City were E. V. Williams Co., Inc., Tidewater Sand Co., Inc., and Little Creek Sand & Gravel Corp. These companies produced engine sand, sand for building, paving, fill, foundry uses, and filler for fertilizer. Near Oceana, J. C. Jones Sand Co., Inc., and R. H. Baillio Co., produced building, paving, and fill sand; traction sand for engines; sand for molding, filtration, grinding and polishing; and sand for fertilizer filler.

**Prince William.**—Gainesville Stone Quarry, Inc., Gainesville, mined and crushed diabase for concrete aggregate, roadstone, and railroad ballast.

Woodbridge Clay Products Co. operated two clay pits and mills near Manassas for building brick.

**Pulaski.**—Limestone was quarried in Pulaski County by Radford Limestone Co., Inc., Radford, processed at a stationary plant, and marketed as aggregate, roadstone, agstone, railroad ballast, and stone sand for concrete and mason's sand.

Limestone for concrete aggregate and roadstone was produced in portable plants by Montgomery Limestone Corp. at its New River quarry and Salem Stone Corp. at its Newburn quarry. The city of Radford produced crushed limestone for street maintenance.

Crude natural iron ore pigments were produced near Hiwassee by American Pigment Corp. Ocher, sienna, umber, and natural yellow iron oxide were mined and finished at a nearby plant. Manufactured

Digitized by Google

red and yellow oxide pigments were made by the same company at its Pulaski plant.

**Roanoke.**—Rockydale Quarries Corp., Rockydale, quarried and prepared limestone for concrete aggregate, roadstone, and agricultural stone. Old Virginia Brick Co., Inc., near Salem mined and processed shale for building brick.

**Rockbridge.**—Lone Jack Limestone Co., Inc., and Charles W. Barger and Son mined and prepared limestone for railroad ballast, roadstone, and concrete aggregate. W. G. Mathews, Jr., Inc., Natural Bridge Station, produced quartzite for manufacturing ferrosilicon.

Locher Silica Corp., Glasgow, produced sand for glass, building, and traction. Surface (miscellaneous) clay was mined by Locher Brick Co., Inc., near Glasgow for building brick.

**Rockingham.**—Limestone was mined and prepared for agricultural stone, concrete aggregate, and roadstone by C. S. Mundy Quarries, Inc., Broadway, and Fred K. Betts III, and R. Y. Frazier, Harrisonburg. Marble was crushed for terrazzo by Jamison Black Marble Co., Inc., at its marble quarry near Harrisonburg.

Zinc ore was mined and concentrated at the Bowers-Campbell mine and mill of the Tri-State Zinc, Inc., near Timberville and the flotation concentrate was shipped to the St. Joseph Lead Co. smelter at Josephtown, Pa. The mine and mill were active the entire year. The mine was worked by the room and pillar method from adit opening or haulageway. The mine is 2½ miles northwest of Timberville on State Highway 42.

A detailed discussion of the geology and mineral resources of Rockingham County was published as part of the continuing geological investigations of Virginia resources by the State Division of Mineral Resources.[6]

**Russell.**—Coal production declined 11 percent from 1959. Thirty-two active mines included three strip and four auger operations. Underground tonnage comprised 93 percent of the output. Equipment used underground included 41 handheld and postmounted drills and 11 rock drills; haulage facilities included 8 animals, 61 locomotives, 691 mine cars, and 22 shuttle cars. Leading coal producers were Clinchfield Coal Co., Stallard-Lawson Coal Co., Smith Coal Co., Hicks Coal Co., and Meadows Coal Co. Principal coal seams mined included the Tiller and the Upper and Lower Banner veins.

Clinch River Quarries, St. Paul, produced limestone which was sold for concrete aggregate and roadstone.

The Virginia Department of Highways mined limestone for highway construction at Camp No. 29.

Clinchfield Coal Corp., in its first year of lightweight aggregate production, expanded sizable quantities of shale obtained from the operation of the Moss No. 3 mine.

**Scott.**—Foote Mineral Co. produced limestone from its underground mine near Duffield for use as a reagent in the manufacture of lithium products at its refining plant at Sunbright. The lithium ore (spodumene) used in making lithium products was mined and concentrated at the company's Kings Mountain, N.C., quarry. Limestone was pro-

[6] Brent, William B., Geology and Mineral Resources of Rockingham County: Virginia Division of Miner. Res. Bull. 76, Charlottesville, Va., 1960, 174 pp.

Digitized by Google

duced at Speers Ferry by the Penn-Dixie Cement Corp., and shipped to its cement plant near Kingsport, Tenn. Natural Tunnel Stone Co. quarried and crushed limestone at Glenita for concrete aggregate and roadstone, and Blountville Construction Co. mined limestone at the Tri-State Lime Quarry near Blountville, Tenn., for concrete aggregate, roadstone, agstone, filler in fertilizer, and filter bed material.

Increased production of bituminous coal was reported from three underground mines (two in 1959).

**Shenandoah.**—Dominion Division of Chemstone Corp. (Strasburg) produced limestone mainly for lime and metallurgical flux, but smaller quantities were used for cement manufacture, asphalt filler, and other uses. The company's nearby lime plant, employing four gas-fired shaft kilns, produced quicklime and hydrated lime principally for chemical uses. These uses included metallurgical flux, paper bleach, sewerage treatment, tanning of leather, and water purification. Out-of-State shipments were principally to Pennsylvania and Ohio. Shenandoah Valley Lime and Stone Corp. mined high-calcium limestone for flux in blast furnaces and open-hearth plants and for cement manufacture. Toms Brook Lime & Stone Co., Inc., Toms Brook, mined and processed limestone for concrete aggregate, roadstone, and agstone at its stationary plant. Roadstone and concrete aggregate were produced at limestone quarries near Mt. Jackson and Timberville, by N. K. Kipps and C. S. Mundy Quarries, Inc., respectively.

**Smyth.**—Organic Chemical Division of Olin-Mathieson Chemical Corp. produced a large quantity of limestone at the Worthy mine near Saltville for manufacturing lime and for roadstone. The limestone was transported to the nearby plant of the Industrial Chemical Division of Olin-Mathieson Chemical Corp., by aerial tramway to supply the company lime plant which consisted of 3 rotary and 14 vertical coal and coke fired kilns. Brine pumped from salt wells and quicklime produced at the lime plant were used to manufacture chlorine, soda ash, and other chemicals.

Concrete aggregate and roadstone were produced from limestone quarries of E. P. Ellis and Holston River Quarry, Inc., both near Marion. Rockydale Hardrock Co. was inactive during the year. Building sand was produced by C. R. Snider & Sons and Sayers Sand Co., both near Marion.

**Spotsylvania.**—Railroad ballast, concrete aggregate, and roadstone were produced by Fredericksburg Stone Co. at its granite quarry near Fredericksburg. The entire output was sold to agencies of the State and Federal governments. Massaponax Sand & Gravel Corp. washed and screened building and paving sand and gravel at its stationary plant near Fredericksburg.

**Stafford.**—Jobe Newton and Diamond Construction Co. with plants near Fredericksburg produced sand and gravel for building, paving, and fill.

**Surrey.**—Friend Sand & Gravel Co. produced building and paving sand and gravel at a portable plant.

**Tazewell.**—Production of coal dropped 30 percent, although the number of active mines increased by one. Of total mines, 31 were underground, 2 were strip, and 4 were auger. Over 92 percent of the tonnage came from underground mines. Equipment used under-

Digitized by Google

ground included 46 handheld and postmounted drills, 25 rock drills, and 37 cutting machines. Haulage facilities included 18 animals, 57 locomotives, 131 mine cars, 53 shuttle cars, 17 rope hoists, and 4 main conveyors. Four diesel powered shovels were used in the strip mines. Auger-mine equipment included 4 augers, 1 diesel power shovel, 5 bulldozers, and 8 trucks. Principal producers were Pocahontas Fuel Co., Southeastern Mining Co., Wildcat Coal Co., Rebecca Coal Co., and Alfredton Coal Co. The chief seams mined were the Upper Seaboard, the Red Ash and the Jawbone.

Pounding Mill Quarry Corp. with operations at Bluefield and Pounding Mill mined, crushed, and prepared limestone principally for concrete aggregate and roadstone. Other uses included railroad ballast, dust for coal mines, and stone sand. About two-thirds of the output was shipped by truck, and one-third, by railroad.

Peery Lime Co., Inc., North Tazewell, and Blue Grass Lime Co., Maxwell, mined limestone to supply their nearby lime plants. Both companies used coal-fired pot kilns and produced hydrated lime for mason's and agricultural lime. Output was used locally and shipped to West Virginia, Tennessee, South Carolina, and North Carolina.

Miscellaneous clay and shale was produced by General Shale Products Corp. near Richland at an open-pit mine for the manufacture of heavy clay products.

**Warren.**—Riverton Lime & Stone Co., Division of Chadbourn Gotham, Inc., mined shaley limestone to supply its nearby masonry cement plant. The principal consuming areas were Virginia, North Carolina, and the District of Columbia. Limestone mined by Skyline Crushed Stone Co. and Riverton Lime & Stone Co. Quarry No. 5 was sold for concrete aggregate, roadstone, agstone, and stone sand.

**Washington.**—Lambert Bros., Inc., Division of Vulcan Materials Co., with quarries at Abingdon and Bristol, and Meadowview Lime Co., Meadowview, quarried and prepared limestone for building and highway construction and for agstone.

United States Gypsum Co. produced the only gypsum mined in the State, at Plasterco. This firm also produced and sold plasterboard and other gypsum products.

**Westmoreland.**—Sand and gravel for building, paving, and fill was produced by Potomac Sand & Gravel Co. in its stationary plant at Kinsale and by Brown Construction Co. near Colonial Beach.

**Wise.**—Output of bituminous coal dropped 14 percent but the county retained its rank as the third largest coal-producing county. There were 232 active mines, of which 195 were deep mines, 26 were strip mines, and 11 were auger mines. Over three-fourths of the tonnage came from deep mines, and nearly one-fifth came from strip operations. Wise County again ranked first in production of strip mine coal, although output declined to 1 million tons compared with 1.3 million tons in 1959. Underground equipment included 227 handheld and postmounted drills, 35 rock drills, and 168 cutting machines. Haulage facilities included 126 animals, 165 locomotives, 818 mine-cars, 48 shuttle cars, 6 rope hoists, and 40 main conveyors. Strip mine equipment comprised 11 diesel electric power shovels, 49 power shovels, 4 carryall scrapers, 35 bulldozers, 11 horizontal and 6 vertical power drills, and 67 trucks. Auger mine equipment included 9

Digitized by Google

augers, 8 bulldozers, 2 power drills, and 7 trucks. The chief producers were Stonega Coke & Coal Co., Coal Processing Corp., Wise Coal & Coke Co., Sunrise Coal Co., Inc., and Mudlick Coal Co. The principal seams mined were the Taggart, the Imboden, the High Splint, the Norton, and the Blair veins.

Beehive coke was produced by five companies—Christie Coal & Coke Co., Hawthorne Coke & Mining Co., Stonega Coke & Coal Co., Norton Coal Co., and Wise Coal & Coke Co. No slot-type ovens were in operation, and no byproducts were recovered.

The Clinchfield Coal Co. completed one natural gas well into the Big Lime formation.

Limestone was mined for concrete aggregate and roadstone by Southwest Quarries, Inc., near Big Stone Gap. Shipments of finished stone were 90 percent by truck, and 10 percent by railroad.

A detailed description of the occurrence and appearance of strontium minerals in the county was reported. Other localities in Virginia where these minerals have been found also were mentioned.[1]

**Wythe.**—Recoverable lead and zinc were produced at the Austinville mill of the New Jersey Zinc Co., Bertha Minerals Division. This mill handled the output of both the Ivanhoe and Austinville mines. Ore from the Ivanhoe mine was hauled through a 2½-mile tunnel under the New River to the Austinville concentrating mill with 10-ton diesel locomotives and 80-cubic-foot mine cars. The ore was mined by the room and pillar method. Mine openings were vertical shafts. The Austinville mine worked at full capacity for the first 8 months of the year. Operations were then interrupted by a 113-day strike (August 6 through November 30). The labor contracts negotiated expire July 27, 1963, with the right to open discussions, for a wage change only, on March 27, 1962. Concentrate was treated at smelters at Palmerton, Pa., East Chicago, Ind., Omaha, Nebr., and Carteret, N.J. Because of the closing of the American Smelting & Refining Co. smelter at Federal, Ill., where silver had been obtained from smelting lead concentrate, no byproduct silver was reported during 1960. Another byproduct of the lead and zinc ores at Austinville and Ivanhoe was the limestone county rock which was sold chiefly for agricultural purposes, including fertilizer filler.

Limestone for concrete aggregate and roadstone was produced near Austinville and Wytheville by H. D. Crowder & Sons, Virginia Stone & Construction Corp. and Pendleton Construction Corp. The Town of Wytheville also mined and prepared limestone for road building and maintenance. Newman Brothers, Sylvatus, mined and crushed sandstone for concrete aggregate and roadstone. Silica Products Co. produced building sand at its Max Meadows plant.

# The Mineral Industry of Washington

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Washington Division of Mines and Geology.**

By Frank B. Fulkerson,[1] William N. Hale,[1] and A. J. Kauffman, Jr.[2]

MINERAL production in Washington totaled $70 million in 1960, a record for the State. This value was 4 percent greater than the previous high of $67.3 million in 1955 and 10 percent greater than the 1959 total of $63.9 million. Half the gain over 1959 was attributed to metal mining and half to nonmetal extraction. In the value of metal output larger yields of gold, silver, uranium, and zinc more than offset lower production of lead. Among the nonmetals, sand and gravel and stone production and cement shipments increased in volume. Higher prices and unit values for some minerals and metals were offset by declines for other commodities, and the increase in total value was due entirely to greater quantities produced. The index of the quantity of production was 110 (1959 = 100), which represented the same 10-percent gain over 1959 as in the value of production. The index was an average of the percentage changes from 1959 to 1960 in the quantities of the commodities produced, weighted by their 1960 values.

Five mines supplied nearly the entire metal production. These were Knob Hill (gold-silver, Ferry County), Gold King (gold-silver, Chelan County), Pend Oreille and Grandview (both lead-zinc, Pend Oreille County), and Midnite (uranium, Stevens County).

Production of primary aluminum increased from 333,615 to 346,126 tons. The 1960 figure was 72 percent of the rated capacity of the Washington primary aluminum industry. The long-term outlook for this industry in the State was good owing to greater availability of power and expected market expansion. Production has been curtailed since 1957.

**Trends and Developments.**—The Industrial Raw Materials Advisory Committee to the State Department of Commerce and Economic Development recommended a 10-year program of mapping to assist in developing and using the mineral resources of Washington. It was estimated that only 25 percent of the State had been covered by adequate topographic maps, and that less than 10 percent was covered by adequate geologic maps. The committee reported that many raw materials, known to occur in Washington, were being purchased elsewhere.

New power for industrial users became available from the Bonneville Power Administration (BPA) in 1960 because new projects were completed by Federal and non-Federal agencies in the Pacific Northwest. Another favorable power development was the agreement reached by delegations appointed by the Governments of Canada and the United States on basic terms for cooperative development of the water resources of the Columbia River Basin. The agreement, which was to be incorporated into a treaty early in 1961, if implemented by construction would provide 15.5 million acre feet of controlled storage at Arrow Lake, Duncan Lake, and Mica Creek, British Columbia. The storage would be usable for increased hydroelectric power generation downstream as well as in providing substantial benefits for flood control, irrigation, navigation, and pollution abatement.

The Atomic Energy Commission (AEC) was studying the possibility of converting the new plutonium reactor under construction at the Hanford atomic works at Richland to a dual-purpose reactor for producing electricity to aid in the development of the Pacific Northwest. The conversion, estimated to cost $100 million, would require Congressional approval. The reactor, rated at 700,000 kw., would be the largest nuclear powerplant in the world.

A bibliography of Washington mineral resources was published.[3]

**Consumption, Trade, and Markets.**—Slower business conditions led to slackened production of some commodities by yearend.

Although building activity in the State dropped sharply (building permits decreased 21 percent in value) because of less residential construction, the overall annual trend in the construction industry was about the same as in 1959. Employment and weekly hours of construction workers increased slightly, and cement shipments to and within Washington declined slightly. Value of contracts awarded by the State highway commission increased more than one-third, and value of highway work put in place during the year was the same as in 1959. Heavy-engineering awards declined sharply compared with 1959 because of decreases in several categories including military, electric power, and nuclear energy projects. A number of exceptionally large contract awards had been made in 1959, and as a result heavy-engineering construction in the State increased in 1960.

[1] Some of the 1960 figures are preliminary.

Sources: Survey of Current Business, Construction Review, Pacific Builder and Engineer, Washington State Highway Commission, The Farm Income Situation, Washington Labor Market, Employment and Payrolls in Washington State, Labor Force and Employment in Washington State, and Bureau of Mines.

The increase in personal income in Washington in 1960 was equal to the national gain. Annual average unemployment increased 12 percent in 1960 as the result of curtailed employment in the aircraft and lumber and wood products industries. Employment was maintained in food processing, the third largest manufacturing industry. Employment declined 4 percent in all manufacturing industries, but payrolls remained the same as in 1959.

**Employment and Injuries.**—Average annual employment in the mining industry increased slightly. In most other mineral industries, employment was below 1959, according to the Washington Employment Security Department. As the result of dwindling employment in the last quarter, the number of workers in the primary aluminum industry averaged 5,900 for the year, compared with 6,600 in 1959 and 9,800 in 1956, when peak activity in this industry was reached.

The injury statistics in table 4 were compiled from reports to the Bureau of Mines from the mining companies in the State.

# REVIEW BY MINERAL COMMODITIES

## NONMETALS

**Abrasive Materials.**—Manufacturers Mineral Co., Chewelah, Stevens County, produced grinding pebbles for use at its Seattle plant. Output was less than in 1959.

**Barite.**—Production of barite more than doubled, compared with 1959. Two companies—D & P Lewis Mining Co. (formerly Chewelah Minerals Co.) and Natural Stone Co.—supplied the output. Work at the Lynx Cats deposit (D & P Lewis) on Eagle Mountain near Chewelah was resumed in September after having been idle since 1958.

**Cement.**—Combined output of portland and masonry cement was 7 percent lower than in 1959; shipments were 1 percent higher. The industry, comprised of six plants owned by four companies, operated at about 66 percent of capacity (67 percent in 1959); yearend stocks decreased considerably. Within-State-shipment terminations increased to 88 percent, compared with 83 percent in 1959; the remainder went to other Pacific Northwest States and Alaska.

Construction of a cement-distribution terminal at Vancouver by Ideal Cement Co. continued. Three storage silos having a capacity of 100,000 barrels were completed about midyear. Field studies were continued by the company on limestone deposits 30 miles up the Snake River from Clarkston, Asotin County; location of the site and interest in building a cement-producing facility were announced in 1959.

Combined production from nine cement plants in Washington and Oregon was 8,244,300 barrels (376 pounds each); the same plants shipped 8,319,400 barrels during the year. Average value of portland cement shipped by producers in Washington and Oregon was $3.52 per barrel, f.o.b. plant, compared with $3.50 in 1959.

**Clays.**—Clays sold or used by producers decreased 5 percent, largely because of reduced output of miscellaneous clay for heavy clay products (building brick and draintile); smaller output of fire clay used in making refractory products (firebrick and block) also contributed to the decline.

Fire clay was mined at five operations in Spokane and King Counties; 13 pits in 8 counties yielded miscellaneous clay; and King, Spokane, and Whatcom Counties were the source of clay used in manufacturing cement. A small quantity of bentonite was dug in Yakima County for lining irrigation canals.

**Diatomite.**—Quantity and value of diatomite production increased 10 percent and 2 percent, respectively, over 1959. Kenite Corp., Quincy, Grant County, mined and prepared diatomite for filler, insulation, and miscellaneous purposes.

**Gypsum.**—Agro Minerals, Inc., mined gypsite (a mixture of gypsum, quartz, and clay) from its Poison Lake deposit near Tonasket, Okanogan County. Output was marketed for agricultural uses.

In Seattle, Kaiser Gypsum Co., Inc., processed raw material from Baja California, Mexico, for gypsum building products. Gypsum

Digitized by Google

imported from British Columbia was marketed by a Spokane firm for agricultural purposes.

**Magnesian Minerals.**—Lessened demand for refractory magnesia by the steel industry resulted in a 25-percent decrease in tonnage and value of crude magnesite mined by Northwest Magnesite Co.

Production of olivine, principally for use as foundry sand, continued to increase and was 42 percent higher than in 1959. Northwest Olivine Co. mined olivine at the Twin Sisters quarry, Skagit County, and processed the material at its Hamilton plant.

**Pumice.**—Grimes Co. marketed pumicite from its Sunnyside quarry, Yakima County, for use as a pozzolan material. Output increased substantially over that of 1959.

**Sand and Gravel.**—Production of sand and gravel increased from 21.4 million tons ($18.6 million) in 1959 to 25.3 million tons ($19 million). Demand for use in highway construction and maintenance continued strong.

Sand and gravel was produced in 36 of the 39 counties in the State. The output of each of five counties was valued at over $1 million—Walla Walla, Pierce, Snohomish, King, and Franklin. Distribution by use was road building and maintenance, 30 percent; construction, 26 percent; and miscellaneous, 44 percent. Included under miscellaneous for 1960 was a large quantity of fill material used at dam-construction projects.

**TABLE 5.—Sand and gravel sold or used by producers, by classes of operations and uses**

(Thousand short tons and thousand dollars)

| Class of operation and use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Commercial operations: | | | | |
| Building | 5,366 | $5,725 | 4,765 | $4,854 |
| Road material | 4,267 | 4,076 | 3,584 | 3,360 |
| Railroad ballast | (1) | (1) | 359 | 214 |
| Other [2] | 1,693 | 1,368 | 2,039 | 1,393 |
| Total | 11,325 | 11,170 | 10,748 | 9,821 |
| Government-and-contractor operations: | | | | |
| Building | 975 | 894 | 1,781 | 2,251 |
| Road material | 5,953 | 3,973 | 4,026 | 3,284 |
| Other [2] | 3,106 | 2,539 | 8,742 | 3,623 |
| Total | 10,034 | 7,406 | 14,549 | 9,158 |
| All operations: | | | | |
| Building | 6,340 | 6,619 | 6,546 | 7,105 |
| Road material | 10,220 | 8,049 | 7,610 | 6,644 |
| Railroad ballast | (1) | (1) | 359 | 214 |
| Other [2] | 4,799 | 3,908 | 10,780 | 5,016 |
| Total [3] | 21,360 | 18,576 | 25,297 | 18,979 |

[1] Included with "Other" to avoid disclosing individual company confidential data.
[2] Mainly fill material used at dam-construction projects; also includes special sands for construction and industrial uses and sand and gravel used for miscellaneous unspecified purposes, including items indicated by footnote 1.
[3] Owing to rounding, individual items may not add to totals shown.

Digitized by Google

**Stone.**—The quantity of stone quarried totaled 13.9 million tons valued at $15.8 million, compared with 12.3 million tons valued at $13.6 million in 1959. Consumption by the U.S. Army Corps of Engineers (Walla Walla district) furnished a large part of the increase. Stone was quarried in 34 of the 39 counties. Walla Walla County led in stone output, followed by Klickitat and Douglas Counties; Walla Walla and Klickitat Counties each had production valued at more than $1 million.

R. H. Sussex developed a silica deposit along the Loup Loup Pass highway, 14 miles from Okanogan. Lane Mountain Silica Co. began constructing a 400-ton-a-day silica-processing plant near Valley, Stevens County. The mill was to upgrade silica (weathered quartzite) from a deposit on Lane Mountain, 10 miles distant, to a high-grade sand suitable for use by the glass industry in the Pacific Northwest.

Basalt, greatest in tonnage output, was used for concrete aggregate, roadstone, riprap, and ballast. Walla Walla and Klickitat Counties had the largest output.

Limestone production from Chelan, Pend Oreille, Skagit, Stevens, and Whatcom Counties was used in manufacturing cement. Crushed limestone for agricultural purposes came from Snohomish County, and limestone from Stevens County was used at paper mills and metallurgical plants. Dimension marble and marble crushed for roofing granules and terrazzo chips and for agricultural uses were marketed from Stevens County quarries.

**TABLE 6.—Stone sold or used by producers, by uses**

(Thousand short tons and thousand dollars)

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Dimension stone (building) | (1) | (1) | 7 | $265 |
| Concrete and roadstone | 8,458 | $8,600 | 6,534 | 6,743 |
| Riprap | 2,408 | 1,930 | 1,229 | 2,003 |
| Railroad ballast | (1) | (1) | (1) | (1) |
| Other [2] | 1,412 | 3,056 | 5,828 | 6,786 |
| Total [3] | 12,278 | 13,587 | 13,897 | 15,796 |

[1] Included with "Other" to avoid disclosing individual company confidential data.
[2] Used as cement, paper, metallurgical, and chemical plants; sugar refineries; and for miscellaneous unspecified purposes in addition to items listed by footnote 1.
[3] Owing to rounding, individual items may not add to total shown.

Dimension granite was quarried in Grant, Kitsap, Spokane, Whatcom, and Yakima Counties. Crushed granite quarried in Chelan, Douglas, Ferry, King, Kitsap, Okanogan, and Snohomish Counties was used mainly as roadstone; other uses included roofing rock, riprap, and poultry grit.

Sandstone was quarried for facings and flagging (Ferry and Kittitas Counties), as rough blocks (Pierce County), for use in manufacturing cement (Pend Oreille County), and for making ferroalloys (Spokane County).

Digitized by Google

**Talc and Soapstone.**—Tonnage and value of soapstone output were about half the 1959 totals. Soapstone mining was limited to Skagit County where three operators near Marblemount produced the raw material for processing at two grinding plants. Some of the output was shipped to Oregon for grinding. The chief use for the ground soapstone was as a carrier for insecticides; a small quantity was sold for paint filler.

**Vermiculite (Exfoliated).**—An increased tonnage of Montana vermiculite was expanded at the Spokane plant of Vermiculite Northwest, Inc. The product was marketed principally for use in insulation and lightweight-plaster and concrete aggregate.

## METALS

**Aluminum.**—Primary aluminum output totaled 346,126 short tons valued at $181.1 million, an increase of 4 percent in tonnage and 10 percent in value over 1959. Aluminum output, largely because of slackened markets and increased competition from new plants in the Midwest and East, was 28 percent (136,900 tons) short of the total State primary capacity (483,000 tons).

**TABLE 7.—Primary aluminum plant capacity and production data**

| Year | Rated primary capacity, short tons | Primary production | | | Average U.S. ingot price per pound, cents |
|---|---|---|---|---|---|
| | | Short tons | Percent of national total | Value (thousands) | |
| 1951–55 (average) | 389,000 | 368,475 | 31 | $146,757 | 21.0 |
| 1956 | 481,000 | 486,204 | 29 | 233,632 | 26.0 |
| 1957 | 483,000 | 445,709 | 27 | 227,383 | 27.5 |
| 1958 | 483,000 | 311,417 | 20 | 156,376 | 26.9 |
| 1959 | 483,000 | 333,615 | 17 | 165,423 | 26.9 |
| 1960 | 483,000 | 346,126 | 17 | 181,138 | [1] 26.0 |

[1] Price of pig now applied to ingot. The use of the term "pig" was discontinued in August 1960.

Higher purity end products and exports of primary metal and semifabricated products to western Europe were becoming more important to State producers. Additional refining cells for producing superpurity aluminum were in operation at the Mead plant of Kaiser Aluminum & Chemical Corp. at Spokane. The Mead plant became one of the leading producers of superpurity aluminum in the world. New products were aluminum shot for deoxidizing steel and impact extrusion slugs for manufacturing seamless cans. The Kaiser company Trentwood rolling mill began producing sheet for food cans, using new equipment that cost $3 million.

Further expansion of facilities to produce higher purity products was considered by some of the aluminum companies. Reynolds Metals Co. planned to expand the Longview aluminum reduction plant to produce extrusion ingot, improved ingot products, and bar stock for making aluminum conductor wire. The estimated $600,000 expansion included a new building, three holding furnaces, a horizontal

Digitized by Google

casting machine, sawing equipment, and homogenizing furnaces. Aluminum Company of America (Alcoa) decided to increase manufacturing facilities in the ingot-casting department of the Vancouver plant; $250,000 was to be spent to construct a building and install a preheat furnace for extrusion ingot.

**Bauxite.**—The Washington Division of Mines and Geology mapped bauxite deposits in Cowlitz and Wahkiakum Counties during the year.

**Copper.**—Copper output was 78 tons, an increase of 59 percent over 1959. Of the total, 53 percent came from lead-zinc ores of Pend Oreille Mines & Metals Co. (Pend Oreille mine) and American Zinc, Lead & Smelting Co. (Grandview and Mineral Rights mines)—all in Pend Oreille County. Operations directed principally to recovering lead and zinc had been the main source of copper since closure of the Holden mine, Chelan County, in 1957.

Kromona Consolidated Mines, Inc., produced 40 percent of the State total from the Kromona mine, Snohomish County, where ore was valued chiefly for its copper content. Small quantities of copper concentrate were shipped to the Tacoma smelter by Paymaster Mines, Inc. (Paymaster mine), Okanogan County; Amco Mining Co. (Wayside mine), Snohomish County; Bonanza Mines, Stevens County; and Machinery Center, Inc. (Holden mine cleanup operations), Chelan County.

**Ferroalloys.**—Keokuk Electro-Metals Co., Wenatchee, produced silicon metal and ferrosilicon in four electric furnaces (three silicon, one ferrosilicon) until July 1; output was curtailed during the remainder of the year owing to depressed markets.

Pacific Northwest Alloys, Inc., reactivated the second of its four furnaces early in the year at the Mead ferrochromium plant.

**Gold.**—Gold output increased 9 percent over 1959. Lovitt Mining Co., Chelan County (Gold King mine), and Knob Hill Mines, Inc., Ferry County (Knob Hill and Gold Dollar mines) were the principal producers. Four other companies were active gold producers; Machinery Center, Inc., Salt Lake City, Utah, recovered the metal from cleanup operations at the Holden mine, Chelan County.

**Iron Ore.**—No iron ore was produced in 1960. Results of a magnetometer and scintillometer survey, made by Hunting Geophysical Services, Inc., in 1959, were published.[4] This report, including 25 maps, covered parts of northeastern Okanogan County and northwestern Ferry County.

**Lead.**—A lengthy strike at The Bunker Hill Co. lead smelter, Kellogg, Idaho, and a higher price for zinc (companies focused attention on zinc production) contributed to a decline in lead production. Lead output decreased 25 percent from the 10,310 tons produced in 1959; however, total value of lead production dropped 24 percent, indicating a slightly higher 1960 weighted average price for lead ($0.117 a pound compared with $0.115 a pound for 1959).

**TABLE 8.—Mine production of gold, silver, copper, lead, and zinc, in terms of recoverable metals [1]**

| Year | Mines producing | | Material sold or treated [2] (thousand short tons) | Gold (lode and placer) | | Silver (lode and placer) | |
|---|---|---|---|---|---|---|---|
| | Lode | Placer | | Troy ounces | Value (thousands) | Troy ounces (thousands) | Value (thousands) |
| 1951–55 (average) | 26 | 2 | 1,536 | 65,168 | $2,281 | 344 | $312 |
| 1956 | 34 | 1 | 1,697 | 70,669 | 2,473 | 448 | 406 |
| 1957 | 19 | 1 | 1,495 | [3] | [3] | [3] | [3] |
| 1958 | 14 | 3 | 975 | [3] | [3] | [3] | [3] |
| 1959 | 15 | 1 | 958 | [3] | [3] | [3] | [3] |
| 1960 [4] | 17 | ---- | 1,070 | [3] | [3] | [3] | [3] |
| 1860–1960 | ---- | ---- | [5] | [6] 2,844,331 | [6] 78,307 | [6] 16,391 | [6] 12,333 |

| Year | Copper | | Lead | | Zinc | | Total value (thousands) |
|---|---|---|---|---|---|---|---|
| | Short tons | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) | |
| 1951–1955 (average) | 3,956 | $2,267 | 10,218 | $3,051 | 24,583 | $6,584 | $14,494 |
| 1956 | 2,926 | 2,487 | 11,657 | 3,660 | 25,609 | 7,017 | 16,044 |
| 1957 | 1,700 | 1,023 | 12,734 | 3,642 | 24,000 | 5,568 | 13,766 |
| 1958 | 52 | 27 | 9,020 | 2,111 | 18,797 | 3,835 | 10,469 |
| 1959 | 49 | 30 | 20,310 | 2,371 | 17,111 | 3,936 | 10,986 |
| 1960 [4] | 78 | 50 | 7,725 | 1,808 | 21,317 | 5,500 | 12,388 |
| 1860–1960 | 122,000 | 43,233 | 208,000 | 47,912 | 420,000 | 94,722 | 294,216 |

[1] Includes recoverable metal content of gravel washed (placer operations), ore milled, and ore shipped to smelters during calender year indicated. Owing to rounding, individual items may not add to totals shown.
[2] Does not include gravel washed.
[3] Figure withheld to avoid disclosing individual company confidential data.
[4] No placer operations in 1960.
[5] 1860–1903—data not available; 1904–60—30,339,091 short tons.
[6] Excludes 1957–60.

**TABLE 9.—Mine production of gold, silver, copper, lead, and zinc in 1960, by classes of ore or other source material, in terms of recoverable metals**

| Source | Number of mines | Material sold or treated (short tons) | Gold (troy ounces) | Silver (troy ounces) | Copper (pounds) | Lead (pounds) | Zinc (pounds) |
|---|---|---|---|---|---|---|---|
| Lode ore: | | | | | | | |
| Dry gold | 6 | 108,214 | [1] | [1] | 8,000 | ---- | ---- |
| Dry gold-silver and dry silver [2] | 3 | 100 | [1] | [1] | 2,000 | ---- | ---- |
| Copper | 5 | 1,933 | [1] | [1] | 64,000 | ---- | ---- |
| Lead-zinc | 3 | 959,822 | [1] | [1] | 82,000 | 15,450,000 | 42,634,000 |
| Total | 17 | 1,070,069 | [1] | [1] | 156,000 | 15,450,000 | 42,634,000 |

[1] Figures withheld to avoid disclosing individual company confidential data.
[2] Combined to avoid disclosing individual company confidential data.

Three mines in Pend Oreille County (American Zinc, Lead & Smelting Co., Grandview and Mineral Right mines; and Pend Oreille Mines & Metals Co., Pend Oreille mine) yielded the entire production.

**Manganese.**—Sixty-seven manganese deposits in Clallam, Jefferson, Mason, and Grays Harbor Counties were described in a publication.[5]

[5] Magill, E. A., Manganese Deposits of the Olympic Peninsula: Bureau of Mines Rept. of Investigations 5530, 1960, 82 pp.

Digitized by Google

**Nickel.**—No nickel was produced in 1960. The Jumbo Mountain nickel deposit, Snohomish County, was the subject of a report.[6]

**Silver.**—Silver production increased 3 percent over 1959. As in 1959, Knob Hill Mines, Inc. (Knob Hill and Gold Dollar mines, Ferry County), was the leading source of silver. Six gold producers supplied 96 percent of the total silver output. Silver was recovered at the average ratio of 4.7 ounces per ounce of recoverable gold.

Three lead-zinc operations furnished 3 percent of the silver output; silver was recovered at the average ratio of 2.7 ounces per ton of lead produced, compared with a 3.6:1 ratio in 1959.

Two silver and five copper producers supplied about 1 percent of the State total; ore from the silver mines averaged 76.6 ounces a ton, and silver from copper mines was recovered at the average ratio of 24 ounces per ton of recoverable copper.

**Steel.**—Bethlehem Steel Co., Pacific Coast Division, installed a new Universal platemill, which was capable of rolling plate up to 30 inches wide, 3 inches thick, and 70 feet long.

The company expanded the industrial fastener plant at Seattle: new equipment included a ¾-inch cold boltmaker for production of 6-inch long, ⅝-, ¾-, and ⅞-inch diameter bolts and 1-inch diameter rivets. Also planned was installation of a new Universal cold header for forming ½- and ⅝-inch diameter bolts and ½-, ⅝-, and ¾-inch diameter rivets all up to 6 inches in length.

**Uranium.**—According to the Newmont Mining Corp. annual report, Dawn Mining Co. (controlling interest—51 percent Newmont Mining Corp. and 49 percent Midnite Mines, Inc.) milled 170,142 tons of uranium ore in 1960, compared with 160,000 tons in 1959. Dawn Mining Co. purchased the Silver Buckle Mining Co. Peters uranium lease for $1 million in June. Isbell Construction Co., Reno, Nev., contractor for open-pit mining operations at the Dawn company Midnite mine, also began mining the Peters lease.

The Dawn company uranium-ore-purchasing contract with the AEC was made effective until December 31, 1966; it provided only for purchase of concentrates produced from uranium ores that were developed before November 24, 1958. Twenty-five Pacific Northwest operators met the September 30, 1959, deadline for submitting ore reserve data to the AEC and became eligible to sell ore to the Dawn company for processing at the Ford mill under the new contract. Twenty-five percent of the Dawn company mill capacity was allocated for handling custom ore.

**Zinc.**—The rise in zinc output, 25 percent above that in 1959, was attributed to the emphasis placed on zinc recovery as the result of a price increase; the yearly weighted average price of zinc was $0.129 a pound compared with $0.115 a pound in 1959. Increased price and higher production boosted the value of output 40 percent above that of 1959.

Digitized by Google

Zinc concentrate, usually shipped to The Bunker Hill Co. electrolytic plant at Kellogg, Idaho, was moved to The Anaconda Company zinc facility (Anaconda, Mont.) during the 7-month strike at Bunker Hill. Three mines in the Metaline district—the Pend Oreille, Grandview, and Mineral Right—yielded lead-zinc ore.

## MINERAL FUELS

**Carbon Dioxide.**—There was a 9-percent increase in the quantity of carbon dioxide recovered from mineral waters in Klickitat County by Gas-Ice Corp. The gas was converted to dry ice by the company. Another plant was maintained by the same concern at Finley, Benton County, for making carbon dioxide from an ammonia-plant waste product. Dry ice and liquid and gaseous carbon dioxide were marketed.

**Coal.**—Nine underground and two strip-mine operations contributed to the 228,000-ton coal output, about 14,000 tons less than 1959. Stoker Coal Mining Co. operated the Tono No. 4 (Thurston County) under lease but was not active at the Stoker Nos. 2 and 3 in Lewis County.

Two announcements by midyear indicated the possibility of a brighter picture for coal mining in the State—Japanese interests reported favorably on coking coal from Pierce County for use by the steel industry in Japan, and the Hanford atomic works contracted for a minimum of 50,000 tons of bituminous coal from Washington producers. Negotiations were reopened during the year between interested parties relative to a coal-fired steamplant for generating electrical energy at Lake Cle Elum in Kittitas County. The county public utility district has had an option to buy the Roslyn operations of Northern Pacific Railway Co. Coal Department.

A mechanical planer, designed by Bureau of Mines engineers at Spokane for use in underground phosphate mines of the Western States, was tested at the Northern Pacific Railway Co. Coal Department No. 9 mine at Roslyn. The planer worked well in a steeply dipping coalbed, yielding a ton of coal per minute of working time from a 35-foot test face. The planer as used in phosphate mining was described in a Bureau of Mines report.[7]

**Peat.**—Production of peat was 27,800 tons, 5,100 tons less than 1959. King County led in peat production, followed by Snohomish, Kitsap, and Thurston.

**Petroleum and Natural Gas.**—Recovery of crude oil from Sunshine Mining Co. Medina No. 1, Ocean City, Grays Harbor County, was the same as in 1959.

Sunshine Mining Co. and Cascade Natural Gas Co. jointly drilled the Oscar No. 1 and Oscar No. 1–A, a southeast extension of the Ocean

[7] Service, A. L., and Howard, T. E., Design and Test Operation of a Pneumatic Vibrating-Blade Planer. A Progress Report on Phosphate-Mining Research, 1956–57: Bureau of Mines Rept. of Investigations 5437, 1959, 22 pp.

Digitized by Google

City discovery, as well as the Rayonier No. 1 and Rayonier No. 1–A, 12 miles north of Ocean City at Aloha. According to the companies, electrical logs of the Rayonier well, which was bottomed at 6,500 feet, indicated the presence of several producing horizons down to a depth of 4,700 feet. The production casing was set to 4,731 feet and a flow rate of 120 barrels a day was reported from a short production test.

TABLE 10.—Test holes drilled for oil and gas in 1960

| Company | Well | Total depth | County |
|---|---|---|---|
| Sunshine Mining Co., Cascade Natural Gas Co., and others | Rayonier No. 1 | 1,220 | Grays Harbor. |
| Do | Rayonier No. 1A | 6,500 | Do. |
| Do | Oscar No. 1 | 5,280 | Do. |

Source: Washington Division of Mines and Geology.

It was announced that Sunshine, through Summit Pipeline Co., a wholly-owned subsidiary, would pipe natural gas to Ocean City and Copalis Beach from the Sampson-Johns No. 1 near Oyehut.

## REVIEW BY COUNTIES

**Chelan.**—Limestone from the Soda Springs quarry near Leavenworth was shipped to the Grotto plant (King County) of Ideal Cement Co.

**Clark.**—Miscellaneous clay was used for making heavy clay products by Hidden Brick Co. and Ridgefield Brick & Tile Co.

A $250,000 expansion of the ingot-casting department of the Alcoa Vancouver aluminum plant was expected to be completed by the fall of 1961. The new facilities would permit production of higher quality ingots for use in making extruded shapes.

In August, over 1,500 tons of aluminum ingot produced at the Alcoa Vancouver plant was shipped to western Europe. The shipment, the largest aluminum cargo ever loaded at the Port of Vancouver, consisted of extrusion ingot and smaller ingot shapes to be used as a metallurgical additive and for general foundry purposes at West German steel plants.

**Cowlitz.**—Reynolds Metals Co. produced aluminum metal at its Longview reduction plant; a $600,000 plant expansion was planned.

**Douglas.**—Silicon metal and ferrosilicon were produced in electric furnaces at the Keokuk Electro-Metals Co. plant near Wenatchee.

**TABLE 11.—Value of mineral production in Washington, by counties[1]**
(Thousand dollars)

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Adams | $1,239 | $396 | Stone, sand and gravel. |
| Asotin | (2) | (2) | Sand and gravel. |
| Benton | 256 | 125 | Sand and gravel, stone. |
| Chelan | 1,749 | (2) | Gold, stone, sand and gravel, silver, copper. |
| Clallam | 109 | 88 | Sand and gravel. |
| Clark | 890 | 608 | Sand and gravel, stone, clays. |
| Cowlitz | 420 | 371 | Sand and gravel, stone. |
| Douglas | 685 | 849 | Stone, sand and gravel. |
| Ferry | (2) | (2) | Gold, silver, sand and gravel, stone. |
| Franklin | 1,131 | 1,838 | Sand and gravel, stone. |
| Garfield | 52 | 51 | Stone. |
| Grant | 1,682 | 891 | Diatomite, sand and gravel, stone. |
| Grays Harbor | 288 | 350 | Sand and gravel, stone, petroleum. |
| Island | 236 | 220 | Sand and gravel, stone. |
| Jefferson | 318 | 457 | Stone, sand and gravel. |
| King | 10,000 | 7,558 | Cement, sand and gravel, stone, coal, clays, peat, silver. |
| Kitsap | 232 | 282 | Sand and gravel, stone, peat. |
| Kittitas | 1,214 | 1,071 | Coal, sand and gravel, stone, gold, silver. |
| Klickitat | 1,692 | 2,828 | Stone, sand and gravel, carbon dioxide. |
| Lewis | 668 | 654 | Sand and gravel, stone, coal, clays. |
| Lincoln | 230 | 484 | Stone, sand and gravel. |
| Mason | (2) | (2) | Sand and gravel, stone. |
| Okanogan | 506 | 238 | Sand and gravel, gypsum, stone, silver, copper, gold. |
| Pacific | 204 | 171 | Stone, sand and gravel. |
| Pend Oreille | (2) | 10,194 | Zinc, cement, lead, stone, sand and gravel, copper silver, uranium. |
| Pierce | 3,012 | 3,290 | Sand and gravel, stone, clays. |
| San Juan | 120 | 156 | Sand and gravel. |
| Skagit | 3,539 | 3,053 | Cement, stone, sand and gravel, olivine, talc and soapstone. |
| Skamania | 703 | 188 | Stone, sand and gravel. |
| Snohomish | 1,828 | 1,938 | Sand and gravel, stone, peat, clays, copper, gold, silver. |
| Spokane | 4,980 | 3,872 | Cement, sand and gravel, stone, clays, uranium. |
| Stevens | 3,391 | 5,093 | Uranium, magnesite, stone, sand and gravel, barite, copper, silver, grinding pebbles, gold. |
| Thurston | 588 | 267 | Coal, sand and gravel, stone, peat. |
| Walla Walla | 1,547 | 6,486 | Sand and gravel, stone. |
| Whatcom | (2) | (2) | Cement, stone, sand and gravel, clays. |
| Whitman | 496 | 190 | Stone, sand and gravel. |
| Yakima | 964 | 1,290 | Sand and gravel, stone, pumice, clays. |
| Undistributed[3] | 20,861 | 16,378 | |
| Total[4] | 63,894 | 70,005 | |

[1] No production reported in Columbia and Wahkiakum Counties.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Includes value of some sand and gravel, stone, and gem stones that cannot be assigned to specific counties and values indicated by footnote 2.
[4] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement.

**Ferry.**—Knob Hill Mines, Inc., the leading producer of gold and silver in the State, operated its Knob Hill gold mine and the adjacent Gold Dollar mine owned by Day Mines, Inc., at Republic.

According to the Day Mines, Inc., annual report to shareholders, the Knob Hill company produced 41,376 tons of gold ore from the Gold Dollar mine on a joint production basis with the Day company. Ore reserves were expanded with development of the 11th level, and two diamond drill holes indicated the persistence of the vein to the 13th level; however, indications were that the grade was lower at depth. A new ore body, 400 feet long, designated as the No. 3–JO vein, was disclosed on the 8th level at the Gold Dollar property.

615629—61——70

Digitized by Google

Adjoining properties were developed in 1960; development included 5,638 feet of drifts and crosscuts and 12,188 feet of diamond drilling.

Thomas Consolidated Mines, Inc., Spokane, trenched and sampled the South Penn open-pit gold mine in the Republic district. The work extended the known mineralized zone 75 feet beyond the open-pit boundaries, which had been carried out over a 200-foot width; metallurgical tests indicated that the ore was amenable to cyaniding.

**Franklin.**—Sand and gravel production was 1.3 million tons (471,000 tons in 1959); the county ranked fourth in the State. Most of the increase was used by the U.S. Army Corps of Engineers at the Ice Harbor Dam.

**King.**—The value of nonmetal commodities produced in King County was $2.4 million less than in 1959. This marked the first time King County had been surpassed as a source of these commodities. Substantial decreases in output of cement, sand and gravel, and stone contributed to this decline.

Cement production by Ideal Cement Co. at its Grotto plant was less than in 1959; the quantity of clay mined by the company was almost double the 1959 tonnage. The Seattle plant of Lone Star Cement Corp. was closed for a short while for inventory adjustments.

The Danville and Rogers mines of Palmer Coking Coal Co., Inc., supplied most of the coal production. The company also dug clay at its Bagley pit for making clay products.

Locally mined clays were used by manufacturers of firebrick and block, heavy clay products, and flowerpots. Soapstone mined in Skagit County was ground at the Manufacturers Mineral Co. plant in Seattle.

Bethlehem Steel Co., Pacific Coast Division, Seattle, operated a new platemill at the steel plant and installed new equipment at a nearby fabrication plant to make a greater variety of cold-formed bolt products. A building for 150 office employees, completed in 1960, was the last major project of a 3-year, $25-million expansion program.

**Kittitas.**—Kittitas County maintained its position as the leading source of coal produced. Northern Pacific Railway Co. Coal Department and Roslyn Cascade Coal Co. each operated a surface and underground mine.

**Okanogan.**—Gypsite was mined near Tonasket (Poison Lake) by Agro Minerals, Inc. An epsomite deposit owned by the company in the same area was idle.

Paymaster Mines, Inc., Pateros, completed construction of a 50-ton-a-day mill at the site of a gold-silver-copper-tungsten property which included 80 claims along Squaw Creek, northwest of Pateros. An air raise was being driven in the old Hunter tunnel, which was opened between 1892 and 1900. Work at the mine, which started in April, included opening old tunnels on the property, setting up a dam and sawmill, and building a pilot-type ore-reduction plant.

**Pend Oreille.**—The Metaline Falls plant of Lehigh Portland Cement Co. was the principal nonmetal industry in the county. Cement production by the company decreased 18 percent in contrast to a 30-percent increase in shipments compared with 1959. Sand and gravel

Digitized by Google

output increased sharply. The county gained some $600,000 in value of nonmetals over the preceding year.

Pend Oreille Mines & Metals Co., according to the company annual report to stockholders, mined and milled 727,759 tons of ore, a 17-percent increase over 1959. Total costs were reduced from $3.384 a ton in 1959 to $3.254; operating costs were reduced from $3.116 to $3.004 a ton. Underground development expenditures totaled $305,132 ($298,340 in 1959) and consisted of 6,725 feet of drifts and raises, 25,380 cubic feet of station excavation, and 67,215 feet of diamond and long-hole drilling. Management substituted long-hole drilling where feasible to cut exploration and development costs; long-hole drilling costs averaged $0.37 a foot, compared with $2.80 a foot for diamond drilling.

Ore production at the Grandview mine (American Zinc, Lead & Smelting Co.) near Metaline Falls was started on a 650-foot level that was reached by sinking an inclined shaft 3,000 feet from the bottom of the main shaft; ore was mined from three levels.

American Zinc, Lead & Smelting Co. opened up working stopes in the Mineral Right mine on company property near the Grandview mine. According to the annual report to shareholders, the company expected to mine 50 percent of its tonnage from the Mineral Right mine by mid-1961, and by the end of the year only a small tonnage, if any, would come from the Grandview mine property.

A property merger of claims in the Metaline district owned by Metaline Contact Mines, Inc.; Day Mines, Inc.; and The Bunker Hill Co. into one operating unit (Metaline Contact Mines, Inc.) was proposed and accepted by directors of the companies involved. The property acquisition was to be handled by exchange of Bunker Hill and Day Mines holdings for common stock of Metaline Contact. Consolidation of the Metaline area holdings was considered desirable to facilitiate a program of exploration, development, and operation under one operating unit. The agreement was subject to stockholder ratification.

Pend Oreille County Public Utility District No. 1 and Diamond National Corp. granted $5,000 and $2,000, respectively, to two Washington State University geologists to make a geochemical and geophysical mineral resources survey in the Metaline mining district. Geochemical soil samples and geophysical anomalies were correlated with ore deposits indicated by previous diamond drilling.

**Skagit.**—Value of nonmetal commodities produced was $485,000 less than in 1959. A sharp drop in production of sand and gravel was not offset by gains in cement, stone, and soapstone production. The Lone Star Cement Corp. plant at Concrete was the major nonmetal industry in the county. Olivine was mined at the Twin Sisters quarry. Soapstone was mined at deposits near Marblemount by Herman Smith, William Soren, and Cascade Talc & Silica Co.

**Snohomish.**—The value of mineral production was $1.9 million. The county ranked second as a peat-producing area. Lowell Brick & Tile Co. used locally mined clay to make building brick.

Bear Creek Mining Co., exploration subsidiary of Kennecott Copper Corp., did geological work at the Index mine, Sultan Basin area,

Digitized by Google

where three large breccia zones contain copper mineralization. Bear Creek also continued geological, geophysical, and geochemical exploration work on the Glacier Peak Mining & Smelting Co. property south of Plummer Mountain on Miners Ridge. The firm had worked summers on the property since 1953 and had made regular option payments. E. J. Longyear Co. conducted extensive diamond drilling at the Glacier Peak property for Bear Creek during the summer. Glacier Peak Wilderness Area, established September 6 by the Secretary of Agriculture, encompassed this property.

Equipment to separate molybdenite from chalcopyrite was installed at the Kromona property, Sultan Basin district.

**Spokane.**—Nonmetal mineral production was valued at $3.9 million, compared with $5 million in 1959. This decrease caused the county to drop to fourth place in value of nonmetals. Cement, sand and gravel, and stone production was lower. There was a small advance in clay output. Clay mined locally, limestone from Stevens County, and iron ore from Benewah County, Idaho, were used at the Irvin plant, Ideal Cement Co., the principal nonmetal industry in the county. Fire clay refractories and other clay products were made at Mica by Gladding, McBean & Co. Greenacres Gypsum Co. marketed Canadian gypsum for use as land plaster.

Uranium ore was shipped by Daybreak Uranium Co. (Dahl lease) and Evergreen Uranium Exploration Co. (Morning lease), 48 and 62 miles, respectively, to the Dawn Mining Co. mill at Ford, Stevens County.

Silver Hill Mining Co., Spokane, purchased a 130-acre tungsten property on Moran Prairie from Spokane Tin Mines Co. Silver Hill planned to build a pilot mill on the property.

**Stevens.**—Magnesite mining at the Red Marble and Keystone quarries of Northwest Magnesite Co. was the main nonmetal mineral industry. Limestone was quarried for use in cement manufacture, as a metallurgical flux, and for various other purposes.

Triton Mining Co. developed the old Schumaker property (Joe Creek mine) near Colville. Development consisted of retimbering a 300-foot adit, diamond drilling, and draining and sampling a winze.

Goldfield Consolidated Mines Co. drove a 1,500-foot drift from the bottom of the 100-foot-deep Anderson open-pit mine; three zinc ore bodies, discovered by diamond drilling, were developed. The 15- by 16-foot drift was driven at a grade of about 10 percent to permit use of diesel-powered trucks to haul ore out of the mine.

Clayloom Uranium Co. moved a 1,000-ton-a-day mill from Spokane to the Stevens County Lead Trust mine. Jigs, ore crushers, hoppers, a 175-horsepower diesel-electric powerplant, and other equipment were taken to the property and set on foundations built early in the year. A building was constructed over the equipment in the fall; late in the year the lead-zinc gravity-type mill was operated on a test basis, treating ore from the company-leased Lead Trust and Lead King mines.

The Dawn Mining Co. Midnite mine was the leading producer of uranium ore in the State. The nearby Peters lease, purchased by Dawn from Silver Buckle Mining Co. in June, yielded a considerable tonnage. Ore was hauled about 20 miles to the Dawn Mining Co. mill at Ford for processing.

Digitized by Google

**Walla Walla.**—Value of sand and gravel and stone production, the only mineral commodities produced, rose to $6.5 million from $1.5 million in 1959. Most of the output was used by the U.S. Army Corps of Engineers at its Ice Harbor Dam project.

**Whatcom.**—Whatcom County ranked first as a source of nonmetal production. Substantial increases in cement and stone output accounted for the advance. The Olympic Portland Cement Co., Ltd., plant at Bellingham was the leading nonmetal industry in the county, and it continued to have the largest cement output in the State. Limestone for use at the cement plant was produced by the company from the Kendall quarry near Maple Falls.

**Yakima.**—Pumicite mined near Sunnyside was used as a pozzolan material. A small quantity of bentonite was produced for use in sealing irrigation canals by Tietonite Mines, Inc., near Naches. Granger Clay Products Co. made building brick from clay mined locally.

# The Mineral Industry of West Virginia

**This chapter has been prepared under the cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the West Virginia Geologic and Economic Survey.**

By James R. Kerr [1] and Jean Pendleton [2]

MINERAL production in West Virginia declined 2 percent in value in 1960 despite increased production of most mineral commodities. The continuing decline in coal output after the steel strike was the contributing factor in the decline. Coal prices dropped $0.17 to $5.02, further decreasing the total dollar realization from this major industry.

Greatly increased crushed stone production was recorded to meet the demand for materials used in constructing Interstate routes 77 from Charleston to Parkersburg and 64 from Huntington to Charleston. Clays, salt, and petroleum output also increased significantly.

Leading in mineral production were the larger coal-producing counties of McDowell, Logan, Wyoming, Marion, Kanawha, and Raleigh.

**TABLE 1.—Mineral production in West Virginia [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays.....thousand short tons | 596 | $2,492 | 626 | $2,639 |
| Coal.....do | 119,692 | 621,003 | 118,944 | 597,222 |
| Natural gas.....million cubic feet | 204,633 | 53,205 | 208,757 | 54,694 |
| Natural gas liquids: | | | | |
| Natural gasoline.....thousand gallons | 29,242 | 1,808 | 28,211 | 1,513 |

# REVIEW BY MINERAL COMMODITIES

## MINERAL FUELS

**Coal.**—Coal production decreased slightly from 1959. Captive production for the metallurgical market increased 7 percent but did not compensate for a 2-percent decline in commercial output. Although total output decreased, the number of mines increased significantly from 1,464 to 1,700. The increase was chiefly in small underground mines as many miners, who were out of work because of increasing mechanization in the larger mines, opened pits and produced small tonnages for local markets.

Underground-mined tonnage comprised 92 percent of total production; strip, 6 percent; and auger, 2 percent. The average value of coal production dropped from $5.19 to $5.02 per ton, reflecting a continuance of cost-cutting practices and greater competition for markets.

Over 90 percent of underground production was loaded mechanically. Output by continuous mining increased 6 percent to 32 percent of total mechanically loaded output. There were 55 more continuous miners in use, bringing the total to 315. Most of the new machines loaded directly onto conveyors and into shuttle cars rather than onto the bottom for disposition by mobile loaders. The number of mobile loaders, decreased by 123, and the tonnage loaded by these devices dropped 5 percent to comprise 66 percent of mechanically loaded output. Of the 1,060 mobile machines, 88 loaded into mine cars; 169, onto conveyors; and 803, into shuttle cars. The remaining tonnage was mechanically loaded by 326 hand-loaded face conveyors.

Other equipment at underground mines included 1,865 cutting machines, 2,420 handheld and post-mounted drills, 147 mobile drills, and 703 rotary and 483 percussion roof or rock drills.

The following equipment was used at strip mines: 280 power shovels, 13 dragline excavators, 9 carryall scrapers, 247 bulldozers, 86 horizontal and 58 vertical overburden drills, and 570 trucks of an average of 14-ton capacity, hauling an average of 7 miles from pit to tipple. At auger mines, 101 augers, 23 power shovels, 1 carryall scraper, and 78 bulldozers were used. A total of 210 trucks, average capacity of 14 tons, traveled an average of 6 miles from pit to tipple.

The number of active cleaning plants dropped 14 to 170. Almost

Digitized by Google

86.5 million tons of coal, 73 percent of total output, was cleaned. Jigs cleaned 37 percent, wetwashing other than jigs, 54 percent; and pneumatic methods, 9 percent. Of total output, 31 percent was crushed and 15 percent was treated, chiefly with oil for dust-allaying purposes.

According to preliminary data, the State coal-mining industry recorded 119 fatal and 4,580 nonfatal lost-time injuries during the year, compared with 86 fatal and 4,800 nonfatal injuries in 1959. An alarming increase in fatality rates over the commendable record of 1959 was evident in the rise from 0.73 to 1.00 fatal injury per million tons of coal mined. Nonfatal injury rates were 60.28 per million man-hours and 38.33 per million tons mined, compared with 56.46 and 40.68, respectively, in 1959. Comparative employment data showed that the average number of men active decreased from 54,800 to 48,100. The average number of days worked per man increased to 200.5 from 196.9. Total man-hours decreased to 76 million from 85 million.

A major disaster occurred in a West Virginia mine on March 8 when a mine fire claimed the lives of 18 men. Preliminary data indicated that 91 of the State's remaining 101 fatalities occurred underground. Of these, 64 were caused by falls of roof, 12 by haulage, 4 by machinery, 3 by electricity, 3 by gas or dust explosions, 2 by falls of face, and 3 by other circumstances. The fatalities occurring in surface facilities associated with the underground mines were caused by haulage (3), machinery (1), and other circumstances (4). The one fatality each occurring at strip and auger mines was caused by machinery.

Two West Virginia mines were among the top five bituminous coal mines in the Nation with the lowest injury-severity rates in the 1960 National Safety Competition. They were (ranking 2d), the Montcoal No. 1 mine of Armco Steel Corp., Montcoal, Raleigh County, which worked 362,508 man-hours without a lost-time injury: and (ranking 5th), the No. 6 mine of United States Steel Corp., Gary, McDowell County, which worked 252,169 injury-free man-hours.

Initial planning was announced for constructing a $125 million-plus coal-slurry pipeline from West Virginia to the east coast. The proposed pipeline, 24 inches in diameter, would move coal 350 miles to utility companies in Pennsylvania, New Jersey, and New York. Partners in the venture were Texas Eastern Transmission Corp. and Consolidation Coal Co.[3]

[1] Included with "Undistributed."
[2] Includes data for Clay, Marshall, and Ohio Counties, and Counties indicated by footnote 1.

**TABLE 3.—Bituminous coal production**

(Thousand short tons and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 138,858 | $696,733 | 1958 | 119,468 | $635,291 |
| 1956 | 155,980 | 824,043 | 1959 | 119,692 | 621,003 |
| 1957 | 156,842 | 875,587 | 1960 | 118,944 | 597,222 |

**Coke and Coal Chemicals.**—Four oven-coke plants with 691 ovens were active, 51 ovens less than in 1959. Oven-coke production was 2,758,002 tons, a decrease of 10 percent from 1959. Average value per ton at the ovens was $17.43, an increase of $0.87 per ton. A total of 4,038,073 tons of coal was carbonized (average yield 68.3 percent). Recovered products at the oven-coke plants included 168,889 tons of coke breeze, almost 47 billion cubic feet of coke-oven gas; 41,483 tons of ammonium sulfate equivalent, 41,252,265 gallons of coke-oven tar, and 12,012,892 gallons of crude light oil from which were derived 7,521,720 gallons benzene, 2,143,073 gallons toluene, 665,239 gallons xylene, and 72,002 gallons of solvent naphtha (crude and refined).

Pennsylvania provided almost three-fourths of the coking coal requirements in West Virginia. However, West Virginia was the

Digitized by Google

leading coking coal-producing State; Pennsylvania, Ohio, and Indiana, consumed large tonnages.

Wheeling Steel authorized Koppers Co. to rebuild a battery of 51 coke ovens at its East Steubenville plant. The existing No. 3 battery of an original 6-battery plant of 314 ovens was to be replaced.

**Petroleum and Natural Gas.**—Production of petroleum increased 6 percent, and natural gas production increased 2 percent. Total production of natural gas liquids increased because of a 7 percent increase in output of LP-gases. Natural gasoline production dropped 21 percent.

The number of well completions increased by 78 to 884. Only 11 of these were wildcat completions. Of total completions, 686 were gas, 78 were oil, 94 were dry holes, and 26 were service wells. Total footage drilled was 2,161,149, an average of 2,445 feet per well. Drilling was done chiefly with cable-tool rigs; 880 wells were completed by this method. Lewis County led in total completions with 141, followed by Doddridge, 107; Wayne, 94; Ritchie, 83; and Calhoun, 74.[4]

According to the American Petroleum Institute and the American Gas Association, reserves on December 31, 1960, were 1,831,125 million cubic feet of natural gas; 51,433,000 barrels of petroleum, and 44,734,000 gallons of natural gas liquids.

## NONMETALS

**Cement.**—Production of portland and masonry cements decreased 3 percent. Shipments from the one plant, in Berkeley County, were mostly non-air-entrained, general use, and moderate heat types, principally to Maryland, Virginia, and the District of Columbia. Consumers were chiefly ready-mixed concrete companies. Concrete product manufacturers and building material dealers also consumed significant quantities.

**Clays.**—Total production of clays increased 5 percent. Production of fire clay for firebrick and block and foundries and steelworks rose to meet the demand of renewed steel production, but fire clay output for building brick dropped. Miscellaneous clay production for heavy clay products (mainly building brick) increased 19 percent, but output for cement manufacture dropped 19 percent.

Fire clay was mined at three underground mines and one open pit in Kanawha and Hancock Counties. Miscellaneous clay was mined at seven open-pit mines in Berkeley, Cabell, Mercer, Lewis, and Taylor Counties.

**TABLE 4.—Clays sold or used by producers**

| Year | Fire clay | | Miscellaneous clay | | Total | |
|---|---|---|---|---|---|---|
| | Short tons | Value | Short tons | Value | Short tons | Value |
| 1951–55 (average) | 545,555 | $1,931,719 | 324,258 | $312,173 | 869,813 | $2,243,892 |
| 1956 | 428,033 | 2,171,942 | 341,485 | 277,266 | 769,518 | 2,449,208 |
| 1957 | 402,581 | 2,445,427 | 304,952 | 245,182 | 707,533 | 2,690,609 |
| 1958 | 264,107 | 1,732,634 | 245,699 | 227,310 | 509,806 | 1,959,974 |
| 1959 | 328,792 | 2,178,974 | 266,932 | 312,970 | 595,724 | 2,491,944 |
| 1960 | 346,053 | 2,328,865 | 279,570 | 310,341 | 625,623 | 2,639,206 |

Digitized by Google

**Gem Stones.**—Quartz crystal and miscellaneous gem materials were collected by hobbyists at scattered locations throughout the State.

**Lime.**—Lime production increased 3 percent, owing to increased output (12 percent) for chemical and industrial uses. The refractory market was virtually unchanged from 1959. Output of quicklime for agricultural uses was only a fraction of the preceding year's output. Two producers operated in Berkeley County, and one operated in Jefferson County.

**Natural Salines.**—Elemental bromine, ethylene dibromide, miscellaneous bromide compounds, and calcium-magnesium chloride were produced from well brines at South Charleston. Output of the double salt decreased, but bromide materials increased 15 percent.

**Salt.**—An improved market for chlorine, the chief end product of brine salt, brought about a 13-percent increase in salt production. Three companies, two in Marshall and one in Kanawha, produced salt in brine for chlorine manufacture. One company in Mason County produced evaporated salt for sales to feed dealers and water-softener manufacturers.

**Sand and Gravel.**—Production of sand and gravel decreased for the third consecutive year. Output was 7 percent lower than that of 1959, as gravel output dropped sharply. Paving gravel output decreased 35 percent in sharp contrast to paving sand production which increased 39 percent. Building sand and gravel decreased 7 percent and 17 percent, respectively, but building comprising 53 percent of the total remained as the most important use for sand and gravel. Significant tonnages of glass sand and ground sand also were produced.

There were 27 commercial operations active in 18 counties. In addition, the State Road Commissioner of West Virginia reported Government-and-contractor production in six counties. Hancock County led in production, followed by Morgan, Wood, Cabell, and Ohio. Morgan County with its valuable glass sand deposits led in value of production.

| Gravel: | | | | |
| Fill | | | 1,350 | 500 |
| Paving | | | 91,400 | 90,280 |
| Total sand and gravel | 4,854,052 | 10,513,051 | 4,506,148 | 9,802,460 |

[1] Includes blast, glass, molding, ground, and other sands, railroad-ballast gravel, and other gravel.

**Stone.**—A heavy demand for roadstone caused a 35-percent increase in stone production. Limestone output, which comprised 87 percent of total, increased 28 percent over 1959. Instrumental in this increase was over 500,000 tons of Government-and-contractor output. Leading uses for limestone were concrete aggregate and roadstone, flux, and cement and lime manufacture. Commercial production of crushed sandstone, chiefly for roadbuilding, decreased considerably, but, combined with almost 650,000 tons of Government-and-contractor production for roadbuilding, total production of sandstone more than doubled. A small quantity of dimension sandstone was produced for rough construction.

Leading counties for limestone production were Berkeley, Jefferson, and Greenbrier. Leading sandstone-producing counties were Lewis, Harrison, and Kanawha.

**TABLE 6.—Stone sold or used by producers, by uses**

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Crushed and broken stone: | | | | |
| Flux | 2,091,241 | $3,926,152 | 2,231,617 | $4,164,780 |
| Concrete and roadstone | 2,327,733 | 3,951,001 | 3,711,942 | 6,003,084 |

## METALS

**Aluminum.**—Kaiser Aluminum & Chemical Corp. completed its first full year of operation at its four-potline primary aluminum plant at Ravenswood, W. Va. Yearly capacity of the plant, which was completed in 1959, was estimated at 145,000 tons of aluminum per year.

**Ferroalloys.**—Union Carbide Metals Co. and Vanadium Corporation of America produced a wide variety of ferroalloys at Alloy and Graham, respectively, in electric furnaces.

**Iron and Steel.**—Weirton Steel Co., Division of National Steel Corp., began operating a new continuous annealing line enlarging its capacity to produce annealed tin, for which there was an increasing demand. A new 650-ton-per-day oxygen plant was to begin operating in 1961, bringing total oxygen supply for the 14 open-hearth furnaces to 1,100 tons of oxygen per day. One of four company blast furnaces was blown out for enlarging and relining after 8 years of continuous operation, a new record for the steel industry.

**Zinc.**—Matthiessen & Hegeler Zinc Co. operated a vertical-retort zinc smelter at Meadowbrook.

**Zirconium.**—Carborundum Metals Co., Inc., produced zirconium sponge at its plant in Wood County from Florida zircon.

## REVIEW BY COUNTIES

**Barbour.**—Coal production increased 6 percent as the number of active mines increased by 14 to 66. Underground mining supplied 74 percent of total output; strip mining, 23 percent; and auger mining, 3 percent. Significant new mines were opened by Virgil Harris Coal Co., Marino Coal Co., and Turkey Run Coal Co., Inc. The Glen Cambria mine which had been abandoned by Mountain Fuel Co. in 1959 was taken over by McGraw Coal Co. The Lechiara Coal Co. abandoned its Carol mine at yearend.

Over 80 percent of the underground tonnage was loaded mechanically. Badger Coal Co. added two continuous miners, bringing the county total to five, which furnished one-third of the mechanically loaded total. The remainder was handled by mobile loading machines. Forty-two percent of total production was mechanically cleaned, 70 percent was crushed, and 10 percent was treated. The first-aid teams of the Compass No. 1 mine of Clinchfield Coal Co. won the State and National first-aid contests.

Crushed sandstone was produced at a portable plant near Belington by Feather Construction Corp. for road construction.

**Berkeley.**—Standard Lime & Cement Co., Martinsburg, was the sole cement producer in the State. Output decreased slightly in 1960. The company operated five kilns; a sixth kiln was down for repairs the entire year. The bulk of the output was shipped to Maryland, Virginia, and the District of Columbia to ready-mixed concrete companies, concrete product manufacturers, building material dealers, and highways contractors.

The county continued to lead in limestone production. Plants of Standard Lime & Cement Co., Blair Limestone Division of Jones & Laughlin Steel Corp., W. S. Frey Co., and J. E. Baker Co. crushed limestone, mainly for cement and lime manufacture and for metallurgical uses. Blair Limestone put two new gas-fired limestone kilns into operation; these new kilns doubled lime capacity and should improve quality. The two kilns, with a yearly capacity of 72,000 tons of burned lime for Jones & Laughlin furnaces in Pittsburgh and Aliquippa. The gas-fired kilns reportedly reduced the sulfur content of the burned lime, thus increasing efficiency of steelmaking furnaces; they replaced 11 coke-fired kilns. Standard Lime & Cement Co. also manufactured lime. County lime production decreased 10 percent.

Standard Lime & Cement Co. mined shale for cement manufacture, and Continental Clay Products Co. and United Clay Products Co. mined miscellaneous clay for building brick. Clay output increased significantly.

**Boone.**—Although coal production decreased 2 percent, the county increased in rank from 10th to 9th. Underground tonnage from 33 mines comprised almost 90 percent of total output. The only strip mine was operated by Glenn Brooke Coal Co. There were five active auger mines. The Red Parrot mines (underground and auger) of North American Coal Corp. were abandoned in October, and the company Red Cedar mine was closed all year, idling an average of 375 men. The Westmoreland Coal Co. opened the Hampton No. 2 underground and auger mines in November, employing 26 and 12 men, respectively. Ninety-seven percent of the underground tonnage was mechanically loaded. The number of continuous miners rose from 6 to 17 as Eastern Gas & Fuel Associates added 10 and Armco Steel added 1. However, 56 mobile loading machines loaded over three-fourths of the mechanically loaded coal. There were seven active cleaning plants, one less than in 1959 owing to the closing of the North American Red Cedar mine. Eighty-nine percent of the county tonnage was cleaned; 24 percent was crushed; and 5 percent was treated.

**Braxton.**—Coal production increased 78 percent because of increased production by Guardian Coal Co. at a mine formerly operated by Cedar Creek Coal Co. There were nine mines: seven underground (an increase of two over 1959), one strip, and one auger. Jigs and other wet-washing methods were used at the Guardian Coal Co. cleaning plant. Two mobile loading machines, loading into shuttle cars, and 2 hand-loaded face conveyors, loaded almost nine-tenths of the underground tonnage. Four-fifths of the county output was crushed, and one-third was treated with calcium chloride.

Digitized by Google

**Brooke.**—Coal production increased 46 percent and the number of mines rose by 3, to 12. Underground mines furnished 56 percent of the output; strip mines, 41 percent; and auger mines, 3 percent. Captive coal for power generation was mined from the Pittsburgh No. 8 seam by Windsor Power House Co. The Half Moon cleaning plant and the Beech Bottom cleaning plant of Windsor Power House operated jigs and an R. & S. Hydro Separator, respectively. Ninety-four percent of the underground output was mechanically loaded into shuttle cars by six mobile loading machines.

Sand for fire or furnace use and building and fill gravel were produced by the Brilliant Sand Co.

**Cabell.**—Sand and gravel production, chiefly for building and paving, increased slightly. Producers were Ohio River Dredging Co. and Union Sand & Gravel Co. both of Huntington. Sand comprised about two-thirds of county output; gravel, the remainder.

Miscellaneous clay (red shale) was mined by Barboursville Clay Mfg. Co. for building brick.

**Clay.**—County coal mines increased by 3, to 11. Elk River Coal & Lumber Co. was the largest of eight underground producers. The company also operated one of the county's two auger mines but abandoned the auger in April. There was one strip mine. Underground tonnage, which comprised nine-tenths of output, was mined from the Kittanning seams. About nine-tenths of the output was cleaned at the Rich Run cleaning plant of Elk River Coal & Lumber Co., which employed dense-medium washers. Ninety-two percent of output was crushed, and 80 percent was treated with oil. Eighteen mobile loaders loaded 90 percent of the underground tonnage into shuttle cars, and four hand-loaded face conveyors handled 3 percent.

**Fayette.**—Coal production declined 3 percent even though the number of mines increased by 19 to 148. Of the total tonnage, 97 percent came from 139 underground mines. The remainder was from three strip and six auger mines. In June, Eastern Gas & Fuel Associates abandoned its operations in the county when it closed the Beards Fork mine, idling 240 men. The Layland and Minden mines of New River & Pocahontas Consolidation Coal Co. were abandoned during the year. Eel River Mining, Inc., abandoned its Long Branch strip mine in January and opened the Gamoco strip and auger mines in June. Seventy-eight percent of the underground coal was mechanically loaded. Of this quantity, mobile loaders handled 85 percent; continuous miners, 10 percent; and hand-loaded face conveyors, the remainder. Jigs cleaned 26 percent and wetwashing other than jigs cleaned 38 percent of the output. Twenty percent was crushed; 11 percent was treated mostly with oil.

**Gilmer.**—Among the coal-producing counties, production from Gilmer increased the most (126 percent), because output from Rochester & Pittsburgh Coal Co. was over four times that of 1959. Output from 13 underground mines comprised 82 percent of the county total; the remainder came from 2 strip mines (9 percent) and 2 auger mines (9 percent). Jigs were used at the O'Donnell plant of Rochester & Pittsburgh Coal Co. to clean its underground, strip, and auger output.

615629—61——71

Digitized by Google

Three-fourths of the county underground coal was mechanically loaded by one continuous miner and four mobile loading machines. Forty-six percent of the county total was crushed.

Sandstone was crushed for use as concrete aggregate by Basil R. Heavner. The State produced sandstone for use in concrete and as roadstone.

**Grant.**—The number of mines decreased from seven to five, causing a decrease in production. Lindsey Coal Mining Co., the largest producer, operated the only strip mine. The largest of the four underground mines was that of Moomau Coal Co.

Limestone from the two quarries of the Beans Lime & Stone Co., Inc., Moorefield and Petersburg, and of Keplinger & Co., Maysville, was crushed for use in concrete as roadstone and for agricultural purposes.

**Greenbrier.**—Coal production increased 27 percent, because 27 new mines were active. Although only seven were strip mines, strip tonnage comprised 41 percent of total output. In comparison, 96 underground mines produced 58 percent. The only auger mine was operated by Beech Run Coal Co. The Lafayette Springs Coal Co. strip mine was by far the leading producer. Strip mining utilized 17 shovels, 4 draglines, 18 bulldozers, and 23 trucks with average capacity of 18 tons. Underground mines were small hand-loading operations, except four mines which employed mechanical loading methods. Lafayette Springs Coal Co. and Leckie Smokeless Coal Co. operated cleaning plants where over half the total production was cleaned by wetwashing methods. Seventeen percent of the output was crushed. Anjean Coal Co. took over operation of the Leckie Smokeless Coal Co. preparation plant on November 1 and acquired more than 20 small underground operations during the year.

Limestone produced by H. Frazier Co., Inc., was used for railroad ballast. Output from the Snow Flake quarry of Acme Limestone Co. was used for concrete aggregate, railroad ballast, agricultural purposes, dust for coal mines, and stone sand. The Fort Spring Stone Co. produced dimension sandstone (rough blocks for construction). Gravel for State roads was produced by the State Road Commission.

**Hampshire.**—Crushed limestone for concrete and roadstone was produed by Terra Alta Limestone Co. and Williams Quarry, Inc., from operations near Forks Capon, and Romney, respectively. Output increased significantly over 1959.

**Hancock.**—Clay production increased 24 percent, and sand and gravel output decreased 13 percent. Despite the lower production of sand and gravel, the county remained the leader in production of both commodities. Fire clay for refractories was mined by The Globe Brick Co., Newell, and Crescent Brick Co., Inc., and West Virginia Fire Clay Manufacturing Co., both of New Cumberland. The refractory clay industry in the county depended chiefly upon the steel industry. The market was firm as the year began, but slowed as the year progressed.

Digitized by Google

The number of sand and gravel producers increased to three with the addition of a new stationary plant by Volino Brothers near Newell. The Dravo Corp. Nos. 9 and 16 plants and Arroyo Sand & Gravel Co. continued operations. Sand comprised 55 percent and gravel 45 percent of production. Except for a small quantity for fill, output was used for building purposes.

Coal was mined by the Velegol Coal Co. from the Freeport seam.

**Hardy.**—The State Soil Conservation Potomac Valley District crushed limestone at its Baker plant for agricultural purposes.

**Harrison.**—Harrison County ranked eighth in coal production. Output decreased 4 percent. The number of mines remained at 102 (70 underground, 23 strip, and 9 augers). Of the total, underground production comprised 81 percent and strip production, 16 percent. Strip pits used 34 power shovels, 5 draglines, 39 bulldozers, and 116 trucks. About nine-tenths of the underground coal was mechanically loaded, of which 78 percent was loaded by mobile loaders and 22 percent by continuous miners. There were 7 continuous miners and 68 mobile loading machines. Fifty-eight percent of the output was cleaned by wetwashing methods. Galloway Land Co. used pneumatic cleaning for the first time.

Feather Construction Corp., Wolfe Summit, and North View Stone Co. crushed sandstone for concrete aggregate and roadstone. The State Road Commission produced sandstone for paving.

**Jackson.**—Sandstone was crushed for paving by the State Road Commission.

**Jefferson.**—Jefferson County was the second largest stone producer. Firms were U.S. Steel Corp., Michigan Limestone Division; Jones & Laughlin Steel Corp., Blair Limestone Division; and American-Marietta Co., Standard Lime & Cement Co. Division. Output was used for metallurgy, the manufacture of dead-burned dolomite, railroad ballast, concrete aggregate and roadstone, and for agricultural purposes. Over four-fifths was shipped by railroad.

Output of calcareous marl by West Virginia Lime Co. decreased considerably. The product was sold in raw sun-dried condition for agricultural purposes.

**Kanawha.**—Kanawha County ranked fourth in coal production. Virtually the same tonnage was produced as in 1959 although an additional 19 mines were active, bringing the total to 120. Ninety percent was mined by 111 underground mines; the remainder came from 6 auger and 3 strip mines. The Dana No. 1 mine of Amherst Coal Co. was abandoned in March, idling 180 men. Auger No. 6 was opened by Carbon Fuel in June employing an average of 40 men. Imperial Colliery Co. purchased the No. 2 underground mine from Wyatt-Seanor Coal Co. in May. Oglebay Norton Co. closed its No. 11 underground mine and opened the No. 12 underground mine in November. The four leading producers mined over 1 million tons of coal each and furnished over half the underground production. Continuous miners, which increased to 15 with the addition of 1 by Cannelton Coal Co., loaded 13 percent of the underground-mined

615629—61——72

Digitized by Google

coal. Mobile loading machines (118) handled 78 percent, and the remainder was taken care of by 26 hand-loaded face conveyors and hand loading into mine cars. Sixty-three percent of the coal was cleaned (69 percent by jigs, 20 percent by wetwashing other than jigs, and 11 percent by air methods); 40 percent was crushed, and 11 percent was treated with oil.

Westvaco-Chlor-Alkali Division, Food Machinery & Chemical Corp., increased salt output for manufacturing chlorine. Bromine, bromine compounds, and calcium-magnesium chloride also were produced.

Tony Pacifico opened a stone quarry near Charleston and produced crushed sandstone for use in furnaces and irregular-shaped stone for buildings. Mazzela Quarries, Inc., South Charleston, crushed sandstone for concrete aggregate.

Fire clay was mined near Charleston by West Virginia Brick Co. and Charleston Clay Products Co. An over-heated stove sent flames through part of the West Virginia Brick Co. plant and caused damage estimated at $175,000. A 320-foot-long warehouse, a railroad loading dock, the plant office, two railroad cars, an 1,800-foot-long conveyor belt, and a mine tipple were destroyed.

Engine sand was produced by the St. Albans Sand Co. The company discontinued business on May 3. Building sand was produced by the Charleston Sand Corp. near Big Chimney.

**Lewis.**—Active coal mines increased by one to nine, but production decreased 36 percent. Three each—strip, auger, and underground mines—supplied 64 percent, 34 percent, and 2 percent of output, respectively. Stripping operations used 16 power shovels, 16 bulldozers and 26 trucks with an average capacity of 13 tons. In the auger mines, five augers were used along with 9 bulldozers and 17 trucks. Jigs cleaned more than one-fourth of the total output.

Sandstone was crushed for use on State roads by Feather Construction Corp. and Weston Stone Co. Miscellaneous clay for building brick and tile and draintile was mined by Weston-Jane Lew Brick & Tile Co. at mines Nos. 1 and 2 near Weston and Jane Lew.

**Lincoln.**—Coal was dredged from the Guyandot River by Davis & Adkins Coal Co., Dial Coal Co., Rebel Coal Co. and Sand Dredging Operation Co.

The State Road Commission produced crushed sandstone for road paving. Engine sand was produced by Davis & Adkins Sand Co., Ferrellsburg, and sand for industrial use was produced by Hal Dial & Sons Co., Branchland.

**Logan.**—Although coal production decreased slightly (2 percent), the county maintained first place for the sixth consecutive year. The number of mines decreased by 10 to 70. Sixty-four underground mines furnished 96 percent of the total production. Output from one strip mine, operated by Boone County Coal Corp., and five auger mines composed the remainder. Three-fourths of the underground coal was produced, in order of decreasing output, by the following companies: Island Creek Coal Co.; Amherst Coal Co.; Omar Mining Co.; Princess Coals, Inc.; and Lorado Coal Mining Co. An average of 3,490 men

Digitized by Google

were employed in the 23 mines operated by these companies. The Amherst Coal Co. Auger No. 2 was abandoned in December. The Lorado Coal Mining Co. opened an underground mine (No. 5) in July. Six percent of the underground tonnage was loaded by 12 continuous miners, 5 more than in 1959; Amherst Coal Co. added 3 and Island Creek Coal Co. and Omar Mining Co. added 1 each. Ninety-three percent of the output was loaded by 179 mobile loading machines. The remainder was hand-loaded into mine cars and onto face conveyors. Twenty-one cleaning plants prepared 92 percent of the coal. One-fifth was crushed, and 14 percent was treated with oil and a combination of oil and calcium chloride.

Gravel for roads was produced by the State Road Commission.

**Marion.**—Coal production decreased 4 percent, but the county continued to rank fifth. There were 12 mines (10 underground and 2 strip), 3 less than in 1959. Almost all the coal was mined mechanically from the underground mines of Mountaineer Coal Co. (four mines), Bethlehem Minerals (two mines), Eastern Gas & Fuel Associates, Joanne Coal Co., Rochester & Pittsburgh Coal Co., and Corwin Coal Co., Inc. Equipment included 45 mobile loading machines loading 31 percent and 42 continuous miners loading 69 percent. In addition, 32 mobile loaders were used in conjunction with the continuous miners. Two-thirds of the total production was cleaned, of which jigs and wetwashing other than jigs cleaned 47 percent each and pneumatic methods, 6 percent. Forty-six percent of the coal was crushed. In December, Eastern Gas & Fuel Associates began constructing a multimillion dollar coal-cleaning plant. When in full production, the plant was to process 12,500 tons of coal per day with a heavy-medium washer, concentrating tables, and froth flotation.

Sandstone was crushed by the State Road Commission.

**Marshall.**—Underground coal mines were operated by Hanna Coal Co., Division of Consolidation Coal Co., Valley Camp Coal Co., and West Virginia State Penitentiary. Almost all the coal was mechanically loaded by 2 mobile loaders and 19 continuous miners (an increase of 3 miners). Four-fifths of the coal was cleaned by jigs, chance cones and concentrating tables; almost three-fourths was crushed.

Output of salt increased slightly. Columbia Southern Chemical Corp., New Martinsville, and Solvay Process Division of Allied Chemical Corp. continued to produce salt in brine for use in manufacturing chemicals, chiefly chlorine. Solvay announced plans for new facilities to increase production by 20,000 tons per year. A 40 percent increase in capacity for chlorinated methanes also was planned.

The State Road Commission crushed sandstone for concrete aggregate and roadstone.

**Mason.**—Coal output dropped 11 percent. Nine underground mines produced 83 percent of the total; one strip and two auger mines produced the remainder. Of the underground output, over nine-tenths was mechanically loaded by 11 mobile loading machines. Seventy-eight percent of the total was crushed.

Digitized by Google

The Liverpool Salt Co. evaporated salt production was sold to feed dealers and mixers and water-softener manufacturers. Sand and gravel for road paving was produced by Letart Sand & Gravel Co., Inc., New Haven.

**McDowell.**—McDowell ranked second among the coal-producing counties in tonnage but led in value. Thirty-two additional mines brought the total active to 184, the most in any county. Of this number, 168 were underground mines from which 95 percent of the total production was loaded. The remainder was mined by nine strip and seven auger mines. U. S. Steel Corp. was the leading producer, followed by Island Creek Coal Co., Olga Coal Co., and Eastern Gas & Fuel Associates. Companies and mines closed in 1960 were: U. S. Steel Corp., No. 6 mine in July (210 men idled); New River & Pocahontas Consolidation Coal Co., No. 6 mine in March and No. 9 mine in June (156 idled); Pocahontas Fuel Co., Peerless mine in April and Amnonate mine in August (556 men idled). No large mines were opened. Over nine-tenths of the underground tonnage was loaded mechanically. Of this total, 61 percent was cut and loaded by 74 continuous miners, 14 more than in 1959. Eastern Gas & Fuel Associates, Island Creek Coal Co., Olga Coal Co., and U. S. Steel Corp. installed the additional machines. Thirty-seven percent of the coal was loaded by 82 mobile-loading machines (38 less than in 1959). The remainder was loaded by 4 duckbills and 17 hand-loaded face conveyors. A total of 23 cleaning plants (2 more than in 1959) cleaned 86 percent of the output. Forty-three percent of the coal was crushed, and 50 percent was treated.

**Mercer.**—Coal mines increased from 16 to 25, but production decreased 20 percent. Ninety percent of the total was mined by 22 underground mines. The remainder was mined at two strip and one auger mines. Nine-tenths of the underground coal was loaded by 15 mobile loading machines and 1 continuous miner. Four cleaning plants cleaned most of the output. The Arista mine of Weyanoke Coal & Coke Co. closed for an indefinite period in August, idling 122 men.

The Oakvale Stone Co., Princeton, crushed limestone for concrete and roadstone. The Virginian Brick & Tile Co. mined miscellaneous clay near Princeton for building brick and heavy clay products.

**Mineral.**—Production of limestone increased significantly. Aurora Stone Co., near Thomas, and Spencer Lime Co., Keyser, crushed limestone for use in ceramics, concrete, and roadstone plus a small tonnage of agstone.

Although the number of active coal mines dropped from nine to five, production increased significantly owing to output of the new strip operation of Walter H. Duncan, Inc. Output from two hand-loaded underground mines and one auger mine comprised 16 and 18 percent, respectively, of the remaining tonnage.

**Mingo.**—Because coal production decreased 11 percent, despite the addition of 46 mines, Mingo County dropped from 7th to 10th place among the coal-producing counties. Total active mines increased to 94, but the additional mines were small, and the leading operators

Digitized by Google

were idle part of the year. The Junior mine of Island Creek Coal Co. was abandoned in April; the Massey Coal Mining Co. No. 1 mine closed temporarily in June; the Ben Creek No. 2 strip mine ceased operation in August; the Alma mine of the Sycamore Coal Co. closed in July; and the S.B. & O. Coal Co. mine was abandoned in January. Of total output, 97 percent was mined at 88 underground mines. Output of five auger and one strip mine comprised the remainder. The largest producers were Island Creek Coal Co., Massey Coal Mining Co., Crystal Block Coal & Coke Co., and Ames Coal Co. Six continuous miners and 50 mobile loading machines loaded 93 percent of the underground coal. Eleven cleaning plants, one less than in 1959, cleaned 91 percent of the coal; 20 percent was crushed.

Engine sand was produced by Guyan Valley Sand Co., Gilbert. Gravel was produced for paving roads by the State Road Commission.

**Monongalia.**—Coal production decreased 5 percent, but the county continued to rank sixth. Almost the entire output came from 64 underground mines, of which the leading were the Christopher Coal Co. Pursglove No. 15, Osage No. 3, Humphrey No. 7, Booth No. 6, and Arkwright No. 1, which combined employed 1,115 men. The Christopher Coal Co. Booth No. 6 mine was abandoned in August, and the South Union Coal Co. No. 11 and No. 12 mines were abandoned in January and April, respectively. The Maiden No. 1 mine of Valley Camp Coal Co. was sold to Petitte Coals, Inc., in August. The number of cleaning plants, which dropped by two to seven, cleaned 70 percent of the coal. Continuous miners, which increased to 29 with the addition of 2 by Christopher Coal Co., loaded 70 percent of the underground coal. Of the remainder, 18 mobile loading machines loaded 26 percent and 4 percent was hand-loaded. Twenty-two percent of the coal was crushed.

Limestone was crushed, mainly for use as concrete aggregate and roadstone, by Greer Limestone Co. in Greer. Lambert Bros, Inc., was not active. Keeley Construction Co. did not operate its sandstone quarry in 1960. The company reported it was no longer in the stone-quarrying business.

Deckers Creek Sand Co. produced glass and engine sands at a stationary plant near Masontown.

**Morgan.**—Production of glass sand by the Pennsylvania Glass Sand Co. Berkeley Works increased slightly. Output was used chiefly for glass manufacture and for grinding for abrasives.

Quartz crystals were collected by Raymond W. Grant near Berkeley Springs.

**Nicholas.**—An additional 20 mines brought the county total to 111 and increased production 3 percent. Ninety-nine underground mines, the largest of which were operated by Maust Coal & Coke Corp., Johnstown Coal & Coke Co., Imperial Smokeless Coal Co., and Sewell Coal Co., mined over nine-tenths of the output. Five strip and seven auger mines produced the remainder. The number of cleaning plants dropped to eight, which prepared slightly over half the total output. Over 80 percent of the underground output was mechanically loaded, of which 71 percent was loaded by 60 mobile loading machines; 16

Digitized by Google

percent, by 131 hand-loaded face conveyors; and 13 percent, by 7 continuous miners. Nineteen percent of the coal was crushed, and 15 percent was treated. The auger mine of Eel River Mining Co. and the strip mine of Quinwood Mining Co. were abandoned in June and December, respectively. Also, Tasa Coal Co. closed its Peerless strip mine.

Building sand was produced by Nettie Sand Co., Nettie. Gravel for fill was produced by the City Engineer of Wheeling.

**Ohio.**—Coal production increased 7 percent. The strip mine of the Jesuit Fathers of Wheeling College was closed. Valley Camp Coal Co. (two mines) and Dependable Coal Co. were active. Virtually all the coal was cleaned by tables and jigs and loaded by six mobile loading machines. Two-thirds was treated with oil, and one-third was crushed.

Sand and gravel was produced by Delta Concrete Co., Wheeling; Ohio River Sand & Gravel Corp., Parkersburg; and the City Engineer of Wheeling, for building and paving.

**Pendleton.**—Because a new quarry was opened by Germany Valley Limestone Co., Riverton, limestone production increased sharply. This company along with Ruddle Lime, Franklin, and North Fork Lime Producers, Riverton, crushed limestone for concrete aggregate and roadstone, agricultural purposes, and rock dust for coal mines.

**Pleasants.**—Sand and gravel was dredged from the Ohio River by Ohio River Sand & Gravel Corp. Output was used mostly for paving. The remainder was used for building, railroad ballast, and fill.

**Pocahontas.**—The same number of coal mines operated as in 1959, but production decreased 17 percent. Nine of the eleven mines were underground mines, whose output composed the major part of total output. Maust Coal & Coke Corp. was the leading underground producer. One strip and one auger mine were operated by Cherry River Coal & Coke Co. and Erickson & Bowers Co., respectively. Four mobile loading machines and 19 hand-loaded face conveyors loaded three-fourths of the underground tonnage. All coal was mined from the Sewell seam, which averaged 40 inches in thickness.

A small tonnage of gravel was produced by the State Road Commission.

**Preston.**—The number of coal mines increased from 91 to 105, and production increased 18 percent. Over two-thirds of the total was mined at 87 underground mines. The remainder was mined by 16 strip and 2 auger mines. Chapel Coal Co., Tri-State Mining Co., and Brookside Mining Co., Inc., were the largest underground producers. The largest strip mine was operated by Kingwood Mining Co. Over half the underground coal was hand-loaded; the remainder was mechanically loaded by 8 mobile loading machines and 21 hand-loaded face conveyors. The No. 4 mine of Fiord Fuel Co. was abandoned in February and the No. 1 mine of Bellfield Coal Co., in May. Both mines employed over 20 men.

Digitized by Google

Output of limestone increased significantly owing to the new operation of Preston Limestone Co., Inc., Kingwood, and greater production by Terra Alta Limestone Co., Aurora. Most of the crushed output was used for concrete and roadstone. A small tonnage was used for agricultural purposes. Irregular-shaped dimension building sandstone was quarried at Aurora by Consolidated Supply Co.

**Putnam.**—Virtually the same tonnage of coal was mined as in 1959 from 18 underground mines (an increase of 3). All the mines were small hand-loading operations producing less than 10,000 tons each. Mining was from the Pittsburgh No. 8 seam which average 63 inches in thickness.

**Raleigh.**—Coal production increased 2 percent, and Raleigh County rose to seventh place despite 17 fewer mines. Ninety-six percent of the output came from 113 underground mines. Six auger mines and five strip mines produced the remainder. Two-thirds of the output was produced by four underground operators: Winding Gulf Coals, Inc. (five mines, two of which were the Eastgulf and Mead No. 4, purchased from C. H. Mead Coal Co. in February), Eastern Gas & Fuel Associates (three mines), Slab Fork Coal Co. (one mine), and Armco Steel Corp. (two mines). Of the underground coal, 70 percent was loaded by 74 mobile loading machines; 13 percent, by 18 continuous miners; 6 percent, by 39 hand-loaded face conveyors. The remainder was hand-loaded into mine cars. Almost two-thirds of the coal was cleaned. Of this amount, 40 percent was cleaned by jigs, 30 percent was wetwashed other than by jigs and 30 percent was cleaned by pneumatic methods. Over 100 men were idled because of mine closings by Raleigh Eagle Coal Co., Sterling Smokeless Coal Co., and Crandon Coal Co. Raleigh Pocahontas Mining Co., a newly organized concern, purchased the Affinity, Killarney, and Lillybrook No. 3 mines, which were closed in 1959 by Lillybrook Coal Co. The new company planned to reactivate the No. 3 mine as soon as possible and install a new preparation plant at the Affinity mine, which would eventually process the coal from all three mines.

Sandstone was crushed for concrete aggregate and roadstone by the Table Rock sand plant, Beaver. Beaver Block Co., Beaver, produced building sand.

**Randolph.**—Because of increased production by Bethlehem Minerals Co. and Peerless Coals, Inc., the county's largest underground mining companies, coal production increased considerably. A total of 22 underground mines produced 83 percent of the total output; 6 strip mines and 3 auger mines produced the remainder. The addition of 1 continuous miner by Peerless Coals, Inc., and 2 by J. T. Coal Co. increased the total to 10, which loaded almost half the underground tonnage. Over one-fourth was loaded by five mobile loading machines; the rest was hand-loaded onto face conveyors and into mine cars. There was no cleaning, but 40 percent of the coal was crushed, and 8 percent was treated with oil.

Elkins Limestone Co. crushed limestone near Elkins chiefly for concrete aggregate and roadstone, plus a small tonnage for road sand.

Digitized by Google

**Roane.**—Sandstone was crushed for concrete aggregate and roadstone by Tri-State Stone Corp. at the Roberts quarry near Spencer and by the State Road Commission.

**Taylor.**—Underground coal production increased 26 percent as Blue Ridge Coal Co., the leading producer, tripled production. Two auger mines were active; none produced in 1959. One-third of the coal was crushed.

The State Road Commission crushed sandstone for concrete aggregate and roadstone. Miscellaneous clay for building brick was mined near Grafton by the Grafton Brick Co.

**Tucker.**—The new Kempton strip operation, opened on January 1 by Douglas Coal Co., Inc., increased coal production significantly. Two hand-loaded underground mines produced only a small part of the total tonnage. Seven power shovels and one dragline were used at the four strip operations.

Fairfax Sand & Crushed Stone Co. produced crushed sandstone near Thomas for concrete aggregate and roadstone.

**Tyler.**—Sand and gravel was dredged from the Ohio River by the Ohio River Sand & Gravel Corp. Paving uses consumed most of the output; railroad ballast and fill, the remainder. Crushed sandstone for State roads was produced by the State Road Commission.

**Upshur.**—Underground mining increased 8 percent, but owing to decreased strip and auger output, there was little change in overall production. Eighty-five percent of the underground coal was mechanically loaded at 4 of the 27 underground mines. Seven mobile loading machines and two continuous miners were active. Reppert Fairmont Coal Co. and Pecks Run Coal Co. were the leading producers. Four cleaning plants prepared 71 percent of the output. Two-thirds was crushed, and a small tonnage was treated.

Corhart Refractories Co., a subsidiary of Corning Glass Works, announced plans in October for constructing a new refractories plant at Buckhannon that would employ 60 persons.

**Wayne.**—Decreased output by the four underground mines dropped coal production by one-third. Traction and building sands were dredged from the Big Sandy River near Fort Gay by Laval Sand Co., Inc.

**Webster.**—Output from nine additional mines increased coal production. Twenty underground mines produced most of the coal output. One auger mine also was in operation. The Sewell seam was mined solely. Johnstown Coal & Coke Co., the leading producer, operated the only cleaning plant in the county. Four mobile loading machines and 4 continuous miners were used. Williams River Coal Co. merged with Johnstown Coal & Coke Co. in July.

Basil R. Heavner operated a portable crusher near Bolair and crushed sandstone for concrete aggregate and roadstone.

**Wetzel.**—Sand and gravel production was less than half that of 1959 as the Ohio River Sand & Gravel Corp. did not operate in 1960. The Ohio Valley Sand Co. dredged sand and gravel near New Martinsville. Building sand comprised over three-fourths of the output:

Digitized by Google

the remainder was used for paving. Crushed sandstone and gravel for concrete aggregate and roadstone was produced by the State Road Commission.

**Wirt.**—Tri-State Stone Corp. continued operations at the Vandall quarry near Elizabeth and crushed sandstone for concrete aggregate and roadstone.

**Wood.**—Production of sand and gravel by Pfaff & Smith Builders Supply Co., Charleston, and Kanawha Sand Co., and Ohio River Sand & Gravel Corp., Parkersburg, decreased one-third. Output was mainly for building and paving. Railroad ballast and fill uses constituted the remainder.

**Wyoming.**—Wyoming County continued to rank third as a coal-producing county. Although the number of mines increased by 27 to 93, production decreased 2 percent. Eighty-three underground mines produced over nine-tenths of the tonnage. Of this quantity, nearly two-thirds was mined by Eastern Gas & Fuel Associates, Pocahontas Fuel Co., Semet Solvey Division of Allied Chemical Corp., and Island Creek Coal Co. Six strip mines and four auger mines furnished the remainder. The Glen Rogers mine of Raleigh-Wyoming Mining Co. was closed indefinitely in July, idling 196 men. Over two-thirds of the coal was cleaned at 17 plants; 23 percent was crushed; and 14 percent was treated, mainly with oil. Continuous miners increased by 12 to 36 and loaded over one-fourth of the underground coal. Two-thirds was loaded by 122 mobile loading machines; duckbills and hand loading onto face conveyors and into mine cars supplied the remainder. The 82 mother conveyors, averaging 1,517 feet in length, in use ranked Wyoming County second only to Kanawha County in the number of mother conveyors.

Engine sand was produced by Casto & Lackney Sand Co. near Kimball.

# The Mineral Industry of Wisconsin

**This chapter has been prepared under a cooperative agreement for collection of mineral data between the Bureau of Mines, U.S. Department of the Interior, and the Geological Survey of Wisconsin.**

By Samuel A. Gustavson [1]

MINERAL output of Wisconsin was valued at $77.2 million in 1960, exceeding the 1959 high of $72 million. Nonmetals represented about three-fourths of this total, and sales of these minerals were generally at about the same level as, or slightly less than, in 1959. The increased total mineral value for the State in 1960 can be attributed to increased production of lead, zinc, and iron ore.

**Consumption, Trade, and Markets.**—Sand and gravel production, especially for highway use, declined slightly from 1959. However, the State Highway Commission indicated that this decrease could be attributed more to the stage of road construction than to decline in activity. Proportionally less fill and subsurface work was done compared with surfacing and finishing. Declining sales of abrasive stones reflected strong competition from foreign grinding pebbles and synthetic grinding stones. Sales of most other nonmetallic minerals were little changed from the previous year. Relatively

**TABLE 1.—Mineral production in Wisconsin [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Abrasive stones: Pebbles (grinding) and tube-mill liners—short tons | 770 | $27 | 397 | $12 |
| Clays—thousand short tons | 178 | 192 | 144 | 156 |
| Iron ore (usable)—thousand long tons, gross weight | 701 | (2) | 1,502 | (2) |
| Lead (recoverable content of ores, etc.)—short tons | 745 | 171 | 1,165 | 273 |
| Peat—do | 7,500 | (2) | 8,500 | (2) |
| Sand and gravel—thousand short tons | 41,999 | 27,535 | 35,681 | 25,648 |
| Stone—do | 13,522 | 23,782 | 16,486 | 22,302 |
| Zinc (recoverable content of ores, etc.)—short tons | 11,635 | 2,676 | 18,410 | 4,750 |
| Value of items that cannot be disclosed: Cement, lime, and values indicated by footnote 2 | | 18,541 | | 25,619 |

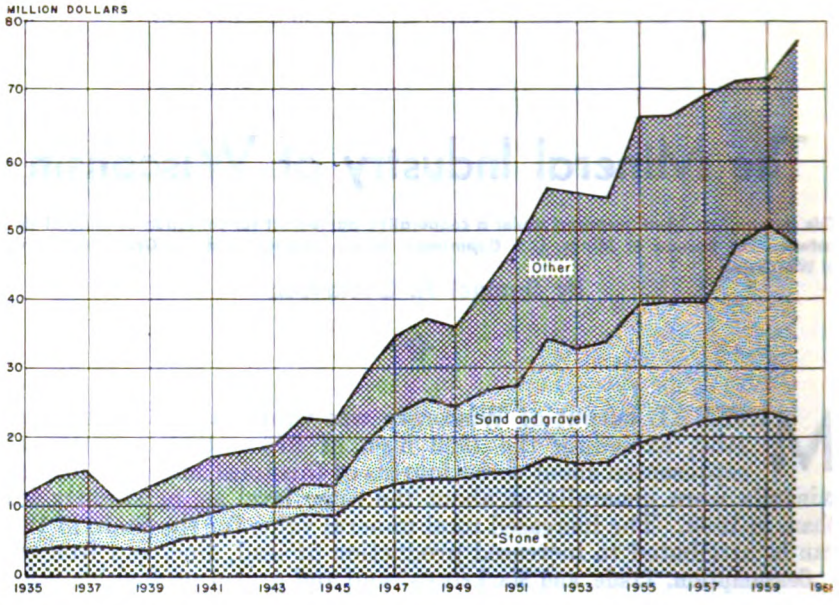

FIGURE 1.—Value of sand and gravel, stone, and total value of all minerals produced in Wisconsin, 1935–60.

stable zinc and lead prices and nearly continuous operation by two major companies in southern Wisconsin resulted in substantially greater output of these two metals in 1960. Demand for iron ore was strong at the beginning of the season as a result of the previous year's extended strike. However, expected demand for steel did not develop, and the shipping season closed early because of high iron-ore stock levels at lower ports. Even with early closing of the season, shipments of iron ore were double those of 1959 and about average for the last 10-year period.

**Trends and Developments.**—There was no exploratory drilling for iron ore in Ashland, Bayfield, or Iron Counties. Work on lower-grade magnetic iron-ore deposits in the vicinity of Butternut in Ashland County was reportedly abandoned.

Cerro Corp. ceased exploration for copper in Douglas County; however, Bear Creek Mining Co., a subsidiary of Kennecott Copper Corp., continued exploration on property owned by Douglas County.

The New Jersey Zinc Co. was driving an inclined tunnel to a zinc deposit south and east of Platteville. Plans to construct a mill at the site were deferred.

[7] Excludes quarries producing limestone used exclusively in manufacturing cement and lime.
[8] Preliminary figures.

# REVIEW BY MINERAL COMMODITIES

## NONMETALS

**Abrasive Stones.**—Production and sales of grinding pebbles and tube-mill liners were less than half those of 1959, as lower-cost pebbles imported from Europe and synthetic materials manufactured in the United States continued to capture an increasing percentage of the market. The Baraboo Quartzite Co. manufactured these items from a hard quartzite deposit near Baraboo in Sauk County. Tubemill liners are cut to specifications furnished by the buyer. Grinding pebbles are usually cut to standard sizes. Grinding pebbles are made by first cutting the quartzite into cubes of the desired size. These cubes are then placed in a grinding mill, where the corners are rounded.

**Cement.**—Total sales of portland cement produced by plants in Wisconsin were about 5 percent under 1959 sales; however, sales within the State remained about the same. The Manitowoc Portland Cement Co., a subsidiary of Medusa Portland Cement Co., manufactured cement at Manitowoc, using limestone from Michigan and locally obtained clay. The company had four kilns and used a wet process. The Marquette Cement Manufacturing Co. of Chicago, at Milwaukee, produced cement, using limestone from Michigan and shale from Illinois. The company had one large kiln and used a dry process. Cement clinker was shipped in from Michigan by Universal Atlas Cement Co. and ground at a plant in Milwaukee. The Huron Portland Cement Co. maintained storage silos at Milwaukee and Green Bay for cement made at its plant in Michigan.

Digitized by Google

All cement produced in the State was of types I and II, general use and moderate heat. Some masonry cement was made at the Milwaukee plant. Capacity of the two producing plants had not changed since 1957. The average mill value per 376-pound barrel of portland cement was slightly over $3.30.

**Clays.**—Production of miscellaneous clay or shale in 1960 was reported by the same eight companies and from the same pits in seven counties as in 1959. All output was consumed by the producers. The Manitowoc Portland Cement Co., at Manitowoc, used clay in the manufacture of cement. Output for this purpose was slightly less than in the previous year. Other producers used clay in the manufacture of building brick or draintile. Consumption for brick and tile manufacture was also slightly less than in 1959.

**Lime.**—There was virtually no change in the output or value of quicklime and hydrated lime in 1960. Production was from the same six plants. The Western Lime and Cement Co. operated one plant each in Brown, Dodge, and Fond du Lac Counties; the Mayville White Lime Works operated in Dodge County; Cutler-LaLiberte-McDougall Corp. in Douglas County; and Rockwell Lime Co. in Manitowoc County. Lime, in order of decreasing quantities, was used for the following purposes: Paper manufacture, mason's lime in the building industry, water purification, metallurgy, agriculture, insecticides, polishing compounds, paints, sewage disposal, plastics, and tanneries. About 23 percent of all the quicklime was hydrated. Hydrated lime represented about 28 percent of the total weight of quicklime and hydrated lime shipped in Wisconsin in 1960.

**Perlite.**—Crude perlite from Colorado and New Mexico was expanded in plants of the Western Mineral Products Co. at Milwaukee and the Midwest Perlite Co. at Applington. Expanded perlite was used chiefly in lightweight plaster and concrete. Vermiculite from Montana also was expanded by Western Mineral Products Co. It was used as insulation and as a lightweight aggregate.

**Sand and Gravel.**—The quantity and value of sand and gravel output declined to 35.7 million tons and $25.6 million, respectively, decreases of 15 and 7 percent from 1959. Most of the decline was explained by the Wisconsin State Highway Commission as a "stage of road construction." During the year much of the highway construction was that of finishing and surfacing. Sand and/or gravel in the past had been produced in every county. In 1960 operators reported production from 63 counties; several operators did not designate the source of their output. Most of the production, 71 percent, was for highway use; 18 percent was for building uses. The quantity and value of sand and gravel sold for building uses was little changed from the previous year, indicating a virtually unchanged level of building construction and continued keen competition for work, unit values did not increase with labor and operating costs.

Demand for industrial sand increased slightly over 1959, approaching $3 million. Uses of industrial sand included foundry, engine, blast, filter, and hydrofractionating. Most of the industrial sands were produced from surface or near-surface deposits in Clark, Portage, Sauk, and Wood Counties. Preparation of industrial sands for

marketing usually required special equipment for sizing and removing contaminants if the deposit were not free of contaminants.

The 10 leading commercial operators were: Consumers Co., Division of Vulcan Materials Co., Chicago; Courtney & Plummer, Inc., Neenah; Janesville Sand & Gravel Co. and Wm. J. Kennedy & Son, Janesville; Edward Kraemer & Sons, Inc., Plain; C. C. Linck, Inc., Beaver Dam; Arthur Overgaard, Inc., Elroy; Ozaukee Sand & Gravel Co., Milwaukee; H. Turner & Son, Boscobel; and Wissota Sand & Gravel Co., Eau Claire.

**Stone.**—Limestone deposits are widespread throughout the southern two-thirds of the State. Thinly bedded limestone deposits, chiefly in eastern Wisconsin, yielded dimension stone of good quality for building, construction, and house veneer. Most of the quarries of companies producing dimension limestone were in Waukesha County.

Digitized by Google

Others produced dimension limestone from quarries in Brown, Door, Fond du Lac, Manitowoc, and Milwaukee Counties in the eastern portion of the State, and one company operated in each of Juneau, La Crosse, and St. Croix Counties in the western part of the State. Commercial and noncommercial producers indicated output of crushed and broken limestone from quarries in 42 counties. Some reporting companies did not designate the locations of their quarries. About 88 percent of the crushed and broken limestone was used for concrete aggregate and roadstone and about 8 percent for agricultural purposes. Uses of the remaining 4 percent, in order of magnitude of tonnages sold, were: riprap, railroad ballast, lime, metallurgical flux and other metallurgical, asphalt filler, filter beds, fertilizer filler, and chemical (paper mills).

There was a declining market for dimension limestone, which had a high unit value. Tonnages of crushed limestone sold for most uses also declined in 1960. Several companies reported that sales of agricultural limestone were as much as 20 percent less than in the previous year. However, sales of crushed limestone for highway and building construction increased about 3 million tons, resulting in a net increase in tonnage of limestone produced, although the total value of limestone sold was about the same as in 1959.

The 10 leading commercial producers of crushed and broken limestone, listed alphabetically, were: Badger Highways Co., Inc., Menasha; Consumers Co., Division of Vulcan Materials Co., Chicago; Courtney & Plummer, Inc., Neenah; Fond du Lac Stone Co., Inc., Fond du Lac; Halquist Lannon Stone Co., Sussex; Edward Kraemer & Sons, Inc., Plain; Arthur Overgaard, Inc., Elroy; Quality Limestone Products, Inc., Sussex; H. Turner & Sons, Boscobel; and Waukesha Lime & Stone, Inc., Waukesha.

Digitized by Google

Granite, quarried chiefly for building and monumental uses, was produced in Marathon, Marquette, and Waushara Counties. Some of the material was sold as rough blocks, and some rough blocks were shipped to finishing plants in Minnesota. Most of the granite, however, was cut and polished in plants near the quarries. Trimmings and pieces not suitable for dimension purposes were crushed for local use as concrete aggregate. In Marathon County, decomposed granite from weathered outcroppings was excavated and sold locally as a road-surfacing material.

Deposits of sandstone, quartzite, andesite, argillite, and basalt were also operated in the State. Dimension sandstone was sold chiefly for flagging and rough construction uses. One quartzite deposit was quarried to produce grinding pebbles and tubemill liners. Most of the quartzite produced was ground and sized for use in the manufacture of sandpaper or refractory brick. Andesite and argillite served as a raw material in the manufacture of roofing granules.

## METALS

**Iron Ore.**—Shipments of iron ore were more than double those of 1959, when production was adversely affected by a 116-day strike. Wisconsin production was chiefly from two underground mines on the Gogebic Range in Iron County. They were the Montreal mine, operated by Oglebay, Norton & Co., and the Cary mine, operated by Pickands Mather & Co. Ore from these two mines was of direct-shipping grade. Some iron-ore concentrates were produced and shipped from stockpiles at the Badger and Meress mines in Florence County by Zontelli Brothers Division of Pittsburgh Pacific Co. These stockpiles were reported as depleted by the company in 1960. Ore from the Montreal and Cary mines was shipped to ports at Ashland, Wis., or Escanaba, Mich., for lake transport to consumers. In 1960, because of adjustments in freight rates, more than half of the ore was shipped through Escanaba. Ore from the Badger and Meress mines was shipped through the port at Escanaba.

Base prices per long ton for iron ores were unchanged from those posted January 30, 1957, as follows: High Phosphorus, $11.45; Mesabi Non-Bessemer, $11.45; Mesabi Bessemer and Old Range Non-Bessemer, $11.70; and Old Range Bessemer, $11.85. Prices for iron ore included all shipping costs from the mines to lower Lake ports; these costs do not appear in the total value of iron-ore output of Wisconsin. The base prices were for ores grading 51.50 percent iron (natural)

TABLE 5.—Iron-ore production and shipments

| Year | Number of mines | Production (thousand long tons) | Shipments (thousand long tons) | Iron content of shipments natural (percent) |
|---|---|---|---|---|
| 1956 | 3 | 1,551 | 1,488 | 52.49 |
| 1957 | 3 | 1,618 | 1,576 | 52.32 |
| 1958 | 2 | 1,152 | 867 | 53.72 |
| 1959 | 4 | 944 | 701 | 53.39 |
| 1960 | 4 | 1,484 | 1,502 | 53.50 |

Digitized by Google

and for Bessemer ores less than 0.045 percent phosphorus (dry). Ores higher than 0.18 percent phosphorus (dry) were classed as High Phosphorus. Variations in grade from this base and diversities in physical structure from established norms called for premiums or penalties.

Shipments of iron ore from Ashland started April 17 and ended November 6; those from Escanaba started March 28 and ended November 17. The closing dates for iron-ore shipping were unusually early and reflect the lack of demand for steel in the latter half of the year.

**Lead and Zinc.**—Lead and zinc production increased 56 and 58 percent, respectively, over 1959. Eagle-Picher Co. operated its Shullsburg mine and mill continuously, the Birkett-Bastian-Andrews mine from January through November 4th with the exception of the period October 1–31 during a labor strike and the Kickapoo-Alden Thomson mine and Linden mill from March through September. Vinegar Hill Division, American Zinc, Lead and Smelting Company operated its mill and the Blackstone, Temperly, and Thompson mines continuously and the Hancock mine from August through December. Piquette Mining Co. operated its mine and mill from January to July. A small tonnage of ore was shipped by the Mifflin Mining Co. All mines except the Shullsburg operation of Eagle-Picher Co. had been idle during most of 1959.

A report on shallow lead diggings in Grant and Lafayette Counties based on work done in 1947–49 was published.[2]

Average weighted prices per pound used to calculate the values of lead and zinc in table 1 in 1960 were, respectively, 11.7 and 12.9 cents. The average price used in 1959 was 11.5 cents for both metals. There was little fluctuation in prices in 1960. Lead quotations, per pound New York, opened at 12 cents, remained at that level through December 12, and were 11 cents beginning December 13 to the end of the year. Zinc quotations, per pound East St. Louis, opened at 12.5 cents, rose to 13 cents January 8, declined to 12.5 cents December 13, and to 12 cents December 19.

**TABLE 6.—Mine production of lead and zinc, in terms of recoverable metals**

## REVIEW BY COUNTIES

Sand and gravel or crushed limestone for use in construction and roadbuilding was produced in virtually every county. Reports received for 1960 indicated production of one or both of these mineral commodities for 69 of the 71 counties. Several of the larger road-building contractors, who operated portable plants, did not indicate the county source on their reports. Among the commercial operators, 192 produced sand and gravel and 113 produced crushed limestone. Noncommercial or Government-and-contractor operators included State and county highway departments, cities, towns, and full-time contractors for Federal or State projects. Production of minerals other than sand and gravel or crushed limestone was reported from only 30 counties. These minerals included dimension stone (limestone, granite, sandstone, and quartzite), special sands, marble, andesite, marl, and peat in the nonmetals group and zinc, lead, and iron ores among the metals.

**Ashland.**—No new work was reported at the low-grade magnetic iron deposit near Butternut, and plans for bringing the property into production were deferred.

**Bayfield.**—A dolomitic marble deposit was quarried near Grand View by Wisconsin Marble Heights Quarries, Inc. The product was crushed and sold as chips for manufacture of a synthetic stone.

**Brown.**—Production of sand and gravel and crushed limestone for roadwork was reported by 12 operators. Among the largest producers were Allard & Van Nelson, Daanen & Janssen, Fred Kropp, Schuster Construction Co., W. B. Sheedy, Vic Zeman, Scray Quarries, and Village of Howard Highway Department.

Miscellaneous clay for brick and other heavy clay products was produced by Duck Creek Brick Co. and Hockers Brothers Brick & Tile Co.

Western Lime & Cement Co., Milwaukee, made quicklime and hydrated lime at its plant in Green Bay.

**Buffalo.**—Crushed limestone for roads and agricultural uses was the only mineral production reported for the county. Herbert Tiffany, Jr., and Neuheisel Lime Works accounted for most of the production.

**Calumet.**—Sand and gravel was produced by Sell Brothers Stone & Gravel Co., Quality Sand & Gravel Co., and Arnold M. Ortlepp. Sand and gravel and limestone were produced by the Calumet County Highway Department.

615629—61——73

Digitized by Google

and for Bessemer ores less than 0.045 percent phosphorus (dry). Ores higher than 0.18 percent phosphorus (dry) were classed as High Phosphorus. Variations in grade from this base and diversities in physical structure from established norms called for premiums or penalties.

Shipments of iron ore from Ashland started April 17 and ended November 6; those from Escanaba started March 28 and ended November 17. The closing dates for iron-ore shipping were unusually early and reflect the lack of demand for steel in the latter half of the year.

**Lead and Zinc.**—Lead and zinc production increased 56 and 58 percent, respectively, over 1959. Eagle-Picher Co. operated its Shullsburg mine and mill continuously, the Birkett-Bastian-Andrews mine from January through November 4th with the exception of the period October 1–31 during a labor strike and the Kickapoo-Alden Thomson mine and Linden mill from March through September. Vinegar Hill Division, American Zinc, Lead and Smelting Company operated its mill and the Blackstone, Temperly, and Thompson mines continuously and the Hancock mine from August through December. Piquette Mining Co. operated its mine and mill from January to July. A small tonnage of ore was shipped by the Mifflin Mining Co. All mines except the Shullsburg operation of Eagle-Picher Co. had been idle during most of 1959.

A report on shallow lead diggings in Grant and Lafayette Counties based on work done in 1947–49 was published.[2]

Average weighted prices per pound used to calculate the values of lead and zinc in table 1 in 1960 were, respectively, 11.7 and 12.9 cents. The average price used in 1959 was 11.5 cents for both metals. There was little fluctuation in prices in 1960. Lead quotations, per pound New York, opened at 12 cents, remained at that level through December 12, and were 11 cents beginning December 13 to the end of the year. Zinc quotations, per pound East St. Louis, opened at 12.5 cents, rose to 13 cents January 8, declined to 12.5 cents December 13, and to 12 cents December 19.

**TABLE 6.—Mine production of lead and zinc in terms of recoverable metals**

| Year | Mines producing | | Material treated | | Lead | | Zinc | | Total value |
|---|---|---|---|---|---|---|---|---|---|
| | Lode | Tailings | Ore (short tons) | Tailings (short tons) | Short tons | Value | Short tons | Value | |
| 1951–55 (average) | 18 | 6 | [illegible] | [illegible] | [illegible] | [illegible] | [illegible] | [illegible] | [illegible] |
| 1956 | 14 | 5 | [illegible] | [illegible] | [illegible] | [illegible] | [illegible] | [illegible] | [illegible] |

| June | 110 | 1,750 | | | |
| July | 80 | 1,320 | Total | 1,165 | 18,410 |

## REVIEW BY COUNTIES

Sand and gravel or crushed limestone for use in construction and roadbuilding was produced in virtually every county. Reports received for 1960 indicated production of one or both of these mineral commodities for 69 of the 71 counties. Several of the larger road-building contractors, who operated portable plants, did not indicate the county source on their reports. Among the commercial operators, 192 produced sand and gravel and 113 produced crushed limestone. Noncommercial or Government-and-contractor operators included State and county highway departments, cities, towns, and full-time contractors for Federal or State projects. Production of minerals other than sand and gravel or crushed limestone was reported from only 30 counties. These minerals included dimension stone (limestone, granite, sandstone, and quartzite), special sands, marble, andesite, marl, and peat in the nonmetals group and zinc, lead, and iron ores among the metals.

**Ashland.**—No new work was reported at the low-grade magnetic iron deposit near Butternut, and plans for bringing the property into production were deferred.

**Bayfield.**—A dolomitic marble deposit was quarried near Grand View by Wisconsin Marble Heights Quarries, Inc. The product was crushed and sold as chips for manufacture of a synthetic stone.

**Brown.**—Production of sand and gravel and crushed limestone for roadwork was reported by 12 operators. Among the largest producers were Allard & Van Nelson, Daanen & Janssen, Fred Kropp, Schuster Construction Co., W. B. Sheedy, Vic Zeman, Scray Quarries, and Village of Howard Highway Department.

Miscellaneous clay for brick and other heavy clay products was produced by Duck Creek Brick Co. and Hockers Brothers Brick & Tile Co.

Western Lime & Cement Co., Milwaukee, made quicklime and hydrated lime at its plant in Green Bay.

**Buffalo.**—Crushed limestone for roads and agricultural uses was the only mineral production reported for the county. Herbert Tiffany, Jr., and Neuheisel Lime Works accounted for most of the production.

**Calumet.**—Sand and gravel was produced by Sell Brothers Stone & Gravel Co., Quality Sand & Gravel Co., and Arnold M. Ortlepp. Sand and gravel and limestone were produced by the Calumet County Highway Department.

**TABLE 8.—Value of mineral production in Wisconsin, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Adams | (2) | (2) | Sand and gravel. |
| Ashland | (2) | | |
| Barron | (2) | $193,833 | Sand and gravel. |
| Bayfield | (2) | (3) | Stone. |
| Brown | $1,230,889 | 1,083,562 | Sand and gravel, lime, stone, clays. |
| Buffalo | (2) | (2) | Stone. |
| Burnett | 171,790 | 59,055 | Sand and gravel. |
| Calumet | 187,506 | 246,297 | Sand and gravel, stone. |
| Chippewa | 19,730 | 18,170 | Sand and gravel. |
| Clark | 129,891 | 450,605 | Sand and gravel, stone. |
| Columbia | (2) | 1,478,915 | Stone, sand and gravel. |
| Crawford | 203,268 | 213,875 | Do. |
| Dane | 1,683,855 | 1,809,914 | Sand and gravel, stone. |
| Dodge | 797,975 | 1,336,528 | Sand and gravel, lime, stone. |
| Door | (2) | 358,349 | Sand and gravel, stone. |
| Douglas | (2) | (2) | Lime, sand and gravel. |
| Dunn | 332,212 | 175,073 | Sand and gravel, stone, clays. |
| Eau Claire | (2) | (2) | Sand and gravel, stone. |
| Florence | (2) | (2) | Iron ore. |
| Fond du Lac | 1,095,429 | 1,319,331 | Stone, sand and gravel, lime, clays. |
| Forest | 64,549 | 84,170 | Sand and gravel. |
| Grant | 533,900 | 886,350 | Stone, zinc, lead, sand and gravel. |
| Green | 493,623 | 388,639 | Stone, sand and gravel. |
| Green Lake | 259,798 | 234,564 | Sand and gravel, stone. |
| Iowa | 442,018 | 637,010 | Stone, zinc, sand and gravel, lead. |
| Iron | (2) | (2) | Iron ore, sand and gravel. |
| Jackson | 111,500 | (2) | Sand and gravel. |
| Jefferson | 160,247 | 159,124 | Sand and gravel, stone. |
| Juneau | (2) | (2) | Stone, sand and gravel. |
| Kenosha | 426,650 | 232,584 | Sand and gravel. |
| Kewaunee | 98,226 | 127,411 | Do. |
| La Crosse | 94,509 | 102,628 | Sand and gravel, stone. |
| Lafayette | (2) | (2) | Zinc, lead, stone. |
| Langlade | 295,895 | 284,607 | Sand and gravel. |
| Lincoln | (2) | 137,940 | Sand and gravel, stone. |
| Manitowoc | (2) | (2) | Cement, sand and gravel, lime, stone, clays. |
| Marathon | 6,691,290 | 2,854,133 | Stone, sand and gravel, clays. |
| Marinette | (2) | (2) | Stone, sand and gravel. |
| Marquette | (2) | 265,211 | Do. |
| Milwaukee | 5,637,496 | 5,568,869 | Cement, stone, sand and gravel. |
| Monroe | 85,729 | 103,167 | Stone. |
| Oconto | 314,934 | 148,759 | Sand and gravel. |
| Oneida | 142,622 | 150,665 | Sand and gravel, stone. |
| Outagamie | 323,900 | 497,070 | Do. |
| Ozaukee | 89,895 | 195,425 | Sand and gravel. |
| Pepin | (2) | 5,303 | Stone, sand and gravel. |
| Pierce | 340,279 | 417,109 | Sand and gravel, stone. |
| Polk | 677,199 | 496,112 | Stone, sand and gravel. |
| Portage | 410,472 | (2) | Sand and gravel, stone. |
| Price | 1,699 | 3,154 | Sand and gravel. |
| Racine | 1,677,608 | 1,822,205 | Stone, sand and gravel, clays. |
| Richland | (2) | (2) | Stone, sand and gravel. |
| Rock | 1,325,628 | 1,533,220 | Sand and gravel, stone. |
| Rusk | 80,650 | 83,022 | Sand and gravel. |
| St. Croix | 696,716 | 677,456 | Sand and gravel, stone. |
| Sauk | 1,242,697 | 1,738,637 | Stone, sand and gravel, abrasives. |
| Sawyer | 68,671 | 63,323 | Sand and gravel. |
| Shawano | 474,010 | 469,224 | Sand and gravel, stone. |

| Taylor | (2) | 189,777 | Sand and gravel. |
| Trempealeau | (2) | (2) | Stone. |
| Vernon | (2) | (2) | Stone, sand and gravel. |
| Vilas | 56,500 | 63,135 | Sand and gravel. |
| Walworth | 272,109 | 591,872 | Do. |
| Washburn | | 71,034 | Do. |
| Washington | 1,029,451 | 1,235,010 | Sand and gravel, stone. |
| Waukesha | 6,382,187 | 5,848,522 | Sand and gravel, stone, peat. |
| Waupaca | (2) | 115,365 | Stone, sand and gravel, clays. |
| Waushara | (2) | (2) | Sand and gravel, stone. |
| Winnebago | 1,884,696 | 2,262,803 | Do. |
| Wood | (2) | (2) | Stone. |
| Undistributed[3] | 33,831,446 | 38,788,005 | |
| Total[4] | 71,959,000 | 77,171,000 | |

[1] No production reported for Washburn County (1959).
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Includes some sand and gravel and stone that cannot be assigned to specific counties and values indicated by footnote 2.
[4] Total adjusted to eliminate duplicating value of clays and stone.

Digitized by Google

**Clark.**—Sand and gravel was produced by three companies. The largest producer was Plautz Brothers Sand & Gravel Co. The Clark County Highway Department also produced sand and gravel. Sandstone produced by Ellis Quarries, Inc., was used for building, construction, and flagging.

**Columbia.**—Several companies produced sand and gravel, the largest being C. C. Linck, Inc., followed by A. T. Riese Trucking Co. and Columbia Ready Mix Co. The Columbia County Highway Department also was a large producer of sand and gravel.

Crushed limestone and dolomite were produced by Dann & Wendt and Edward Kraemer & Sons, Inc.

Portage-Manley Sand Co., Rockton, Ill., produced high-quality glass and foundry sand from a quarry near Portage. Representative samples of this sandstone contained more than 99.5 percent silica. The quarry face stood vertically and was about 75 feet high. Overburden was up to 50 feet deep. Only moderate blasting was necessary.

**Crawford.**—Sand and gravel was produced by the Prairie Sand & Gravel, Inc., and Lakeside Sand & Gravel. Limestone and dolomite were produced by Edward Kraemer & Sons, Inc., Loren J. Slaght, and Velmer Monroe.

**Dane.**—This county was the leading producer of crushed limestone. It also produced sand and gravel.

Leading producers of crushed limestone included Madison Stone Co., Inc., Hammersley Stone Co., Inc., Baumgardt Construction Co., and Melvin Paulson.

The larger sand and gravel producers included C. C. Linck, Inc., Wingra Stone, Capitol Sand & Gravel Co., Madison Sand & Gravel Co., Hartland-Verona Gravel Co., and General Silica Co.

**Dodge.**—Mayville White Lime Works, Mayville, and Western Lime & Cement Co., Milwaukee, produced limestone for lime, metallurgical use, and roadstone. The former made quicklime at its plant near Mayville; most of the quicklime is used in preparing a barn disinfectant. Western Lime & Cement Co. manufactured quicklime and hydrated lime at its Knowles plant.

Larger operators producing sand and gravel included C. C. Linck, Inc., Linck & Henes, and the Dodge County Highway Department.

**Door.**—Sand and gravel and crushed limestone were produced. Vernon E. Olsen Excavating Co. and the Door County Highway Department were the larger producers of sand and gravel. The highway department and Adamski-Fisher Quarry produced crushed limestone.

**Douglas.**—Quicklime and hydrated lime were manufactured at a plant in Superior, Wis. by Cutler-LaLiberte-McDougall Corp., Duluth, Minn. The plant was equipped with two rotary kilns. Limestone was purchased in Michigan.

Some sand and gravel was produced by the Douglas County Highway Department and the Superior City Engineer.

**Dunn.**—Sand and gravel was produced by Edward Kraemer & Sons, Inc., and the Red Cedar Sand & Gravel Co.

Limestone was produced by the Barron County Agricultural Agent for agricultural uses. The Menomonie Brick Co. made building brick from clay mined near Menomonie.

Digitized by Google

**Eau Claire.**—Eau Claire Sand & Gravel Co. mined and prepared industrial sand for blast, engine, filter, and foundry uses at its plant in Eau Claire. The company also produced sand and gravel for building and highway construction. One of the largest producers of sand and gravel for construction and highway use was the Wissota Sand & Gravel Co.

**Florence.**—Zontelli Brothers Division of Pittsburgh Pacific Co. produced iron ore from stockpiles of the Badger and the Meress open pit mines on the Menominee Range near Florence. The company reported depletion of these stockpiles during 1960.

**Fond du Lac.**—The larger producers of sand and gravel included Braun Construction Co., M. A. Leiberg, and the Fond du Lac County Highway Department.

Larger producers of crushed limestone were Fond du Lac Stone Co., Hamilton Stone Co., Elmer Dais Stone Co., C. C. Linck, Inc., Nellis Stone Quarry, Inc., Waupun Ready-Mix Concrete Corp., Western Lime & Cement Co., Oakfield Stone Quarry, and Edward Kraemer & Sons, Inc.

The Oakfield Shale Brick & Tile Co., mined clay for the manufacture of heavy clay products, and Western Lime & Cement Co. quarried limestone to make both quicklime and hydrated lime.

**Grant.**—The Piquette mine and mill, the county's only producer of lead and zinc, after reopening December 7, 1959, operated continuously until the early part of July. The company sold its jig tailings for road use.

A small quantity of sand and gravel was produced by Becker & Tuckwood.

The principal producers of crushed limestone for road use included Becker & Tuckwood, Dell Needham, George Wendtlandt, Bertie & Russell Zenz, and Harry Croft & Sons.

**Green.**—Crushed limestone and dolomite and sand and gravel were produced. The chief producers of crushed limestone were P. W. Ryan Sons, Inc., and Rees Construction Co.

Sand and gravel was produced by Henry Altman and Green County Sand & Gravel Co.

**Green Lake.**—Molding sand was produced by Chier St. Marie Sand Co. and Clifford Chier Sand Co. The larger sand and gravel producers for highway use were Paul Polenska & Son, Kopplin & Kinas Co., Inc., and the Green Lake County Highway Commission.

Crushed limestone was produced by Gaastru Brothers.

**Iowa.**—The Eagle-Picher Co. operated the Kickapoo-Alden Thomson mine and Linden mill from March through September for the production of zinc and lead ores. Mifflin Mining Co. shipped a small quantity of zinc ore from the Bickford-Coker mine.

Crushed limestone for building and highway construction was produced by several companies. The larger included Ivey Construction Co., George Wendtlandt, and the Iowa County Highway Department.

A relatively small quantity of sand and gravel was sold by Davis & Richardson.

**Iron.**—Most of the iron-ore production from the State came from two underground mines operated in this county—the Montreal mine, operated by Oglebay Norton & Co., and the Cary mine, operated by

Digitized by Google

Pickands Mather & Co. Output was about the average for the last 10-year period and about double that of 1959, when an abnormally low production was reported as a result of a 116-day strike. Most of the ore from the Cary mine was shipped via Escanaba, Mich., and that from the Montreal mine through the Ashland, Wis., port.

Edward Kraemer & Sons, Inc., produced sand and gravel for highway construction.

**Jackson.**—Sand and gravel for building and road use was produced by Laurence Murphy and H. T. Smith.

**Jefferson.**—Sand and gravel and crushed limestone were produced for road use, chiefly by the Jefferson County Highway Commission and Rude Sand & Gravel.

**Juneau.**—Limestone was quarried for use as flagging by the Lone Rock Stone Quarry.

Arthur Overgaard Co. produced crushed stone for highway use and agricultural purposes. This company had seven portable crushing units. The Juneau County Highway Commission produced sand and gravel.

**Kenosha.**—Gravel for road construction was produced by Consumers Co., Division of Vulcan Materials, Chicago, and Bloss Sand & Gravel. Limestone was produced by the Kenosha County Highway Department.

**Kewaunee.**—Schuster Construction Co. produced sand and gravel for highway purposes.

**La Crosse.**—Dimension limestone was produced by Herbert Hass of La Crosse.

Sand and gravel was produced by Kammel-Smith Sand & Gravel Co., La Crosse Sand & Gravel Co., and the county highway department.

**Lafayette.**—The Eagle-Picher Co. and Vinegar Hill Division, American Zinc, Lead and Smelting Company were the only lead and zinc mine operators in the county. Eagle-Picher Co., except for a labor strike October 1st to October 31st, operated the Shullsburg mine and mill throughout the year, and the Birkett-Bastian-Andrews mine from January through November 4th. The Birkett-Bastian-Andrews ore was shipped for concentration to the company's Graham mill in Illinois. Vinegar Hill Division, American Zinc, Lead and Smelting Company operated the Blackstone, Hancock, Thomson, and Temperly mines. The Hancock mine was operated from August through December; the other mines were operated continuously throughout the year. The New Jersey Zinc Co. performed considerable churn drilling and started an incline shaft to a new zinc property a few miles south and east of Galena. Plans to start construction of a mill were deferred.

Production of crushed limestone for highway and building use was reported by several operators—the largest was George Wendtlandt.

**Langlade.**—Sand and gravel was produced chiefly for highway use by Duffek Sand & Gravel, Inc., and the county highway department.

**Lincoln.**—Sand and gravel and crushed limestone were produced chiefly for road work by the county highway department, Merrill Gravel & Construction Co., and Clifford Gatterman.

Digitized by Google

**Manitowoc.**—Portland cement was manufactured by the Manitowoc Portland Cement Co. The plant has four 10-foot-diameter rotary kilns ranging in length from 160 to 340 feet. The company mined its own clay from a nearby pit and used a 6-inch hydraulic line to transport the clay to the plant. Limestone was shipped in from Michigan, as local limestones have too high a magnesium oxide content for the process used.

Quicklime and hydrated lime for building, chemical, and other industrial uses were produced by the Rockwell Lime Co. at its plant near Francis Creek. The company had a rotary kiln and a batch-type hydrator.

Dimension limestone, chiefly for building veneer and flagstone, was produced by Valders Lime & Stone Co.

Sand and gravel and crushed stone were produced by several companies in the area including Manitowoc County Highway Department, Rockwell Lime Co., R. & J. Fricke Co., Schroeder Bros. Sand & Gravel Co., and Fred Radandt Sons.

**Marathon.**—Minnesota Mining and Manufacturing Co., St. Paul, Minn., produced material for the manufacture of roofing granules from an argillite deposit north of Wausau and quartzite, chiefly for manufacture of sandpaper, from a quarry west of Wausau. Output of argillite was somewhat less than in 1959.

Dimension granite for building and monument purposes was produced by Anderson Bros. & Johnson Co., Cold Spring Granite Co., Cold Spring, Minn., Lake Wausau Granite Co., Prehn Granite Quarries, Inc., and Wisconsin Quarries, Inc. (a subsidiary of Rock of Ages). Most of the rough granite produced was cut and finished in plants near Wausau. However, Cold Spring Granite Co. shipped rough block to its Minnesota plant for finishing.

Clay for the manufacture of building brick was produced by the Marshfield Brick & Tile Co.

Tony Schilling Granite Pit produced road material from weathered outcroppings of granite near Mosinee.

Ellis Quarries, Inc., Stevens Point, quarried and dressed sandstone for building use. Several companies produced sand and gravel for highway use. The larger included Riverside Gravel Co., Lotz Sand & Gravel Co., and Heiser Ready Mix Co.

**Marinette.**—Andesite was quarried for use in the production of both natural and colored roofing granules by the Central Commercial Co. of Chicago, Ill., at a pit about 10 miles east of Pembine. The stone has been called basalt, greenstone, and traprock. A basalt dike traverses the quarry, but this material is discarded. Some sand and gravel for highway use was also produced.

**Marquette.**—Montello Granite Co. produced dimension granite for building and monument uses at Montello. Edward Kraemer & Sons, Inc., produced crushed limestone, and the Marquette County Highway Department produced gravel for road use.

**Milwaukee.**—Marquette Cement Mfg. Co. of Chicago, Ill., manufactured cement, using shale from Illinois and limestone from Michigan.

Dimension limestone was produced by Franklin Stone Products, Inc., and the Wauwatosa Stone Co. Crushed stone, chiefly for highway use, was produced by Consumers Co., Division of Vulcan Materials

Digitized by Google

Co., Chicago, Ill., and Wauwatosa Stone Co. Several companies produced sand and gravel.

**Pierce.**—Sand for industrial purposes was produced by Maiden Rock Silica Sand Co., Bay City Sand Co., Inc., and River Falls Sand & Gravel Co. The largest producer of sand and gravel for highway use was the Pierce County Highway Department. Crushed limestone for highway use was produced by Sanders Stone & Lime Co. and Caturia Limestone Co.

**Polk.**—Basalt was quarried and crushed chiefly for road use by the Dresser Trap Rock Co.

The Polk County Agricultural Agent produced limestone for agricultural use. The county highway department and Ostermann Sand & Gravel, Inc., were the largest producers of sand and gravel for highway use.

**Portage.**—Ellis Quarries, Inc., at Stevens Point, quarried sandstone for flagging and construction purposes. A small quantity of marl was excavated and sold by Caldwell's Dredging Co. and Bert Somers for agricultural use. The two largest producers of sand and gravel for highway and building purposes were F. F. Mengel Co. and Wimme Sand & Gravel.

**Racine.**—Large quantities of limestone were quarried by Consumers Company, Division of Vulcan Materials Co., Chicago, Ill.; the product was used for riprap, metallurgical uses, roadstone, and agricultural purposes.

Clay for the manufacture of heavy clay products was produced by the Union Grove Drain Tile Co.

Larger sand and gravel producers in the county included Edward Kraemer & Sons, Inc., J. W. Peters & Sons, and Jeffries Const. Co.

**Rock.**—Considerable quantities of crushed limestone and sand and gravel were produced chiefly for highway use in the county. Larger producers of sand and gravel included Janesville Sand & Gravel Co., Chicago, Milwaukee, St. Paul & Pacific Railroad Co., and Edgerton Sand & Gravel Co.

Larger producers of crushed limestone included Rock County Highway Department, P. W. Ryan Sons, Inc., Little Limestone Co., and Footville Lime & Rock Co.

**St. Croix.**—Dimension stone for building and veneer use was quarried by the St. Croix Valley Stone Co., Stillwater, Minn. Construction road materials were produced by several operators; the largest were St. Croix Highway Department, Edward Kraemer & Sons, Inc., Wilson Rock & Limestone Co., and Leary Constr. Co.

**Sauk.**—Quartzite for the manufacture of grinding pebbles and tubemill liners was quarried by the Baraboo Quartzite Co., Inc. Output in 1960 was considerably less than that of 1959. Competition from foreign imports and synthetic products was severe, and the profit margin reportedly was very small. The plant was built about 17 years ago to provide tubemill liners and grinding pebbles chiefly for war production.

The largest operation in the county was that of Foley Bros., Inc., at a quartzite quarry. The product was chiefly for railroad ballast.

Digitized by Google

Dimension sandstone, chiefly for building purposes, was produced by Alfred Boyles Flagstone Qy., Walter Dwars, and E. R. Gall Stone Co.

General Refractories Co., Philadelphia, Pa., and Harbison-Walker Refractories Co., Pittsburgh, Pa., produced quartzite chiefly for use in manufacturing refractories. General Refractories Co. shipped its product by rail to Joliet, Ill., where it was crushed, ground, and formed into firebrick. Several companies produced sand and gravel and limestone for highway purposes. The larger operators included Edward Kraemer & Sons, Inc., W. R. Dubois & Son, Inc., Deppe Lumber Co., and Baraboo Concrete Products Co.

**Waukesha.**—Quarries in Waukesha County supplied much of the dimension limestone produced in the State from ledge-type deposits prominent in the area. Uses were chiefly for veneer. Producers of dimension limestone included Thomas Lee Carlson, Cawley Stone Quarry, Dudovick Lannon Stone Co., Fonda Lannon Stone Co., Halquist Lannon Stone Co., Joecks Brothers Stone Co., Johnson & Sons, Kindler Brothers Stone Co., Frank & Lindquist Lannon Stone Co., Lisbon Lannon Stone Corp., Meadow Hill Quarries, Inc., Midwest Lannon Stone Co., W. G. Perren Quarry., Quality Limestone Products, Inc., Sussex Lannon Stone Corp., Weather Rock Lannon Stone Qy., West Side Stone Co., and White Rock Lannon Stone Co.

Crushed limestone for miscellaneous uses was produced by the Waukesha Lime & Stone, Inc.

Peat produced by Demilco, Inc., was used chiefly in the company's own product, which was sold as a potting mixture.

Sand and gravel also was produced.

**Waupaca.**—Building brick was manufactured from clay produced near New London by the Hockers Brick Co.

Some marl was produced by Caldwell's Dredging Co. for agricultural use.

A small amount of sand and gravel was produced for construction and highway use.

**Waushara.**—Granite was quarried by the Lohrville Stone Co. at Redgranite for construction and monumental uses. The company also produced dimension sandstone or quartzite in the same general area.

Other minerals produced included marl for agricultural purposes and gravel for highway use.

**Winnebago.**—Badger Highways Co., Inc., produced limestone for riprap, roadstone, and agricultural uses. Other large producers of crushed limestone were Consumers Company, Division of Vulcan Materials Co., Chicago, Ill. and Courtney & Plummer, Inc., Neenah, Wis. The latter also produced considerable sand and gravel. Production of over 1 million tons each of limestone and sand and gravel was reported for the county.

**Wood.**—Dimension sandstone for construction and flagging uses was quarried and dressed by Ellis Quarries, Inc., Klesmith Stone Co., and Tony Schmick.

# The Mineral Industry of Wyoming

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Geological Survey of Wyoming.**

By F. D. Everett [1]

THE WYOMING mineral industry in 1960 continued a trend of increasing annual output uninterrupted since 1949. The value of mineral production was $443 million, a 12-percent gain over 1959. The principal increases were in the value of petroleum, natural gas, and uranium production with significant gains recorded for sand and gravel, sodium carbonate, and natural gas liquids. Small declines were noted in output of iron ore, phosphate rock, and sodium sulfate. Of the 22 mineral commodities produced, petroleum contributed 77 percent of the total value, followed in order by uranium and natural gas.

The second of two 100,000-kw. units of the Dave Johnston powerplant of Pacific Power & Light Co. at Glenrock was placed in operation in November. Coal for both units was strip mined from a 35-foot seam in a pit 17 miles north of the plant. Utah Power & Light Co. completed an earth-fill dam as the first stage in construction of a reported $90 million steam-electric project on Hams Fork River near Kemmerer. Coal was to be supplied from a strip mine adjacent to the plant.

The Intermountain Chemical Co. completed an expansion program at the Westvaco plant 22 miles west of Green River and announced another to be completed by 1962 for production of 700,000 to 750,000 tons of soda ash annually. West End Chemical Co. Division of Stauffer Chemical Co. began construction of surface facilities for producing sodium carbonate (trona) at a site 21 miles northwest of Green River. Sinking of two circular concrete-lined shafts began in November, and a 10-mile rail spur from the main line of the Union Pacific railroad was begun in December. Completion of the project, designed for production of 200,000 to 300,000 tons annually, was scheduled for 1962.

Big Horn Gypsum Co. began a $3 million project for mining and processing gypsum and manufacturing wallboard at Cody. The plant, designed for a capacity of 100 million square feet of gypsum board yearly, was to begin producing early in 1961. The product was to be marketed in several Western States, principally in Wyo-

ming, Montana, Idaho, South Dakota, North Dakota, Nebraska, Oregon, and Washington.

The Columbia-Geneva Steel Division of United States Steel Corp. began constructing facilities to mine, concentrate, and agglomerate the taconite iron ores of the Atlantic City area. The project, estimated to cost $73 million, was designed to produce 4,000 tons of pellets a day. Completion was scheduled for late in 1962. Reportedly, exploration indicated 300 million tons of taconite ore containing 21 to 35 percent iron.

Globe Mining Co., a unit of Union Carbide Nuclear Co., a division of Union Carbide Corp., started processing uranium ore in its Gas Hills plant in January. Utah Mining Corp., subsidiary of Utah Construction & Mining Co., mined the first commercial uranium in the Shirley basin 50 miles south of Casper. Petrotomics Co. (a corporate combine of Kerr-McGee Oil Industries, Inc., Tidewater Oil Co., Skelly Oil Co., and Getty Oil Co.) was awarded an Atomic Energy Commission (AEC) contract that provided for Government purchase of 1 million pounds of $U_3O_8$ concentrates before March 31, 1962, and 3.2 million pounds of concentrates between that date and December 31, 1966. Total value of the contract quantity of uranium concentrates approximates $25 million. Petrotomics Co. reportedly will mine the ore by open-pit methods and build a mill at the mine site.

# REVIEW BY MINERAL COMMODITIES

## MINERAL FUELS

Mineral fuels represented 85 percent of the value of mineral production in the State, an increase from $342 million in 1959 to $379 million in 1960.

**Coal.**—Coal was mined from 19 mines in 8 counties, and production was 2 percent greater than in 1959. Converse County had the greatest output, followed in order by Campbell, Sheridan, Lincoln, Sweetwater, Carbon, Hot Springs, and Fremont. The strip mine supplying the Dave Johnston powerplant of Pacific Power & Light Co. had the largest production. The second addition to the powerplant was placed in operation in November, and the two units required 3,000 tons of coal a day when operating at rated capacity. A test plant to produce metallurgical coke from subbituminous coal mined from surface operations near Kemmerer was started jointly by the United States Steel Corp. and Food Machinery & Chemical Corp. The plant, scheduled to begin operations in mid-1961, was to have a reported capacity of 250 tons of coke daily.

**Natural Gas.**—Natural gas production was 24,632 million cubic feet more than in 1959, an increase of 16 percent. Gasfields in Big Horn, Carbon, Converse, Fremont, Hot Springs, Johnson, Lincoln, Natrona, Niobrara, Park, Sublette, Sweetwater, Uinta, and Washakie Counties contributed to the production. Reported [2] reserves as of January 1, 1961, totaled 3,975 billion cubic feet, 128 billion cubic feet more than on January 1, 1960. Colorado Interstate Gas Co. placed in operation a new compressor station 8 miles east of Rawlins which increased the capacity of its Wyoming pipeline from 138 to 188 million cubic feet a minute. This company won conditional approval from the Federal Power Commission for a $151 million project to construct a 155-mile pipeline from Rock Springs to Provo, Utah; the pipeline would con-

**TABLE 3.—Coal production, by counties**

(Excludes mines producing less than 1,000 short tons annually)

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Average value per ton [1] | Short tons | Average value per ton [1] |
| Campbell | 426,609 | $1.27 | 458,644 | $1.25 |
| Carbon | 98,307 | 3.18 | 151,676 | 3.68 |
| Converse | 471,506 | 3.32 | 525,998 | 3.58 |
| Fremont | 1,902 | 6.01 | 1,329 | 6.17 |
| Hot Springs | 14,789 | 8.36 | 11,820 | 9.47 |
| Lincoln | 313,146 | 3.08 | 249,605 | 3.24 |
| Sheridan | 385,923 | 3.36 | 382,377 | 3.36 |
| Sweetwater | 264,626 | 7.00 | 242,747 | 7.27 |
| Total | 1,976,808 | 3.37 | 2,024,196 | 3.45 |

[1] Value received or charged for coal f.o.b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked, as estimated by producer at average prices that might have been received if such coal had been sold commercially).

Digitized by Google

nect with a 395-mile line to be built by El Paso Natural Gas Co. to the California-Nevada border near Las Vegas, Nev.

**Natural Gas Liquids.**—Production of natural gasoline, butane, and propane was 25 percent greater than in 1959. Fifteen natural gas processing plants in 13 counties recovered 192,888,000 gallons of natural gas liquids. The Big Horn plant of Mobil Oil Co. at Manderson terminated operations in mid-1960.

**Petroleum.**—Crude-petroleum production was 9.5 million barrels greater than in 1959, an 8-percent increase. Output came from 206 fields in 20 of the State's 23 counties. Forty-seven fields had an output that exceeded 100,000 barrels for the year. Wildcat drilling of 435 wells resulted in 31 oil and 9 gas discoveries for a success ratio of 9 percent. Development drilling of 639 wells yielded 452 oil and 47 gas producers for a success ratio of 78 percent.

An important source of oil, the development highlight of the year, was at the Patrick Draw, Beacon Ridge, and Arch units in Sweetwater County. Areas in Campbell and Crook Counties also were among the most active in petroleum development. In Campbell County, the Rozet field, which entered production in 1959, had developed into one of the most important oil finds in Wyoming in many years.

Counties having an annual output of 10 million or more barrels of crude oil were, in order of production, Park, Hot Springs, Fremont, Natrona, and Big Horn. Wildcat drilling resulted in discoveries in the four major basins—Powder River (16 oil, 1 gas), Green River (6 oil, 7 gas), Wind River (5 oil, 1 gas), and the Big Horn (4 oil). Forty-five percent of the successful development wells were in the Powder River basin (206 oil, 1 gas) followed in order by Green River (142 oil, 45 gas), Big Horn (70 oil), Wind River (33 oil, 1 gas),

**TABLE 4.—Crude petroleum production, by counties**

(Thousand barrels)

| County | 1959 | 1960 [1] | Principal fields in 1960 in order of production |
|---|---|---|---|
| Albany | 365 | 409 | Quealy. |
| Big Horn | 12,386 | 11,471 | Garland, Byron, Bonanza. |
| Campbell | 966 | 1,816 | Dead Horse Creek, Rozet, Barber Creek. |
| Carbon | 4,216 | 3,970 | Wertz, Rock River, Big Medicine Bow. |

Source: Oil and Gas Journal.

and Laramie (1 oil) basins. A contract was awarded for drilling 10 wells in the Teapot Dome reserve in Natrona County. This field, controlled by the U.S. Navy, had been idle for many years. Refinery crude-oil throughput was 38.7 million barrels, an increase of 4 percent over that of 1959. Husky Oil Co. completed expansion at the Cody refinery, raising capacity from 7,200 to 9,000 barrels of crude oil a day. The addition of a 2,500-barrel-per-day gas-oil cracking unit and a 700-barrel-per-day sulfuric acid alkylation unit was scheduled for the refinery in 1961. Texaco, Inc., completed installation of a hydrotreating unit with a capacity of 4,000 barrels a day. Standard Oil Co. (Indiana) continued a modernization program at the Casper refinery, and announced replacement of a 37,000-barrel-a-day distillation unit which was to be installed in the spring of 1961. Products Pipeline of El Paso Natural Gas Co. built 32 miles of 6-inch line from the expanding Patrick Draw field to a connection

Digitized by Google

with Service Pipeline Co. line near Wamsutter. State approval was granted for extending pipeline service northwest of Donkey Creek to Miller Creek and Rozet fields in Campbell and Crook Counties. One of the 10 compressor stations planned by Colorado Interstate Gas Co. was completed 8 miles east of Rawlins on the Green River to Denver (Colo.) transmission lines. Late in 1960 the Federal Power Commission gave its final but conditional approval to the Utah Project of El Paso Natural Gas Co. for a pipeline from Green River to Provo, Utah, and to the California-Nevada border near Las Vegas, Nev. Delivery of 470 million cubic feet of gas per day would be possible through the system.

The Federal Bureau of Mines Laramie Petroleum Center at Laramie continued its studies on petroleum production, petroleum processing and use, and oil shale, with particular emphasis on Rocky Mountain and Alaskan problems. Production and secondary recovery research concerned the variation of the physical characteristics of petroleum-reservoir fluids within geological basins and determinations of the types and amounts of clay minerals in reservoir rocks, their effects and that of permafrost on the behavior and water sensitivity of the petroleum-producing formations. Processing and utilization research included analysis of newly discovered crude oils from the Rocky Mountain States and compositional studies of sulfur and nitrogen compounds found in petroleum.

Research on oil shale and shale oil included studies of the composition and properties of oil shale, analysis of shale oil and its fractions, studies of thermal reactions of shale-oil components, and research on new methods for converting shale organic matter to oil, such as by in situ retorting, irradiation, and the action of micro-organisms. A study was made of the application of depleted uranium catalysts in hydrogenating and reforming shale oil and its fractions.

Reports[3] of the results of petroleum and oil-shale research and pilot-plant processing of oil shale were published.

## NONMETALS

**Cement.**—The quantity of cement manufactured in the only cement plant in the State was approximately the same as in 1959. The cement was marketed chiefly in Wyoming, Colorado, and Nebraska. Shale (natural cement rock), limestone, gypsum, and sandstone were the raw materials used in the processing.

**Clays.**—Clay production was slightly higher. Bentonite was first in value of the clays mined, and its production was 2 percent greater than in 1959. Deposits in five counties were the principal source of swelling-type bentonite in the United States. Eleven plants were operated by nine companies, and the processed product was used chiefly for foundry, oil-well drilling, and iron-agglomerating industries. A new plant with a designed capacity of 50,000 tons a year was being constructed by the Benton Clay Co. of Casper.

Miscellaneous clay production increased by 39,000 tons over 1959. Building brick and heavy clay pipe continued to be manufactured in plants at Lovell and Sheridan. Great Western Aggregates, Inc., mined bloating shale near Laramie and processed it into a lightweight aggregate marketed chiefly in the Laramie, Cheyenne, and Denver (Colo.) areas. Clay production started from two new pits 15 miles north of Evanston in Uinta County early in 1960. Brick manufacturing companies in Utah used the clay in making high-quality white building brick.

**Gem Stones.**—Wyoming was a source of several semiprecious or ornamental stones. Such stones, hunted by individuals and commercial collectors, consisted mainly of varieties of Wyoming jade, agate, petrified wood, fossils, and mineral specimens. The reported value of the stones collected was estimated at 11 percent less than for 1959.

**Gypsum.**—Gypsum was mined in Albany County by Wyoming Construction Co. for use in manufacturing cement. A relatively small quantity was sold by Cody Sulphur Production Corp. as a soil-treating material from stocks of gypsum previously mined in Park County.

A deposit near Cody in Park County was being developed by the Big Horn Gypsum Co. for processing into plasterboard in a plant that was to be completed early in 1961.

**Mica.**—A small quantity of hand-cobbed sheet mica was produced from pegmatite mines in Goshen and Platte Counties.

**Phosphate Rock.**—Production of phosphate rock was less than in 1959; San Francisco Chemical Co. was the only producer. Phosphate rock from Wyoming and Utah mines was processed in a plant at Sage in Lincoln County. The processed rock was sold to companies in Utah for manufacturing superphosphate and triple superphosphate fertilizers and phosphoric acid; the company exported phosphate rock to Canada.

**Pumice.**—Production of scoria from a deposit in Sheridan County was 61,000 tons less than in 1959. The crushed and screened scoria was used for railroad ballast.

**Sand and Gravel.**—The value of sand and gravel was 35 percent greater in 1960. Paving sand and gravel accounted for the major increase. Production of commercial sand and gravel came from 29

| Park | 258 | 194 | Total | 5,928 | 5,356 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."

commercial operations in 16 counties and from Government-and-contractor operations in 19 counties. Sand and gravel prepared by washing, screening, or crushing continued to increase and comprised 58 percent of the Government-and-contractor and 92 percent of the commercial output.

The Bureau of Public Roads [4] indicated that from July 1, 1956, to December 31, 1960, 98.9 miles of road was completed and 20.5 miles of road improved to acceptable standards. On the basis of 119.4 miles of road open to traffic from this program, the State ranked 28th in the United States. One hundred sixty-six miles of road was under construction and 59.3 miles was in engineering or right-of-way status. The total designated mileage for the State was 916.8 miles, of which 572.1 miles remains to be completed. Wyoming had completed 38 percent of its interstate road program.

**Sodium Carbonate and Sulfate.**—Intermountain Chemical Co. increased trona (natural sodium carbonate) production to a new high. The company started and completed mine and plant expansion so that facilities had a capacity of 600,000 tons at the end of 1960. Still another expansion program was announced, to be completed in 1961, when facilities will have a capacity of 700,000 to 750,000 tons a year.

West End Chemical Co. started work during the year on a project for mining trona and processing 200,000 to 300,000 tons of soda ash annually. Completion was scheduled for late 1962. Diamond Alkali Co. had been actively exploring for trona for 2 years. Texota Oil Co., Utah Construction & Mining Co., and Allied Chemical Corp. also were reported to have interests in trona deposits.

Sweetwater Chemical Co. and William E. Pratt continued to harvest sodium sulfate from saline lake deposits in Carbon and Natrona Counties. Most of the product was shipped to the Midwest as an additive to stockraising feed.

**Stone.**—The value of stone production was 29 percent greater than in 1959. Crushed limestone, constituting the largest production, was used in manufacturing cement and refining sugar beets. Crushed

[4] Bureau of Public Roads, Quarterly Report on the Federal-Aid Highway Program, Dec. 31, 1960, press release BPR 61-6, Feb. 22, 1961.

Digitized by Google

granite and dolomite were prepared for riprap and railroad ballast, and miscellaneous stone was used for riprap and road building. De Wald Stone Works quarried and prepared sandstone near Laramie for use as stone facing blocks in buildings of the University of Wyoming.

**TABLE 7.—Sand and gravel sold or used by producers, by classes of operations and uses**

(Thousand short tons and thousand dollars)

| Class of operation and use | 1959 | | 1960 | |
|---|---|---|---|---|

Digitized by Google

**Sulfur.**—Output of sulfur processed from hydrogen sulfide-bearing natural gas was 11 percent less than in 1959. Production was in three counties, by Texas Gulf Sulphur Co. (Washakie County), Pan American Petroleum Corp. at Elk Basin (Park) and Cottonwood Creek (Washakie), Texas Seabord, Inc. (Park) and Jefferson Lake Sulphur Co. (Big Horn). According to the Jefferson Lake Sulphur Co. annual report, the Manderson plant, which began producing elemental sulfur from concentrated hydrogen sulfide in March 1955, discontinued operations in August 1960, having produced approximately 90,000 long tons of high-grade sulfur. The Mobil Oil Co. adjacent sour-gas-processing plant, which delivered hydrogen sulfide, discontinued operations because of losses due to greatly reduced volumes of sour natural gas from wells of the Manderson field.

**Vermiculite.**—Golden Clover Corp. was developing the Platt mine near Encampment for vermiculite.

## METALS

**Beryllium.**—Five tons of beryl valued at $2,407 was produced from three mines. Two operators shipped hand-cobbed beryl to the Government purchase depot at Custer, S. Dak., and one operator sold to Mineral Concentrates & Chemical Co., Inc., of Loveland, Colo., and Gladys Wells of Custer, S. Dak.

**Gold and Silver.**—A lode and a placer operation in the Atlantic City-South Pass area of Fremont County produced 40 ounces of gold and 4 ounces of silver.

**Iron Ore.**—Iron-ore production decreased. Reduced operating schedules of the steel plant at Pueblo, Colo., necessitated stoppage of work at the Sunrise mine of The Colorado Fuel and Iron Corp. (CF&I) in Wyoming for two periods, the first from August 21 to September 25 and the second from November 27 to December 31. Iron ore produced by Magnetite Products Corp. from the Cobar No. 1 mine in Albany County was concentrated and shipped to Texas for use as a heavy aggregate in coating underwater pipelines and transmission lines.

The proposed $73 million taconite-iron mining project of Columbia-Geneva Steel passed from the planning into the development stage during the year. Pomeroy-Bechtel Joint Venture was contracted to start the open pit and construct the concentrating plant. Arthur G. McKee and Co. was subcontracted to construct the 4,000-ton-a-day pelletizing plant. A 76-mile railroad spur was started from Winton Junction on the main line of the Union Pacific railroad to the iron deposit near Atlantic City. Initial production was scheduled for late in 1962. Reportedly, exploration indicated 300 million tons of taconite ore containing 21.8 to 35.2 percent iron.

**Uranium.**—Uranium-ore production increased 57 percent. Production started at several large mines after long periods of development. The 492-ton-per-day mill of Globe Mining Co. started processing ore in January, and all five uranium mills in the State were operating at or above rated capacity most of the year. Fremont County supplied 73 percent of the ore mined, with Natrona, Crook, Converse, Carbon, Campbell, Big Horn, Niobrara, and Johnson Counties supplying the remainder. A total of 106 operations was reported.

Utah Mining Corp. mined the first commercial uranium ore from the Shirley basin 50 miles south of Casper near the Natrona-Carbon County line; the ore was processed in the Lucky Mc mill in the Gas Hills. Several companies contributed to the development of multi-million-ton reserves in the Shirley basin. Petrotomics Co. was awarded an AEC contract which provides for the purchase of 1 million pounds of $U_3O_8$ concentrates before March 31, 1962, and 3.2 million pounds of concentrates between that date and December 31, 1966. Total value of the contract quantity of $U_3O_8$ approximated $25 million. The Petrotomics Co. had AEC permission to build a mill or to make arrangements with other companies for treating the ore produced at existing mills.

The uranium-concentrate purchase contract between AEC and Susquehanna-Western, Inc., operator of a 500-ton-a-day uranium processing plant at Riverton, was extended to December 31, 1966. Under the extended contract AEC will purchase uranium concentrates valued at approximately $47 million. All five of the uranium processing companies and the Petrotomics Co. had AEC contracts with extending concentrate purchasing through 1966.

**Vanadium.**—Vanadium oxide was recovered from Wyoming uranium ores processed at the uranium mill of Mines Development, Inc., at Edgemont, S. Dak., where installation of a vanadium-recovery unit was completed in November. The uranium ore containing vanadium came chiefly from mines in Crook, Campbell, and Converse Counties. Recovery of vanadium from Wyoming ores, previously processed at mills in southwestern Colorado, was reported in 1954 and 1956–58.

## REVIEW BY COUNTIES

**Albany.**—Cement manufacture at the Laramie plant of Monolith Portland Midwest Co. accounted for the large value of mineral production in the county. Shale (cement rock) and limestone were mined by the company, and cement was produced in about the same amount as in 1959. Gypsum was mined by Wyoming Construction Co. for use in cement manufacture. A plant adjacent to the cement plant and operated by Great Western Aggregates, Inc., processed shale as lightweight aggregate, chiefly used in building construction in the Laramie, Cheyenne, and Denver (Colo.) areas. Production was 19 percent greater than in 1959. DeWald Stone Works continued to supply sandstone blocks for facing buildings at the University of Wyoming. One Wyoming State Highway Department and three commercial operations produced 56 percent more sand and gravel than in 1959. Magnetite Products Corp. mined iron ore and shipped it to Gulf Coast areas.

Major production of petroleum continued to be from the Quealy field.

**Big Horn.**—Big Horn County was fifth in production of petroleum, which amounted to 91 percent of the value of the county mineral output. Four new discoveries were made, and 12 successful development wells were completed. Production came from 13 fields, the most active being Garland with 5.2 million barrels, Byron with 2.5 million, and Bonanza with 2.4 million. New discoveries included a new pay zone in the Lamb field, pumping 50 to 60 barrels of oil a day from the Peay formation; a new field on the Cherry anticline, pumping 2.5 barrels a day from the Phosphoria formation; a new field at Lovell, pumping 15 barrels of oil a day from the Phosphoria; and a new field at North Deaver, pumping 120 barrels from the Tensleep formation. Of 16 development wells, 12 resulted in completions. Mobil Oil Co. operated a natural gas plant at Manderson for 6 months of the year, producing an unreported quantity of natural gas liquids. The residual gas was processed in a plant of Jefferson Lake Sulphur Co. for elemental sulfur until the plant was closed because of inadequate supplies of concentrated hydrogen sulfide gas.

The bentonite producers in the county maintained the second largest production in the State, although output was 42,000 tons less than in 1959. Magnet Cove Barium Corp. had the largest operation in the State with mines and a mill north of Greybull. Wyo-Ben Products Co. also produced bentonite from mines and a mill in the same vicinity. Lovell Clay Products Co. maintained its steady operation of mining clay and shale and manufacturing building brick and heavy clay pipe. Production was reported from one Government-and-contractor sand and gravel operation.

**Campbell.**—Petroleum production accounted for 87 percent of the value of mineral output. Five fields were in operation, with the main activity at Dead Horse Creek with 703,600 barrels of oil, Rozet with 628,400, and Barber Creek with 350,200. Of 56 exploratory wells drilled, 5 resulted in oil discoveries. A well in a new pay zone in the Raven Creek field pumped 440 barrels of oil a day from the

[9] Includes natural gas, natural gas liquids, vanadium (1960), some sand and gravel, stone, gem stones, beryllium concentrate (1960), and values indicated by footnote 8.
[10] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement.

Minnelusa formation; a discovery in the Rainbow Ranch field pumped 125 barrels of oil a day from the Minnelusa formation; a North Donkey field discovery well pumped 100 barrels of oil a day from the Minnelusa formation; an O'Connor field discovery well pumped 295 barrels of oil from the Muddy formation; and a Pownall Ranch field discovery pumped 90 barrels of oil a day from the Minnelusa formation. Of the 71 development wells, 56 resulted in oil completions.

A new strip coal mine was started on the south side of U.S. Highway 14–16 by Wyodak Resources Development Corp. The company produced 32,000 tons more than in 1959. The coal, mined from a seam averaging 70 feet thick, was used chiefly in thermo-powerplants in eastern Wyoming and western South Dakota.

Uranium production reported from 20 mines had approximately double the value of the 1959 output. Some vanadium was recovered as a byproduct in concentrating uranium ore.

Digitized by Google

**Carbon.**—The value of mineral production increased 7 percent because of new uranium production in the Shirley basin. Petroleum output, which provided 85 percent of the total mineral valuation, was 246,000 barrels less than in 1959. Oil production came from 90 wells in 13 fields; the producing oilfields were Wertz with 2.3 million barrels, Rock River with 976,000 barrels, and Big Medicine Bow with 107,000 barrels. Of 24 wildcat wells, 3 natural gas discoveries were made. The Cow Creek discovery flowed 11 million cubic feet of gas from the Frontier and Nugget formations, and the Cole Springs Draw discovery flowed 8.2 million cubic feet of gas from the Sundance formation. Nine development wells resulted in six oil completions. Sinclair Refining Co. operated its 26,000-barrel-a-day refinery throughout the year. Ohio Oil Co. operated a refrigeration-absorption natural gas plant at Rock River and produced 7,600 gallons of natural gas liquids from an average daily throughput of 1.4 million cubic feet of gas.

Uranium production was from the Shirley basin and Baggs area. Utah Mining Corp. shipped ore to the Lucky Mc mill in the Gas Hills, and producers near Baggs shipped to the Trace Elements mill at Maybell, Colo. The underground operation of Utah Mining Corp. was plagued by pumping and high-cost mining because of the large amount of water encountered in the productive zone. Basin Engineering Co. and Trace Elements Corp., a unit of Union Carbide Nuclear Co., division of Union Carbide Corp., were the principal ore producers in the Baggs area.

Coal production increased 54 percent. Monolith Portland Midwest Co., Hanna Basin Construction & Coal Co., and Rosebud Coal Sales Co. operated strip mines; Mike & Harry Thomas worked an underground mine.

The Sweetwater Chemical Co. harvest of sodium sulfate from a saline lake north of Rawlins was slightly less than in 1959. Two Government-and-contractor and one commercial sand and gravel operation had triple the output of 1959.

**Converse.**—Petroleum, coal, and uranium had the highest value of the minerals produced. Petroleum output decreased 9 percent from 1959, but still accounted for 81 percent of the value of mineral production. Of the seven producing fields, Glenrock and Big Muddy led in output with more than 2.3 and 1.8 million barrels of oil, respectively. No new fields were discovered, but eight crude oil completions were reported. The Cabot Carbon Co. operated its natural gas plant at Glenrock. Throughput averaged 5 million cubic feet, with recovery of 46,000 gallons of natural gas liquids. Coal was produced from two strip mines.

The value of uranium ore mined was almost double the 1959 output, although the number of operations decreased from 19 to 13. Robert W. Adams, B. & H. Mines, and Vernon A. Mrak operated the major producing mines. Some vanadium was recovered as a byproduct of uranium-ore processing.

One commercial sand and gravel operation was reported.

**Crook.**—Petroleum continued to increase in importance, and production from six fields was 53 percent greater than in 1959. Major fields

Digitized by Google

and production were Donkey Creek with 2.7 million barrels, Robinson Ranch with 855,000 barrels, and Coyote Creek with 793,000 barrels. Sixty-three wildcat attempts resulted in one natural gas and five oil discoveries. The natural gas discovery, in the Kummerfeld field, flowed 5.2 million cubic feet a day from the Dakota formation. The Coyote Creek well pumped 50 barrels of oil a day from a new pay zone in the Muddy formation; the Grasshopper Butte discovery pumped 6 barrels a day from a new pay zone in the Minnelusa formation; the Kummerfeld discovery flowed 231 barrels a day from the Dakota formation; the Mellott Ranch discovery pumped 38 barrels a day from the Minnelusa formation; and the Prairie Creek discovery pumped 271 barrels a day from the Newcastle formation. Development-well completions totaled 51 oil and 1 gas.

Bentonite production, 14 percent above that of 1959, assumed second place in the county value of mineral products. Mines were operated by American Colloid Co., Archer-Daniels-Midland Co., Black Hills Bentonite Co., International Minerals & Chemical Corp., and Baroid Division of National Lead Co. Mills at Colony were operated by Baroid and Archer-Daniels-Midland Co. The other companies processed bentonite in mills in South Dakota.

Uranium ore produced from 13 operations was shipped to the mill at Edgemont, S. Dak. The Hauber mine of Homestake Mining Co. had the largest production. Vanadium was recovered at the mill from some of the uranium ore mined in Crook County.

Rounds Construction Co. mined and crushed stone for use in road surfacing.

**Fremont.**—Fremont County was second highest in value of mineral production; petroleum production represented 62 percent of the mineral output. Petroleum was produced from 21 fields, and output was 2 percent above that of 1959. Major fields were Steamboat Butt with 2.9 million barrels of oil, Winkleman Dome with 2.7 million, Beaver Creek with 2.6 million, and Big Sand Draw with 1.8 million. Two discoveries were made at Sage Creek field, with one well pumping 2 barrels of oil a day from a new pay zone in the Red Peak formation and the other pumping 53 barrels a day from the Phosphoria formation. A natural gas discovery at Pavillion Unit flowed 1.9 million cubic feet a day from the Fort Union formation. Natural gas liquids were produced at plants of Northern Utilities Co. and Pan American Petroleum Corp. Pan American Petroleum Corp. processed 19,600 gallons of natural gas liquids from an average daily gas throughput of 26 million cubic feet. Residual gas from both plants was transported to consumers through pipelines of the Rocky Mountain Gas Co.

Uranium-oxide production had the second highest mineral valuation in the county, representing 37 percent of the mineral output. Production was reported from 39 operations in the Gas Hills and Crooks Gap areas. The five uranium-ore processing mills operated steadily; contracts with the AEC were to allow for purchase of specific quantities through 1966. Mills were operated by Utah Construction & Mining Co. (Lucky Mc mill), Western Nuclear, Inc. (Jeffrey City), Susquehanna-Western, Inc. (Riverton), and Federal-Radorock-Gas Hills Partners (Gas Hills).

Digitized by Google

The Duncan mine, operated by Atlantic Western Mining Co., and Bonanza No. 1 placer, operated by D. H. Branson, had a small output of gold and silver. A highlight of the year was the start of construction of the reported $73 million Atlantic City iron-ore project by Columbia-Geneva Steel.

Sand and gravel was reported from 13 Government-and-contractor and 4 commercial operations. The county gem stone production, largest in the State, was chiefly jade, agate, and petrified wood.

Less than 1,400 tons of coal was produced from one operation.

**Goshen.**—Petroleum production from the Torrington field, the only producing field in the county, again declined. Two exploratory wells were drilled, but both were dry. Nicola & Harvey produced a small quantity of beryl concentrate from the Spook mine. One Government-and-contractor sand and gravel operation was active.

**Hot Springs.**—Petroleum accounted for 99.8 percent of the value of mineral output, the second largest in the State. Production came from 17 fields, the major ones being Hamilton Dome with 7.6 million barrels of oil, Grass Creek with 4.4 million, Murphy Dome with 2.9 million, Little Buffalo basin with 2.1 million, and Gebo with 1.2 million. No new discoveries were made; 22 development wells of 29 drilled resulted in oil completions. Empire State Oil Co. increased the throughput to its refinery to 2 million barrels of oil per year.

Two underground coal mines were operated, with approximately the same production as in 1959. The Roncco Coal Co. mined 79 percent of the coal produced.

One commercial sand and gravel operation was reported.

**Johnson.**—Petroleum output, 5 percent above that of 1959, accounted for nearly all the value of mineral production. Eleven oil fields were active, the largest production coming from Sussex with 3.1 million barrels of oil, North Fork with 1.4 million barrels, and Meadow Creek with 1.3 million barrels. One oil discovery was made at the Cellers Ranch field, where pumping produced 358 barrels of oil a day from the Tensleep formation. Of 32 development wells drilled, 30 resulted in oil completions. Continental Oil Co. processed natural gas at the Linch refrigeration plant; 34,500 gallons of natural gas liquids was recovered from an average throughput of 15.6 million cubic feet a day.

Bentonite production held steady in 1960. The Benton Clay Co. operated a mine near Kaycee and trucked bentonite about 70 miles to its plant in Casper. One commercial and one Government-and-contractor sand and gravel operation were reported.

Uranium production was limited to a small yield from one mine.

**Laramie.**—Petroleum production, 7 percent less than in 1959, came from four relatively small fields, one of which, Horse Creek, produced 131,600 barrels. One development well was completed. The 21,000-barrel-a-day refinery of Frontier Refining Co. at Cheyenne processed 6 percent less crude oil than in 1959.

The Great Western Sugar Co. continued to mine and crush limestone for its sugar refineries. Production was reported from two commercial and two Government-and-contractor sand and gravel operations.

Digitized by Google

**Lincoln.**—The only phosphate-rock mine in the State, at Sage, was operated by the San Francisco Chemical Co.

Coal production from the Elkol strip mine near Kemmerer decreased, but coal production from the underground Brilliant No. 8 mine slightly increased. Both mines were operated by the Kemmerer Coal Co. United States Steel Corp. and Food Machinery & Chemical Corp. began constructing a plant to make metallurgical coke from subbituminous coal near the Elkol mine south of Kemmerer. Coke pellets from the plant were to be used in electric furnaces making elemental phosphorus near Pocatello, Idaho, and in the Columbia-Geneva Steel plant at Provo, Utah.

El Paso Natural Gas Co. recovered 164,700 gallons of natural gas liquids from its gas absorption plant at Opal. The residual gas was marketed through the company pipeline system in the Northwestern States.

Stone was mined and crushed for road construction. One commercial and one Government-and-contractor sand and gravel operation were in production.

**Natrona.**—Petroleum production, accounting for 92 percent of the value of the mineral output, came from 1,277 wells in 23 fields. Major fields were Salt Creek-L & B with 4.4 million barrels of oil, Grieve Unit with 4.2 million barrels, and Salt Creek-E with 1 million barrels. Three discoveries resulted from 37 exploratory attempts. A Wallace Creek discovery flowed 80 barrels of oil a day and 1.4 million cubic feet of gas a day from the Muddy and Thermopolis formations; a well in the Boone Dome field flowed 325 barrels of condensate a day and 28.5 million cubic feet of gas from a new pay zone in the Frontier formation; and a Twenty-Mile Hill discovery flowed 274 barrels of oil a day from the Frontier formation. Development drilling resulted in 1 gas and 26 oil completions from 44 tries. Oil refineries of Texaco, Inc., Socony Mobil Co., and Standard Oil Co. (Indiana) continued refinery operations at Casper; the combined throughput was 16.6 million barrels of oil, an increase of 4 percent. Pan American Petroleum Corp. operated its natural gas absorption plant at Midwest, producing 99,300 gallons of natural gas liquids from an average daily throughput of 18 million cubic feet of gas. The residual gas was transported through Northern Utilities Co. pipelines.

The value of uranium-oxide production increased sevenfold over that of 1959. This production, from eight operations in the Gas Hills, was centered in the operations of Globe Mining Co. and Federal-Radorock-Gas Hills Partners. The Globe Mining Co. mill began operating in January at its capacity of 492 tons a day and maintained capacity output most of the year.

Benton Clay Co. increased bentonite output 11 percent over that of 1959. William E. Pratt continued to harvest sodium sulfate from a small saline lake 28 miles west of Casper. Three commercial and three Government-and-contractor sand and gravel operations reported production.

**Niobrara.**—Petroleum accounted for virtually all the mineral production value. Production, which came from 325 wells in 8 fields, was 3 percent more than in 1959. Principal fields were Lance Creek with 754,000 barrels of oil, Lance Creek-E with 233,600 barrels, and

Digitized by Google

Little Buck Creek with 125,000 barrels. One discovery was made from 28 exploratory wells. The KREJCI discovery well, completed in the Mowry formation, flowed 93.5 barrels of oil a day. Development drilling resulted in four completions from eight attempts. The oil refinery of C & H Refinery Co. operated with 19 percent less throughput. The natural gas absorption plant of Ohio Oil Co. operated throughout the year with recovery of 18,400 gallons of natural gas liquids.

A small beryl operation by Dale McDermond and a uranium operation by Silver Cliff Mining Co. each had production valued at less than $1,100.

**Park.**—Petroleum production, highest in the State, represented nearly the entire value of mineral output. Twenty-five fields produced; the major fields were Elk Basin-Hvy with 17.8 million barrels of oil, Oregon Basin with 5.2 million barrels, Fourbear with 3.2 million barrels, and Frannie with 2.7 million barrels. No new discoveries were made, but 32 oil completions resulted from 39 development wells. Husky Oil Co. increased the daily capacity of its refinery at Cody from 7,200 to 9,000 barrels of oil but processed 5 percent less petroleum than in 1959. Texaco Seaboard, Inc., and Pan American Petroleum Corp. produced elemental sulfur as byproducts from their natural gas plants. The Pan American Petroleum Corp. plant at Elk Basin processed 80,100 gallons of natural gas liquids from an average daily throughput of 13.2 million cubic feet of gas.

One Government-and-contractor and three commercial sand and gravel operations had production. Big Horn Gypsum Co. was constructing a gypsum-board plant at Cody.

**Platte.**—Although iron ore produced by CF&I at the Sunrise mine decreased 4 percent, it was the principal mineral commodity. Additional sinking of the main hoisting shaft was one of the company improvements at the Sunrise property.

Dolomitic limestone was produced by Guernsey Stone Co. for use as railroad ballast. One Government-and-contractor sand and gravel operation was reported.

**Sheridan.**—Petroleum and coal were the chief minerals produced. Oil output increased 14 percent, with 944,600 barrels of oil being produced from the Ash Creek field. No new discoveries were made. Coal production by Big Horn Coal Co. and Welch Coal Co. held steady in 1960.

Sheridan Press Brick & Tile Co. mined less clay in 1960. Tongue River Stone Co. decreased its scoria output to one-third; the scoria was used for railroad ballast. Two commercial and four Government-and-contractor sand and gravel operations were in production.

**Sublette.**—Petroleum accounted for nearly all the value of mineral production. Output came from seven fields, the largest being Big Piney with 820,300 barrels of oil a day, followed by La Barge with 367,900 barrels. Two oil discoveries and one gas were made from 20 exploratory wells. The discovery well in the Hogsback field pumped 285 barrels of oil a day from the Nugget formation; the Mickelson Creek discovery well flowed 360 barrels of oil a day from the Mesaverde formation; and the McDonald Draw discovery well flowed 11.6

Digitized by Google

million cubic feet of gas a day from the Wasatch formation. Of 54 development wells, 26 oil and 22 gas wells were completed.

Two Government-and-contractor sand and gravel operators reported production.

**Sweetwater.**—Petroleum, sodium carbonate, and coal comprised most of the minerals produced. Petroleum accounted for 55 percent of the value of mineral output with production from 82 wells in 13 fields; the output was almost double that of 1959. Principal fields were Lost Soldier with 3.6 million barrels of oil and Patrick Draw with 2.3 million barrels. Four oil and three natural gas discoveries were made from 51 exploratory wells. A discovery in the State Line Unit flowed 450 barrels of oil a day, and another well in the field flowed 6.2 million cubic feet of gas a day, both from the Fort Union formation; an Arch Unit well flowed 607 barrels of oil a day, and two wells in the West Desert Springs area flowed 14 and 200 barrels, all from the Almond producing zone. A Jackknife Springs well flowed 7.2 million cubic feet of gas from the Mesaverde formation; the Sand Butte discovery well flowed 10.6 million cubic feet of gas a day; and an unnamed field discovery well flowed 65,000 cubic feet of gas a day from the Almond producing zone. Of 137 development wells, 110 oil and 16 gas completions resulted, with most activity in the Patrick Draw, West Desert Springs, and Arch Units. The natural gas plant of Sinclair Oil & Gas Co. at Baroil recovered 8,000 gallons of natural gas liquids from a throughput averaging 7 million cubic feet a day.

Coal production decreased 8 percent. The Union Pacific Coal Co. operated the Rock Springs No. 8 and the Superior D. O. Clark mines, Gunn Quealy Coal Co. operated the Rainbow Nos. 6 and 7 mines, and Edwin L. Swanson Bros. operated the Van Dyke mine.

Intermountain Chemical Co. increased soda-ash output 11 percent over that of 1959. In November, the West End Chemical Co. began constructing buildings and sinking a shaft for trona 21 miles west of Green River. One commercial sand and gravel operation was in production.

**Teton.**—Utah-Idaho Sugar Co. mined and crushed limestone for sugar refining and road material. One Government-and-contractor sand and gravel operator reported production.

**Uinta.**—Petroleum produced from two fields increased from 74,000 barrels of oil in 1959 to 93,000 barrels. No new discoveries or development completions were made. Mountain Fuel Supply Co. operated a natural gas absorption plant at Lyman and produced 1,200 gallons of natural gas liquids from an average daily throughput of 55 million cubic feet of gas a day. One commercial and one Government-and-contractor sand and gravel operator reported production.

**Washakie.**—Petroleum represented most of the value of mineral production. Crude-oil production decreased 11 percent. Eleven fields were active, the largest being Cottonwood Creek with 2 million barrels of oil, followed by Worland with 332,000 barrels, Slick Creek with 243,000 barrels, and Hidden Dome with 186,000 barrels. No new discoveries were made, but four oil completions resulted from six development wells. Pan American Petroleum Corp. recovered

elemental sulfur and 5,000 gallons of natural gas liquids from its natural gas plant at Cottonwood field. Pure Oil Co. recovered 72,000 gallons of natural gas liquids from its absorption plant near Worland, and Texas Gulf Sulphur Co. recovered elemental sulfur from the concentrated hydrogen sulfide gas. One commercial and one Government-and-contractor sand and gravel operation was reported.

**Weston.**—Petroleum and bentonite accounted for almost all mineral production. Petroleum production was up 59 percent. Among 14 producing fields, the following were the most active: Fiddler Creek with 1.2 million barrels of oil, Miller Creek with 1.1 million barrels, Clareton with 589,000 barrels, and Skull Creek with 430,000 barrels. Four new oil discoveries resulted from 50 exploratory wells. A discovery well in the Lovetree Creek field flowed 455 barrels of oil a day from the Dakota formation, and a well in an unnamed field pumped 120 barrels of oil a day from the Muddy formation. Of 87 development wells, 57 new producers were completed. Sioux Oil Co. operated its 6,000-barrel-a-day refinery at Newcastle; throughput was 1 percent above that of 1959. Wyton Oil Co. operated its 5.5-million-cubic-foot-a-day natural gasoline plant at Newcastle.

American Colloid, Archer-Daniels-Midland, and Baroid mined and processed 5 percent more bentonite than in 1959. Two commercial and one Government-and-contractor sand and gravel operation were reported.
